Phorpres Fletton bricks, of which over 1,000,000,000 are produced annually, are displayed by the LONDON BRICK CO. AND FORDERS, LTD. (Row G, Stand 131). The structure itself is faced with the 2 in. and $2\frac{5}{8}$ in. rustic bricks. The standard Phorpres brick is seen in one of the dwarf walls. The interior of the office is faced with the company's special white facing bricks. An exhibit of particular interest is a 9-in. wall constructed of the company's latest product, the Phorpres cellular Fletton, a patent brick giving honeycomb or cellular construction with, it is claimed, a very considerable saving in weight. One of the dwarf walls is constructed of these bricks, with a multicoloured rustic facing. At the back of the stand is a fireplace executed in rustic bricks. At the entrance to the stand, as well as on the sides of the building, are exhibited the company's hand-made sand-faced roofing tiles. Around the stand are photographs of some of the company's works and plant, and drawings and photographs in colour of some of the buildings erected with the firm's bricks. There are also panels illustrating the special qualities of the cellular Fletton, and some interesting facts illustrating the company's huge output. Samples of special bricks, partition blocks, agricultural pipes, flooring quarries, road stone, special granite chippings, and other products of the company are also exhibited.

*

Following are a few of the specialities exhibited on Row F, Stand 108, by J. A. KING & CO., LTD. King concrete building, wall and partition blocks, for the erection of external and partition walls and internal partitions in thicknesses from $1\frac{1}{2}$ ins. to 9 ins. thick. These blocks have a rough surface for plastering or rough casting when used for external work. They are also made with a cement face for external work and internal partitions; the latter are being used considerably at the present time to avoid internal plastering. King pumice partition blocks, which are very light in weight and afford an excellent hold for nails and screws. King plaster partition slabs for partitions, pugging and ceilings: the surface is finished either keyed for plastering or smooth face. King reinforced plaster roofing slabs: they form a light, fire-resisting roof construction and have been used on many important buildings; they are particularly adaptable for factory and warehouse roofs, and give a smooth finish on the underside equal to a plastered ceiling. King self-centering floor tube system: the tubes are made in lengths up to 2 ft. 11 ins. and are so notched that they rest on and practically cover the lower flange of the R.S. fillers, which are spaced at 3 ft. centres maximum. The tubes are laid in dry, and a very small amount of concrete topping is claimed to make a floor which is light, strong and economical. Ferro-Glass patent pavement, floor, roof

A Phorpres cellular Fletton.

and stallboard light construction: this is composed of glass prisms about 2 ins. deep and 4 ins. square, so shaped that small reinforced concrete beams are made between each prism. The lips of these prisms are so shaped that they form practically one entire glass surface on the underside; there is no exposed ironwork. Glas-Crete patent floor and roof light construction, while being similar to ferro-glass in that it is composed of reinforced concrete and glass prisms, differs in that the glass covering to the reinforced concrete beams is omitted. There being no exposed ironwork, rusting is impossible and painting eliminated. Both Ferro-Glass and Glas-Crete constructions are extensively used for flat-topped lantern lights. The lights rise no higher than sill level of surrounding windows and consequently do not obstruct light or ventilation. Cristol glass construction, an electro copper glazing incorporating units of high relief moulded glass: this construction is used for domes, laylights, etc., and is claimed to be fire and weather resisting.

*

Among the exhibits of the INTEROVEN STOVE CO., LTD. (Stand 223, Row L), is the firm's latest production, a 22-in. width Super Interoven, which can be had with or without boiler for hot-water supply. Also shown are a 35-in. width Super Interoven, which is capable of cooking for big families, and the Pascall side-oven grate, in which the lower oven is instantly converted to a large hot-plate space. All the above stoves can be converted into open fires when cooking is finished. The Cheer-ee-o open-fire stove for continuous burning, night and day, at small cost, can be supplied in various finishes. Bewty barless fire fronts include a good trivet top, and fit any type of existing fire grate. The Cheerio wrought steel independent boiler gives continuous hot water day and night, burns any kind of fuel, also kitchen refuse, and has a large nickel-plated hot plate for light cooking, etc. It can be used as an open or closed fire.

The New 22 in. Super Interoven.

*

The stand of VENESTA, LIMITED, Row F, 118, has been designed by M. Le Corbusier to display in the most effective manner possible the grades of Venesta birch plywood and the various other types of Venesta plywood—oak, walnut, mahogany, gaboon, etc. Photographs are exhibited to illustrate work that has been carried out with the different grades and types of plywood. The use of Plymax—the armoured plywood—is also shown by practical examples. The design of the stand enables the structural and decorative significance of all the materials to be seen at a glance.

*

A large model, 7 ft. by 3 ft., on the stand of TUKE AND BELL, LTD. (Row D, 60), shows a country house and the layout of grounds and gardens, with the drainage system and sewage-purification plant, discharging the purified effluent into a stream running near the bottom of the site. The firm's ærobic bacterial filter bed is 9 ft. in diameter, and is fitted with their Ideal revolving distributor. This distributor is positive in action and, having no perforations liable to choke, is claimed to be capable of working for weeks without requiring any attention. The ball-bearing head works in an enclosed oil bath. In the Tuke and Bell oil and petrol interceptor, which is in coated cast iron, 30 ins. by 18 ins. by 24 ins., with 4-in. swivel outlet, the inlet grating is slightly sunk to permit of dished channels in the washing space floor, so that all washing water enters the petrol interceptor at the grating. The interceptor has two compartments, with dip pipe, to prevent the oil and petrol passing through, and ventilation is provided. The swivel outlet forms a trap. Above the inlet and outlet orifices there is a space for oil to accumulate. This interceptor is suitable for dealing with the washing water from one or two cars. The firm also manufacture a coated cast-iron grease trap for dealing with the kitchen and scullery wastes from large country houses, hotels, etc. A special feature of the traps is that the top portion provides for the accumulation of grease. These traps are fitted either with a horizontal inlet socket for a 4-in. pipe or a vertical inlet socket for a 2½-in. pipe, with 4-in. swivel outlets.

*

Since the last Building Trades Exhibition, Snowcrete, British white Portland cement, and Colorcrete, the rapid-hardening coloured Portland cement, have been placed on the market, and many exhibits are displayed by the CEMENT MARKETING CO., LTD. (Row F, Stand 114), to demonstrate their artistic possibilities. Tests on Ferrocrete, the rapid-hardening Portland cement, and Blue Circle are carried out at frequent intervals.

*

In a miniature building—an enclosed stand of simple modern design—WILLIAMS AND WILLIAMS, LTD., show metal windows and doors in use. In one side is the standard bay window for domestic use. On the other are two typical standard cottage windows. The window at the back of the stand, looking on to a painted scene, is of the heavy standard type suitable for mansions. In the front is a pair of French doors suitable for country houses, and on either side of the entrance are standard factory windows. Inside, other types of metal window frames are displayed, as well as a collection of photographs showing not only the full range of output, but the great variety of work which the firm have in hand in four continents.

*

The stand itself, a reproduction in English oak of a Tudor hall and staircase, is the chief exhibit of RIPPERS, LTD. The exterior work is left in its natural colour, except for a treatment which reproduces the effect of age and brings out the natural quality of the wood. Inside there is a room panelled to match the remainder of the stand. In the upper portion of the stand are panels in different woods designed to illustrate a variety of treatments, particularly in oak. Another exhibit illustrates the advantages of the Hygienic patent flush door. This embodies special features, and is shown in a variety of finishes. The firm exhibit on Stand 51, Row D.

*

The stand of the LONDON SAND BLAST DECORATIVE GLASS WORKS, LTD. (95, Row E), includes exhibits of sandblasted and acid designs on different types of glass, special tinted and decorated mirrors, electric lighting fittings in engraved glass, samples of advertising tablets, mirrors and desk novelties. The centre feature of the exhibit is a decorative design composed of different tints of plate glass.

Continental Architecture

Among foreign art periodicals circulating in England none are better known than the two published by the firm of Alexander Koch, *Innen-Dekoration* and *Deutsche Kunst und Dekoration*.

The second of these is rather wider in scope than the other, and has long been a favourite among painters and sculptors, while its craftsmanship section keeps in remarkably close touch with the latest Continental movements. The August issue has an excellent account of the Exhibition of the Austrian Werkbund at Vienna, illustrated with examples of the work of Holzmeister, Sobotka, and the veteran Josef Hoffmann, whose influence on the Viennese school of design is still pre-eminent.

The Paris Exhibition of the German Werkbund is described in the September issue. This time the bulk of the work is done by Walter Gropius. The article on the German sculptor Georg Kolbe ought also to be of considerable interest to English architects.

Innen-Dekoration is a paper which, as its title indicates, deals exclusively with interior decoration. A number of Berlin restaurants by the architect Michael Rachlis and Mr. Serge Chermayeff's London flat are the most important subjects dealt with in August. The photographs of the latter are of a very high standard indeed, and it is interesting to compare them with the work of German photographers which fills the rest of the issue.

The house of the Viennese architect Ernst Schwadron is exhaustively dealt with in the September issue, which also has some interesting interiors by the French designer Jean Michel Frank.

LITERATURE

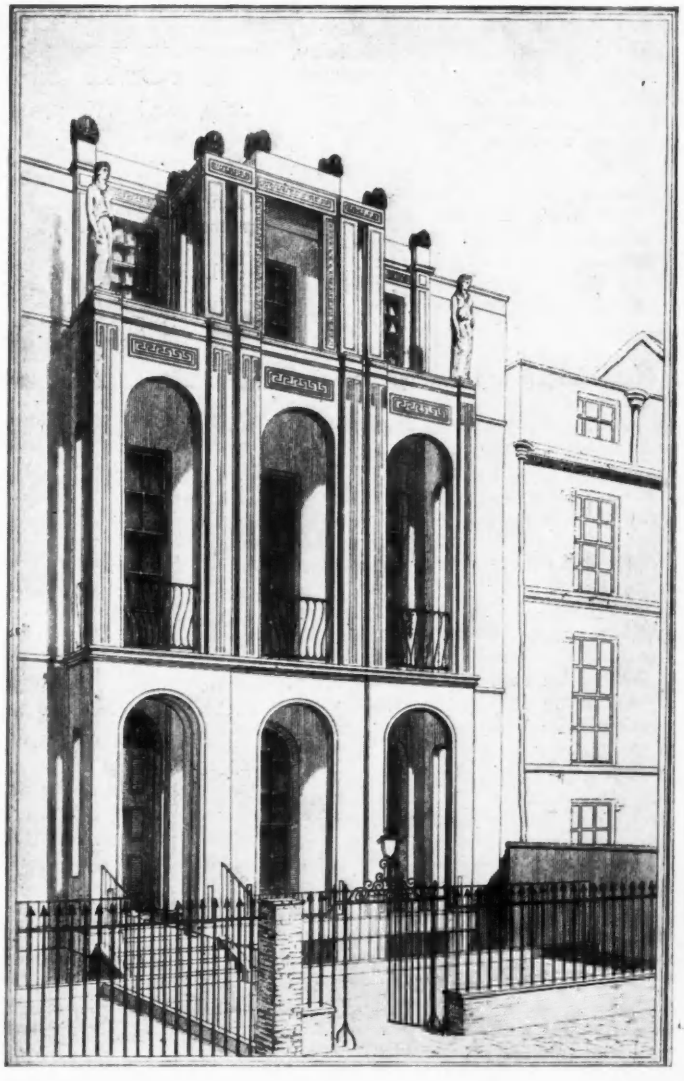
SOANE'S MUSEUM

THE eleventh edition of the description of Sir John Soane's residence in Lincoln's Inn Fields has recently been issued. It has been edited by Mr. Arthur T. Bolton, F.R.I.B.A., the present (seventh) curator of the museum.

Mr. Bolton, in his preface, points out that the publication of a new edition of the *Handbook* or *General Description of Sir John Soane's Museum* occurs just ninety years after the first edition by the first curator in 1840. Within three years after the inauguration of the Sir John Soane Museum under the private Act of Parliament (obtained by Sir John Soane in 1833) which came into force on the death of the founder, January 20, 1837, it became evident that some general description of the house and its contents was required for the use of students and visitors. The first curator, George Bailey, appointed by Sir John Soane's will in accordance with that Act, undertook, with the concurrence of the trustees, the first *Handbook* at a published price of one shilling. This first edition of the *Handbook* (1840) is now seldom met with, but an examination of the original MS. in George Bailey's handwriting shows that it was an abridgment of the text of Sir John Soane's own *Description of the House and Museum* (1835). This work, a large quarto, "privately printed, only 150 copies," was mainly distributed to the author's friends and connections, and is marked "Not published."

There was, continues Mr. Bolton, an earlier book of 1827 produced by Soane's friend, John Britton, F.S.A., entitled *The Union of Architecture, Painting, and Sculpture*. The text of this work appears to have been really written by W. H. Leeds, while the drawings were supplied by Soane. Another short account appeared in Pugin and Britton's *Public Buildings in London* (1828). Britton's book of 1827 was not a success, and in 1830 Soane made his first attempt on his own account. Finally, after his retirement in 1833, the veteran undertook what proved to be his best literary effort, with the sole co-operation of Mrs. Barbara Hofland, who was engaged to follow his own account, in each successive stage, with notes of a more popular and descriptive character. Her contribution to Soane's book was to a considerable extent designed to interest the more youthful class of visitor.

The notes of the lady author have now been separately edited under the title, *Popular Description of Sir John Soane's House, Museum, and Library*, and it appeared to the present curator that a reversion, as close as possible to the original text of Soane's own *Description* (1835), would provide the best possible handbook for the student and visitor. At the same time, much indispensable information, added by the successive editors of the previous ten editions of the handbook, has been retained in the present text. Other additions have been made by the editor, both in notes and appendices, in the hope of making the *Handbook* of real service to the student and visitor, not only on the spot, but also for general use as a work of reference.



Description of the Residence of Sir John Soane. Edited by Arthur T. Bolton, F.S.A., F.R.I.B.A. Eleventh edition. Oxford University Press. Price 1s. net.

MODERN HOUSES AND BUNGALOWS

THE seventy-eight houses illustrated in this book are "architects' houses"; that is to say, they have been designed by architects and not by builders. All of them are designed with reference to the fact that comfort and economy lie in the direction of limited domestic labour. They are either one-servant or servantless houses, and the plans only differ according to the kind of home life that is contemplated. Several of the examples have been planned to qualify for the Government subsidy.

Every house nowadays is, or at least aims at being, a labour-saving house. Innumerable "gadgets" with this end in view have been offered to the house-owner. Some of them are good and useful; others, as Mr. Hugh B. Philpott, the editor of the book, points out in his introduction, are merely silly. He rightly points out that the best labour-saving device of all is a good plan.

The façade of Sir John Soane's Museum, as originally built in 1812.

[*From* A Description of the Residence of Sir John Soane, R.A.]

Much apprehension still exists with regard to architects' fees. Mr. Philpott is wise in publishing particulars of the commission recognized by the R.I.B.A., and showing how the service given for this fee will render the house the individual possession of the client, and in some measure an expression of his own individuality. Everyone who reads his notes will agree that the architect who skilfully, patiently and conscientiously plays his part, earns every penny of his commission.

Modern Houses and Bungalows. Edited by Hugh B. Philpott. London: Illustrated Carpenter and Builder. Price 2s. 6d. net.

LAW REPORT

ALLEGED WAIVER OF BREACHES

Morgan-Jones v. *Wilson. Court of Appeal. By Lords Justices Scrutton, Greer and Slesser*

ALLEGED waiver of certain breaches formed the main ground in this appeal, which was by the plaintiff, Miss P. Morgan-Jones, from a judgment of a King's Bench Divisional Court, consisting of Justices Talbot and Finlay, allowing the appeal of the defendant, Mr. R. Wilson, from the judgment of the deputy county court judge sitting at Marylebone, in favour of the plaintiff. Mr. Wilson had rented a service flat from Miss Morgan-Jones at Westbourne Terrace, Paddington, under an agreement, from July, 1929. Mr. Wilson had paid the rent in October till the following January 9, and Miss Morgan-Jones claimed rent from then to April. Mr. Wilson set up that there had been a breach of plaintiff's contractual obligations which entitled him, under the agreement, to determine the contract for tenancy. He also counterclaimed for damages.

The county court judge had evidence that there had been a failure to implement the obligation to provide hot water and central heating in October and again in November, and he came to the conclusion that there had been a breach by the plaintiff, but that the payment of rent in the October constituted such a waiver by the defendant of the breach that he was not entitled to rely upon it, and in the circumstances there could not be a determination of the tenancy. He gave judgment for the plaintiff for £54 odd, but on the counter-claim for the defendant for £5 damages for breach of contract by plaintiff.

Upon this judgment, the defendant appealed to the King's Bench Divisional Court. They allowed the appeal, Mr. Justice Talbot saying that the only waiver which the county court judge appeared to have considered was one affected by the payment of rent. It was subsequently discovered that the payment of rent was made on September 27 and not in October. In the circumstances, Mr. Justice Talbot said, it was impossible to hold that the payment in September could operate as a waiver of breaches which began early in October. He accordingly held that the county court judge had misdirected himself as to the effect of the facts he had found and judgment should be entered for the defendant, Mr. Wilson.

Mr. Justice Finlay agreed. Miss Morgan-Jones now appealed from that judgment.

Sir Albion Richardson, K.C., argued the case for the appellant, but the court, without calling upon Mr. Laski, K.C., for the respondent, dismissed the appeal with costs.

Lord Justice Scrutton said the court had come to the conclusion that on the facts of the case there was no material in law sufficient for the court to decide that the defendant had waived the breach of the plaintiff's contract to provide the hot water and heating.

ALMSHOUSES, POTTERS BAR

Following is a list of the general contractors and some of the sub-contractors for the almshouses at Potters Bar, High Barnet, illustrated on page 412 :

General contractors, Pettengell. Sub-contractors : A. H. Herbert & Co., Ltd., bricks and roof tiling; MacDowall, Stevens & Co., Ltd., stoves; Leeds Fireclay Co., Ltd., sanitary fittings; Comyn Ching & Co., Ltd., locks and furniture; Crittall & Co., Ltd., casements; Fernden Fencing Co., fencing and gates.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

COMPETITIONS OPEN

September 30.—The Isle of Man Education Authority invited architects to submit competitive designs for a new Grammar School at Ramsey, Isle of Man. Assessor, T. Taliesin Rees, F.R.I.B.A. Premiums : £250, £150 and £75. Particulars, etc., were obtainable from T. R. Lewin, Clerk of the Authority, Education Office, Strand Street, Douglas, until July 1. Deposit £1 1s. Latest date for submission of designs : September 30.

October 1.—The Burton-on-Trent Local Education Authority invited architects to submit competitive designs for a proposed new Council school to accommodate approximately 800 children, to be erected on a site in Clarence Street. Assessor : H. T. Buckland, F.R.I.B.A. Premiums : £150, £100 and £50 for the designs placed 1st, 2nd and 3rd, respectively. Applications for the conditions of the competition and site plan should have been made before September 8 to L. E. Burgess, Secretary and Director of Education, Education Offices, Guild Street, Burton-on-Trent. Latest date for submission of designs : October 1.

October 20.—The Maternity and Child Welfare Committee of the City of Birmingham invites architects to submit competitive designs for two infant welfare centres, one at Warren Farm Road, Kingstanding (Perry Barr), and the other at Trittiford Road (Billesley). Competitors must have occupied offices in Birmingham as their head office for six months prior to July 19, 1930. Assessor : A. T. Butler, F.R.I.B.A. Premiums, £100 in respect of each centre. Conditions of competition and plans of the sites may be obtained on application to Herbert H. Humphries, M.INST.C.E., City Engineer and Surveyor, the Council House, Birmingham. Deposit £1 1s. for each centre. Latest date for submission of designs : October 20.

October 30.—The General Building Syndicate, Ltd., invites architects to submit competitive schemes for the development of a site at Liverpool, fronting St. John's Lane, Queen Square and Rose Street. Premiums : £250, £100 and £50, for first, second and third prizes, respectively. Particulars, etc., are obtainable on application to the Secretary, the General Building Syndicate, Ltd., 36 St. Martin's Lane, W.C.2. Latest date for submission of designs : October 30.

November 30.—The Guildford Cathedral Committee invites any architect, who has been engaged in the design of cathedrals or churches, to submit for examination drawings and other illustrations of his works; or a design for a cathedral. Not more than three sets of drawings may be submitted, packed in one large portfolio. The Committee, with the assistance of Mr. Walter Tapper, A.R.A., will examine the portfolios, and select a limited number of architects for the Final Competition. Each architect selected for the final competition will receive 500 guineas, whether his design is accepted or not. Portfolios should be addressed to The Venerable the Archdeacon of Surrey, The Diocesan Office,

Lloyds Bank Chambers, Guildford, not later than November 30.

December 25.—A prospectus giving full particulars of the international competition for the Ukrainian State Theatre, organized by the Kharkov Town Council, Russia, has recently been issued. The theatre is to be erected in the centre of Kharkov, on the site of the present Comsomolsky Square (Young Communist Square), and will contain a mass musical stage and seating capacity for 4,000 persons. The competition will be assessed by a jury comprising a president, vice-president and fifty-six members. Prizes: 1st, 10,000 rub.; 2nd, 8,000 rub.; 3rd, 6,000 rub.; 4th, 5,000 rub.; 5th, 4,000 rub.; 6th, 3,000 rub.; 7th, 8th and 9th, 2,000 rub.; 10th, 11th, 12th, 1,500 rub. Drawings should be sent to the Kharkov Town Council on or before December 25. Copies of the prospectus are obtainable from the Embassy of the Union of Soviet Socialist Republics, Harrington House, 13 Kensington Palace Gardens, London, W.8.

December 31.—The Incorporated Association of Architects and Surveyors invites competitive designs for a Model Petrol Filling and Service Depot. The competition has the full support of the Automobile Association, the Scapa Society and other bodies which have at heart the preservation of the countryside, as well as the principal motor-trade journals. Assessors: Alfred Stephens Cross, M.A. (CANTAB.), V-P., I.A.A.S.; Edward H. Fryer, Deputy Secretary of the Automobile Association; and Walter Groves, Editor of *The Motor*. Prizes: 50 guineas, 20 guineas and 10 guineas for first, second and third places, respectively. Smaller awards may also be made on the advice of the assessors, and at the discretion of the Council of the Association. In addition a prize of 10 guineas and two prizes of 5 guineas each will be awarded to laymen for the best suggestions submitted with or without sketches. Full particulars, etc., are obtainable from the Secretary, the Incorporated Association of Architects and Surveyors, 1 Wilbraham Place, London, S.W.1. Latest date for submission of designs: December 31, 1930.

No date.—The Committee of the Foundation Hospital and the Rectorate of the Royal Yugoslavian University of Zagreb invites competitive designs for the general rebuilding plans of the Foundation and Clinic Hospital of Zagreb. Assessors: 1. Dr. Srkulj Stjepan, Burgomaster and Chairman of the Foundation, as president of the jury. 2. Henauer, W., architect, of Zurich (or his representative, Ch. Thevenaz, architect, of Lausanne), for the Swiss Engineers' Association of Germany. 3. Dr. Ing. Kreis Wilhelm, of Dresden, for the Engineers' Association of France. 4. Arch. Expert H.R., of Paris, for the Engineers' and Architects' Association of France. 5. Dr. Culumovic Pavao, Primarius, for the Medical Association of Zagreb. 6. Ing. Gabric Franjo, for the Yugoslavian Association of Engineers and Architects, Zagreb section. 7. Dr. Rasuhin Josip, deputy for the Directors of the Institute of Hygiene Foundation Hospital of Zagreb 8. Prof. Dr. Prasek Emil, for the medical faculty of Zagreb. 9. Dr. Durst Franjo, for the medical faculty of Zagreb. 10. Arch. Heinzel Vjekoslav, Alderman of the City of Zagreb. Committee representative of the jury: Ing. Jurkovic Mato, Stadtbaurat in Zagreb. Prizes: 1st, 20,000 Swiss francs; 2nd, 15,000 Swiss francs; 3rd, 10,000 Swiss francs. 15,000 Swiss francs have been set aside for any further work which may be required. Programme and particulars of the competition will be sent on or after August 15, 1930, on application to the Stadtvorstand of Zagreb (Mr. Matica, secretary), Room No. 70, 2nd floor, on payment of 200 dinar. Latest date for submission of designs: January 15, 1931.

THE ARCHITECTS' DIARY

WEDNESDAY, SEPTEMBER 17

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visits to the Flaxman Automatic Exchange, Mallord Street, Chelsea, and the Holborn Automatic Exchange, 268 High Holborn, W.C. **3 p.m.**

INTERNATIONAL BUILDING TRADES EXHIBITION, Olympia. Until October 1.

BRITISH GLASS CONVENTION. At Buxton. Until September 20. Morning: Meeting of the Council of the Society of Glass Technology. Afternoon: General Meeting of the Society of Glass Technology. Evening: Informal Presidential Reception of members and their friends at the Palace Hotel.

THURSDAY, SEPTEMBER 18

BRITISH GLASS CONVENTION. At Buxton. Morning: Official welcome by the Mayor and Corporation of Buxton, at the Peak Buildings. Presidential Address. Discussion on "Elimination of Waste in the Glass Industry," to be opened by Dr. Miles. Official luncheon. Evening: Mayoral Reception at the Palace Hotel.

L.C.C. HAMMERSMITH SCHOOL OF BUILDING AND ARTS AND CRAFTS, Lime Grove, Shepherds Bush, W.12. Exhibition of Students' Work. 10 a.m. to 9 p.m. Until September 20. (Sept. 20, 10 a.m. to 4 p.m.) **10 a.m.**

FRIDAY, SEPTEMBER 19

R.I.B.A., 9 Conduit Street, W.1. Exhibition, in the Galleries, of drawings submitted in competition for the Archibald Dawnay Scholarship (10 a.m. to 7 p.m.; Saturdays, 2 p.m.). Until September 30. **10 a.m.**

BRITISH GLASS CONVENTION. At Buxton. Morning: Discussions on "Marketing Methods in the Glass Industry" and "Public Propaganda in the Glass Industry," to be opened by Sir Francis Goodenough, C.B.E., and H. Gordon Selfridge, respectively. Afternoon: Golf Competition for championship of the Glass Industry. Evening: Banquet at the Palace Hotel.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS. Meeting to be held at Southampton.

SATURDAY, SEPTEMBER 20

Sunrise, 6.41 a.m. Sunset, 7.5 p.m.

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS, 26 Buckingham Gate, S.W.1. Debate on official architecture, to be held at the Building Exhibition, Olympia. Chairman, Lord Riddell. Speakers will include Wynn Owen, F.R.I.B.A., and H. V. Lanchester, F.R.I.B.A. **3 p.m.**

BRITISH GLASS CONVENTION. At Buxton. Morning: Discussion on "The Convention—Present and Future," to be opened by Mr. Walter Chance, M.A., J.P.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS. North Wales District meeting, to be held at Bangor.

WELSH SCHOOL OF ARCHITECTURE, Technical College, Cardiff. Latest date for submission of application forms for the Scholarship Examinations.

MONDAY, SEPTEMBER 22

NORTHERN POLYTECHNIC, Holloway, N.7. Commencement of new term.

TUESDAY, SEPTEMBER 23

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to the Church of St. Martin-in-the Fields, Charing Cross, W.C.2. Tea will be served in the Crypt. **3 p.m.**

LIBRARY ASSOCIATION. Fifty-third Annual Conference, to be held at Cambridge. Until September 27.

FRIDAY, SEPTEMBER 26

NATIONAL SMOKE ABATEMENT SOCIETY. Annual Conference, to be held at Leicester until September 28. During the conference the following papers will be read: "Fuel Research and Smoke Abatement," by Dr. Margaret Fishenden; "The Smoke Problem in Sheffield," by F. J. Bailey and E. C. Evans; "Smoke and the Weather," by a meteorological expert; and "The Smoke Nuisance as the Airman Sees It."

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, S.W.1. London and Home Counties Branch. Dinner and Dance to be held at the Quadrant Restaurant, Regent Street, W. Tickets, 7s. 6d.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS. Yorkshire District meeting, to be held at Hipperholme.

SATURDAY, SEPTEMBER 27

Sunrise, 6.53 a.m. Sunset, 6.49 p.m.

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to the Church Bell Foundry of Mears and Stainbank, 32-34 Whitechapel Road, E.1. **11.30 a.m.**

VICTORIA AND ALBERT MUSEUM, Cromwell Road, South Kensington, S.W.7. "Continental Glass," 12 noon. "English Domestic Glass." 3 p.m. Both lectures by Miss B. Goldsmid. **12 noon.**

MONDAY, SEPTEMBER 29

ROYAL SANITARY INSTITUTE, 90 Buckingham Palace Road, S.W.1. Commencement of Sanitary Inspectors' Course. **6 p.m.**

TUESDAY, SEPTEMBER 30

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, S.W.1. London and Home Counties Branch. "The Making of a Cathedral—Liverpool." By E. W. Harvey-Piper. (Lantern Illustrations.) **7 p.m.**

ISLE OF MAN GRAMMAR SCHOOL COMPETITION. Latest date for submission of designs.

WEDNESDAY, OCTOBER 1

BURTON-ON-TRENT SCHOOL COMPETITION. Latest date for submission of designs.

FRIDAY, OCTOBER 3

TOWN PLANNING INSTITUTE. Twelfth Annual Country Meeting, to be held at Leicester. Until October 5.

SATURDAY, OCTOBER 4

Sunrise, 7.4 a.m. Sunset, 6.53 p.m.

MONDAY, OCTOBER 6

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Commencement of Winter Term.

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Motor Coach Excursion: Special Visit to Greenhithe Cement Works. Leave Portland House, Tothill Street, Westminster, S.W.1, at 1.45 p.m. Tickets obtainable from the Secretary of the Society. **1.45 p.m.**

WELSH SCHOOL OF ARCHITECTURE, Technical College, Cardiff. Commencement of School Year.

ROYAL SANITARY INSTITUTE, 90 Buckingham Palace Road, S.W.1. Commencement of Smoke Inspectors' Course. **6 p.m.**

TUESDAY, OCTOBER 7

R.I.B.A., 9 Conduit Street, W.1. Closing date for applications for admission to the Intermediate Examination.

THURSDAY, OCTOBER 9

C.P.R.E. Third Annual Conference, to be held at Welwyn Garden City. Until October 11. Among the papers to be read are the following: "The Preservation of Commons, Parks, Open Spaces and Nature Reserves, and the Provision of Playing Fields." By Sir Lawrence Chubb. "Town and Regional Planning in their Relation to the Objects of the C.P.R.E." By Sir Theodore Chambers, K.B.E., F.S.I. "Education and Citizenship in their Relation to the Safeguarding of the Countryside, etc.," and "Flora and Fauna, including the Preservation of Trees, Wild Flowers, Roadside Plants and the Protection of Birds." Each paper will be open to discussion.

ROYAL ACADEMY, Burlington House, W.1. "Early Methods of Oil Painting." By A. P. Laurie, D.SC. **4 p.m.**

FRIDAY, NOVEMBER 21

R.I.B.A., 9 Conduit Street, W.1. Intermediate Examination. Until November 27.

SATURDAY, NOVEMBER 22

Sunrise, 7.28 a.m. Sunset, 4.3 p.m.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1*s.* 3½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour;* NAVVY, 1*s.* 3½*d. per hour;* TIMBERMAN, 1*s.* 5*d. per hour;* SCAFFOLDER, 1*s.* 4½*d. per hour;* WATCHMAN, 7*s.* 6*d. per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.

Transport hire per day:

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0	1	6
SPREAD and level, including wheeling, per yd.	0	1	6

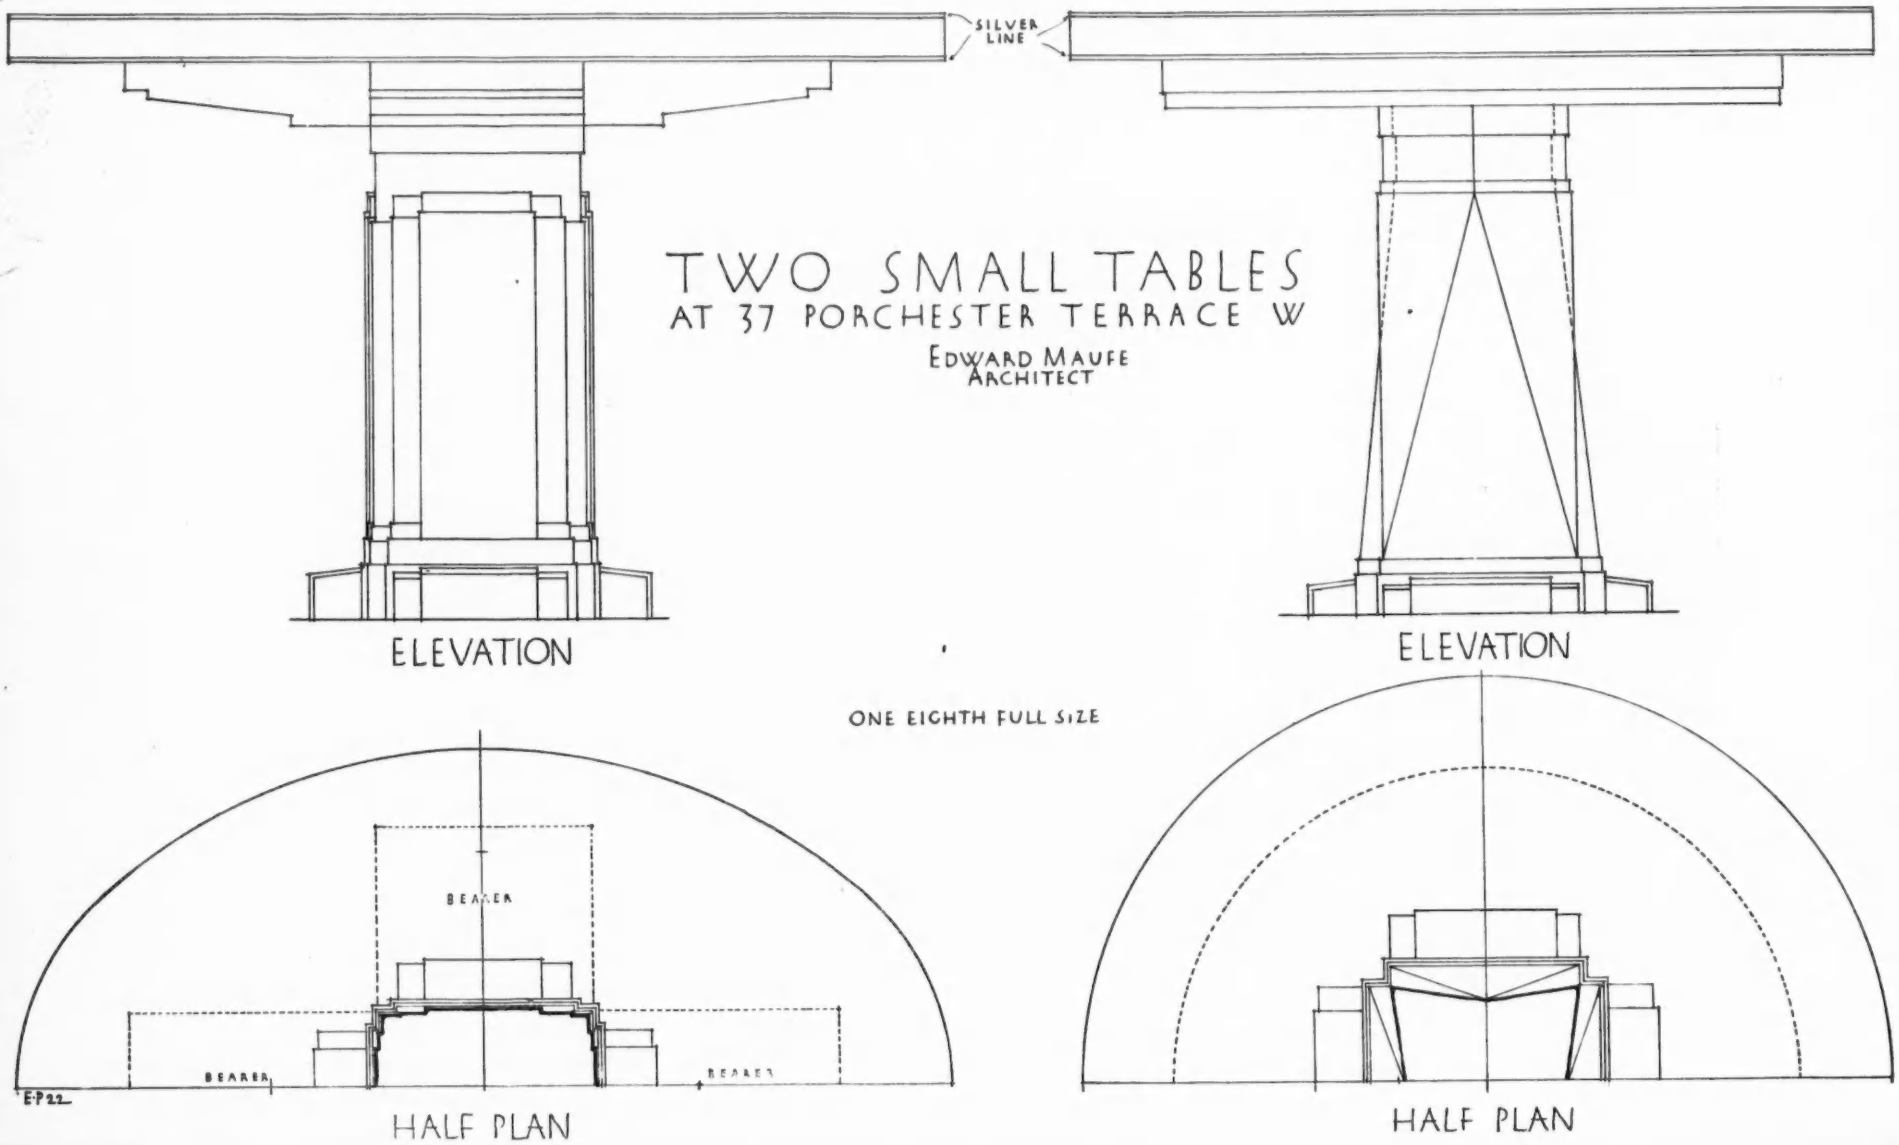
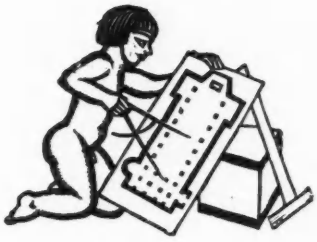
A WEEKLY SERIES

TWO SMALL TABLES:
AT 37 PORCHESTER TERRACE, W.
BY EDWARD MAUFE



THESE two tables, though forming a pair in the usual sense, differ considerably in detail although in mass they are similar. One has a circular top of a diameter which strikes a mean dimension between the major and minor axes of the other, which is elliptical.

Both are framed up of hardwood covered with a veneer of Macassar ebony, with two fine silver inlaid lines round the edges of the table.



The tables were made for the silver-walled living-room of a flat at 37 Porchester Terrace, for which Mr. Maufe was responsible.

The drawing can be read with an architect's scale.

ARCHITECTURE AND THE FARM

How often have I paused on every charm,
The sheltered cot, the cultivated farm . . .

—OLIVER GOLDSMITH

ONE is familiar with the viewpoint, nauseatingly stressed by the daily Press from time to time, and capable of brief statement as "only a woman who lives in a kitchen is fit to design one." This viewpoint is undoubtedly responsible for much bad amateur planning and needless consequent inconvenience—Mr. G. K. Chesterton has pithily said that "a practical man is usually a man who practises the mistakes of his ancestors." Nowhere are these mistakes more assiduously practised than in the design of farm buildings. There is one quality which seems almost general to all farmers, and that is an evident feeling that it is almost sacrilege for any but a practical farmer (with accent on the *practical*) to attempt to know anything of farming processes or the arrangement of the buildings constituting a modern farm. If farmers would put their cards freely on the table and describe fully and in detail their needs and intended routine they might secure from architects much the same kind of guidance as the modern manufacturer commonly does—and with equal advantage, but a large proportion of architect-designed farm buildings fail from non-acquaintance with simple essentials; probably too simple and obvious to the farmer to be even stated among the preliminaries, and not realized by him until errors and offences in idea have become solid fact.

On the other hand, the architect who is privileged to adventure in the field of homestead design ought to realize that, in the present circumstances afflicting agriculture, his efforts should be concentrated on a good working plan and a sound structure developed with that appearance of rightness which should be the result of training and competence, rather than upon finding means to introduce any cherished tricks of design or favourite materials. Architecture proper will only come in on those rare occasions when a wealthy landowner desires to sacrifice profit to æsthetic satisfaction. He will perform a similar service to his immediate client in particular, and to the community in general, if he succeeds in producing a farm building which shall be convenient, shapely, and sound, as does the housing architect who, with no straining for effect, does the same thing in that field of effort. Such achievement will be more highly esteemed and will redound to the credit of the architectural profession. It is better social service to design a building which can be built, and when built can be used, and while in use is not viewed with aversion as having cost much more than it should, rather than to produce a "conception" which outruns the means of its intending owner, with equally unsatisfying result whether it is abandoned or translated into fact. The architect must not even jib at the use of asbestos-cement roofing, which offers many advantages for such a structure as a modern double-rank cowhouse. He can, of course, avoid shrimp-pink diagonal tiling. All this is intended to advise the architect that serious farm-building design on a commercial basis is no primrose path.

Cleanliness, light, and air should be striven for in modern farm-building design, as they have been in all other improved forms of building. The innocent old lady who deplored the waywardness of farmers in always placing their gates in the muddiest part of the fields, though her reasoning was absurd, yet had her finger on one of the drawbacks of agricultural employment—particularly as affecting the rising generation, who have a distaste for mud-wallowing. Too often the yards and surroundings of a farm building are tacitly assumed as necessarily filthy throughout a great part of each year, and this is typical of many inconveniences which are held to be inevitable because they "always have been."

This is not the way to encourage the younger generation to farm work.

A MODERNISTIC EXHIBITION STAND

A photographic study of the Venesta Stand at the Building Exhibition, designed by Le Corbusier, Jeanneret and Perriand. The unique design of the stand enables the structural and decorative significance of all the materials to be seen at a glance. An isometric drawing appears on page 463.

NEWS & TOPICS

WELL-BEHAVED OLYMPIA

I DO not think the designs of the stands at this year's Building Exhibition display on the whole a marked originality. One or two seem to have caught a breath from Stockholm and endeavoured to express the modern spirit, but generally they are a sober, well-behaved gathering, with not a few old faces among them. The brick and tile makers possess an advantage in being able to build attractive stands with their exhibits, and Messrs. S. and E. Collier, Ltd., have a pleasing building with a central tower designed by Mr. A. J. Thomas. Another stand, designed by Mr. Walter Brand, of Leicester, for Messrs. W. T. Wright & Co., has a portico of silver-grey bricks, both plain and moulded, which form a shrine to their winning fireplace design within. The large stand of the London Brick Co. and Forders, Ltd., is carried out in rustic Flettons with a pleasing texture, and the paved garden ends with a good Exhibition joke in the shape of two tile pyramids on stems, resembling clipped yews. Messrs. Wheatly & Co. also exhibit a well-designed little stand composed from their various products, whilst Messrs. W. T. Lamb's stand is in the form of an attractive pavilion with two mullioned windows.

★

Two effective designs, which seem to have been produced under the influence of the American skyscraper, are the stands of Messrs. Drytone Ltd., and Messrs. Mallinson and Son, Ltd. These have each a central tower motif, supported at the four corners by lower pavilions. The former is one of the best architectural compositions in the Exhibition, whether seen from the gallery or from the floor of the hall, and the latter deserves credit for the skill with which the design has been carried out, using only the materials exhibited by Messrs. Mallinson in its construction. Another stand of this type, where a simple dignified effect has been produced out of the material exhibited, is that of Masonite, Ltd., and Mr. Scott, the architect to the firm, has produced a pleasing design.

★

Among the moderns is the glass exhibit of the London Sand Blast Decorative Glass Works, Ltd., which is a revelation of what can be done in this material. The stand, with its silver walls, glass ceilings, coloured and etched panels and modern tubular furniture, contains an effective picture made up of coloured plate-glass. Another modern is the Crittall Manufacturing Co., Ltd., which is plain to severity, but only thus displays the more effectively the various forms of metal windows. A pleasing feature is the staggering of the bays which relieves the squareness, which otherwise would be monotonous.

★

The Venesta stand, designed by Le Corbusier, is not the violent shock one might expect. From the author of *Vers un architecture* I expected something uncompromisingly rebellious, a violent reaction against its humdrum neighbours. But, generally it consists of a Plymax ceiling and pillar and a streamline wood casing to one of the columns of the gallery. Within this casing has been schemed a little cupboard. But for the rest, the various exhibits are arranged in a most rational manner.

Two other moderns are to be found in the Empire Hall. One is the stand designed for the Anglo-Colonial Trading Corporation by Mr. Emberton, the architect of the new Olympia building; this is a simple, straightforward stand, with good lighting effect. The other is that of Sika, Ltd., which arrests the attention on account of its startling colour scheme. In this part of the Exhibition Messrs. Haywards have a well-designed stand by their architect-director, Mr. Davis, which includes an interesting lighting effect of a metal and glass canopy, where the hidden lights shine through deep-coloured green glazing.

★

The gas companies cannot display themselves to advantage without an architectural setting, and have produced two good stands. The South Metropolitan Gas Co. have a stand in light-cream colour, with a deep overhanging roof, ornamented at the corners with a modern light fitting. Mr. Tapper, architect to the Gas Light and Coke Co., has designed a series of rooms in which the various fittings and gas fires are well displayed. The whole of this stand, both within and without, presents a most pleasant colour scheme, and the little windows give just that sense of fun which is fitting in an ephemeral building. Messrs. Candy & Co., Ltd., have built a loggia of tiles against the wall of their stand and in it have arranged two small niches of dark-blue tiles which produce a very telling effect with their narrow jointing. Perhaps, Messrs. Carter & Co. have an unfortunate " pitch " in the Exhibition, for their obelisk, with its chromatic cap and base, is partly hidden by other stalls until one almost falls over it. But one of the jolliest things at Olympia is the peep through a brightly coloured side opening of their stand at a tiled wall panel within. For a moment one has a vision of Spain and Algiers.

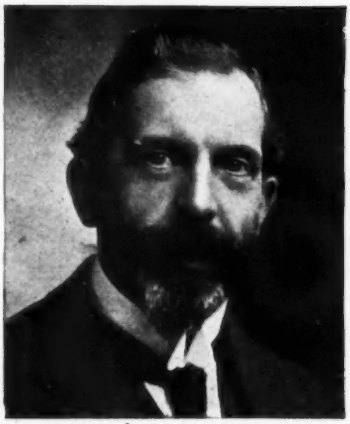
★

Much has been said in praise of the " Silent House," but Mr. Trystan Edwards's schemes of decoration also deserve mention. The rooms are all modern—but not too modern to be dwelt in by mere man. During my inspection I overheard a lady say : " I don't like these silent rooms. They are so creepy ! " While in the gallery one should salute in passing the stand of the Council for the Preservation of Rural England. Here, I felt, sits the genius, friend of the architect, who watches over these materials and processes so that they may be used to adorn and not disfigure the English scene.

A GREAT STORE

The gradual movement of departmental stores towards Oxford Street strides forward with the building of Gamages enormous store on a site near Marble Arch. This very imposing building is remarkable as being the only example, to my knowledge, of the combination of a great store with residential flats. Two floors will be occupied by the store, with all the space above given over to flats of quite fabulous magnificence. The result of this combination in the façade of the building is to give a dignity unusual in a commercial building, a character quite naturally unattainable where you have floor after floor of selling space to be lit as adequately as large windows can light them. This feeling of quiet dignity should help to attract the sort of people who like quiet dignity in their shopping; and as this is what all the advertisements seem to suggest is to be the future spirit of the enterprise, Gamages should start upon their new life with every encouragement.

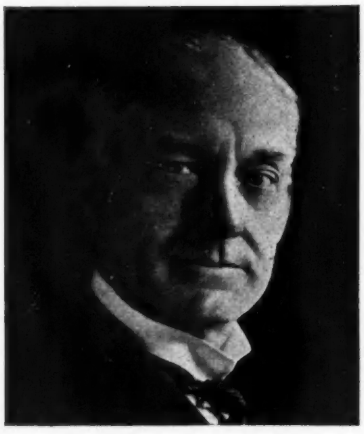
ASTRAGAL



OFFICIAL ARCHITECTURE

The Debate at Olympia

A DEBATE on "Official Architecture," under the auspices of the Association of Architects, Surveyors and Technical Assistants, took place in the Conference Room, at the Building Exhibition, Olympia, London, on Saturday last, the chair being occupied by the Right Hon. Lord Riddell, HON. A.R.I.B.A.

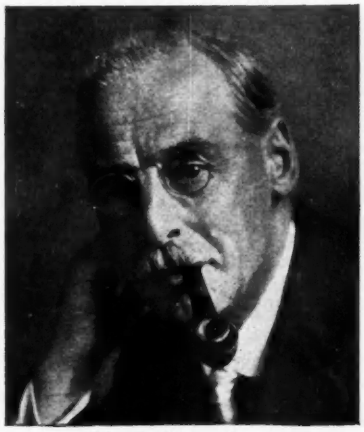


The Chairman said the subject of official architecture had been much discussed for some years, but this was the first time that both sides had been brought together with a definite issue. For the purpose of this discussion the term "official architect" meant a departmental architect engaged for the whole of his time on a salaried basis. A private practitioner who undertook official duties during a part of his time would not be regarded as an official architect for the purpose of the debate. The aim of the debate was to promote a better understanding of the whole subject, and not merely to provide an arena for a gladiatorial combat.

Mr. R. Wynn Owen, F.R.I.B.A. (Architect, L.M.S. Railway), in opening the debate, said it was essential that anyone taking part in the debate should examine the precise wording of the terms of reference and so obviate any waste of effort upon side issues. He therefore at the outset moved "That the cause of architecture is served equally by the official architect and the private practitioner." He said, in order to discuss the subject effectively they must at the outset arrive at a definite and clear-cut conception of its essential elements. And what were those elements? They were (1) The cause of architecture; (2) the official architect; (3) the private practitioner; and (4) the quality of service rendered by each of the two types of architects—official and private practitioner—to the cause of architecture.

Mr. H. V. Lanchester.

It would be noted that they were not asked to discuss the comparative service of official architects and private practitioners to the public, private clients, or to the architectural profession, but only to the cause of architecture. What was the cause of architecture? How many of those present, who had practised architecture for years, had formulated for themselves any clear definition of architecture. In his view the elementary definition could be expressed in two words, "beautiful construction." He asked them to note the words "beautiful construction" carefully, not "beautified construction," because "beautified construction" implied that the beauty was applied and so was not inherent, and, as such, was not architecture. The demands of gravity and other natural forces could be met by construction or engineering, but architecture, while meeting all those demands, must also satisfy the more subtle demands of beauty.



The Rt. Hon. Lord Riddell.

The beauty must be an inherent, integral element of the construction, which it would permeate from its conception to its ultimate materialization. In fact, architecture was to a structure or building what expression was to the living human face, i.e. the reflection of the life or soul within; and as a dead face still had features, so a building might be a collection of architectural features and yet be devoid of the living soul reflection which alone could elevate it from the category of engineering to that of architecture.

Architecture was therefore that living soul of our art which quickens and imparts expression to our work—revealing its construction through a tissue of beauty, which imparts to and presents our construction in that softness of outline and form which muscle, tissue and flesh impart to the bone structure of the human body, which was, he believed, the acme of natural beauty; and incidentally, in like manner, expressing its purpose or the life within. This, then, is architecture, and its "cause" is its maintenance, its development, promotion and advancement. Then, precisely what was an architect? A dictionary would doubtless say, an architect was one who practised the art of architecture.

An official architect was one who undertook to perform the functions of, or to officiate as, an architect exclusively for one specific employing body or client for an agreed remuneration, regardless of the volume of work. Official architects were retained by His Majesty's Government in various departments, the most obvious of which was H.M. Office of Works; by counties, municipalities, educational and ecclesiastical authorities, railway companies, and a large number of industrial and commercial undertakings. Their number was legion, and at the present time they probably represented approximately 40 per cent. of the total membership of the Royal Institute of British Architects. In this category he included not only principals, but all qualified assistants, who as such were architects. On the other hand, a private practitioner in architecture was one who had conceived the idea that by inherent faculty, training and scholarship, he was adequately qualified effectively to perform the functions of an architect, as he comprehended them, took an office or chamber, supplied himself with the

Mr. R. Wynn Owen.

necessary equipment, and usually upon a brass plate indicated to the public in general that he was at its service, i.e. that he was prepared to carry out any architectural work ostensibly for a remuneration in accordance with the scale of charges of the R.I.B.A., but as anyone was entitled to practice as an architect, the remuneration might vary in direct ratio to the architect's self-esteem. In this connection he desired to say that though what he had said defined a private practising architect, the office and brass plate were not necessarily the hall-mark of an architect.

An architect was in fact one who, by training and scholarship, had proved himself to be possessed of that knowledge which was essential in the individual to the production of architecture, quite regardless to the possession of an office or brass plate.

As a tree was known by its fruit, so was an architect known by his work, and the only effective test or measure of his services to the cause of architecture was the quality of his output—i.e. the quality of his accomplished work.

Continuing, Mr. Owen said here he came to the touchstone of the subject—viz., the question, "Was the accomplished work of the official architect equal in quality to that of the private practitioner?" and to this question must of necessity be added the words, "in the aggregate," because, as one star differeth from another in glory, so also did one architect differ from another in inherent ability, whether he be acting officially or as a private practitioner. To put it tersely, there were architects and architects. There were also estate agents, auctioneers, engineers, surveyors, valuers, decorators, speculative builders, and various others who conceived the notion that they also were architects, in complete inability to appreciate that their works eloquently deny their conception and acclaim their innocence of a comprehension of the rudimentary elements of the art.

As an official architect and the opener of the debate on the affirmative side, it was only incumbent upon him to prove equality of service to the cause of architecture to establish his case. The onus of proving superiority of service on the part of official architects or private practitioners rested entirely upon Mr. Lanchester if he would prove his case, and he claimed that he must include amongst private practitioners the company of ubiquitous and promiscuous gentlemen to which he had just drawn attention, because, in accordance with the accepted interpretation of the term, they practised as architects. Now, what was the general conception of the official architect? Thirty years ago all architects were private practitioners, while the comparatively few official appointments of that time were invariably held by ill-trained men possessed of but little knowledge of architecture or design, and having no appreciation of professional status—men who frequently, and often unconsciously, deluded themselves by the use of the term "practical" applied to themselves into the belief that they ranked amongst the successors of Inigo Jones, Wren, Pugin, or Sir Gilbert Scott.

Then there was the average official architect of thirty years ago, but from what he gleaned from the expressed opinions of a certain element amongst present-day private practitioners he had a more than shrewd suspicion that this was the conception with which a very large number of private practising architects deluded themselves today in regard to official architects.

In this matter, however, as, he feared, in some other modern developments approaching to architecture and the architectural profession, private practising architects had not been marching with the times, and so, from lack of observation, had almost entirely failed to appreciate an almost revolutionary economic evolution which had been, and still was, developing with amazing rapidity in the profession.

The old order of official architects had now faded and passed away, and had been replaced by men of equal education and scholarship with their colleagues throughout the profession, with the result that he had no hesitation in saying that in the not far-distant future the private practising architect would be engaged in an unequal struggle to maintain the standard of his service to the cause of architecture, a struggle in which he would find himself handicapped to keep pace with his official contemporary.

The average private practising architect was already handicapped, and he was not so sure whether this handicap did not even extend to the higher ranks of private practice. And what was this handicap? That the architects of both categories now start from the same mark as regards education and scholarship must be granted by anyone who knew anything of the subject; but while the private practitioner had at all times to work against time, provide his own equipment in the form of office staff, etc., and study the economic exigencies of his practice as a business concern, his official contemporary could proceed with his work unshackled by any such considerations. His equipment was given him, and provided he kept within the limits of economic production, he could bring to bear upon his work a mind entirely free from any extraneous embarrassment.

All but the inly blind must recognize that an immense increase in the number of official architects had been, and was, taking place, and the reason for this was a purely economic reason. We are all creatures of economic development, and it was more than obvious that, for economic reasons, the number of official architects must of necessity increase, for the very simple reason that, in spite of the uninformed protestations of certain elements of private practising architects, architecture was being, and would increasingly continue to be, produced more economically by the employment of official architects than by the employment of the private practitioner. The actually accomplished increase in the number of official architects was the only correct barometer by which the economic aspect of this question could be read, inasmuch as it was a record of facts, and one might just as well attempt to stem the rising tide as endeavour by argument to stay the progress of this development.

Of course, the greatest monument to the official architect was commended to our consideration by the trite but highly appropriate epitaph of Sir Christopher Wren in the crypt of St. Paul's Cathedral: "Lector, si momentum requiris circumspice." How many of them realized that Wren was an official architect and St. Paul's an outstanding example of official architecture. Yet those were facts, and the epitaph applied also to the modern official architect. If they wished to see his monument, look around London and every large city throughout the country, and in many small county towns. He, by reason of his official capacity, was nameless, yet his monument met the eye at every turn.

Continuing, Mr. Owen said, in order to develop his argument to its logical conclusion, he found himself compelled to make reference to modern architectural works in order to demonstrate the equality of service to the cause of architecture which he claimed on behalf of official architects as compared with private practitioners, and he would endeavour to do so by citing well-known modern examples. He spoke solely of the buildings as he saw them in entire detachment from their authors. Was it an official architect who committed the following atrocities in the name of architecture to the everlasting detriment of the metropolis? *a*: Grosvenor House, which had to his mind irreparably ruined the architectural amenities and possibilities of Park Lane; *b*: the Regal Cinema Theatre, which, occupying a magnificent site, had defaced the environment of the Marble Arch beyond

remedy; and *c* : the Cenotaph, which, dissociated from the cogent fact that it was the focus of a very sacred and revered memory, was in itself merely a meaningless, if perhaps shapely mass of masonry, which, if it survived, would one day utterly defy the archæologians of the distant future, inasmuch as it reflects nothing, and might readily be mistaken for a gigantic gate-post or the base of a titanic lamp-standard.

Unfortunately,as in many other things, so in architects, there was often a vogue. The public loved a name; so a building whose official architect was unknown to the man in the street, and often even to the members of his own profession, did not attract the attention which it sometimes deserved. Nevertheless, he would cite for consideration three examples of modern official architecture as nearly as possible comparable with the foregoing examples of the essays of private practising architects : 1 : The London County Council flats at Wandsworth; 2 : the station entrance and office buildings at the corner of Kingsland Road and Old Street, Shoreditch; and 3 : the London and North-Western Railwaymen's War Memorial in Euston Square.

In conclusion, Mr. Owen said he contended that if anyone, who by training, scholarship and experience was qualified to offer an opinion, could obliterate from his mind the personal human element and merely consider the works cited purely as modern essays of architecture, he could not fail to admit that the three last-cited examples were architecturally at least as good as the first three cited, and if he arrived at such conclusion, he must of necessity concede that he (Mr. Owen) had the logical right to affirm " That the cause of architecture is served equally by the official architect and the private practitioner."

Mr. H. V. Lanchester, F.R.I.B.A., in opposing the resolution, said he would deprecate any endeavour to decide the question by a comparison of the buildings erected under the alternative systems; it was easy to pick out good and bad resulting from either. The issue was a much broader one .than this. The " official " method was merely one feature of a general trend towards the organization of activities on socialistic lines, in fact more than socialistic; the term communistic would perhaps be more appropriate, adopting the communistic principle that all activities should be rewarded on a predetermined scale, as in Russia, such a scale providing the maximum variation in reward found to be practicable.

Now, this system was based on a high ideal; it was in its way a religion, but unfortunately, like some other religions, it was far ahead of the ethical standards within the capacity of any but a very small minority, the vast majority in every country being incapable of doing their best without the incentive of a reward proportionate to the effort and skill demanded, and, moreover, any imaginative occupation demanded more freedom in its exercise than the communistic system admitted of. The actual position at the moment did not offer sufficient guidance. It was the tendency towards an ultimate result that they had to consider.

In discussing the relative positions of the independent architect and the " official " one, he would like to make it clear that his view was not that it would be impossible to employ an ideal system by means of which as good architecture would be produced by salaried men, as by those paid by commission. Apart from modern communism, such a system had existed in the past and might revive again; but at the present moment he saw no likelihood of this, and the conditions of official employment were almost always antagonistic to the freedom necessary for a living art. Under the most favourable conditions there were many obstacles to artistic progress, and it was important to eliminate rather than increase these.

We need not make a fetish of our six per cent. This was merely a rough approximation of what might be regarded as a fair living wage for one who possessed the experience and ability to design and dominate building works. This six per cent. might mean, in the case of the independent architect, anything from half down to one-tenth of this sum received as personal remuneration (he was told that the lower figure was quite usual in the U.S.A.), and the architect had not only his responsibilities to the client, but also that of organizing his own office. It might well be imagined that many an architect would gladly unload this responsibility, if while drawing a salary he could retain the same freedom in the design and conduct of his work. We look back with envy at the position of the master mason charged with the erection of a mediæval cathedral. If he could be regarded as representing in function the official architect of today, objections would be difficult to sustain, but sad to say the case was far from similar. While the mediæval mason was expected to concentrate on the problems of design and construction, leaving management and finance to others, the modern architect had to cover the whole ground, and when an official he has even less opportunity of using his own discretion as to what he would delegate than when he is in independent practice.

In order to exploit his artistic gifts to the utmost and get the best out of himself, the architect needed the maximum degree of freedom in the time and place for his work, and the power to adjust the demands he makes on himself to his mentality at a given moment. This was difficult enough under any circumstances, but it was obvious that it was much more difficult for the architect in an official position than for the independent man. Moreover, the latter had much greater latitude in choosing his staff. He could vary the type of assistance he might require to meet the needs of the moment, and the fact that these needs range over a wide field tends to broaden his outlook, to make him more resourceful, and to prevent his work becoming stereotyped.

This was the great danger when an architect was appointed to an official position. The general public was only too prone to demand exactly what it was accustomed to; but this was even more definitely the case with public bodies which were less susceptible to new ideas than individuals, groups having to adapt their pace to that of the slower if not the slowest.

The R.I.B.A. had laid it down that in the case of public works, public competitions were desirable. This was not with the idea of securing more money for the profession (obviously it costs the profession a good deal more), but to raising, by emulation, the standard of ability to the highest degree possible—a line of action which was psychologically sound as compared with the communist view of service independent of reward, which was unsound. As César Daly said in 1861, " We require the competition as indispensable for ascertaining periodically and definitely the direction of architectural ideas."

The extension of official methods would extinguish the competition which had done so much to advance the standard of efficient planning, and to a less extent of imaginative design. We should lose this valuable incentive to the study of modern requirements and the expression of those in terms of architecture. Instead of this, there would be stagnation and a tendency to repeat standardized plans and modes of expression.

Mr. V. L. Nash, A.R.I.B.A., in support of the motion, said he was glad that Mr. Owen had made the necessary premise that official architects and private practitioners started from the same mark as regards training and competitions, because that was a point which was frequently overlooked in discussions on the subject.

[*A report of the other speeches made during the debate will be published in our next issue.*—ED. A. J.]

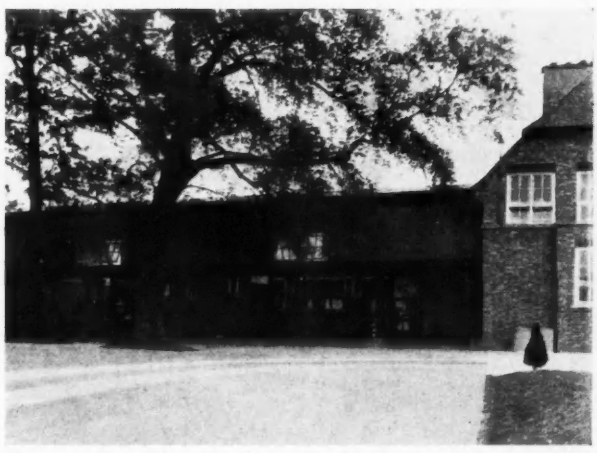
AN OPEN-AIR SCHOOL IN DERBYSHIRE

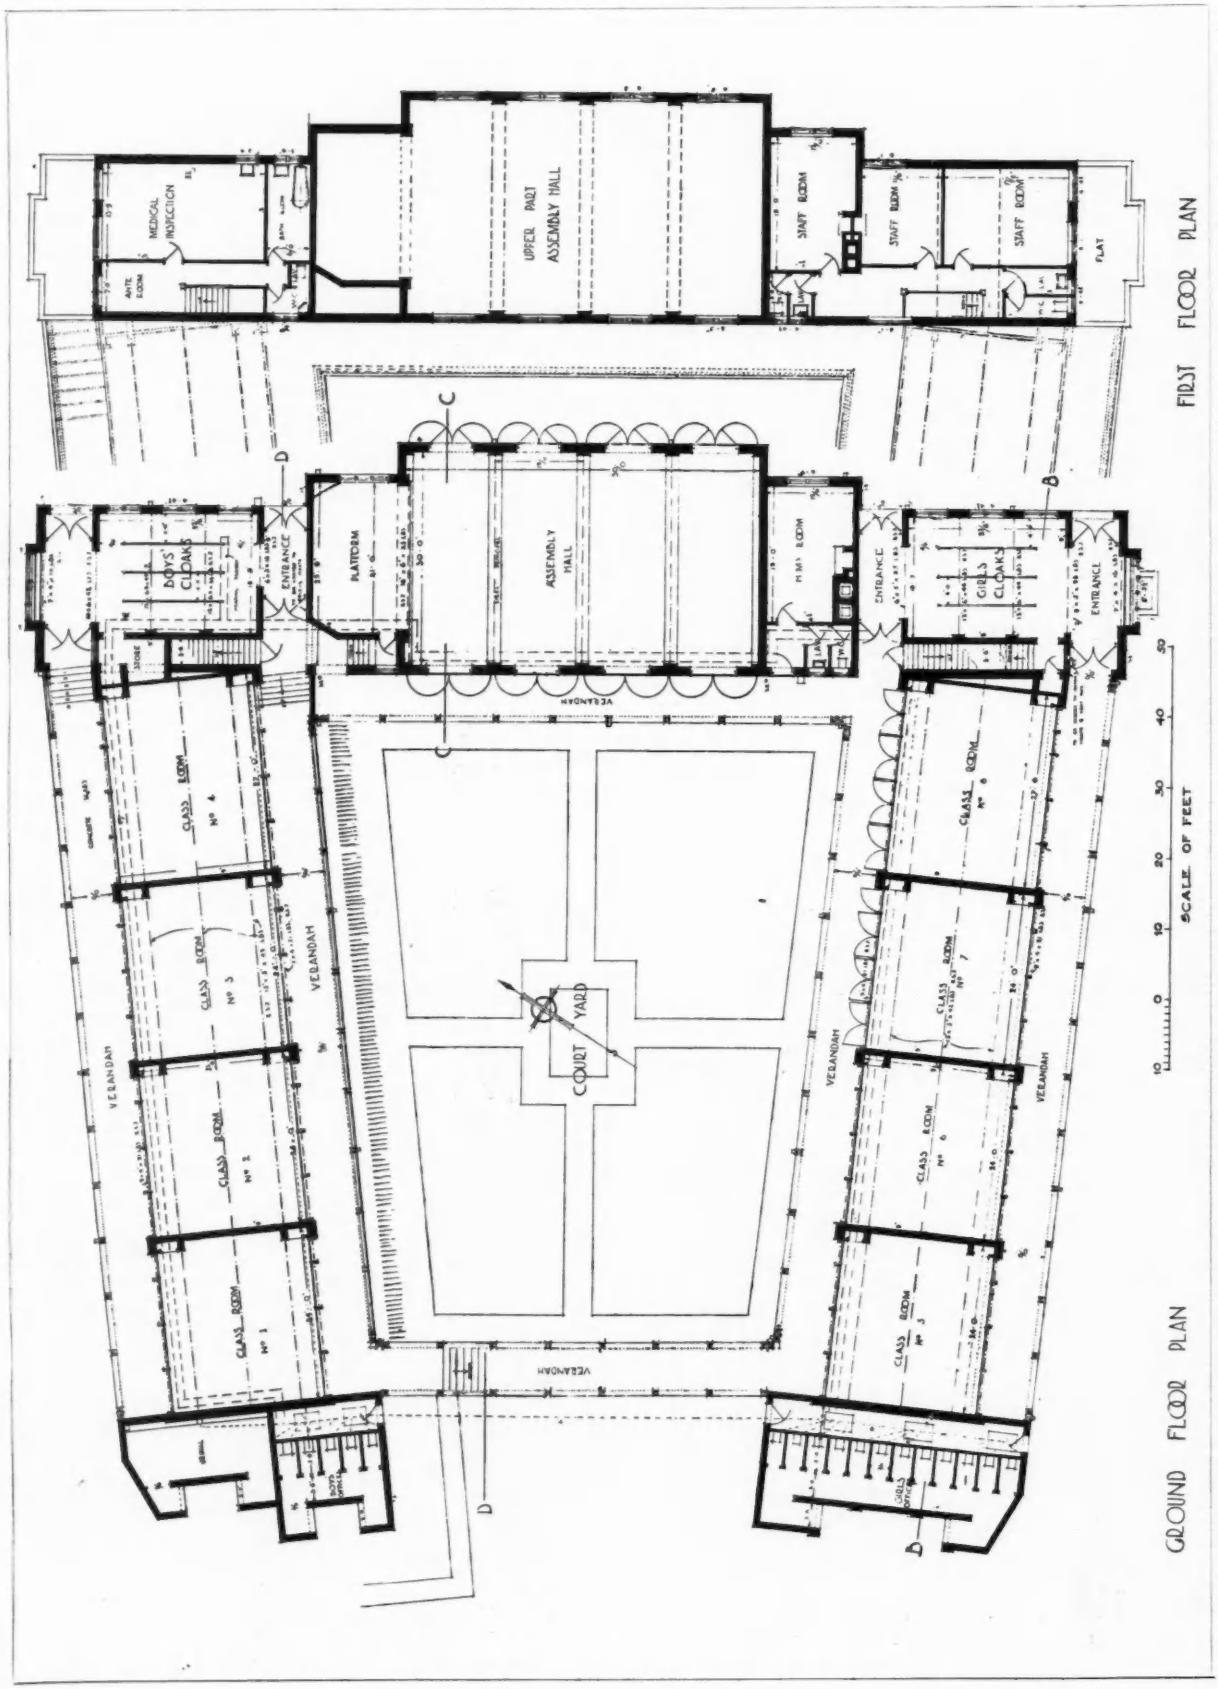
DESIGNED BY GEORGE H. WIDDOWS

THE Staveley Hollywood Council School, Staveley, near Chesterfield, was erected as a junior school to accommodate 340 children.



The site, a little over four acres in extent, was presented to the Derbyshire Education Committee by the Staveley Coal and Iron Company. On the site are many trees, and the school has been so planned that these have been disturbed as little as possible.

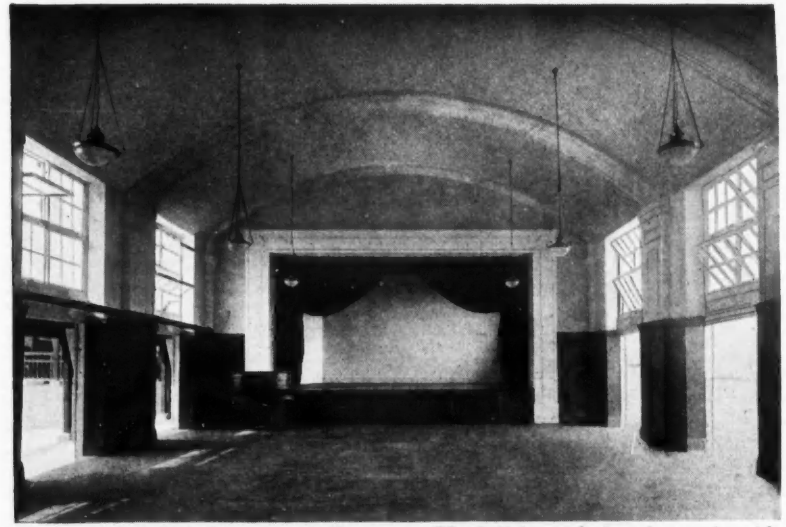
The school consists of eight classrooms, assembly hall, boys' and girls' conveniences, staffrooms, cloakrooms and medical inspection department. It follows the usual lines of the well-known Derbyshire open-air type of school. As the outcome of the erection of the North Wingfield experimental rooms in 1913, all Derbyshire schools are planned on these lines, and consideration is given not only to open-air treatment but also to the effect of beautiful surroundings on the life of the children. In order to meet this requirement, the school is placed on a large site, of which every natural advantage has been taken. The ground immediately around the school and in the courtyards is laid out as gardens with shrubs, rose trees, flowers, etc., as will be seen from the accompanying photographs. A belt of trees runs round three sides of the school.



The assembly hall is planned on the main front of the school, and direct access can be obtained through double doors, as shown in the above photograph. The doors are repeated on the other side of the assembly hall, thus allowing an uninterrupted view of the courtyard from the ground in front of the school. The headmaster's room adjoins the assembly hall, and is flanked on the other side by one of the four separate entrances on the main front. These entrances, situated on either side of the girls' and boys' cloakrooms respectively, lead to the verandas running along both sides of the two wings containing the classrooms. Six of the classrooms are 24 ft. long and 21 ft. 6 ins. wide, and of the remaining two, one measures 27 ft. wide by 21 ft. 6 ins. long and the other 27 ft. 6 ins. long by 21 ft. 6 ins. wide. Above the girls' cloakrooms and the headmaster's room are the staffrooms; above the boys' cloakroom is the medical inspection room. The school was officially opened last April.

Looking along the south-east veranda, the doors of which give access to the classrooms marked Nos. 5, 6, 7, and 8 respectively on the plan reproduced on the following page. The open door on the extreme right of the photograph leads to the girls' cloakroom.

The south-east veranda, looking directly into the classrooms. The doors can be widely opened, thus allowing the maximum amount of air to penetrate into the classrooms. The windows on the right light the entrance to the girls' cloakroom and the staffroom above.



Ground- and first-floor plans. The school consists of an assembly hall, medical inspection department, staffrooms, cloakrooms, boys' and girls' conveniences, and eight classrooms, providing accommodation for 340 pupils. It is planned on the usual lines of the well-known Derbyshire open-air type of school. Consideration is given not only to open-air treatment, but also to the effect of beautiful surroundings on the life of the children.

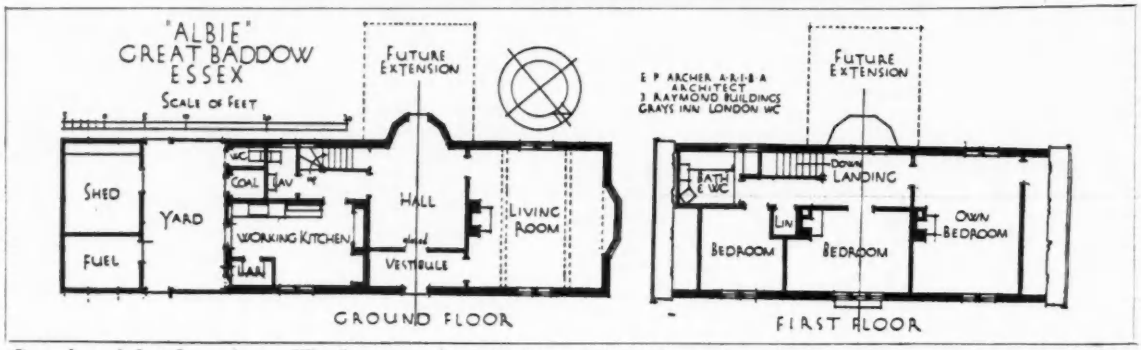
The north-westerly wing contains classrooms 1, 2, 3 and 4. The ground around the school and in the courtyard is laid out as gardens, with shrubs, rose trees, flowers, etc.



"ALBIE," GREAT BADDOW, ESSEX

DESIGNED BY E. PERCY ARCHER

A view of the south-west front. This house is built on an acre of the vicarage orchard at Great Baddow. The site was a very expensive one, and the house had to be built as simply and economically as possible.

The exterior is finished with traditional Essex plaster panelling to conform with other buildings in the village. The exposed walls are 11 in. hollow and the other walls 9 in. hollow. The roof is tiled.

Ground- and first-floor plans. The floors are of oak blocks, except in the vestibule, lavatory and part of the kitchen. The house is so planned that it may be enlarged at some future time with the minimum of disturbance to the existing work.

The main front from the north. The plaster walls and wood panelling are emphasized by the tarring of the base.

ENGLISH PRECEDENT No. 134

STAIRCASE, No. 44 GREAT ORMOND STREET, LONDON

As in many examples of eighteenth-century domestic architecture, the staircase at No. 44 Great Ormond Street has been made a special feature. The hall is paved in black-and-white marble, and the view on entering from the street is very fine.

The staircase, which gives access only to the first floor, is in three flights. The spiral to the stairs is exceptionally large, and the sweep of the handrail from the newel to the first landing gives a line of great beauty. The treatment of the balustrade to the first-floor landing, with its carved band of oak leaves and acorns, is nicely designed, and the finish of the outside string of the staircase which adjoins the landing is happily stopped by a carved bracket similar to the stairs.

LETTERS FROM READERS

Official Architecture

SIR,—The practical interest in connection with official architecture centres in most cases round the architectural assistant. Members of local governing bodies are beginning—and in many instances have already begun—to understand that their surveyor, excellently fitted as he may be by his training and experience to deal with the work of a surveyor has, nevertheless, not undergone the training that fits him to deal with matters pertaining to architecture. In order to supplement his abilities in other directions they are under the impression that in this direction all that is necessary is to give him an architectural assistant. But a very little reflection will show that in every branch of work or business the ordinary assistant is, in the nature of things, not equal to the principal. No architect, much as he values his assistants, would leave the designing of his important buildings to them. He stamps his work with his own individuality. The desire of almost all competent assistants is to practice eventually for themselves. It is not surprising, therefore, that architects view with misgiving a system that is satisfied with leaving important architectural work to an assistant. What occurs to them is that if the assistant is above the average he would be in practice for himself; if not, it is unwise to entrust him with important work.

Another point which may be supposed to come home to the local councillor more forcibly, perhaps, than a question of æsthetics, is this. An architect working for a client does so with the knowledge that he is exposed to all kinds of criticism, and he has, in particular, a wholesome dread of incurring extras: he has, moreover, the power to cause inferior work or mistakes to be rectified by the contractor. But an assistant, who is only a member of a department, has but little individual responsibility, and mistakes or extras do not necessarily emerge for criticism.

It may be convenient for the local authority to run its own architectural department, but the incentive of competition in ideas is then absent, and the system cannot be held to tend to the advancement of architecture as an art.

J. A. GOTCH

SIR,—I have read with considerable interest the articles and letters on official architecture that have appeared in recent issues of THE ARCHITECTS' JOURNAL.

Only those who have been in practice for a number of years in a provincial city can fully realize the drastic changes that have taken place. Without wishing to be too critical of the R.I.B.A. might I suggest that this is a matter that calls for much more thorough attention and action on its part than the subject appears to have yet received.

The Institute might direct its attention to the following matters: 1: A model set of "Conditions of Engagement" should be drawn up, with which the agreements entered into by all Members of the R.I.B.A. on becoming official architects should comply.

2: Local authorities should be approached by the Institute and the suggestion made to them that where the amount of work exceeds the normal they should form panels of private architects, and spread the work amongst them rather than engage large temporary staffs, whose work is never economic.

3: The R.I.B.A. should draw up a modified scale of fees which it would be prepared to sanction for work carried out under the above conditions.

I believe that the Institute has discussed these matters, but I cannot find any evidence that it has made a very definite contribution to what is undoubtedly the most vital matter affecting the profession at the present time.

J. MANSELL JENKINSON

SIR,—Your JOURNAL is doing excellent work in taking up the case of official architecture. The ordinary town councillor compares the salary of an assistant with the commission of an architect, and thinks he is saving a lot of money. He does not consider that the assistant is usually kept on after the job is finished; that the head gets an honorarium, and that extra clerks, etc., are also required; nor the question of rates, office accommodation, light and heat.

C. CROFT

SIR,—The report in your September 10 issue of a recent meeting of the Northampton Town Council is interesting and somewhat encouraging reading. It shows that the public, as represented by a few members of the Council, are gradually becoming awake to the fact that the best and most economical results are not obtained by placing the work of new buildings, or large extensions to existing ones, in the hands of an official, in this case the assistant architect, but by throwing it open to public competition, or giving it to those practising architects who are most qualified for the work required.

The attention drawn to official architecture by THE ARCHITECTS' JOURNAL will, I am convinced, bear good fruit; but it will be of slow growth unless greater publicity to the matter is given by the general Press, and I consider it is the duty of every architect who has the beautifying of our cities, towns, and country at heart, to assist in this way whenever opportunity arises.

SIDNEY F. HARRIS

Professional Etiquette

SIR,—With reference to the words recently added to clause 3 of the R.I.B.A. Code of Professional Practice, I must remind you that "authoritative" exposition of R.I.B.A. policy is a prerogative of the President and Council, not to be usurped.

An unofficial, unauthoritative but none the less sane and just view of the Code is that not the least important of its aims is the establishment of reciprocal brotherhood in a world-wide fraternity—from which Scotland is not excluded—of professional practitioners.

A Code designed to that end must, of necessity, be subject to periodic amendment, dictated by experience gained in its application, and I should judge that no more can be safely assumed concerning the latest addition than that it is deemed likely to facilitate the cleansing purpose referred to in the sixth paragraph of the letter published over the signature of Mr. William Davidson in your issue of September 10.

Ablutions are necessary to civilized existence, and I cannot believe that any mystery attaches to the fact that an obvious improvement in its cleansing apparatus has been approved and adopted by the R.I.B.A. Council.

G. C. LAWRENCE

Lady Brash Revealed

SIR,—The advertisement noted on p. 366 of the September 10 issue of the JOURNAL seems to be the work of Lady Brash who, it must be supposed has, since 1926, divorced Brash and is embarking on house-building on her own account.

H. B. C.

Gas v. *Electricity*

SIR,—Ready formulæ for comparing the relative costs and advantages of gas and electricity, as referred to by Mr. L. E. Williams in your issue of September 10, are interesting and amusing, but of no other value.

Savile Row suits cost £15, and Strand suits cost 50s.; the ratio is 6 : 1. Again, a bottle of Bass costs 8d.; a bottle of claret, say, 4s.; and a bottle of champagne, say, 20s. Modest Baby Austin cars cost, say, £140, and other cars are obtainable at from £1,500 to £2,000—yet there is a ready sale for *all* the articles mentioned.

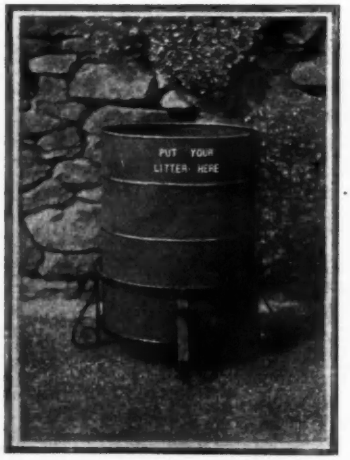
Again, the railway companies sell considerable numbers of first-class

tickets, and the fares on such trains as the Golden Arrow are even higher than the first-class fare, not to mention the third-class fare.

The obvious moral is that "good things do not need to be cheap to command ready sale."

The secret of the comfortably warmed room is to instal relatively large areas of warming surface, operating at temperatures of between 80 degrees and 120 degrees F., and to control the temperature of the room automatically. Walls, floors, ceiling and furniture must all be warmed, and the air be comparatively cool, for real comfort. Automatic control ensures that the room will never be too hot or too cold, notwithstanding the number of occupants, the appearance of the sun, etc.

All these desirable features are obtainable with electricity in the simplest possible and most reliable manner, and at a cost averaging 6d. per room per day, in districts where electricity is available at ¾d. per unit. These figures are not the result of formulæ or calculation, but were actually obtained from an office in the Central London area during last winter.



R. GRIERSON

Suggested Litter Bins

SIR,—We were interested in Astragal's note in September 3 issue of the JOURNAL on the Litter Week held in the New Forest, and his suggestions with regard to placing litter bins at the approaches to the villages.

We think, therefore, that you will be interested in some new sheet metal litter bins which we have recently put on the market. These bins are designed with a view to being substantial and practical, and at the same time of pleasanter appearance than the ordinary wire basket type, and would be quite suitable for use as Astragal suggests.

ROGER PEACH
(THE DRYAD METAL WORKS)

A litter receptacle suitable, it is claimed, for parks, cemeteries, etc. It is of sheet iron, galvanized and painted, and is perforated at the bottom.

The Calton Jail Site

Following are extracts from a letter addressed by the Prime Minister to the Edinburgh Town Council regarding the Calton Jail site :

I have been following with some surprise the controversy which has arisen in connection with the buildings to be placed on the Calton Hill, and regret that for one reason or another the proposals of the Government have been allowed to be clouded by so much misrepresentation and inaccuracy. No one knows better than you the very great desire of the Government not to do anything with the Calton site which does not fulfil three conditions : 1 : The use of the site in such a way as will add to, rather than detract from, the appearance of the city; 2 : the co-operation of the Edinburgh City Council; 3 : the approval of the Royal Fine Art Commission for Scotland. I have never yet known an important building put up without the expression of different opinions as to its merits and its defects, but the controversy which has been worked up in this instance is unique in its recklessness. The more recent phases of the agitation, for instance, appear to have been based upon a drawing published in *The Scotsman* of July 24, which has been accurately described as a "complete travesty of the original design." At the present moment the Office of Works is in consultation with the Royal Fine Art Commission regarding a revised layout of buildings, and is awaiting a further expression of views of a more general character by the Commission. When that advice is received the Department will again consider the matter, and if it decides to proceed with the building the final designs will, according to pledge, have to receive the specific approval of the Corporation of Edinburgh. There will also, in all likelihood, be a debate in the House of Commons.

To crowd the Calton Hill with buildings may be utilitarian, but is damaging to the city, and the question must arise before a final decision has been taken as to whether this site is suitable for the Government requirements. Some of us would like to see the hill far more clear than it now is with its jail, but the Government cannot build, merely to suit the site, offices which will give it neither the conveniences nor the accommodation required. The design of the new Sheriff Court House, I think, can be made most appropriate, and can add to, rather than detract from, the appearance of the hill. If the requirements of the large Government offices cannot be set on the hill they must go elsewhere, and as regards that it must be assumed that the mind of the Government is perfectly clear. I notice that proposals are made that the new building for the Scottish National Library should be placed on the Calton Hill. That proposal may be dismissed. I hope that the trustees of the library would never consent to that site. Not only was the gift made to the nation on condition that the library should remain in its present position, but the arguments from a purely library point of view that that condition should be observed are unanswerable. As a trustee of the library and also of the supplementary gift, I should never consent to the Calton site.

Mainly for indoor use, this litter receptacle is suitable, it is claimed, for public buildings, schools, etc.

Settling-Up Honeywood : xviii

BRASH IS STRANDED

BY KARSHISH
(H. B. CRESWELL)

A consulting analyst employed by the architect, Spinlove, has reported that an unpleasant smell pervading the bedrooms is due to fumes from the heating or hot-water furnaces, though by what means they assert themselves in remote parts of the house remains unexplained.

Serious trouble has arisen from the failure of certain paint ordered by the owner, Sir Leslie Brash. Both the builder, Grigblay, and the manufacturers, the Riddoppo Company, deny responsibility, and Brash has referred the matter to his solicitors, Russ and Co.

GRIGBLAY TO SPINLOVE (AUTOGRAPH)

Sir, 6/11/26.

I write confidentially to let you know, as I don't suppose you have any hand in the matter, that I have received a letter from Russ & Coy., solicitors, threatening proceedings for the failure of this new novelty patent supercrawling and crocodiling paint your client insist I use ; but there are others can employ solicitors besides Sir Leslie Brash as he will find out. I never put anyone into Court myself, and never was brought there except for once, and the man who put me there has been sorry ever since and so will this one be; for I have learnt a bit, these last months, about the successes of the Riddoppo Company with their wonderful new face cream—or whatever it is—and if they have any customers left now, they won't have any after I have done with them. No one had ought to be better pleased than me for the old gentleman

to go on and see what he will get for his trouble; but I am a poor man and have my work to attend to, and it will do me no good being in all the papers, and I think it hard I should have all this trouble put on me because I used the stuff on the understanding I was not responsible, which I should never have done except to oblige; so I just take the liberty to write and ask you, sir, as you know how things are, to drop a hint to Sir Leslie and put him in better mind of where he stands, for this Riddoppo soup of his has given the belly-ache to near everyone who has tasted it, and he will surely lose his case if he tries to make me responsible for the mess at Honeywood.

You will pardon me writing, but thought just as well as it will save a lot of trouble for everyone if the old gentleman can be persuaded to see reason just for once.

I am, sir,
Yours truly,

SPINLOVE TO GRIGBLAY (CONFIDENTIAL)

Dear Mr. Grigblay, 7/11/26.

As you know, I am entirely on your side in this dispute about the painting as Sir Leslie Brash well understands, but he shows extreme impatience whenever I refer to the matter. However, he certainly ought to be told of the general failure of Riddoppo of which you speak, and I will drop him a hint of it.

I have just received Pricehard's report and will write tomorrow.

Yours truly,

I have several times expressed the opinion that it was long ago Spinlove's duty, as architect, to take control of the position and guide his client's discretion; and have deprecated his policy of sitting on the fence—though, in point of fact, his was no policy, but a mere instinct of weak evasion. I have now to confess, however, that his inertia has given him a position of neutrality which astute, active diplomacy might well fail to accomplish; he has avoided falling out either with Grigblay or with Brash, and has still an opportunity, if he can but use it, of intervening to prevent the miserable disaster of an action at law.

SPINLOVE TO GRIGBLAY

Dear Sir, 8/11/26.

I enclose copy of Mr. Pricehard's letter covering his report of the tests he made. The question is, How do the fumes get into remote bedrooms when they are not noticeable downstairs; and how is the nuisance to be cured? It is clear there must be some serious flaw in the building of the house, and I must call on you to find out what it is and to let me have your proposals for putting things right, and without delay, for this is a serious matter as you will see from what Mr. Pricehard says of the poisonous effect of the fumes. I am not writing to Sir Leslie on the subject until I can give him your explanation and tell him the defect is being remedied.

Yours faithfully,

Spinlove's readiness to dissociate himself from the disaster and to deny all sympathy to Grigblay, is not only wrong in policy, but has the appearance of being thoroughly bad-natured. For two years Grigblay has served Spinlove as a devoted colleague, and on many occasions has helped him out of difficulties with his wise advice and kindly forethought; and Spinlove must know perfectly well that this defect in the building, whatever it may be, is not Grigblay's fault but his misfortune. Grigblay has before endured similar treatment from Spinlove, with patience; and he no doubt understands that these gaucheries are merely due to fright and want of self-confidence in the person he probably thinks of, and perhaps speaks of, as "the young gent."

BRASH TO SPINLOVE

Dear Mr. Spinlove, 8/11/26.

I herewith transmit enclosed communication I have received from Mr. Cohen Snitch. This is the gentleman — may I remind you — who endeavoured to foist upon me fraudulent plans of cottages which, it eventually transpired, were a purloined illegal infringement of another practitioner's copyright. You may have observed that within the last few months a number of wretched little common villas have been springing up like mushrooms —or rather I should more appropriately say like *toadstools*—on either side of the Honeywood Hill Road after it leaves Thaddington Village. These abortions must represent the Honeywood Garden Estate the fellow speaks of. The villas so far built are all exactly similar replicas of one another, and we have been greatly annoyed to observe that they reproduce the form of the bay window, chimney and gable of the little pretty Den projection of Honeywood Grange which, as you know, is visible from our entrance gates; and the names all up the road, "Honeywood House," "Honeywood Lodge," "Honeywood Manor" are also an intolerable violation of my rights! Has it come to this, that a gentleman may scarcely call his house his own? It is clearly evident that Mr. Snitch intends to retaliate on my refusal to submit to his attempted fraudulent extortion of fees, and I shall have no hesitation whatever in taking all possible necessary steps to stop his proceedings and compel him to alter his designs or even to pull the places down. I therefore desire you will be so obliging as to notify me exactly what are the liabilities for the infringement of my copyright, of which this must be a most flagrant example.

I am even more disturbed at this threat of Mr. Barthold—who is an auctioneer and house-agent in Marlford —of covering the land up to the eastern boundary of my Honeywood property with the insupportable eyesore of shoddy bungalow abominations, though I apprehend that the whole proposal may be a monstrous pretext for bluffing me into extortionate disbursements. The price this saucy fellow asks is nearly three times the rate at which I acquired my Honeywood estate, and approximates to seven times the capitalization of the accommodation rental, and nine times the agricultural value—a most unheard-of proposition. The whole thing is intolerable and beyond bearing, and I have still to consider what suitable reply I can make to the man. If you have any views on this matter I shall be grateful if I may have the advantage of knowing them.

I regret to intimate that the repulsive emanations continue to cause us considerable discomfort, and shall be obliged by the anticipated early communication from you anent the ascertained reason of the odoriferous conditions.

Yours sincerely,

(ENCLOSURE) SNITCH TO BRASH

My dear Sir, 4/10/26.

Re Honeywood Garden Estate. I beg to think you may be interested to know that my client, Mr. Vincent Barthold, who is taking an active local line in this national housing proposition, is considering extending his development up Honeywood Hill to boundary of your property as preliminary to lay-out of back land with Rural Bungalow Allotments the same as has proved so popular below Westerham Hill, as extension of motor bus service to Wedgefield Junc. offers fascinating rural amenities to Londoners.

As adjoining owner, Mr. V. Barthold begs to hope you might be interested to support same and join small syndicate he is contemplating with a view to flotation of a Honeywood Dainty Houselets Co., and will be glad to hear from you privately *re* same.

Mr. Barthold is willing to dispose of part or whole of same, freehold, at from £150 (back) to £350 (front) per acre according to location.

If this proposition interests you, shall be glad to hear from you at early date as other investors are in the market, and will supply further particulars on application.

Yours faithfully,

The Honeywood File recounts how Brash, with the idea of reducing cost, employed this same Mr. Snitch—who practises locally as an architect and surveyor—to build a block of cottages; and how Mr. Snitch

sold Brash the design of another architect which he copied, for the purpose, from an architectural magazine. Spinlove warned Brash that if he used the plans he would make himself liable to an action for infringement of copyright, and this is what Brash has in mind when he notices features of his own house travestied in the villas of "Honeywood Garden Estate."

It is no new thing for commercial enterprise in housing to find profit in the execration its achievements provoke, by acquiring land and then coercing the owners of adjoining houses to buy it at an enhanced price under threat of building on it; and just as the highwayman was obliged sometimes to shoot so that his formula "Your money or your life" might be respected and yield a due harvest, so "Buy or we build" is by no means an empty threat, even when there is no intention of building. A cottage, however hideous, can readily be let, and is a profitable investment when it serves as a warning to rebellious mansion-owners. I know of a remote, solitary, bleak, raw red brick labourer's cottage comprising four stark walls and a drain pipe, set in a break of the hedge on a country road. Its position—which would be readily understood if cottages were jetisoned from passing aircraft—is explained by the entrance drive to a large private house on the opposite side of the road, up which the cottage stares unwinkingly like a village idiot entranced. It is there, as is notorious, because the owner of the mansion refused to buy the field in which it stands.

This is a happy instance of the way commercial enterprise advances the cause of civilization by establishing blackmail as a recognized source of revenue and augmenting the Wealth of the Empire. By building cheaply and rapidly, instead of in the old-fashioned way, not only are larger profits immediately accrued, but future profits are assured by the early need for renewal, and good money may be earned merely by refraining from building.

GRIGBLAY TO SPINLOVE

Dear Sir, 10/11/26.

What Mr. Pritchard says is pretty much what I feared. Of course there is some stupid thing been done somewhere and it will be a job to find out where, for what has happened is that fumes from the heating furnace get into the hollow of the outside walls; and one of those places it gets out again is, in my opinion, where the joists of upper floors bear on the 4½-in. inner thickness of outside walls, and so lets the air be drawn from the hollow into the space between joists and through joints of flooring into the bedrooms. I have had a look at the plans and you will find that those particular bedrooms is just where it can get; for there are no cross walls cutting off the hollow and the joists in those rooms run across to the outer wall and not parallel with it; and another thing that fixes it is the way these fumes came on worse than before when the heating furnace was started up again a few weeks ago, for as the work dried out in the summer the ends of joists, where they were built in, would shrink and leave a bit more room for the fumes to leak through than when the work was newly finished. The joints of flooring will not lie so close now, either. Well, we know the fault is in the heating flue for the complaints stopped just when the fire was drawn for the summer; but where the fault is, and what to look for is the difficulty, unless we open up the flue till we find out. I have never had the like of this happen in any building of mine. None of my bricklayers would play hanky-panky with a chimney flue or leave out a brick, which is what looks like; and Bloggs would not let them if they wanted to. However, there cannot be many places where a little thing wrong would make all that difference, and Bloggs will be likely to say. I have written him today.

Yours faithfully,

Here, then, is the explanation of the famous "drains"—otherwise "odoriferous effluviums"; but the defect giving rise to the nuisance is still a mystery; for carelessness which would leave an opening from a chimney flue into a hollow wall space would seem impossible of men employed by a builder of Grigblay's standing, or in work overlooked by Bloggs.

The subtlety with which smoke will find its way through brickwork has long ago established the parging—or plastering—of the interior of flues, and, until quite recently, the parge was always worked up with a proportion of cow dung which does not develop cracks as a lime and sand rendering is apt to do. Fifty years ago bricklayers began to resist using this tradition parge—probably because its composition seemed ignominious—and as the mortar in which the bricks are laid, now commonly used to parge the flues, seems to be all that is required, it may well be that the traditional parge was, like so many craft-methods, a survival of an immemorial custom.

BRASH TO SPINLOVE

Dear Mr. Spinlove, 12/11/26

I desire that you will be so obliging as to carefully peruse the enclosed copy of a letter I yesterday received from Mr. Russ anent Riddoppo, and of correspondence therein referred to, which I transmit herewith preparatory to your meeting me for the purpose of discussing the position of affairs on an early day. You will observe that I refrain from all comment. Such views as I have to communicate are, I apprehend, more fit to be the subject of verbal rather than of literary intercourse; but you may tell that infernal scoundrel Grigblay that if he or any of his damned workmen put so much as their noses inside my gate I will have them thrown out into the road.

Yours sincerely,

PS.—Pray excuse a pardonable asperity of diction.

(ENCLOSURE 1) RUSS AND CO. (SOLICITORS) TO BRASH

Dear Sir, 10/11/26.

In accordance with the instructions you gave Mr. Russ in your interview with him on September 28th, we entered into communication with Messrs. the Riddoppo Coy., Ltd. (and Reduced), and subsequently, on receipt of the Company's reply, with Mr. Marston Grigblay, and we enclose copy of the correspondence.

Before we received the letter from Mr. Grigblay's solicitors, of 3rd October, it came to our knowledge that a receiving order had been made out against the Riddoppo Coy. The firm is in liquidation, and from information in our possession we are of opinion that reorganization is extremely unlikely; that the assets will be sold for the benefit of the debenture holders, and that there will be little or nothing left for the unsecured creditors. In the circumstances we do not consider the company worth powder and shot. The debenture holders would allow judgment to go against them by default, as there will be no assets to meet the costs of defence; and as such judgment would only allow you to rank as a creditor you would get little or nothing —certainly not enough to pay your costs of the action.

In view of the position Mr. Grigblay takes and the difficulty of showing him to be responsible without the evidence of the Riddoppo Company of the soundness of the paint supplied; and in view also of the opinion given us by Mr. Chawlegger, we do not consider that you could succeed in an action against Mr. Grigblay. It seems to us, therefore, that the only course for you to take is to withdraw.

Yours faithfully,

So the end of this matter is that, for his sins, poor old Brash is left high and dry. Riddoppo, Ltd. (and Reduced) has gone bankrupt, a fate that overtakes not a small number of such ventures and which offers an additional reason why architects should be wary in experimenting in untried materials. The company's property will be sold to pay the debenture holders; creditors will get little, shareholders nothing, and the only person who is likely to have done well out of Riddoppo is perhaps Brash's influential commercial friend Mr. Ziegfeld Swatmug, who may have bought the rights from the inventor for a small sum, sold them to the public for a large one, and then resigned from the board of directors and disposed of his holding.

[NEXT WEEK: XIX—BLOGGS TO THE RESCUE]

QUESTIONS THAT ARISE

Retaining Wall

P. C. writes: "*Can an adjoining owner claim a notice, in the London area, where a boundary retaining wall, the property of the building owner, is being raised, as shown on the accompanying sketch? The work includes the removal of an iron railing and raising the wall for a height of 4 ft. above the level of the existing coping. The wall on the building owner's side is being strengthened with piers in two places. The ground level on the building owner's side is 7 ft. below the ground level on the adjoining owner's property. I have asked the surveyor to the adjoining owner's property under which section of the Act his client claims a notice, and he replies quoting London Building Acts, 1894, Part VIII. (87).*"

The adjoining owner cannot claim a notice from a building owner for raising on his own (building owner's) wall.

The only action he could take would be an injunction, or a claim for damages for any obstruction of the light to his premises, and as your correspondent does not mention this, I assume that this does not apply in this case.

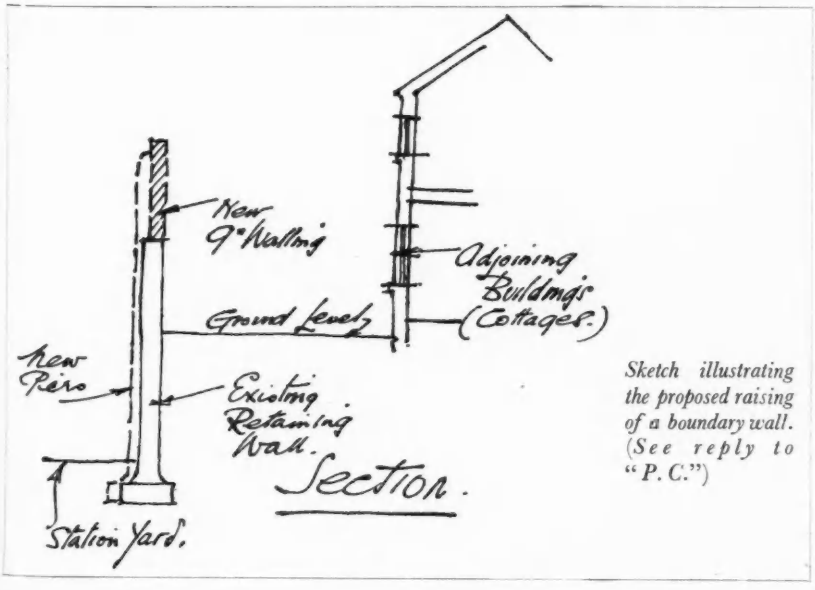
London Building Acts, 1894, Part VIII. (87), refers to land unbuilt on the line of junction and is applicable where the adjoining owner's land is disturbed by building work on the boundary.

If, however, adjoining owner's building is within 10 ft. of the new work, he could claim to be served with a 10-ft. notice under the London Building Acts, Part VIII. (93), if the building owner is executing the work below adjoining owner's foundations, and likely to disturb them; but the strengthening by piering should not apply, unless any work was underpinned in the operation.

W. A. D.

Tiles or Thatch

C. L. writes: "*I have always thought of tiles as being one of the traditional roofing materials of the Old Country. My dream of England (I am Colonial born) is a farmhouse with great tiled gables and long sweeping eaves. Recently when motoring in Norfolk I had a talk with a thatcher. He surprised me by speaking of tiles as if they were newer than thatch, and had been introduced to do his forefathers out of their living. Is this a fact, and is it more correct to use plain or pan tiles, as I want to build a small place for a few years while my boys are being educated in England?*"



In the eighteenth century both plain and pan tiles were manufactured in England, but the former were originally imported from Holland. In 1722 an Act of Parliament specified their size as not less than 13½ ins. long, 9½ ins. wide and ½ in. thick, and by the end of the century their use was becoming general.

The origin of plain tiles is obscure, but they were being made in 1477, for an Act of Parliament regulated their size to 10½ ins. by 6¼ ins. by ⅝ in. All tiles were used only in districts where they could be manufactured, and even in counties like Surrey, where their use is common, the earlier forms of roofing were thatch or Horsham slates.

An old tile can be distinguished from a modern "fake" by the nail holes, which in the genuine old tiles are square, to take the oak pegs with which they were invariably hung.

Your correspondent should study carefully the old buildings in the district in which he is building, and he may discover neither plain nor pan tiles to be the "correct" roofing material. I can recommend for much interesting historical information *Development of English Building Construction*, by C. F. Innocent.

L. E. W.

Sketch illustrating the proposed raising of a boundary wall. (See reply to "P. C.")

Local Bricks

M. J. M. writes: "*I am carrying out works in the West Country, in a district where the local bricks are not too good. My specification for general building bricks reads: 'Bricks to be well burnt, square, local stocks.' I have just visited the brickfields and find that the bricks are sold in three grades: (1) Firsts, which are picked out of the main stack and sold as minor facing for such as gate piers, plinths, etc.: the price increased by 10s. per 1,000, for what are called 'picked stocks'; (2) Seconds, which form the main stack from which the above are picked; (3) Thirds, which are generally underburnt and out of shape, and are picked from the main stack. The Firsts are well burnt and square, but the majority of the Seconds, while being fairly well burnt, include a large proportion of bricks with the edges chipped.*

"*The builder contends that he priced for Seconds, which is the local building brick, the Firsts being sold as facings, and therefore he would ask for an extra if Firsts are selected. Can I force the use of the better brick on the ground that the Seconds do not comply with the specification?*"

"M. J. M." has apparently only visited the brickfields or inquired about the local bricks after the contract has started, and here he has undoubtedly made his mistake.

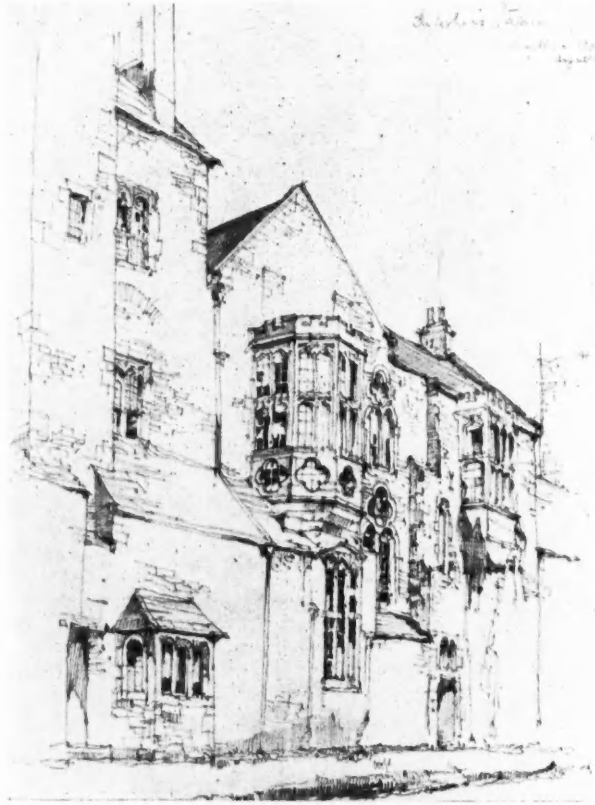
If the best stocks are sold as "Picked Stocks," the specification should have asked for these. In competing for the job the builders are not going to increase their price for brickwork on the assumption that the architect requires something that he does not clearly ask for. There is no doubt that if the bricks which comprise the "Seconds" stock are local bricks for general building work the builder has priced for these, and therefore is entitled to an extra if Firsts are selected.

Your correspondent's only remedy, if he does not wish an extra, is to see the bricks which are badly chipped are thrown out from the loads which come on to the works.

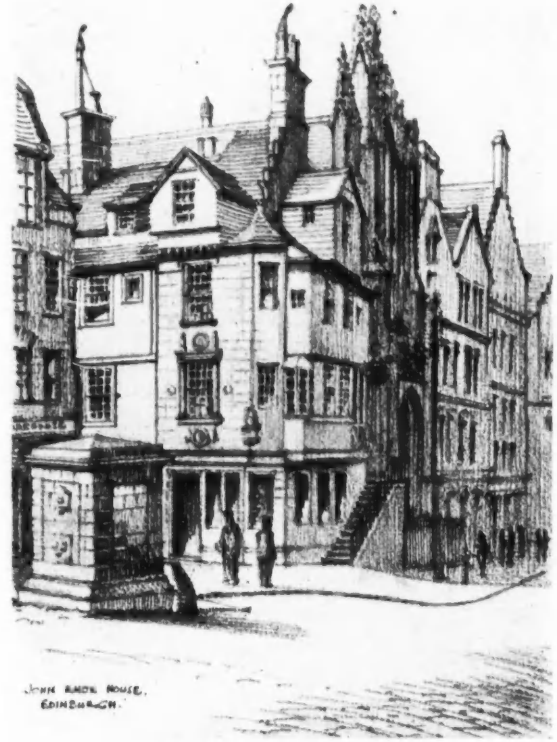
W. A. D.

The partnership between Messrs. William Davidson, F.R.I.B.A., and M. M. Ochterlony, of 2 Coates Crescent, Edinburgh, has been dissolved. In the meantime, each will carry on business at the same address.

THE SKETCH CLUB



TWELFTH SESSION



Bakehouse Close, Edinburgh.
By Stanley Brinton. (Pencil : 5″ × 7″)

THE entries for the last of the three Holiday Sketches Competitions have come in and are being arranged for assessment. The response has been, as we knew it would be, considerably greater than for either of the first two. But no one in THE SKETCH CLUB *realized quite* how much. *It has been staggering. Against 65 drawings entered for the June competition and 52 for July, no fewer than 125 have been received for August.*

The badness of the weather after the end of June meant that a number of July entries would be transferred to the following month. We realized that when the July drawings came in—fewer in number and less good in quality than those for June. But there is more in the August boom than that. There is much *more in it! Though we say it ourselves, the Competitions have been justified beyond the* CLUB'S *wildest hopes.*

The Bishop's Palace, Wells.
By Alan Reiach. (Pencil : 8″ × 11″)

John Knox House, Edinburgh.
By Stanley Brinton. (Pencil : 5″× 7″)

The pick of the August lot will be placed before members at our next session, on Wednesday, October 8. It is a fine lot, and will easily prove the best display of sketching ability the CLUB *has witnessed so far. No member should miss it. Also, there are three prizes instead of two for this occasion—one of £10 and two of £5. The names of the winners will be announced that day. The* CLUB *hope all its members will agree that the best men have won.*

This week we hang a further selection from the July entries. The work of the prizewinners, Mr. R. Knight and Mr. V. Warrilow, was shown a fortnight ago. Here are some runners-up — and a few others besides. Not a bad yield, on the whole, for one of the wettest holidays in the memory of a seafaring nation.

Will "Pentode," whose sketches are illustrated below, kindly send his name and address to the Editor?

A KENTISH REGIONAL REPORT

NORTH-EAST Kent is a region that has provided the scene of some of the most stirring events in the history of England. Situated on the threshold of our capital, traversed by the main land routes to the Continent, and guarding the approaches to the Thames, it has at all times been of immense strategic and economic importance. It is with particular interest, therefore, that Londoners will read the proposals for development and protective measures contained in the report, recently prepared by Messrs. Adams, Thompson and Fry, for this area, which has a population of nearly 360,000 people, and is administered by eighteen local authorities.

After an exhaustive study of existing conditions, the authors have put forward general recommendations for zoning, density and height of buildings, open spaces, roads and the preservation of amenities. The urban zone contains the areas where the population is already concentrated, such as Rochester, Chatham, Maidstone, etc.; the industrial zone includes the districts mostly adjoining the Thames Side and Medway Valley, while the rural zone is defined as those parts of the region almost exclusively agricultural. In the last-named zone the average density of four houses to the acre will be the maximum allowed.

Perhaps the outstanding feature of the report is the proposal for an extensive system of regional open spaces of different types, for example: (a) the North Downs between Kemsing and Charing, to link up with the similar downland reserves in adjoining regions, thus ensuring a continuous open space on the ridge of the Downs from Farnham to Dover, approximately one hundred miles long; (b) the woodlands adjacent to such urban centres as Chatham and Gillingham; (c) parts of the Medway Valley; (d) the Sheppey Cliffs.

One chapter of the report contains suggestions for estate developers in regard to the design and materials of new buildings. This goes into very considerable detail and should be useful as a guide to local authorities engaged on housing schemes, and to others who build without the help of a qualified architect. The volume is produced in an attractive but inexpensive form, with some twenty pages of photographs and diagrams, and a folding map in colours of the whole region, reproduced from the one-inch ordnance survey. The authors' numerous proposals should provide a sound basis on which the constituent authorities of the joint committee can prepare their individual town-planning schemes. W. H. T.

THE BUILDING EXHIBITION

SUPPLEMENT THE SECOND

LONDON'S BUILDING ACTS

The Need for Revision

BY H. D. SEARLES-WOOD

THE need for revision of the London Building Acts has been a subject of public discussion for the last ten years, and today all concerned are in agreement that the Acts are out of date and a hindrance to the development of modern building.

In March, 1920, Mr. Austen Hall read a paper before the R.I.B.A. on the "Planning of some American Store Buildings." In comparing the conditions in America and England, he said: "I am not unconscious of the handicap we work under in London, the queerness of some of our building sites, the mysteries of the law of light and air, and, most of all, the utterly out-of-date Building Acts which, although ably administered, do more than anything else to destroy imaginative work."

In the course of the discussion which followed the paper, several distinguished speakers referred to the Building Acts, and it was evident that the urgency for revision and reform was already in their minds.

Mr. John Murray, Surveyor to the Crown Estates in London, referred to the limitations and restrictions on trade buildings as regards their cube and height, which he considered detrimental to the trade carried on in these buildings. Buildings in America, France and other countries had no such restrictions.

The late Mr. Edwin T. Hall endorsed very strongly Mr. Murray's remarks as to the restrictions imposed by the Building Acts. They are antiquated, and spoil any possibility of imaginative planning when a large area is being dealt with. They prevented the large open areas which are such a feature in the American stores.

Sir Henry Tanner agreed with what had been said as to the limitations buildings were subjected to in London, and referred to the difficulty Crown tenants in Regent Street would have in meeting the Crown requirements and complying with the restrictions of the Building Acts.

Mr. J. J. Joass described the effect of the conditions on a proposed Regent Street building. The Crown required the roof to be 100 ft. high; the Building Act restricted the usable height to 60 ft.; all the rest would be wasted.

The President, Sir John Simpson, in putting the vote of thanks to the lecturer, said: "The Building Act is admittedly out of date, and should long ago have been superseded."

Mr. Austen Hall, in replying, said: "With regard to the building restrictions which hamper us so severely, I think the obvious outcome of the meeting should be to form a committee to urge the reform of the London Building Act. A strong committee should be formed to begin a regular, definite and successful campaign for the modification of this ridiculous Act which dates from 1894. The regulations were out of date even then, yet we in 1920 are still governed by them. Millions of money are wasted because buildings are not built to fulfil their purpose economically and sensibly."

A committee was appointed by the Council of the Royal Institute in July, 1922, and they set to work to

The Saks Store, Fifth Avenue, New York. By Starrett and Van Kleck. America, France and other countries have no such limitations and restrictions as London on trade buildings as regards their cube and height.

review the Acts in detail. The committee prepared three reports, and these were published by the Institute in 1926.

Further suggestions from persons interested were invited and copies were forwarded to the London County Council, the principal Building Act Authority for London; they having previously invited the Royal Institute to submit their recommendations. Conferences held with other interested bodies and much correspondence, indicated that the reform of the London Building Acts was a subject of great interest to Londoners, and was supported by a wide public. The Press has given and continues to give considerable notice to this matter.

At this date the amount of reform or amendment conceded by the London County Council, in the ten years since Mr. Austen Hall read his paper, has done very little to remove the hampering restrictions then referred to. The little accomplished is set out below:

In October of this year an Act will come into force consolidating the present Building Acts. This is merely a preliminary or first step towards reform or revision.

Some minor concessions have been granted by which the Council's Regulations regarding height and cube of trade buildings have been modified, but leaving them much too restrictive for modern requirements.

Some portions of the sanitary code have been revised, permitting the use of mechanical ventilation for internal water-closets, a much overdue necessity in modern City buildings.

Recommendations recently made by the Building Acts Committee of the Council indicate that other concessions may in due course be granted.

The Acts, bylaws and regulations controlling building in London are still far behind present needs. The urgency for reform grows from day to day, the present procedure for bringing them up to date is much too slow and is causing an immense amount of irritation. It can be shown that London trade is directly hampered by restrictions unknown in any other city in the world.

The probable position of a new building in Regent Street, as forecast by Mr. Joass at the Institute in 1920, was completely fulfilled in 1927. Head lines in the evening Press so described them:

DRASTIC L.C.C. ORDER TO SWAN AND EDGAR

Forbidden to use Top Floor of new Building

£50,000 CONTROVERSY

"Passing Swan and Edgar's new building in Piccadilly Circus on the bus tonight, Londoners will look up at the top floor with unusual interest; for it is the bone of an extraordinary contention.

"Under the terms of their Crown lease the firm were compelled, at a cost of £50,000, to build this topmost story to make the building conform with the rest of Regent Street.

"Now the London County Council, which is the building authority for London, has refused the company permission to use the top floor.

"The L.C.C. has issued this drastic fiat because of what it considers are the risks of fire. The situation is fully explained below."

LETTER FROM THE FIRM

"Gravest Doubts as to the Future" if the L.C.C. Maintains its Veto

"The top floor of Swan and Edgar's new building in Piccadilly Circus is the sixth floor; and, as in the case of the other floors, runs the entire length of the island

Swan and Edgar's, Piccadilly, W. Elevations by Sir Reginald Blomfield; plans by J. J. Joass. The top floor, constructed to meet the requirements of the Commissioners of Crown Lands, cannot be used owing to restrictions imposed by the L.C.C.

site. The company has spent about £50,000 in building it.

"But because it infringes the London Building Act of 1894 the L.C.C. say that it must not be used.

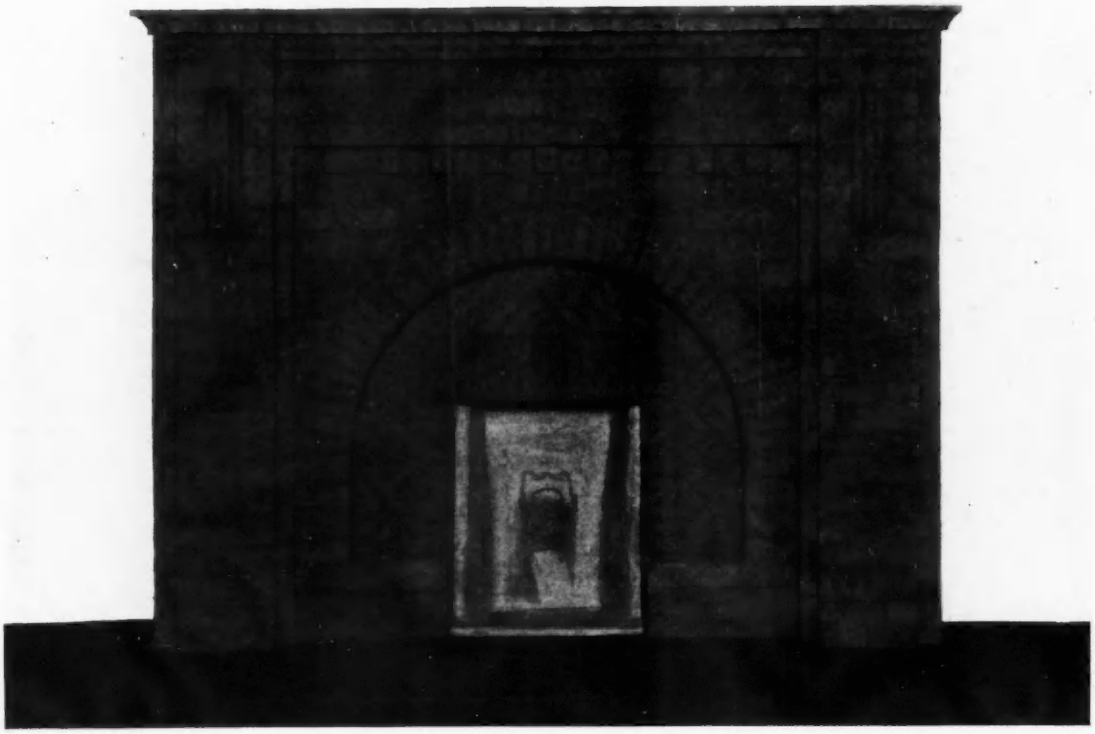
"The firm has written to the L.C.C."

The floor referred to remains unoccupied at this date. That such conditions should be possible in modern London perhaps explains the public irritation which has been referred to. All concerned are now entirely agreed that the procedure for amendment and reform must be expedited.

Inquiry indicates that a new Bill will require a period not less than three years to prepare, and some further time may be occupied by Parliamentary procedure. Other proposals have been made and considered, and it would seem that there is now some considerable opinion in favour of a new building code which could be applied throughout the country. It is thought that such a code could be prepared in a few months, and that its preparation should be undertaken by an expert technical committee. It is also thought that the code might become operative as soon as sanctioned, and that the committee should continue to deliberate and periodically advise the authorities concerned as to new requirements, and so keep the code abreast of modern requirements.

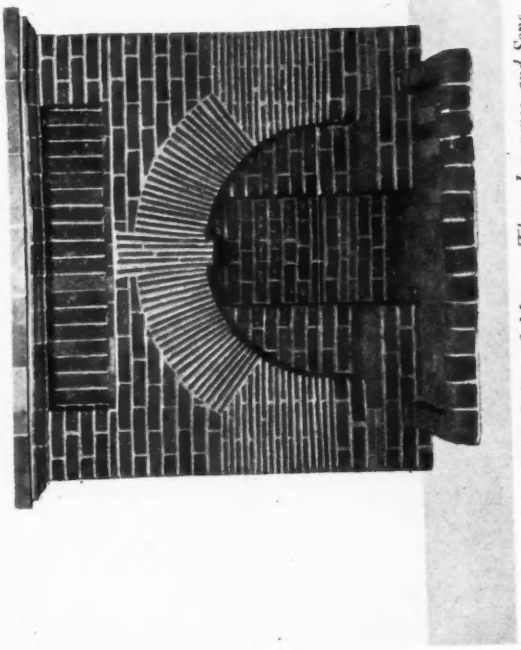
Other suggestions for expediting procedure would be welcome, as meanwhile we erect buildings which do not economically fulfil their purpose, and have already expended millions on such buildings during the period of active discussion.

[*To be concluded*]



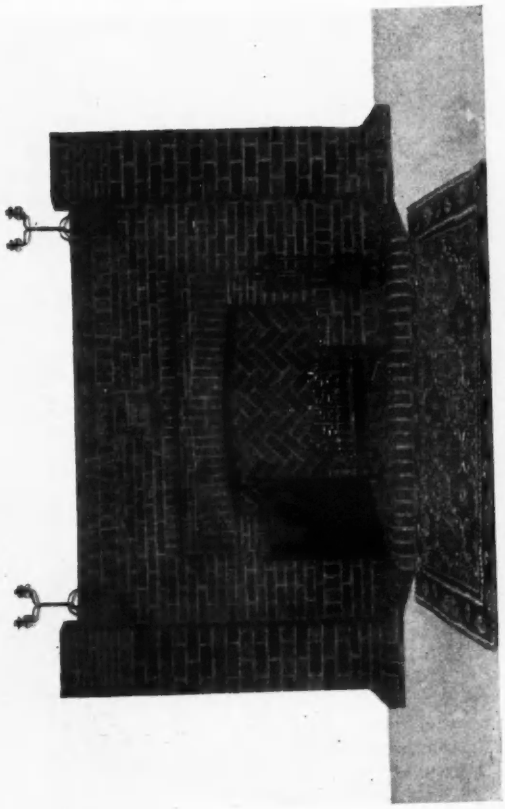
BRICK FIREPLACE COMPETITION

The Winning and Other Designs

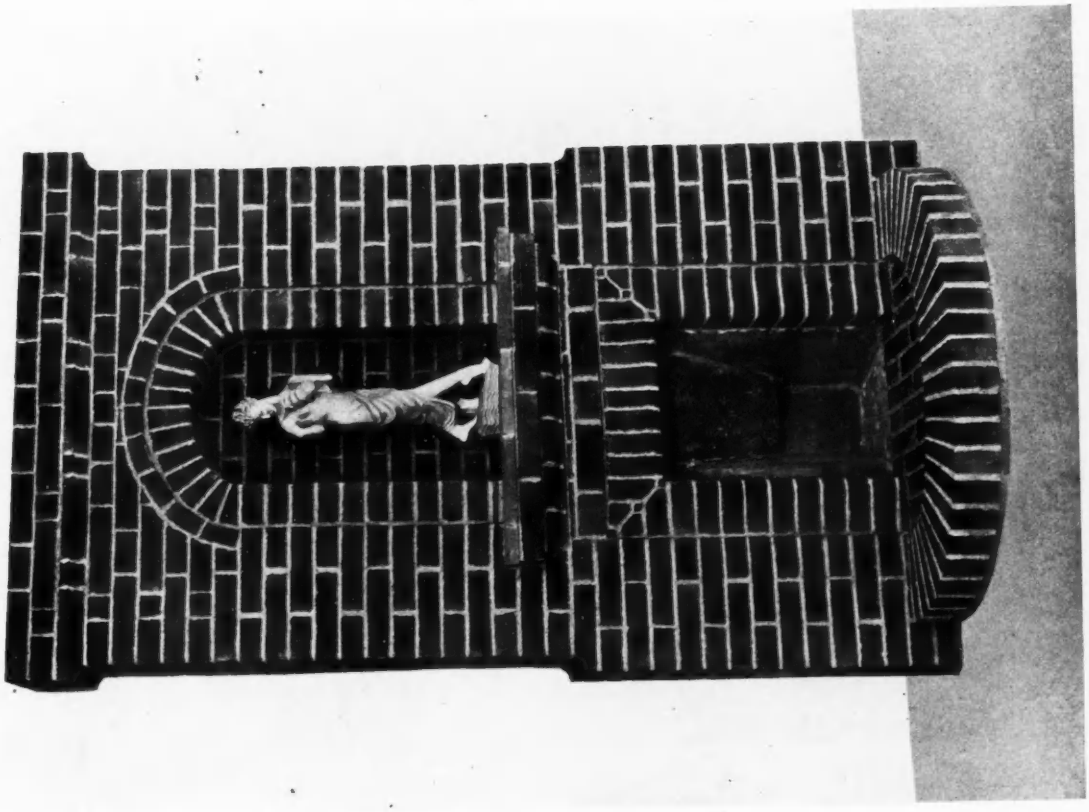


THE gold medal for the best fireplace at the Building Trades Exhibition has been awarded to Messrs. W. T. Wright & Co., Ltd., Sileby, near Loughborough. The design is by Mr. Walter Brand, Leicester. The firm used its silver-grey brick, the colour of wood ash, with a flat, wide mortar joint. The bricks are regular with good arrises, and the resulting face is fairly flat and smooth, so that the fireplace does not collect an unreasonable amount of dust on it. The angles round the fire itself are slightly rounded to prevent their being chipped, as are the angles of the two brick "hobs," always useful features in a fireplace. On the other hand, the colour, so charming in itself, is more likely to show the finger prints of the housemaid or the "batman" than any of the other exhibits.

Mr. Brand's design is satisfactory. The members and projections are kept comparatively small, as befits the subject and material, without sacrifice of breadth of colour. There is no doubt that this is a *brick fireplace*, whilst the refinement of handling makes it suitable not only for a minor baron's hall, but even for a lady's silver-papered boudoir.



The fireplace which comes second was built by Messrs. Barker and Jones, with their bricks varying in colour from



The fireplace, designed by Walter Brand, for W. T. Wright & Co., Ltd., awarded the gold medal.

The design of Messrs. Thos. Lawrence and Sons.

The design of William Davis.

The design of Barker and Jones, placed second.

brown to blue; they are excellent in shape and arris, have enough texture, and will be easily worked into a rich decorative scheme with panelling and furniture. The craftsmanship is good, but not equal to that which gained the medal. In particular, the jointing of the flat arch with the architrave has left an old problem with a botched solution. The niche above the mantelpiece, with the figure, makes a happy feature; nevertheless, this design smells too much of the pencil; its elements have not grown together, but call for those flattering lines which draughtsmen run round a sketchy composition.

The Question of Colour

Several of the other fireplaces, and notably that of Messrs. Blanchards, one of the third-prize winners, are on sound, old-fashioned lines, with too many added enrichments or breaks, or too strong a colour mix. It will need a somewhat pretentious and major baron to stand up to them. I hold that any brick with full-bodied colour must be respected primarily for its colour, which is not improved by fussy lines of shadow or chinks filled with tiles, and I was sorry no competitor had used "Georgian" quoining and filling in two colours. The English classic fireplace has been made of marble in the grand manner; why should it not be made, in a more homely style, of brick?

Messrs. Lawrence's exhibit is commendable for its propriety; the lines reach the limit of simplicity, and the design relies on its good colour.

London Brick Co. and Forders' fireplace is incorporated in an excellent stand designed by Mr. Joseph Emberton; but the bricks are dragged with a deep incised line, which makes them unsuited to surround a coal or wood fire, or indeed for interior work at all, owing to the amount of dust detained by the rough surface. The problem of the mantelshelf has been circumvented by using stucco, and I hardly think the design of the fireplace is worthy of the stand as a whole. Mr. Emberton has certainly done much better things of this sort.

"Rubbers" and "Malms"

The difficulty of all the competitors has been to obtain the "fineness" suitable for modern interiors; in the past rubbers and malms have been used for "quality" in external work, and although rubbers are now out of favour and malms difficult to get, I believe the careful introduction of either will give the look of finish which most of the exhibits lack, and may help the moderns to realize their ideals of plastic form and sveltness in the most popular building material in the country.

P. M. S.

[It is hoped to publish illustrations of some of the other prize designs in our next issue.]

Fireplace Competition Awards:

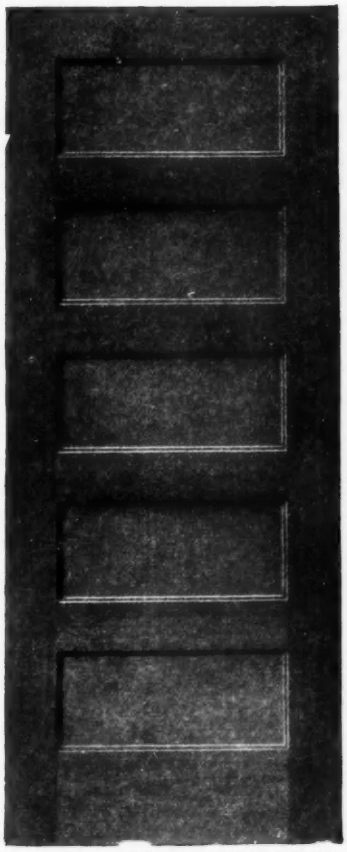
THE STANDARD DOOR

BY HAROLD TOMLINSON

THE architect is still inclined to regard the mass-produced door with suspicion. There are many reasons for this, chief of which, no doubt, is a dislike of using an article which he has not designed himself. It must be confessed that the bulk of the doors which are offered are very bad indeed from the point of view of appearance; but for this the architect is in part to blame. The manufacturer attempts to cater for the largest market, and this he finds in speculative building. But the speculative builder is influenced by prejudice, firstly, in favour of the kind of door to which he has become accustomed and, secondly, towards providing at small cost something which will appear expensive to the purchaser of the house. Both of these tend to produce meaningless complication of design.

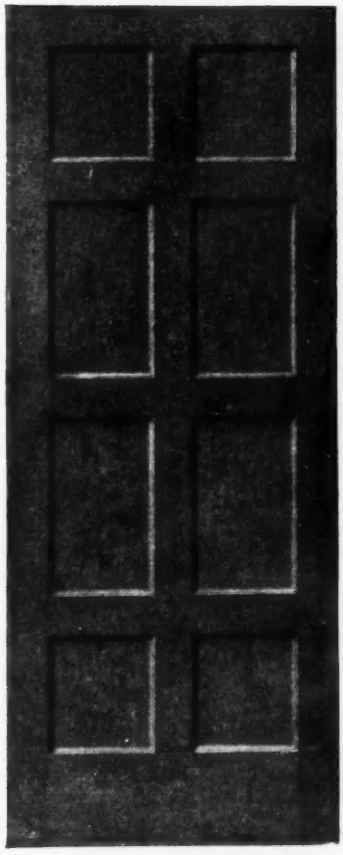
There is another factor which is responsible for the complication of the cheapest doors: many members help to minimize the effects of shrinkage due to the use of unseasoned timber, a multiplicity of rails and panels making it possible for even the most indifferently constructed frames to remain rigid. Competition has probably made the cheapest door too cheap, for economies are strained to such an extent that it is not possible at first sight to believe that they were worth while. Styles and rails, for instance, are frequently made of timber which has been joined both with and across the grain. A well-designed and well-made glued joint is very strong indeed; but one cannot help feeling a little dubious about an article in which such rigid economy of an inexpensive material has been effected. If by this means we are able to have thoroughly seasoned timber the complication is worth while. Seasoning is the most important factor. Good machines do not turn out the faults which would be bound to occur with hasty hand work, and the question of craftsmanship does not therefore arise.



The methods of construction employed by different makers vary greatly. Some doors are morticed and tenoned, some dowelled, and some have specialized joints which have been evolved to meet the exigencies of mass production. For a long time the dowelled doors were viewed with disfavour, and, indeed, the wedging of a mortice and tenoned joint offers a greater proof against shrinkage, as the wedges exercise a pulling action which is absent in the dowelled joint. With thoroughly dry seasoned timber and the impeccably close machine-made joints, however, the dowelled structure is strong enough for its purpose. The dowelled door is obviously much cheaper, as the length of a pair of tenons is saved on each rail.

In "Laminex" and "Metco" doors the dowels are made with two narrow slots, and, being a tight driving fit, are slightly compressed in assembly so that they tend to expand against the sides of the holes which receive them. "Laminex" doors also have styles and rails of unusual construction: these members consist of at least three layers, the inner one generally being grooved to receive the panels. The layers are locked tightly together by dovetails which run along their whole length, and the almost invisible joints are concealed with applied veneers.

Veneered standardized doors need to be chosen with care. Rapid clearing of shops is necessary in mass production, and one way to effect this is by leaving glued work too short a time in the clamps. Most of the better quality veneered doors are reliable; but there are some brands which are not above criticism in this respect. The safest way of finding out how a door will work is not to examine the showroom section (always a marvel of perfection), but to insist on seeing doors which have been hung for several years on an ordinary job.



Recognition of the virtues of plywood has brought the flush door into its own. There is a great deal to be said for a door which has no projections. In hospitals such doors are a necessity, and even in domestic work the valuable effects which can be obtained from broad expanses of richly grained timber is being appreciated more and more. Another advantage of this type is that it is very readily rendered sound-proof, and most makers will supply flush doors which contain sound-proofing material. Plywood, by virtue of its construction, offers new figurings which were not formerly obtainable; but it is not a material to be chosen lightly. The poorer qualities are subject to vagaries which produce distressing effects in both stained and painted work.

As is generally known, there are two

[*Merchant Trading Co., Ltd.*

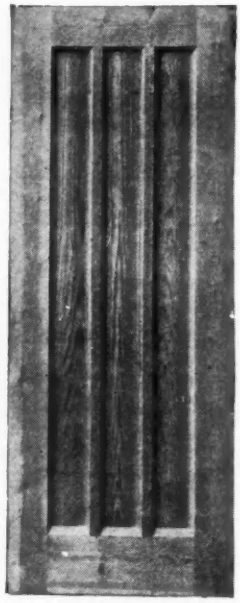
A five-panel "Metco" door.

[*Merchant Trading Co., Ltd.*

An eight-panel "Metco" door.

kinds of plywood, these being made from either "knife-cut" or "saw-cut" veneers. In knife-cutting the veneer is obtained by imposing a long knife against the timber, which is rotated in a lathe. Thus the veneer is unrolled like linoleum, and the knife in travel cuts more or less regularly through the annual rings at each revolution and, incidentally, produces those mysterious "repeats" which are often attractive and sometimes equally unpleasant.

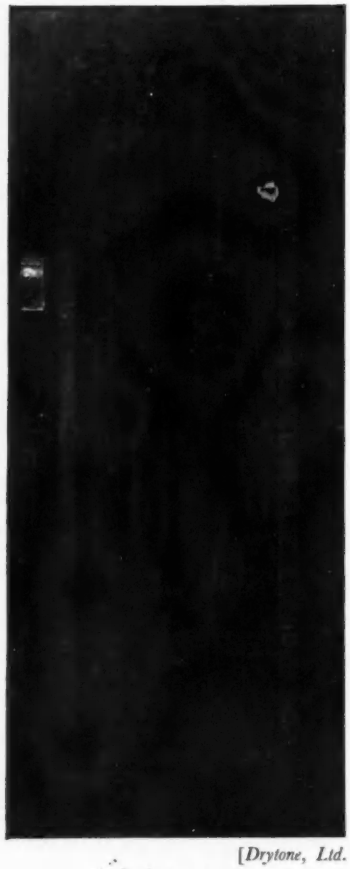
Knife-cutting destroys the original structure which existed in the tree: that which was circular has been induced to become straight. The veneers are glued together at right angles to give strength in both directions, and to counteract the tendency to return to their original form; but unless the gluing is carried out scrupulously, surface undulations, which are particularly distressing in painted work, are bound to occur. The best brands are absolutely reliable and carry a guarantee of replacement of defective goods.



With saw-cut veneers the timber is subjected only to those strains which might be expected from the drying out and seasoning of a cellular structure. The figure of the wood remains normal, and depends on the method of sawing employed. Saw-cut veneers are much more expensive. The knife wastes nothing from the cylinder, but the saw produces laminæ of varying size, which have to be butted if large areas are to be covered. It is therefore evident that doors covered with sawn veneers cannot be produced cheaply. A good example is the "Raleigh" door, made by Messrs. Shapland and Petter. This door consists of a frame of three 7-in. by 1-in. rails, with closely spaced intermediate rails of smaller size. The styles are finished 5 in. by 1 in., which allows the lock to be fitted at any height from the ground. The plywood is fixed to the core and housed in grooves in the slips which embrace the core edges. This standard door is supplied in oak, walnut, mahogany, teak, silky oak, and pine, and finished in wax, french polish or cellulose, the last to any colour.

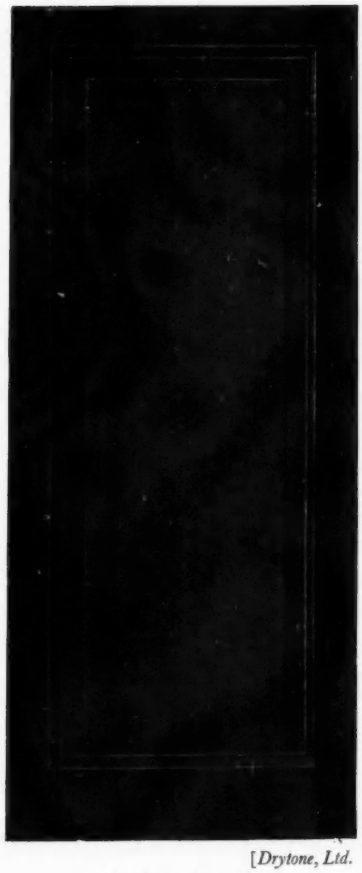
The supplying of doors with their protective covering already applied will often effect a great saving of time, but not every maker is reliable in delivery, and it is well to demand a guaranteed time of delivery before specifying any particular door. Experience has taught that even some of the largest dealers are unable to supply within a reasonable time the goods which they list as standard, and withdrawal of catalogued goods, too, may cause trouble to the unwary.

The writer had hoped for much from a door which made its appearance several years ago. This consisted of boards glued together, through-bored, and reinforced with steel tubes expanded at each end. The only one which he has used (in his own house) has shrunk $\frac{3}{8}$ in. laterally—this, no doubt, due to lack of seasoning. A door more completely articulated, even if badly seasoned, would have shrunk, but its effects would not have been so noticeable.



The cheap door with many panels can be used quite successfully as a flush door by covering up both sides with plywood. This is easily done by means of the "Seecrid" nail now marketed by Messrs. Nettlefold. This nail has two ends, each of which is divided, and so splayed that it spreads on being driven. This ensures intimate contact between plywood and frame, and if the ply covering is slightly chamfered at its edges to avoid fraying, an effective and reliable door may be produced at small cost. Clamping after gluing is unnecessary owing to the binding action of the nails. The chamfered edge is important with plywood unless the veneers are protected from rubbing contact.

The "Knowledge" flush door, which is entirely ply-covered, has its lower edge chamfered to prevent damage by floor coverings, while the solid styles have an ingenious dovetailed contact which not only makes the plywood



[*Boulton and Paul.*

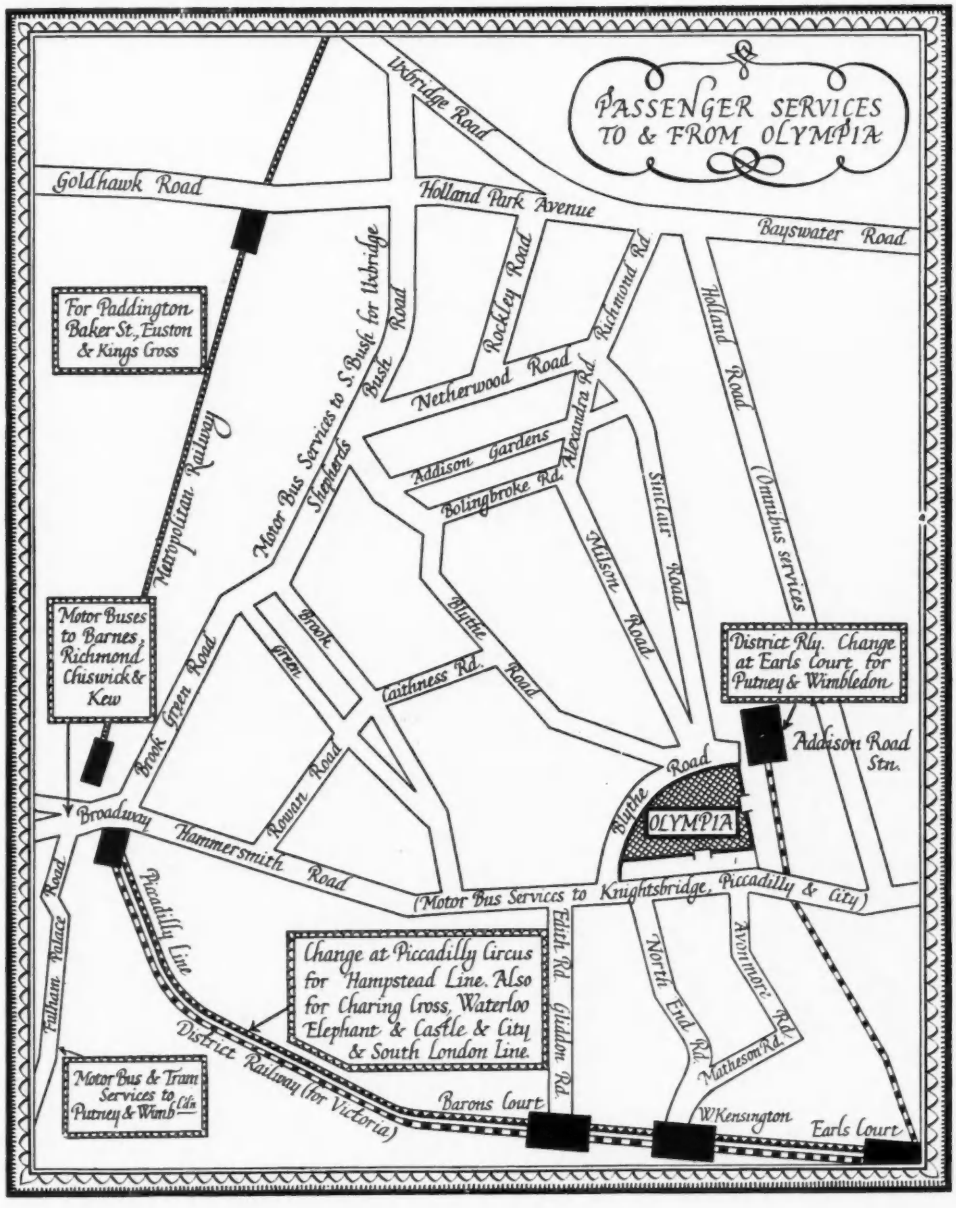
A three-panel door.

[*Drytone, Ltd.*

A flush-panel door.

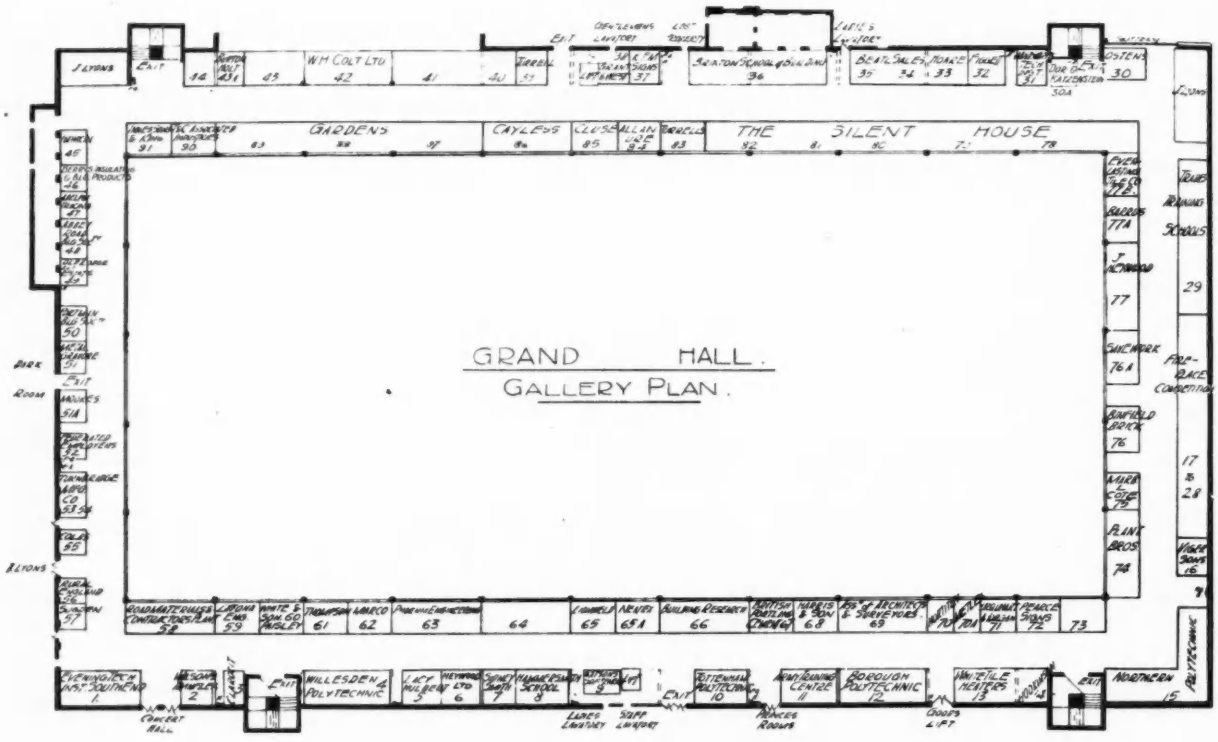
[*Drytone, Ltd.*

A one-panel door.

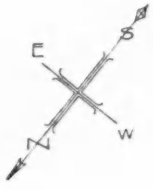


secure but also permits of a perfectly uniform surface. The inner framing of this door is well designed, and it is supplied in many woods, the cheapest being Oregon pine, though a door with knife-cut mahogany veneers and solid styles is reasonably inexpensive.

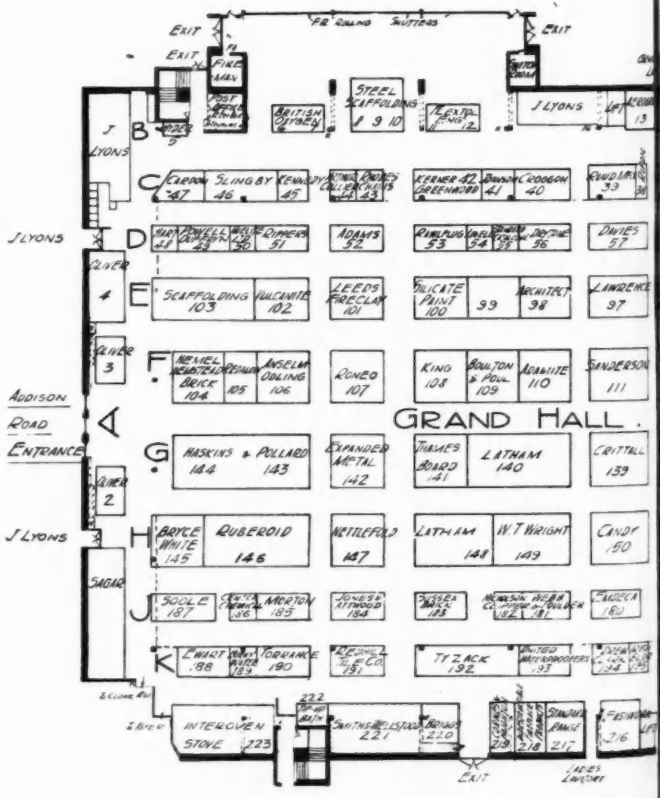
The construction of the "Drytone Metadoor" is interesting. This is a ledged door in which the ledges are of metal, and visible. The ledges are attached to the boards with screws, and swelling or shrinkage may readily take place. Expansion or contraction effects are reduced to a minimum, the width varying only by the amount of movement in the two outermost boards. The plain "Metadoors" are of attractive appearance, the ledges being obtainable in a variety of metals, which makes them at home in modern interiors where metal is often employed decoratively. The more complicated doors are not so satisfactory; but these will no doubt be improved in course of time. The general level of design in the "Drytone" products is very high, and several must receive full marks. Some will find attractive the "Drytone" finish, in which the wood is coloured by chemical treatment and not by stain, the final protection being wax polish for internal work and cellulose for outside doors. "Drytone" doors are also supplied in the white if required for painting or other normal finish.



Apart from the doors already mentioned, there are many others on the market, some good, some not so good; but there is no longer any excuse for condemning the standard door *en bloc*. It is to be hoped that architects will use them more frequently in the future, and at the same time that they will continue to pester the manufacturers to produce reasonable designs.



It is not suggested that the standard range should be used in preference to designing. The evil effects of standard windows when unskilfully used has already produced many unpleasant houses, but in door catalogues the architect will often find just the article he wants, and so save his client much money.



He can protect his interests, as suggested above, by examining doors which have seen long service, and by his influence he has it in his power to induce the trade to supply a cheap door which is satisfactory from every point of view.

NOTABLE EXHIBITS: ii

THE ARCHITECTURAL PRESS cordially invite all architects and readers visiting London for the exhibition to pay a visit to their Stand No. 94, Row E, where a complete range of all their publications will be found. The stand, which has been designed by Professor A. E. Richardson, F.R.I.B.A., is specially arranged to enable visitors to glance through the various publications at their leisure and in comfort, without being disturbed by people passing from one stand to another. In addition to the well-known periodicals, THE ARCHITECTS' JOURNAL, THE ARCHITECTURAL REVIEW, and SPECIFICATION, there are on view all the new books such as *Modern Architectural Sculpture*, by William Aumonier; *Modern French Decorative Art*, vol. ii; *Elements of Domestic Design*, by A. J. Penty; *Architectural Shadow Projection*, by J. M. Holmes; *Mouldings of the Tudor Period*, by Small and Woodbridge; *Isometric Drawing of St. Paul's Cathedral*; and *The Ancient Bridges of the South of England*, by E. Jervoise, published on behalf of the Society for the Protection of Ancient Buildings, together with many others of interest alike to the architect, student of architecture, and all concerned in building and interior decoration.

★

Among the exhibits of MESSRS. ADAMSEZ, LTD. (Row D, 71) is the firm's patent Epic system of flushing closets in range form, which is widely adopted for factories, schools and conveniences. This patented arrangement is claimed to have proved of great service in ensuring thoroughly efficient and sanitary flushing of closet ranges. One of the chief features is that the large reserve of water in the trough enables a flush to be obtained at any time. They are also exhibiting a range of fireclay lavatory basins of modern design, amongst them a selection of coloured basins for high-class domestic work; the colours being of various pleasing light shades which would harmonize with almost any surroundings. They also show a range of high-grade closet suites in Adamesk fireclay ware, both "high-level" type and combination pattern.

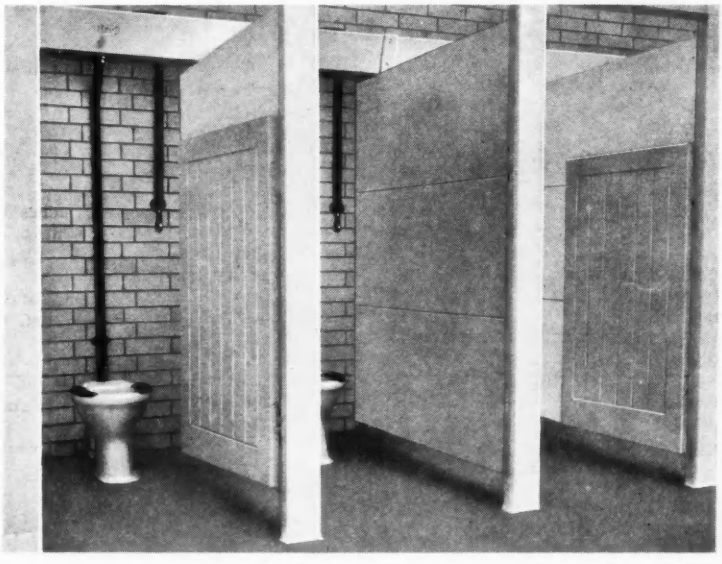
★

The CORK INSULATION CO., LTD., who manufacture and instal Eldorado cork tiles, are exhibiting at Stand 201, Row K. Several styles of tiling are shown, each suitable for different types of buildings. The cork tiles are claimed to be durable, non-slippery though polished, warm, noiseless, easily cleaned, and hygienic. They are made in light, medium and dark brown. The tiles are stocked in a wide range of sizes with coved skirting for finishing at wall angles. There are also shown on the stand many photographs of completed floors, such as banks, schools, clubs, libraries, residences, etc., where Eldorado cork tiles are in use.

★

On their stand (Gallery, 46), BERRY'S INSULATING AND BUILDING PRODUCTS, LTD., show Tricity Sunrays in a special setting, designed for use in cottages and countrified houses. Special samples of mottled coloured facing bricks are also on view. These bricks give a pleasing effect, cool in summer and a warm welcome in winter, and show how monotonous appearance usually may be relieved, as in the case of the Pylon chimney and brick fireplaces. The latest electrical features for modern kitchens, such as built-in ovens and cool chambers, and Cassac art flooring and ornamental walling slabs, are also displayed.

★



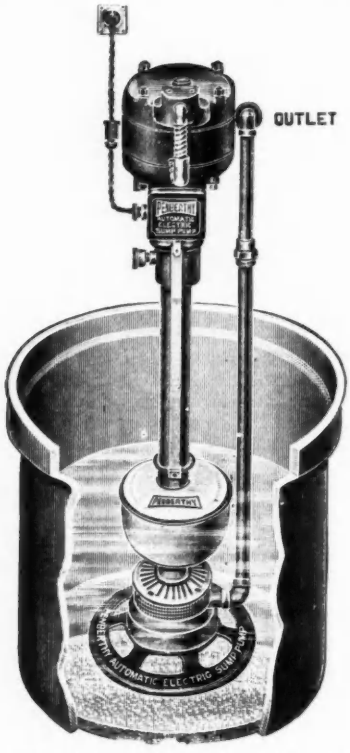
Following are the exhibits of W. E. WHITESIDE, LTD. (Row B, Stand 17). A reproduction of an Early Georgian wrought-iron gate, together with a reproduction of the panel at the Queen's College, Oxford, and the Beverley panel, from the Choir Gates of Beverley Minster. Door furniture for architectural and domestic use: a full display of door furniture is being exhibited in bronze and brass, and particular attention is drawn to the Monel Metal exhibits, also Silveroid. Répoussé work: a demonstration showing the actual production of foliage from sheet metal in charcoal iron, Staybrite, Monel and Silveroid, similar to the Tijou répoussé work. Spinnings (spun metal work): a number of interesting exhibits showing the use of spinnings and castings from the firm's own foundry in bronze, Monel, aluminium, brass, and kindred metals. Ecclesiastical art metal is represented by a number of interesting exhibits. Other exhibits include keys, caskets and trophies, letters and numerals, lanterns, signs, vanes, door and window furniture, gates, railings and grilles, altar fittings and rails.

★

The stand of LAMINATED WOOD PRODUCTS, LTD., manufacturers of patent laminated flush doors, panelling, flooring, partitioning, etc., and of plywood and all kinds of veneer work, is designed by Mr. Herbert A. Welch, F.R.I.B.A. In designing it, Mr. Welch has made use of the firm's special compressed cork and plywood partitioning, specimens of which are shown in section. Among the principal exhibits are the firm's patent flush laminated doors which are shown in various types, from the plainest hospital door to the most decorative patterns, but all in keeping with modern architectural design. The doors are made throughout at the company's own works on a laminated construction, with gaboon mahogany, and pressed together with waterproof cement. Examples of panelling are also exhibited, all guaranteed against warping and shrinking, under the effect of central heating. The doors and panelling, etc., shown are all finished in the exhibitors' spraying shop, and illustrate the very latest methods in cellulose polish and enamel. The stand is No. 266, Row O.

★

MESSRS. THOS. PARSONS AND SONS (Row G, Stand 135) exhibit H.M.S. Endelline, showing some practical applied examples of their enamels, varnishes and paints. The examples include the following specialities for which the undermentioned claims are made. Endelline enamel, for interior or exterior use, producing a porcelain-like finish that may be repeatedly washed without deterioration. Endelflat enamel (flat), for interior use, producing a soft, almost dead flat finish of a hygienic and washable character. Lacreite enamel: when work will not bear the expense of a higher quality enamel like Endelline, a satisfactory substitute will be found in Lacreite, either for inside or outside work. Unicote flat finish, the surface of which can be repeatedly washed without deterioration. Parsons' gloss print, a varnish paint of exceptional body and working qualities for general exterior and interior work. Parsons' undercoating body white, a ready-mixed undercoating paint with a surface particularly adapted to take the finishing coat of gloss or flat enamel; can be tinted to suit the finishing colour. Parso-Glaze, a scumbling paint producing decorative effects quite different from those obtained with ordinary opaque paints. Parsons' rubber stipplers: demonstrations in the use of these in conjunction with Parso-Glaze are given on the stand. Parso-Tex: an oil-bound plastic paint for producing textures



The Epic system of flushing water-closets.

on interior walls. The material can be glazed immediately without any further preparation; it covers approximately ¾ to 1 yard per lb., according to the texture required. Water-Tex: a powder which, when mixed with water, produces a plastic paint which dries as hard as marble. In medium textures it dries hard enough overnight to be sealed and painted the next day. Parso-stone: a paint which gives a rough, stone-like surface on any material. It can be used for inside or outside work, and is made in four colours.

*

W. H. WILLCOX & CO., LTD. (Stand 231, Row N) exhibit their Penberthy automatic cellar or sump drainers. These are for use where water accumulates by seepage, overflow, flood or tidal troubles, which cannot be drained off directly, either because the flow line of the sewer is not deep enough, or because obstacles intervene between the pump and sewer. Among the more common instances of their use are for cellars of buildings where no sewers exist, or where the sewer line is above the basement floor level. They are also used for deep cellars of buildings, boiler rooms, settling basins, flywheel and elevator sumps, tunnels, etc. While ordinarily a seepage may amount to only a small trickle, its flow is continuous and if neglected the accumulated water soon becomes a real menace to health and property. To keep such places dry the incoming water is most economically disposed of as it accumulates, by means of an automatic water-operated, or an automatic electrically-operated cellar drainer. Local conditions determine which is preferable. The Penberthy automatic cellar and sump drainer, Model "E" (electric type) is, as its name denotes, operated automatically by electric motor and impeller. It operates only when water accumulates, and immediately ceases action when the water has been disposed of. Model "L" (automatic water-operated type) is for operating automatically by water pressure from the mains in dealing with flood troubles. This drainer comprises a gunmetal ejector and operating valve with copper float and iron strainer. The ejector is fitted above the float instead of beneath, as in the model "R." A foot-valve in the strainer seals the suction pipe when the drainer stops working, holding the water in all the pipes, so that it is always primed ready to start instantly. The operating valves open and close instantly by action of the water float. In the model "R" (automatic water-operated type) the ejector is placed under the float and below water level, thus saving suction lift and adding to its efficiency. It has a radial arm marked from 10 to 100 lb. to suit the varying operating pressures in water supply. The float remains nearly submerged until valve opens, securing fullest discharge of the accumulated water. Rubber buffers protect the lever and valve stem from shock. The float operates the drainer automatically. The rotary valve reduces all stem packing friction. The rotary packing method is based upon natural laws; no springs. Movement is simple and unaffected by dirt. It requires little sump space owing to the patented float built around the suction tube. It is fitted with interchangeable bronze valve, and the valve seats are protected against dirt by a strainer in the water-supply pipe. The closing of the valve is positive, avoiding any wastage of water. This type is claimed to operate with economy at from 10 to 100 lb. water-main pressure, with lever and link motion adjustable to different pressures.

The Penberthy automatic cellar and sump drainer.

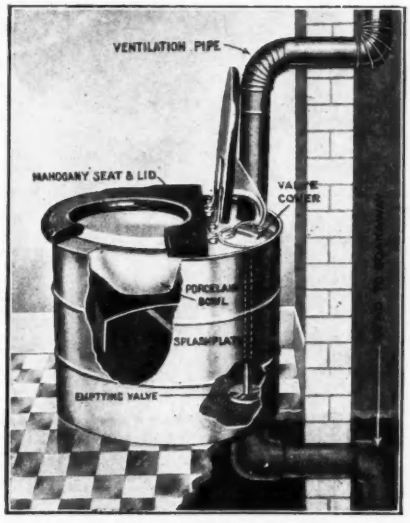
*

On Stand 137, Row G, are examples of the application of the many asbestos-cement roofing and flooring materials, and of the interior and exterior decorative sheets marketed by ASBESTOS CEMENT BUILDING PRODUCTS, LTD. This company incorporates the selling organizations of Bell's Poilite and Everite Co., Ltd., British Fibrocement Works, Ltd., and Turner Brothers Asbestos Co., Ltd. (for asbestos-cement products), and has staged many striking examples of the application of asbestos-cement. The roof surfaces of the stand show Turners' Trafford tiles, Everite Bigsix corrugated sheets, Poilite pantiles, Turnall hand-made plain tiles, and Serval asbestos-cement slates. The outer walls are covered with Everite standard corrugated sheeting and Poilite flat sheets with half-timbered effects. The end gables are carried out in Poilite rough cast sheets. The application of louvres is shown in the jack roof. Of the four cubicles, one displays Serval asbestos felt for roofing, sarking and under-felting, and the other three are devoted principally to decorated wall sheets. Of these three, the first has a bath fitted with asbestos-cement moulded bath panels, the walls covered with Turnall stipple-glaze decorated sheets, and the floor laid with Poilite rigid rubber floor tiles. The second cubicle shows a kitchen where the walls are covered with Turnall stipple-glaze decorated sheets, Decolite composition flooring being used for the floor. In the third cubicle the walls are of decorated Poilite, the floor being tiled with the same material. The interior of the stand displays Turnall oak grained asbestos sheeting in the lounge and hallway, and the front entrance of the stand shows the external application of decorated Poilite. Everite flue pipes are also exhibited, and the gutterings, etc., of the building are carried out in Everite rainwater goods. Various displays of Everite pressure pipes for water mains, Everite curved corrugated sheets, Poilite diagonal pattern slates, Turnall asbestos wood, etc., are arranged on the stand.

*

Essex board, the product of THAMES BOARD MILLS, LTD., has been a feature of the exhibition for nearly ten years. The stand itself (Row G, 141) is designed in a modern style to demonstrate the structural possibilities of this wallboard. Essex board is claimed to be one of the few materials of the kind manufactured in this country, and this point is being strongly emphasized by the manufacturers. Among the features of Essex board demonstrated on the stand are its adaptability and its matt surface. It is found that with one coat of paint or distemper pleasing results can be obtained. In addition to ordinary interior lining purposes, it is used to a large extent for alterations, renovations, repairs and a host of minor purposes. A large number of the stands at this and other exhibitions are constructed of Essex board. The material is made in three thicknesses, namely, $\frac{3}{16}$-in., $\frac{1}{4}$-in. and $\frac{5}{16}$-in., and in a wide range of useful sizes.

*



A very striking example of the work of the L.C.C. SCHOOL OF BUILDING, BRIXTON (Gallery, Stand 36), is the façade of the exhibition stand which has been specially designed by a member of the school staff and erected by the staff and students. The plaster work and decorations have been executed entirely by students of the day school. Special interest attaches to demonstrations of craft instruction by working parties of students from the junior day school. These parties are at work each day during the exhibition. The examples of school work on exhibition include brickwork, masonry, plastering, carpentry and joinery, plumbing and painters' and decorators' work from all sections of the school, and woodcutting machinists' work from the evening department. All the work shown reaches a high standard of craftsmanship, but several examples call for special reference and will repay careful inspection. Of these may be mentioned a geometrical stair and wreathed handrail, constructed to a scale of two-thirds full-size. The example is incomplete but demonstrates the grade and standard of instruction reached in the evening school and also the combination of effort between the woodcutting machinists and joinery students. The masonry exhibit includes details of vaulting, domes and arches of double curvature, while modern constructional requirements are illustrated by examples of

the enclosing of steel stanchions in stonework. The work of the plastering classes includes a complete Georgian ceiling and cornice, modelled, moulded and cast in fibrous plaster by two junior day school boys. There is also a Georgian beam and soffit. The plumbing section is represented specially by a turret roof of simple but effective design; the lead covering is admirably executed, and demonstrates the skill which can be acquired by boys under the close supervision of school instruction. There are also many examples of draughtsmanship from all sections of the school in architecture, building construction and interior decoration, and a selection of drawings submitted in a recent competition for shopfront designs.

Typical of modern housing convenience is the Ure Back-to-Back grate exhibited by ALLAN URE & CO., LTD. Economy is the essence of the situation, and in this respect the Back-to-Back grate provides two fires in one. The outstanding feature of the grate is that the coals burning in the fireplace supply warmth and cheeriness to the living-room, and at the same time provide the requisite heat for cooking, and all other domestic purposes in the scullery. It is claimed that on washing-day the living-room is immune from the steam of drying clothes, and at meal-times it is free from the smell of cooking. The manufacturers state that there are over 40,000 of these grates in operation all over the country. Another notable exhibit is the Ure interior cooker, which has all the appearance of a room grate with tiled cheeks. These are being installed, not only in housing schemes, but are being freely adopted where the old-fashioned ranges are being taken out. Behind the canopy of the Ure interior cooker is an oven for cooking, and it also supplies the hot water for all domestic purposes. This grate has been designed for houses which have not been planned for the Back-to-Back type. These exhibits are on Stand 84 in the Gallery.

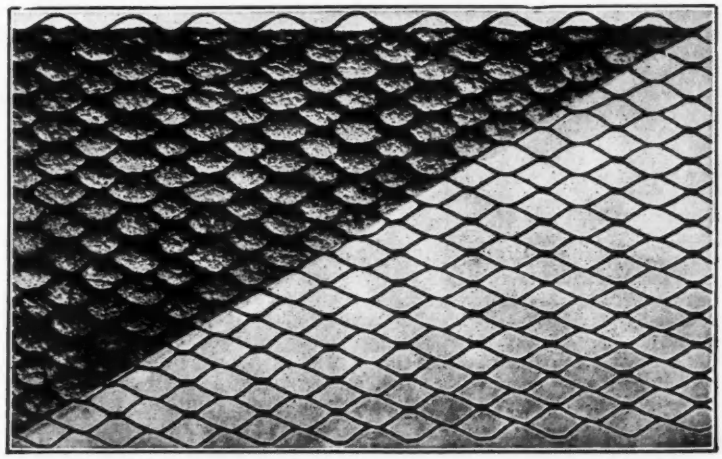
*

On Stand 35, Row C, ELSAN MANUFACTURING CO. exhibit their chemical indoor closets, which include the Elsan overground permanent self-emptying model, suitable for bungalows and all houses not connected with public sewers; and the Elsan underground tank permanent self-emptying model, for factories, works, sports grounds, private houses, etc. The Elkol flake chemical, used in conjunction with the above two models, converts all matter into an innocuous liquid, which is led into a soakaway, where it percolates into the ground, and the bath and sink wastes may also be drained into same. Elsan portable models, also shown, as used in cottages, caravans, motor-coaches, airships, aeroplanes, etc. The chemical used with these models is the new Elsanol (patent applied for), which sterilizes and deodorizes the sewage. This chemical possesses, it is claimed, unique properties, being miscible with water and non-inflammable, and, further, it acts as a seal. The Elsan has been recommended by medical and sanitary authorities and is claimed to be a safe and efficient system for unsewered buildings. It has been adopted by corporations, councils, Govern-

An Elsan chemical indoor closet.

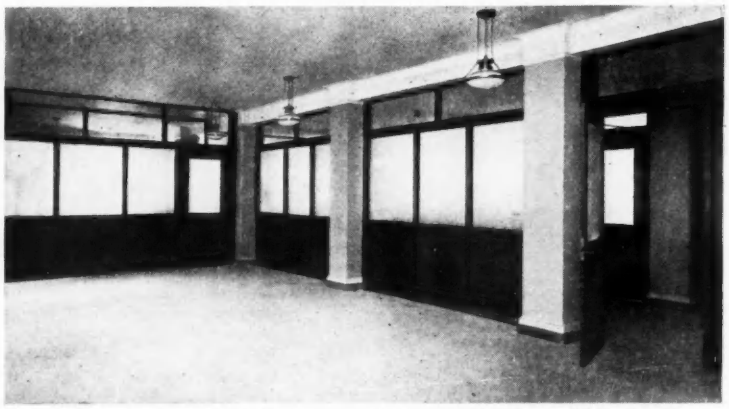
ment departments, and is in use in all parts of the world. The Underground model is particularly suitable for installing where there are a large number of people. The appliances are now fitted at the British Industries Fair, Birmingham.

*



SAL-FERRICITE AND TRADING CO., LTD. (Row O, 274), exhibit Sal-Ferricite, a chemico-metallic substance which, when mixed with concrete or granolithic work, is claimed to make it harder, more durable, dustless and impermeable to oil, water, and some organic acids, etc. In addition to these qualities, it is claimed to help to get over the difficulty of gauging concrete with the exact amount of water, because it seals up the surface and allows complete hydration to go on; consequently, there is no water left to create voids from evaporation. Other claims made for the material are as follows: it forms a metallic oxide which expands in the concrete until the pores are sealed. By making concrete waterproof, all that expansion and contraction due to absorption and giving up of water is eliminated and, it is said, this is the chief cause of cracking. The use of the material has also been developed by a special method so as to produce a floor on one-piece base concrete without the addition of a topping,

*



The EXPANDED METAL CO., LTD., are patentees and manufacturers of Expamet expanded metal, and engineers for all forms of reinforced concrete work. Their exhibit (Row G, Stand 142) consists of samples of their products, with examples of their uses, and photographs of various works carried out. Expamet expanded steel has, it is claimed, been in use all over the world for more than thirty-five years as reinforcement for concrete in foundations, walls, floors, roofs, bridges, culverts, etc. Other specialities shown are RR 6-in. mesh and treble-layer Expamet reinforcement for concrete roadways, pavings, etc.; BB and Expamet lathings for interior and exterior plasterwork; Ribmet for concrete and plaster work; Exmet reinforcement for brickwork, concrete-block work, partition slabs, asphalt, etc.; and mild steel wall-ties for cavity walls.

*

On the stand of YOUNG, OSMOND AND YOUNG, LTD. (Row C, Stand 25), are the following Unity specialities: Tubular electric heaters for the heating of schools, churches, offices, factories, hospitals, theatres and private houses, etc.; electric towel airers for floor or wall mounting, available in chromium or nickel-plated finish; tubular electric heater with gas-tight fittings, as used in cellulose paint shops, powder factories, petrol depots, etc.; tubular four-bar radiators for use where wall space is limited, available with or without three-heat control; thermostats for use in conjunction with Unity tubular electric heaters, to eliminate waste and to maintain a constant temperature; tubular electric heaters bent for use in bow windows, curved rows of theatre seats, etc., tubular electric linen cupboard heater; anti-condensation device for prevention of condensation on show windows; sections and component parts of Unity tubular electric heater, showing all details of construction, and Unity car

Showing key obtained with plaster for "B B" expanded metal lathing.

Roneo steel partitions in the new Underground Offices, Westminster.

bonnet heater for complete protection from frost with safety. A selection of blue prints and photographs illustrate some of the more interesting Unity tubular electric heating installations which have recently been carried out.

*

The steel doors, partitions, shelving, cupboards, etc., exhibited by RONEO, LTD. (Row F, 107), illustrate how it is possible to obtain any architectural treatment which may be desired. Among the exhibits are steel partitions made of standard sections so constructed that they can easily be taken down and re-erected in a new position if conditions make this desirable. Partitions are packed with sound- and fire-resisting material, finished with stoved enamel and cellulose in any colour desired. The counters, desks, filing cabinets and shelving in this exhibit indicate the great advance which has been made in England in the manufacture of steel furniture and fittings. The drawers exhibited are on ball-bearing suspension slides, and can be operated most easily when fully loaded. Steel fittings obviate the danger of warping and cracking, saving continual repairs. They have no joints or cracks in which microbes can accumulate, and are easily cleaned.

*

Tentest insulating fibre board, the product of the TENTEST FIBRE BOARD CO. (1929), LTD., is claimed to be a thoroughly efficient insulator, affording protection against excessive heat, cold, damp and noise. Its appearance, when decorated, can be seen on the walls and ceilings of the dining-room of the Silent House, erected from the designs of Mr. A. Trystan Edwards in the Gallery. Other interesting applications of the material may be seen and discussed at the firm's stand (129, Row G).

*

On the stand of BLUNDELL, SPENCE & CO., LTD. (Row E, 88), Pammel petrifying liquid enamel is given special prominence. Blundell's liquid stainers are also on view. The ease with which these can be used for tinting should be seen by everyone interested in decoration. The stand is painted with Japonette, a flat oil paint, with a matt washable surface, and Blundell's oil-bound water paint. Both these materials are used very largely in all parts of the country. There is also an interesting collection of gums and other raw materials used in the paint industry. Visitors should take away with them a copy of Blundell's " Guide to Architects and Contractors."

*

The stand of W. T. LAMB AND SONS (Row G, 136) is constructed in 2-in. facing bricks, forming a brick pavilion in which are two brick mullioned windows. The brick dressings are of antique multicoloured facings, the main work being in various types of purple and grey stocks. At the entrance of the stand is a lych gate, with piers formed in brick. The roof of the lych is covered with the Godstone antique tile. The stand is bounded by a dwarf wall, into which panels of many different types of facing bricks have been inserted to demonstrate part of the very wide range which the firm can offer. The courtyard thus formed is paved with the firm's wood burnt paving brick and a sundial and birds' baths are placed in the centre of each wing. The brick fireplace inside the pavilion is added as a reminder that this firm now claims to be the largest brick fireplace manufacturers in the country. Many loose samples of facing bricks, roofing tiles, quarries, glazed tiles, paving bricks, and fireplace briquettes are on the stand.

*

An exhibition of students' work is shown by the WANDSWORTH TECHNICAL INSTITUTE on Stand 31 in the gallery. The Institute is exhibiting for the first time. It has been in existence for thirty-five years and has shown uniform progress until it is now one of the most important in London. It provides, among other courses, tuition of a practical nature to meet the requirements of the different classes of students engaged in the various branches of architecture and building, whether in the office, workshop or on buildings in the course of erection. The exhibits illustrate the work of students in carpentry and joinery, plumbing, plastering and painting and decorating. The plastering exhibit—the work of apprentices—is particularly pleasing and will bear comparison with the best work of skilled journeymen. The stand has been designed and constructed by the staff and students of the carpentry and joinery classes.

*

The exhibits of the KLEINE PATENT FIRE-RESISTING FLOORING SYNDICATE, LTD. (Row F, Stand 113), consist of Kleine floors, the Duromit surface floor, and coloured illustrations of Silentium, the firm's patent method of sound-proofing floors.

Ideal domestic boilers for hot-water supply are shown by the NATIONAL RADIATOR COMPANY (Row O, Stand 270). These burn coke or anthracite and consume dry kitchen refuse. For soft-water districts the boilers can be supplied rustless. The new No. 00 Ideal domestic boiler has been produced for use in the smaller type of residence, and should create considerable interest. The Ideal Cookanheat, now supplied with insulating jacket, lifting grate, and giving complete open fire, provides facilities for cooking, hot-water supply and warmth for several rooms, all from one fire. The Ideal Classic boilers for central heating and constant hot-water supply by means of the Ideal indirect cylinder, and a selection of Ideal Classic and Ideal hospital radiators are also exhibited, as well as the Ideal towel rails in nickel and chromium-plated finish. There are Standard sanitary appliances in colour. This exhibit consists of a bath, lavatory basin and water-closet. The fittings are made in eight colours, ranging from ivory white to tulip black.

*

On the stand of WM. OLIVER AND SONS, LTD. (Row A, 2, 3 and 4), are found samples of: Austrian wainscot oak in both square-edged boards and planks and billet cut; teak in a magnificent range of sizes; ten sample logs of Ancona walnut, specially fashionable in the shopfitting world just now; Cuba and Honduras mahogany, for bank and office fittings; English oak, genuinely dry and very specially selected; English wainscot, extra special quality for highest class joinery, and thoroughly seasoned; English walnut; and some logs of sycamore. All the hardwoods in common everyday use amongst builders are kept in stock.

*

On the stand of SIKA, LTD. (Row P, 280), the main exhibit consists of a practical demonstration of the waterproofing material Sika. During the demonstration the effectiveness of the material in sealing leaking concrete and brick walls is shown, and the demonstration concludes with the sealing off of a jet of water of over 1 inch in diameter running full bore from tanks of 500 gallons capacity situated on the floor above. The company's subsidiary compounds, Igas, Igol, Conservado, Purigo, etc., can also be seen. A staff of qualified engineers are in attendance to give advice and assistance in any waterproofing problem submitted.

*

Four different applications of the Coburn system of sliding-door fittings are shown under actual working conditions by O'BRIEN, THOMAS & CO., LTD. (Row F, 120). These are slide-inside garage door fittings, which open against either inside wall of the garage, leaving the opening entirely free from obstruction; double doors sliding past each other and used where only half the opening is required at one time; a single sliding door; and Coburn (system) folding door gear, as used for folding partitions in schools, hospitals, etc. The examples are mounted on No. 1 size of track and fittings which are used for doors weighing up to 3 cwts.; but heavier fittings to carry any weight up to 1 ton

are on view. Rustproof finish has now been introduced as standard on all the working parts of the trollies, hangars, etc. The track and support brackets are supplied in black enamel finish.

*

One of the chief attractions on the stand of SOOLE AND SON, LTD. (Row J, 187), is the Medigo flush door. This consists of a skeleton framed deal core, finished on each side with plywood, glued solid, and fitted on all edges with a solid dovetailed margin piece, which gives special protection to the plywood at the bottom of the door. This door is guaranteed to be specially suitable for buildings where central heating is installed. Standard windows are another feature worthy of special notice. These windows are quoted complete, with metal opening lights and steel-cored lead lights, and can be supplied in either deal, English oak, or teak frames. Front doors, interior door and oak panelling are also exhibited.

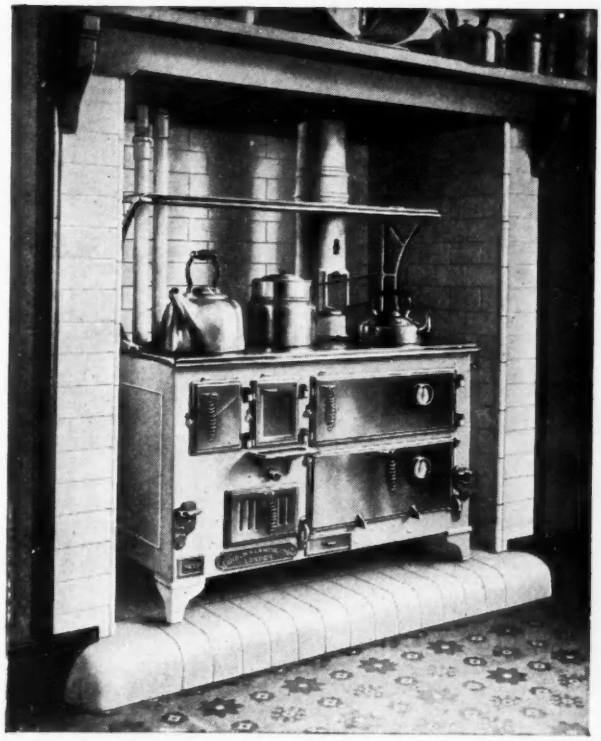
*

THE SUSSEX BRICK CO., LTD. (Row J, 183), are makers of the following bricks, which are all on view: Southwater engineering bricks, Southwater red pressed facing bricks, Southwater mottled pressed facing bricks, Wealden sand-faced multi-reds, Wealden kiln stock facings, Warnham S.B.E.C. hand-made kiln stocks in purple, medium and light shades, Warnham S.B.E.C. hand-made flared reds, Warnham S.B.E.C. hand-made bright reds, Wealden stocks, Tonbridge hand-made kiln stocks, Tonbridge hand-made sand-faced multi-reds, Tonbridge hand-made sand-faced reds, Tonbridge hand-made multi-red roofing tiles, Tonbridge hand-made dun colour roofing tiles, Lingfield wirecuts, Warnham common pressed, Tonbridge wirecuts, Guildford purple stocks, Guildford grey stocks, Guildford sand-faced reds, Guildford wirecuts, Guildford roofing tiles in red and dark shades, Guildford drain pipes, Farnham sand-faced reds, Farnham stocks, Farnham roofing tiles in red and dark shades, Crondall roofing tiles in red and dark shades, Crondall sand-faced reds, Seale lime, Wealden sand-faced multi-red briquettes, and Wadhurst white silica bricks.

*

THE GRINDING, MIXING AND SEPARATING CO., LTD. (Row P, 281), on their stand show the following: Totally enclosed patent single roller mill specially designed for use on cellulose. New patent Super single roller mill with divided hopper for multiple grinding. Standard patent single roller mills for paints, enamels, etc. Improved heavy type three roller mill, suitable for pastes, paints, printing inks, etc. Twin whirlpool mixer arranged with power-driven mechanical lift for pans. Standard type whirlpool mixers with removable pans and mixing gear. Edge runner with positively driven single runner. Horizontal pug mixers, single or twin, for pastes or liquids.

*



At Row E, Stand 85, that of the RUBBER GROWERS' ASSOCIATION (INC.), architects, builders and constructional contractors are able to study rubber at first hand, and ascertain how the resilience, durability, elasticity and abrasion-resisting properties of the commodity can be utilized in the most satisfactory manner. Rubber flooring, sponge rubber carpeting, crazy paving, sponge-backed moquette carpeting, rubber roofing material, expanded rubber—which is claimed to be much lighter than cork, and to be invaluable for sound deadening and vibration absorption—rubber paints and other accessories are prominently displayed.

*

ANTHRACITE RADIATION, LTD., are exhibiting on Row L, Stand 215, a full range of Glow-worm boilers, including their latest model, the Bijou, which is rated at 25,000 B.T.U. All Glow-worm boiler bodies are guaranteed against fracture for three years from date of invoice. The No. 4 Glow-worm boiler is the latest addition, and is designed for large town or country houses, small hotels, etc., where three or four bathrooms are in constant use. It is suitable for fixing in conjunction with a 150-gallon hot-water cylinder or, alternatively, a 90-gallon cylinder and a number of large radiators. Various models of the Kooksjoie ranges are shown, including two new models, the No. 3B 48 ins. and the No. 5A. These ranges are designed to burn smokeless fuel, but it is claimed that they will readily burn any fuel, if proper attention is given to cleaning the flues when soft coal is used. When burning anthracite, it is said that the flues only need cleaning once in three months, and the fire need never be let out. These ranges are made in all sizes from 30 ins. to 84 ins. long. There is, therefore, a size for all kinds of establishments. The No. 3B 48 ins. range is designed for houses where cooking is required for from twenty to thirty people. It is not fitted with a boiler, as the best results in this size household are obtained by fitting an independent Glow-worm boiler. The No. 5A Kooksjoie range is designed for cooking for seventy people. The Glow-worm open fires, which are becoming very popular, are designed to burn smokeless fuel, but they also will burn any other kind of fuel. They are fitted with gas lighters for ease of ignition, and can readily be fitted into existing fireplaces or fireplace recesses. The Osobrite stoves are designed to burn anthracite or any other fuel. When burning anthracite they can be kept alight throughout the winter and can be used with the doors open or closed. An entirely new apparatus will be called the Builder's Set, or Complete Hot-water Installation. This comprises one of their No. 01 Junior Glow-worm boilers, with a 20-gallon hot-water tank mounted on top of the hotplate by means of standards and complete with the necessary flow and return pipes. Unskilled labour can then connect a cold-water supply from the cold-water cistern, and take up from the top of the tank an exhaust pipe from which the hot-water supplies are taken.

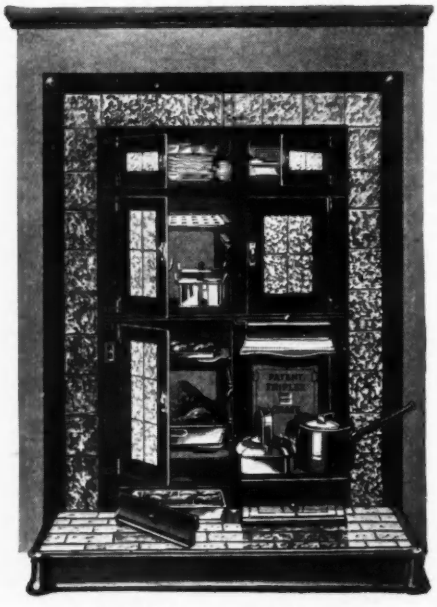
*

The exhibit of JOHN THOMPSON BEACON WINDOWS, LTD. (Row H, 159), is of a most comprehensive character. In the compass of a small building on the stand, a wide range of types of windows and steel doors are shown. The Beacon standard cottage windows are of heavier section than are usually found, and the firm point out that this makes just the difference, and draw attention to the substantial fittings and their attachment to the window structure. The purpose made windows which are shown have various arrangements of glazing bars, showing the differences in architectural lines which are obtainable with Beacon windows. Prominence is given to the patent self-sustaining stay, which enables casement windows to

The Kooksjoie range. It is claimed that when anthracite is burnt the flues need cleaning only once in three months.

be held in any desired position, without any unscrewing or screwing up of fixing screws.

*



THE NATIONAL FLOORING CO., LTD., on their stand (208, Row L) show parquet flooring in all kinds of hardwoods from ¼ inch thickness; patent spring portable parquet dancing floors specially prepared from Macassar ebony; spiral spring dancing floors; oak Parlok panelling; Parlok wood block flooring in all kinds of woods; floor surfacing and polishing by hand or machine; non-cracking terrazzo and mosaic flooring; and composition flooring in all colours, etc.

*

The stand of HORTITEX GLASS, LTD. (Gal., 70), takes the form of a small building displaying Raylite and Hortitex glass, transparent to the ultra-violet rays of the sun.

*

Two types of Triplex grates—the C and the S—are to be seen on Stand 14, Row B, of TRIPLEX FOUNDRY, LTD. Triplex grates have become a very popular means for converting a kitchen into a living-room. The oven doors are either of reeded cast iron or are fitted with tiled centres as desired, and they open right back in line with the mantel, so that the light is fully admitted to the oven. It is claimed that whenever a fire is burning in the grate a Triplex oven is hot, and by simply opening the damper a good cooking oven is ready in a very short time. The flame from the fire travels underneath the oven first, then up the far-side flue and across the top of the oven, heating both oven and hot closet as it passes along. There is a boiling chamber over the oven

The Triplex grate, S Pattern.

which will keep saucepans boiling when cooking is being done in the oven below. It will also warm plates and dishes, and provide an excellent place for the stock pot. The hearth oven is placed directly under the bottom cooking oven, and derives its name from being actually on the hearth level; the heat from the flue above makes this a most useful addition for grilling chops and steaks or warming plates and dishes. A bath boiler is fitted and supplied with the Triplex grate, which is guaranteed to produce two hot baths per hour. The Triplex fire is always open, when at work or otherwise.

*

At HASKINS' Stand 144, Row G (E. Pollard & Co., Ltd.), are improved steel and wood shutters. One of these new interlocking shutters is installed on the stand, and visitors are given every opportunity of testing the shutter in action and proving for themselves the advantages of Firola and Rolador shutters. These fireproof shutters are for hotels, stores, etc., and where openings have to be closed in the event of fire. A few turns of the control handle, and both shutters automatically descend, closing the opening in ten seconds. For garages, warehouses, etc., single Firola or Rolador shutters can be fitted up to 50 ft. in length by any height, controlled by manual, mechanical or electrical operation. Scientific counter-balancing ensures ease of operation for any size shutter. For visitors interested in metalwork there are the specimens covering all types of bronze work, stainless steel, etc. Examples of panelling, furniture and decorations made in the firm's factories are also on view.

*

The RONUK stand (Row F, Stand 112), as on previous occasions, is built entirely of oak, stained and polished in accordance with the methods employed by the workmen of the firm's polishing contract department. The floor is of deal, stained with Colron wood dye, the Ronuk preservative stain, and afterwards polished with Ronuk. Colron is claimed to be the most transparent, penetrating stain made and the easiest of application. It is also claimed to be very economical in use, not to raise the grain, and to dry very quickly and thoroughly. It is obtainable in a useful range of colours, any of which can be blended in varying proportions to provide a wide range of intermediate tints.

*

Stand 40, Row C, of CROGGON & CO., LTD., is a practical example of constructional steelwork and is supplemented by photographs of garages, factories, cinema studios, hay sheds, etc. Fencing is another line in which this firm specialize, and they make an attractive show of their Ceeco gates and fencing. Many examples of wrought-iron and wire fences (including tennis court surrounds) are displayed, giving the visitor a good idea of the appearance of these fences when erected. The tanks, cisterns and cylinders shown are selections from standard sizes; special sizes are made up in a few days. Other steel products of interest are sashes, barrows, reinforcing rods, etc.

*

The stand (Row D, 56) of DRYTONE, LTD., takes the form of a tower in British Columbia pine and other woods, carried to a height of about 22 feet. The broad flat surface of the woodwork emphasizes the decorative effect produced by the Drytone patent processes for colouring woodwork chemically without stain. The stand itself contains a useful range of the Drytone standard doors in British Columbia pine and other woods. Other interesting exhibits are : The Drytone Cubbador, a novel form of front door fitted with a compact hall wardrobe in the panel—a device for a small hall where space for hats and coats is not easily arranged. Drytone sectional panelling in British Columbia pine and other woods, prepared in standard section for erection by builders on site. The Drytone panel desk, which is a small writing-desk that fits against the wall and takes practically no floor space. It is adaptable to a wall with or without panelling. The Drytone kitchen cabinet, is also shown.

*

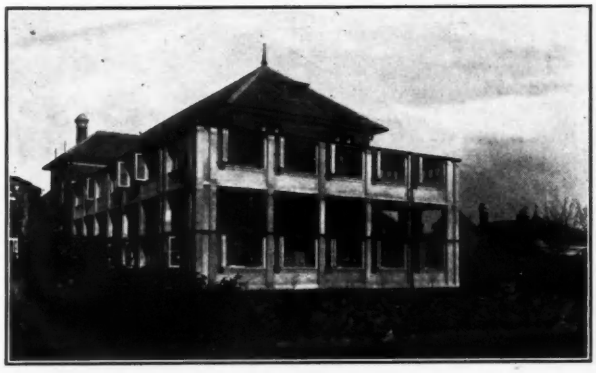
On Stand 1 in the Gallery is exhibited the work of the students in the building department of the EVENING TECHNICAL INSTITUTE, London Road, Southend-on-Sea, of which Mr. M. Finn, B.SC., is the principal. The exhibits include : Brickwork and plastering section : Georgian chimney, church window in tracery brick, model of carving in brick, various types of arches and models of gelatine moulding, plaster casts, cornices, etc. Building construction : drawings. Carpentry and joinery : louvres, dado panelling, door details, pilaster panelling, and stair, roof and joinery details. Plumbing : examples of bossing sheet lead into various shapes, and bending and joint-wiping of lead pipe of all sizes, and lead burning. Special features are a rain-water head bossed out of one piece of sheet lead, and a rain-water head with lead-burnt joints. Surveying and levelling : drawings.

*

Carbolineum wood preservative, Peteroid coloured cements and Peteroid paint are exhibited by C. A. PETERS, LTD. (Row D, Stand 64). It is now over forty years since Carbolineum was introduced, and it has been supplied to most of H.M. Government Departments (War Office, Admiralty, Arsenal, Post Office Telegraphs, Crown Lands, Crown Agents, etc.); to all the leading railway companies; many corporations for wood-paving purposes; mine and estate owners; breweries, etc.; and all over the United Kingdom for the preservation of wood above and below ground. Peteroid permanently coloured waterproof cements are for all kinds of constructional decoration. The manufacturers claim that the cements are manufactured from the highest grade cement and indestructible mineral pigments, that colours never fade, and are proof against all action of the elements and all influences to which the most exposed buildings are subject. Peteroid cement paints are made in white and sixteen different colours.

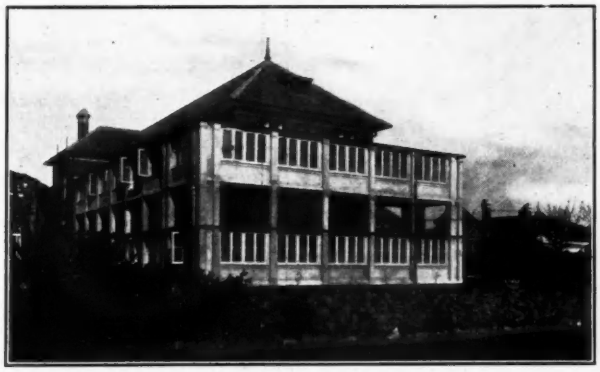
*

Sundeala and Insulwood building boards are shown by the PATENT IMPERMEABLE MILLBOARD CO., LTD. (Row O, Stand 267). Sundeala is shown in various effects. This material, besides being used in buildings generally, has been supplied for panel work in the s.s. "Mauretania," s.s. "Belgenland," s.s. "Alcantara," s.s. "Doric," s.s. "Samaria," etc. It is also used in the



construction of railway carriages. Anyone entering a modern coach on the London Underground Railway can generally see a Sundeala ceiling for himself. Insulwood is, it is claimed, used where such conditions as sound absorption are required. Insulwood is also shown as a panel board. It can also be used as an external and internal sheathing and also as a plaster base, and is shown in various decorated effects.

*



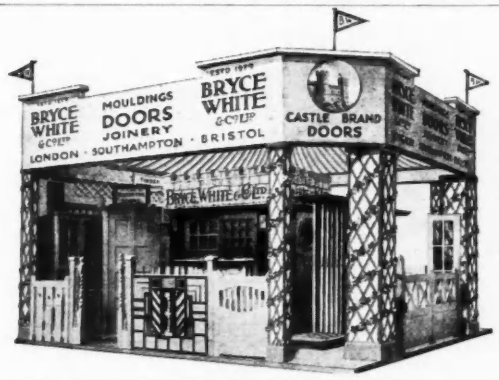
Row H, Stand 145, is occupied by BRYCE, WHITE & CO., LTD., who exhibit doors, mouldings and oak flooring. Castle brand doors are made of well-seasoned Swedish redwood, mortised, tenoned and wedged. They are available in a very wide range of patterns for both interior and exterior use, and may be obtained from stock in all the standard sizes. The Red Cone brand doors are of Western pine, specially selected for the beauty of its grain and freedom from knots and defects. The rails and stiles are solid, with panels of rotary-cut figured plywood. They are widely used where stained or polished doors are required. Stocks are held of distinctive patterns in many sizes. Columbian pine doors can be supplied from stock in a wide range of attractive designs. Brycite mouldings are manufactured from White Sea and first-class Swedish timber, but can be supplied in hardwoods where desired. Also exhibited is kiln-dried selected American oak flooring, T. and G. and ends matched, from stock in the following sizes : 1 in. by 3 ins. (nominal), finished size $\frac{13}{16}$ by $2\frac{1}{4}$ ins. face; and 1 in. by 4 ins. (nominal), $\frac{13}{16}$ in. by $3\frac{1}{4}$ ins. face. The firm also hold large stocks of garage doors and gates, kitchen dressers, chimney pieces, turnery, trellis, matchings and joinery in their London, Southampton and Bristol warehouses.

*

British Empire hardwoods and veneers, also veneered panels with face veneers of Imperial origin, are exhibited by WILLIAM MALLINSON AND SONS, LTD. (Row H, 151). They include: English wainscot oak, walnut, sycamore, chestnut, beech, ash. Australian blackbean, silky oak, Queensland black walnut, myrtle, rose mahogany, jarrah, hoop pine, Kauri pine, Tasmanian oak. Canadian maple—plain and figured, birch—plain and figured, Sitka spruce, British Columbian pine, hemlock, Quebec pine. Indian laurel, teak, silver greywood, Padouk, rosewood, Ceylon satinwood. Honduras mahogany, African teak, pencil cedar, etc.

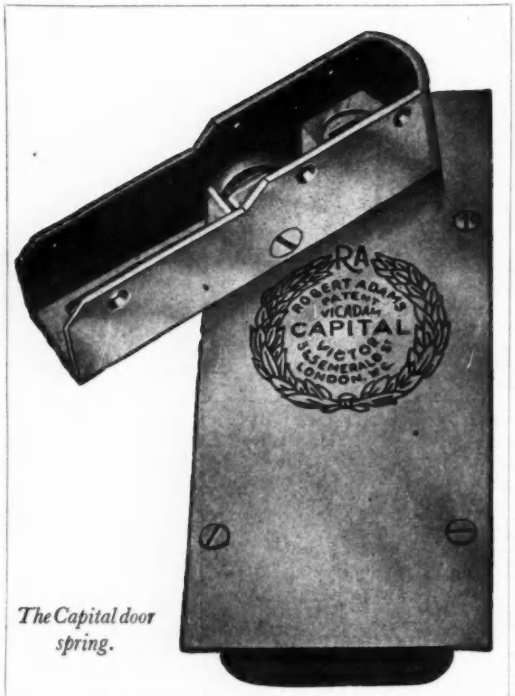
Esavian windows fitted to Royal Victoria and West Hants Hospital, Bournemouth. open—

—and closed.



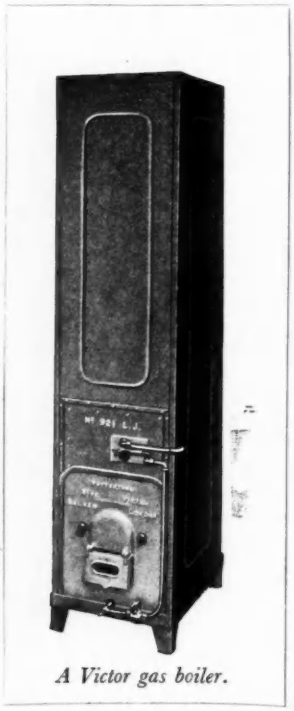
On Stand 86, Row E, the EDUCATIONAL SUPPLY ASSOCIATION, LTD., show a number of adaptations of Esavian folding and sliding movements for windows, partitions and doors. The movements are suitable for attaching to windows as low as 2 ft. 6 ins. in height. They are shown attached to doors 19 ft. 6 ins. high, and have been fitted to doors for aeroplane sheds 32 ft. high. They can also be used for covering openings of any width and have been fitted to aeroplane sheds 100 ft. wide. The firm's ordinary folding window has been fitted to a large number of open-air schools in and around London, and in all parts of England, Scotland and Wales. A special fitting enables bow windows to be thrown open in a similar way to the large circular French window fitted on the stand. Mr. H. G. Wells was one of the first to have a bow window of this type fitted to his house at Easton Glebe. The glazed Esavian folding and sliding loggia doors are arranged to fold flat against the wall in the same plane as the door when extended. This principle can also be applied to the internal folding and sliding partitions. The doors are opened and closed by winding gear. It is claimed that a child of ten can operate a door 19 ft. 6 ins. high and 100 ft. wide. Large doors are also shown, suitable for municipal garages, loading docks and all openings where considerable height and width are required. These are also opened and closed with the greatest ease.

*



The HEMEL HEMPSTEAD PATENT BRICK CO. LTD. (Row F, Stand 104) are manufacturers of the Hempstead terra-cotta partition blocks, hollow floor tiles and building blocks, all of which are claimed to be fire-, sound- and vermin-proof. They are guaranteed fire-resisting to melting point of steel, 2786, Fahr., and to have a crushing strain of 3,540 lb. per sq. inch. The advantages of using the partition blocks are that either nails or screws can be driven into them. They can also be sawn or tooled, and are made either keyed for plastering or smooth both faces. The blocks have been approved by the Ministry of Health for use on housing schemes. The firm's associated company, the Coronet Brick Co., Ltd., exhibit, on the same stand, many of their specialities, which include pressed red, multicoloured and antique facing bricks, tapped wire-cuts, sand stocks in various colours, paving bricks, quarries, oven tiles, copings, red and buff chimney tops, air bricks, architectural terra-cotta, hollow partition blocks, hand-made sand-faced roofing tiles in various colours, ridge tiles, fittings and finials.

*



On Stand 139, Row G, the CRITTALL MANUFACTURING CO., LTD., show metal windows, both standard and purpose-made, suitable for all kinds of buildings. The firm's universal casements—such as are

The stand of Messrs. Bryce, White & Co., Ltd.

The Capital door spring.

A Victor gas boiler.

used in banks, public buildings and other large premises—have a number of new features, such as ring friction centres for horizontally centre hung windows, and a patent locking device for vertically centre-hung ventilators, which eliminates the necessity for stays on this type of window. The firm's metal vertical sliding sash is claimed to be a modern improvement on the wood sash and to have all the advantages, and none of the disadvantages, of the latter. It is constructed of casement sections, and is said to be entirely weather-proof. The sliding members to prevent rattling are fitted with spring rollers, which press them against the side of the channel in which they slide. The balance weights are hung on stout chains instead of cords, thereby minimizing the danger so often associated with sash-cord breakages. There are various ways of opening and shutting the metal sliding sashes, one of the most popular being by means of a cord and pulley fitted to one jamb. Among other exhibits are the firm's balance window for hospital wards, etc. (awarded the Royal Sanitary Institute's silver medal, 1928 and 1929); sliding folding windows for open-air classrooms; and a sliding flyscreen for outward opening standard metal windows (commended by the Royal Sanitary Institute, 1930).

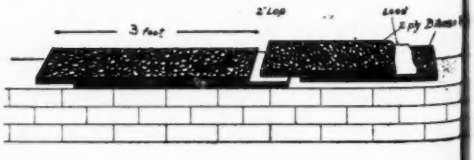
*

ROBERT ADAMS exhibits (Row D, Stand 52) a comprehensive selection of patent door and window fittings. These include the latest patterns of their Victor door springs for swing doors and single-action doors. They are fitted with improved check action for fixing into the floor or overhead. Special exhibits are Victor spring hinges with shallow boxes and self-contained silent check cylinders. A special super-type of this class of hinge is shown, specially designed to suit metal doors of half a ton in weight, also working models of window gearing and fanlight openers, panic bolts and casement fittings. There are also door furniture and locks, sash balances, metal casements, weather bars, passable hopper cheeks, and reversible windows.

*

THOMAS POTTERTON (HEATING ENGINEERS), LTD. (Row C, 37), exhibit a selection of the standardized types of Victor gas boilers, and give working examples of systems supplying hot water for general domestic use, including (a) automatic storage water heaters with insulated cylinders and "snap-action" thermostatic control; (b) automatic storage heaters with adjustable thermostat for heat maintenance to operate secondary circulation to towel-dryers and remote points. A working example of central heating by gas with circulating radiators thermostatically controlled is in operation. Patent thermostats of both the positive and by-pass type are on view, two new designs being exhibited for the automatic control of gas supply in heating water for domestic and trade purposes. Also air thermostats for maintaining temperatures for various purposes. Other exhibits include an example of combined heating and domestic hot-water supply, heating both through direct and indirect systems from coke boilers, operating the full duty from one fire, with an adjunct in the form of a gas boiler for domestic supply during the summer months. Hot-water equipment for sports pavilions and bungalows and other single-story buildings with circulating towel-dryers at a low level.

*



VIGERS, SONS & CO., LTD. (Gal. 16), show specimens of parquet floorings in various patterns, from the ordinary herring-bone to the most ornate designs. Flooring blocks of various woods, and strip floorings in maple, pitch pine and oak are also exhibited. Another speciality of this firm is oak panelling, a specimen panel of which is on view.

*

UNITED WATERPROOFERS, LTD. (Row K, 193) are manufacturers of Supex waterproofing solution for use as a gauging liquid for cement rendering above and below ground against water pressure. Supex can be applied on walls externally by spray, in which case it is colourless in effect and is claimed not in any way to interfere with the texture of the surface to which it is applied. Roofing preparations manufactured from pure mineral gums: these are supplied in liquid and plastic form and are also exhibited. It is claimed that they are not affected by atmospheric conditions, do not dry out or crack, and remain almost indefinitely in a tough, leather-like coating. Elastikote, a super paint made from elastic mineral gums and non-volatile oils: the paint is claimed to be impervious to acids, fumes, brine, etc., and to offer an insulating resistance up to well over 1,000 volts. B. & P. enamel, manufactured from Chinese T'ung oil. Watco for treating concrete and cement floors to prevent dusting and for preserving and hardening wood; also Hope Products —Hope Wood Worm Destroyer, Hope Death Watch Beetle Destroyer and Hope White Ant Destroyer. All manufactured from formulæ approved by the late Professor Maxwell Lefroy.

*

On Stand 44, Gallery, FIELD AND PALMER exhibit Fipaled dampcourse, which is lead-insulated between two layers of two-ply bitumen sheeting, sealed to same with coatings of pure bitumen, and is made in plates 36 ins. long to any width required to fit brickwork. As shown on sketch the lead is left exposed two inches on each end of each plate but sealed with the bitumen mastic to the two-ply bitumen sheeting; at one end to the bottom sheeting layer and at other end to the top layer of ditto. This gives a two-inch lap to every plate when being laid, forming a continuous lead dampcourse insulated and protected top and bottom with the bitumen sheeting layers. The lead is of best quality, rolled, and the minimum weight of same is guaranteed six ounces. Thicker lead can be used if specified. The bitumen felt layers are their own manufacture and the bitumen used in making same is guaranteed to be the highest grade and non-perishable. The surface is well gritted with coarse sharp sand so that it forms a perfect grip to the walls built upon same. Being made in plates and not in rolls it is made always to one standard. It is as easily and as quickly laid as rolled dampcourse. There is, it is claimed, no cracking in cold weather and no squeezing out when exposed to heat and to weight of building.

LIBRARY ARCHITECTURE

YESTERDAY, the second day of the fifty-third annual conference of the Library Association, now in progress at Cambridge, a special session was devoted to the consideration of the architecture of large libraries.

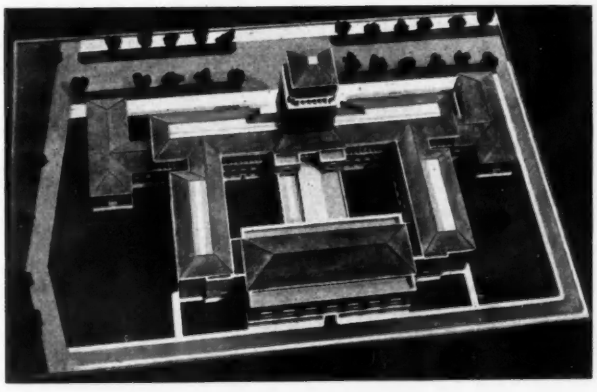
Three papers were read: on "The New Cambridge University Library," "The New Book Stacks at the British Museum," and "The New Reference Library at Manchester," by Mr. Ansell, M.A., F.L.A. (Assistant Under-Librarian, University Library, Cambridge), Sir Richard Allison, C.B.E., F.R.I.B.A. (Chief Architect, H.M. Office of Works), and Mr. E. Vincent Harris, F.R.I.B.A. (Architect for the Manchester Library), respectively.

Following are summaries of two of the above-mentioned papers. That by Mr. Vincent Harris described, in detail, the accommodation to be provided at the Manchester Library.

The New Cambridge University Library

The site of the new University Library was a space of 7½ acres behind the Memorial Building of Clare College. The building itself would be twice the size of the present one, and was expressly planned to allow for expansion.

Sir Giles Gilbert Scott's design combined simplicity with dignity. It was oblong in shape, divided into two courts, and had wings extending from the façade. On the first or main floor the catalogue room, dividing the two courts, would be the centre from which readers would radiate to whatever department they required. The general reading room, capable of seating over 200 persons, would open out of the far end of the catalogue room; the periodicals department would occupy the entire block to the south of the latter; the special reading room, with seating capacity for fifty, would be in the southern wing, adjacent to rooms for manuscripts, incunables and other reserved books; the map and music departments would be in the corresponding north wing, and so on. Galleries for showcases and old bookcases from the present library would be on the main floor.



Many of the administrative rooms, such as those for unpacking, binding, printing and the like, would be located together on the ground floor, thus minimising the staff traffic through public passages and rooms. The bulk of the rest of the building, including the tower, would consist entirely of bookstacks; but there would be chairs and tables for about fifty readers amongst these—for the University Library had always allowed readers access to the shelves. There would be lifts for passengers as well as books, and all the blocks and wings could be isolated in case of need. It was estimated that the £500,000 available would cover the cost of the building, as well as of the extra establishment necessary.

The New Book Stacks at the British Museum

In an old-established institution such as the British Museum Library, the original planning of the structure in relation to the surrounding main Museum building, as also the catalogue system and service routine, impose restrictions on the architect in considering possibilities of improvement. After briefly describing the present arrangements, the author explained the Office of Works' scheme for rebuilding the Stack Rooms, as recommended by the Royal Commission on National Galleries and Museums, to obtain improved conditions and more economical use of space. The proposal is to provide greatly increased facilities for book storage in a structure, designed on modern fire-resisting lines, to be erected in sections, possibly during the next fifteen years or so. The order in which the different sections are to be dealt with has received careful consideration, as temporary transfer of portions of the library is necessary to set free in rotation the sections for rebuilding.

After comparison of different systems it has been decided to abandon the present method of top lighting and open grid floors, and adopt lightly-constructed opaque floors or decks; also side windows supplemented by a complete system of artificial light. Mechanical ventilation and heating will be provided, probably on a system involving distribution and conditioning of warmed air.

The space available has been planned to accommodate a maximum number of racks with attendants' rooms, lifts and staircases being arranged in convenient positions. Book racks will be of metal, finished with an enamel surface. They will be of the rolling type in batteries, each rack being double-faced and installed for rolling endwise from its normal position out into the gangway for placing or withdrawing books. Considerable attention has been given to the problem of providing for books of varying width, with a view to ensuring the utmost use of space available, but the methods contemplated will call for further consideration in detail. The rollers on which the racks will be suspended will run on the lower flanges of the steel joists forming the floor or deck construction in order to economize in height.

A photograph of the model of Cambridge University Library, taken from above, to show the plan. The architect is Sir Giles Gilbert Scott.

LAW REPORT

RIGHT-OF-WAY DISPUTE

Wood v. *Drughorn. Chancery Division. Before Mr. Justice Clauson*

THIS dispute centred round an alleged right of way to certain cottages at Ifield, Sussex, the plaintiffs being the Misses Wood, of Church Cottage, and the defendant Sir John F. Drughorn, Bart., of Ifield Court. Plaintiffs sought a declaration that a right of way existed along a back lane from the Plough Inn to the back of their cottage, Church Cottage, and an injunction against defendant restraining certain obstructions and damages.

Plaintiffs admitted that the property in the soil of the lane was vested in the defendant, but they said there was an ancient user of the roadway by cottagers, who used it for carting coal, etc. The back gates of a number of cottages abutted on the lane and plaintiffs complained that the defendant had placed a fencing along it, allowing gates to such of the occupants as asked his permission.

Defendant alleged that there was only a permissive user of the lane. If there was a right, it was such as was suitable to the cottages at the time of its grant. In any case it was restricted to foot passengers.

His lordship, after hearing a mass of evidence, said he was satisfied of the cottagers' user of the lane for more than half a century, for all purposes of access. It could not matter to the defendant if carts used the lane or a

motor or two, as a motor did not make it a public way. Church Cottage was formerly two cottages, and his lordship thought that the earlier occupants of the two cottages used the back lane. It was a serious matter to deprive defendants of this right of access, and his lordship added that it was most unfortunate where a right of this kind had been enjoyed for a long time that a comparative newcomer should act as the defendant had done and take the law into his own hands. His lordship granted the plaintiffs the declaration they sought and the injunction and £5 damages, and ordered the defendant to pay High Court costs.

SOCIETIES AND INSTITUTIONS

TRADES TRAINING SCHOOLS PRIZES

IN connection with the exhibits by craftsmen of the different Training Schools in London which are being shown at the Building Exhibition at Olympia, prizes have been given by the undermentioned: £20 by the Worshipful Company of Pewterers; £5 by the Armourers and Braziers' Company; £20 by Mr. H. Greville Montgomery, Building Trades Exhibition.

The prizes were allocated as follows: £10, Brixton School of Building; £8, Trades Training Schools; £7, Northern Polytechnic; £5, Southend-on-Sea Technical Institute; £5, Borough Polytechnic Institute; £5, Willesden Polytechnic Day School of Building; £3, Hammersmith School of Arts and Crafts; £2, Tottenham Polytechnic.

A supplementary prize of £5 was given by Mr. Gilbert Christy, Master of the Armourers and Braziers' Company, for the exhibit of the Army Vocational Training Centre, Aldershot, especially in regard to plumbing.

The assessors were: Messrs. F. Adams Smith, F.R.I.B.A., Trades Training Schools; H. Justus Eck, M.A., M.I.E.E., Pewterers' Company; G. J. Newson, A.R.S.I., Tylers' and Bricklayers' Company; George W. Eyles, President, Incorporated Clerks of Works Association; Gilbert Christy, Master of the Armourers' and Braziers' Company, and E. A. Burgess (Joinery Section).

BRITISH GLASS CONVENTION

Mr. Walter Chance, J.P., in his presidential address at the second British Glass Convention, held at Buxton last week, discussed the problem of selling glass and other goods of British manufacture in the oversea markets. He said that many British manufacturers, including not a few in the glass trade, were suffering from an inferiority complex about exports, and were relinquishing effort. Under normal trade conditions there was a potential outlet for British goods not yet sold abroad, but we must face the fact that we had got to compete at equal figures, except in so far as we enjoyed a preference in British oversea markets.

We must, he pointed out, either reduce our prices or educate the public abroad to demand a better quality. It was true that of late years British firms had learned to study much more carefully the idiosyncrasies of oversea customers, but in some respects they had still much to learn.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATIONS

26298. Abingdon, W. Framework for theatre, etc., scenery. September 3.

26182. Aquirre, J. M. Concrete, etc., piles. September 2.

TRADE NOTES

Mr. A. W. Halliwell has resigned from the directorate of Messrs. Phillips and Sons (Chiswick), Ltd., manufacturing electrical and mechanical engineers and contractors.

*

Messrs. Regants, Ltd., on account of increased demand, have opened new showrooms at 53 Great Marlborough Street, W.1 (telephone number: Gerrard 7348). This firm, apart from their "Corrected Glass" fittings, have a good representative display of brackets and pendants of the latest panel type. Architects are cordially invited to visit the showrooms, or to send their specified requirements.

*

In order to be in a position to give more complete service to cement users, the British Portland Cement Association, Ltd., recently opened two new branch offices at 15 Queen Street, Exeter, and 9–14 Exchange Buildings, Upper Hinton Road, Bournemouth. In addition to the head office at 20 Dartmouth Street, S.W.1, and the two offices already referred to, the association is also represented in Birmingham, Cardiff, Dublin, Edinburgh, Leeds and Manchester.

Following is a list of the general contractors and some of the sub-contractors for Staveley Hollingwood Council School, Staveley, near Chesterfield, illustrated on pages 449–451. General contractors, Evans Bros. & Co. Sub-contractors: Granwood Flooring Co., patent flooring; G. N. Haden and Sons, Ltd., heating; Jerram & Co., electric wiring.

COMPETITIONS OPEN

September 30.—The Isle of Man Education Authority invited architects to submit competitive designs for a new Grammar School at Ramsey, Isle of Man. Assessor, T. Taliesin Rees, F.R.I.B.A. Premiums: £250, £150 and £75. Particulars, etc., were obtainable from T. R. Lewin, Clerk of the Authority, Education Office, Strand Street, Douglas, until July 1. Deposit £1 1s. Latest date for submission of designs: September 30.

October 1.—The Burton-on-Trent Local Education Authority invited architects to submit competitive designs for a proposed new Council school to accommodate approximately 800 children, to be erected on a site in Clarence Street. Assessor: H. T. Buckland, F.R.I.B.A. Premiums: £150, £100 and £50 for the designs placed 1st, 2nd and 3rd, respectively. Applications for the conditions of the competition and site plan should have been made before September 8 to L. E. Burgess, Secretary and Director of Education, Education Offices, Guild Street, Burton-on-Trent. Latest date for submission of designs: October 1.

October 20.—The Maternity and Child Welfare Committee of the City of Birmingham invites architects to submit competitive designs for two infant welfare centres, one at Warren Farm Road, Kingstanding (Perry Barr), and the other at Trittiford Road (Billesley). Competitors must have occupied offices in Birmingham as their head office for six months prior to July 19, 1930. Assessor: A. T. Butler, F.R.I.B.A. Premiums, £100 in respect of each centre. Conditions of competition and plans of the sites may be obtained on application to Herbert H. Humphries, M.INST.C.E., City Engineer and Surveyor, the Council House, Birmingham. Deposit £1 1s. for each centre. Latest date for submission of designs: October 20.

October 30.—The General Building Syndicate, Ltd., invites architects to submit competitive schemes for the development of a site at Liverpool, fronting St. John's Lane, Queen Square and Rose Street. Premiums: £250, £100 and £50, for first, second and third prizes, respectively. Particulars, etc., are obtainable on application to the Secretary, the General Building Syndicate, Ltd., 36 St. Martin's Lane, W.C.2. Latest date for submission of designs: October 30.

November 30.—The Guildford Cathedral Committee invites any architect, who has been engaged in the design of cathedrals or churches, to submit for examination drawings and other illustrations of his works; or a design for a cathedral. Not more than three sets of drawings may be submitted, packed in one large portfolio. The Committee, with the assistance of Mr. Walter Tapper, A.R.A., will examine the portfolios, and select a limited number of architects for the Final Competition. Each architect selected for the final competition will receive 500 guineas, whether his design is accepted or not. Portfolios should be addressed to The Venerable the Archdeacon of Surrey, The Diocesan Office,

Lloyds Bank Chambers, Guildford, not later than November 30.

December 25.—A prospectus giving full particulars of the international competition for the Ukrainian State Theatre, organized by the Kharkov Town Council, Russia, has recently been issued. The theatre is to be erected in the centre of Kharkov, on the site of the present Comsomolsky Square (Young Communist Square), and will contain a mass musical stage and seating capacity for 4,000 persons. The competition will be assessed by a jury comprising a president, vice-president and fifty-six members. Prizes: 1st, 10,000 rub.; 2nd, 8,000 rub.; 3rd, 6,000 rub.; 4th, 5,000 rub.; 5th, 4,000 rub.; 6th, 3,000 rub.; 7th, 8th and 9th, 2,000 rub.; 10th, 11th, 12th, 1,500 rub. Drawings should be sent to the Kharkov Town Council on or before December 25. Copies of the prospectus are obtainable from the Embassy of the Union of Soviet Socialist Republics, Harrington House, 13 Kensington Palace Gardens, London, W.8.

December 31.—The Incorporated Association of Architects and Surveyors invites competitive designs for a Model Petrol Filling and Service Depot. The competition has the full support of the Automobile Association, the Scapa Society and other bodies which have at heart the preservation of the countryside, as well as the principal motor-trade journals. Assessors: Alfred Stephens Cross, M.A. (CANTAB.), V-P., I.A.A.S.; Edward H. Fryer, Deputy Secretary of the Automobile Association; and Walter Groves, Editor of *The Motor*. Prizes: 50 guineas, 20 guineas and 10 guineas for first, second and third places, respectively. Smaller awards may also be made on the advice of the assessors, and at the discretion of the Council of the Association. In addition a prize of 10 guineas and two prizes of 5 guineas each will be awarded to laymen for the best suggestions submitted with or without sketches. Full particulars, etc., are obtainable from the Secretary, the Incorporated Association of Architects and Surveyors, 1 Wilbraham Place, London, S.W.1. Latest date for submission of designs: December 31, 1930.

No date.—The Committee of the Foundation Hospital and the Rectorate of the Royal Yugoslavian University of Zagreb invites competitive designs for the general rebuilding plans of the Foundation and Clinic Hospital of Zagreb. Assessors: 1. Dr. Srkulj Stjepan, Burgomaster and Chairman of the Foundation, as president of the jury. 2. Henauer, W., architect, of Zurich (or his representative, Ch. Thevenaz, architect, of Lausanne), for the Swiss Engineers' Association of Germany. 3. Dr. Ing. Kreis Wilhelm, of Dresden, for the Engineers' Association of France. 4. Arch. Expert H.R., of Paris, for the Engineers' and Architects' Association of France. 5. Dr. Culumovic Pavao, Primarius, for the Medical Association of Zagreb. 6. Ing. Gabric Franjo, for the Yugoslavian Association of Engineers and Architects, Zagreb section. 7. Dr. Rasuhin Josip, deputy for the Directors of the Institute of Hygiene Foundation Hospital of Zagreb 8. Prof. Dr. Prasek Emil, for the medical faculty of Zagreb. 9. Dr. Durst Franjo, for the medical faculty of Zagreb. 10. Arch. Heinzel Vjekoslav, Alderman of the City of Zagreb. Committee representative of the jury: Ing. Jurkovic Mato, Stadtbaurat in Zagreb. Prizes: 1st, 20,000 Swiss francs; 2nd, 15,000 Swiss francs; 3rd, 10,000 Swiss francs. 15,000 Swiss francs have been set aside for any further work which may be required. Programme and particulars of the competition will be sent on or after August 15, 1930, on application to the Stadtvorstand of Zagreb (Mr. Matica, secretary), Room No. 70, 2nd floor, on payment of 200 dinar. Latest date for submission of designs: January 15, 1931.

THE ARCHITECTS' DIARY

WEDNESDAY, SEPTEMBER 24

R.I.B.A., 9 Conduit Street, W.1. Exhibition, in the Galleries, of drawings submitted in competition for the Archibald Dawnay Scholarship (10 a.m. to 7 p.m.; Saturdays, 2 p.m.). Until September 30. **10 a.m.**

INTERNATIONAL BUILDING TRADES EXHIBITION, Olympia. Until October 1.

LIBRARY ASSOCIATION. Fifty-third Annual Conference, to be held at Cambridge. Until September 27.

FRIDAY, SEPTEMBER 26

NATIONAL SMOKE ABATEMENT SOCIETY. Annual Conference, to be held at Leicester until September 28. During the conference the following papers will be read: "Fuel Research and Smoke Abatement," by Dr. Margaret Fishenden; "The Smoke Problem in Sheffield," by F. J. Bailey and E. C. Evans; "Smoke and the Weather," by a meteorological expert; and "The Smoke Nuisance as the Airman Sees It."

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, S.W.1. London and Home Counties Branch. Dinner and Dance to be held at the Quadrant Restaurant, Regent Street, W. Tickets, 7s. 6d.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS. Yorkshire District meeting, to be held at Hipperholme.

SATURDAY, SEPTEMBER 27

Sunrise, 6.53 a.m. Sunset, 6.49 p.m.

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to the Church Bell Foundry of Mears and Stainbank, 32-34 Whitechapel Road, E.1. **11.30 a.m.**

VICTORIA AND ALBERT MUSEUM, Cromwell Road, South Kensington, S.W.7. "Continental Glass," 12 noon. "English Domestic Glass." 3 p.m. Both lectures by Miss B. Goldsmid. **12 noon.**

MONDAY, SEPTEMBER 29

ROYAL SANITARY INSTITUTE, 90 Buckingham Palace Road, S.W.1. Commencement of Sanitary Inspectors' Course. **6 p.m.**

TUESDAY, SEPTEMBER 30

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, S.W.1. London and Home Counties Branch. "The Making of a Cathedral—Liverpool." By E. W. Harvey-Piper. (Lantern Illustrations.) **7 p.m.**

ISLE OF MAN GRAMMAR SCHOOL COMPETITION. Latest date for submission of designs.

WEDNESDAY, OCTOBER 1

BURTON-ON-TRENT SCHOOL COMPETITION. Latest date for submission of designs.

FRIDAY, OCTOBER 3

TOWN PLANNING INSTITUTE. Twelfth Annual Country Meeting, to be held at Leicester. Until October 5.

SATURDAY, OCTOBER 4

Sunrise, 7.4 a.m. Sunset, 6.53 p.m.

MONDAY, OCTOBER 6

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Commencement of Winter Term.

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Motor Coach Excursion: Special Visit to Greenhithe Cement Works. Leave Portland House, Tothill Street, Westminster, S.W.1, at 1.45 p.m. Tickets obtainable from the Secretary of the Society. **1.45 p.m.**

WELSH SCHOOL OF ARCHITECTURE, Technical College, Cardiff. Commencement of School Year.

ROYAL SANITARY INSTITUTE, 90 Buckingham Palace Road, S.W.1. Commencement of Smoke Inspectors' Course. **6 p.m.**

TUESDAY, OCTOBER 7

R.I.B.A., 9 Conduit Street, W.1. Closing date for applications for admission to the Intermediate Examination.

THURSDAY, OCTOBER 9

C.P.R.E. Third Annual Conference, to be held at Welwyn Garden City. Until October 11. Among the papers to be read are the following: "The Preservation of Commons, Parks, Open Spaces and Nature Reserves, and the Provision of Playing Fields." By Sir Lawrence Chubb. "Town and Regional Planning in their Relation to the Objects of the C.P.R.E." By Sir Theodore Chambers, K.B.E., F.S.I. "Education and Citizenship in their Relation to the Safeguarding of the Countryside, etc.," and "Flora and Fauna, including the Preservation of Trees, Wild Flowers, Roadside Plants and the Protection of Birds." Each paper will be open to discussion.

FRIDAY, OCTOBER 10

ROYAL SANITARY INSTITUTE, 90 Buckingham Palace Road, S.W.1. Sessional Meeting to be held at the Guildhall, Nottingham. Welcome by Councillor E. H. Lee, Chairman of the Health Committee, followed by tea, 4 p.m. A Discussion will take place on "River Pollution," to be opened by Alderman A. R. Atkey, J.P. 4.30 p.m. Chairman: Charles Porter, M.D., B.SC., etc. **4 p.m.**

SATURDAY, OCTOBER 11

ROYAL SANITARY INSTITUTE, 90 Buckingham Palace Road, S.W.1. Meet at the Guildhall, Nottingham, at 9.15 a.m. for visits to the Factory and Welfare Department of Boots Pure Drug Company, Ltd. Followed by an inspection of the New Council House at 11.30 a.m. **9.15 a.m.**

THURSDAY, OCTOBER 16

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Visit to Cement Marketing Company's Laboratory, Portland House, Tothill Street, Westminster, S.W.1. (Party limited to 30.) **7 p.m.**

MONDAY, OCTOBER 20

BIRMINGHAM WELFARE CENTRES COMPETITION. Latest date for submission of designs.

THURSDAY, OCTOBER 23

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Lecture by T. J. Clark, A.I.STRUCT.E., of the British Portland Cement Association. **7.30 p.m.**

SATURDAY, OCTOBER 25

Sunrise, 6.40 a.m. Sunset, 4.48 p.m.

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Visit to the works of Messrs. Johnson, Dartford. **2 p.m.**

TUESDAY, OCTOBER 28

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, S.W.1. "English Ironwork." By Edward Yates. **7 p.m.**

WEDNESDAY, NOVEMBER 12

ROYAL ACADEMY, Burlington House, W.1. "Rembrandt and his Pupils." (Illustrated by magnified photographs from Continental Galleries.) By A. P. Laurie, D.SC. **4 p.m.**

THURSDAY, NOVEMBER 13

ROYAL ACADEMY, Burlington House, W.1. "Modern Pigments: Their Proper Selection and Use." By A. P. Laurie, D.SC. **4 p.m.**

FRIDAY, NOVEMBER 14

ROYAL ACADEMY, Burlington House, W.1. "Painting Media: Oils, Varnishes and Tempera." By A. P. Laurie, D.SC. **4 p.m.**

SATURDAY, NOVEMBER 15

Sunrise, 7.16 a.m. Sunset, 4.12 p.m.

MONDAY, NOVEMBER 17

ROYAL ACADEMY, Burlington House, W.1. "Methods of Wall Paintings." By A. P. Laurie, D.SC. **4 p.m.**

TUESDAY, NOVEMBER 18

ROYAL ACADEMY, Burlington House, W.1. "The Theory of Colour and its Application to Painting." By A. P. Laurie, D.SC. **4 p.m.**

WEDNESDAY, NOVEMBER 19

ROYAL ACADEMY, Burlington House, W.1. "Early Methods of Oil Painting." By A. P. Laurie, D.SC. **4 p.m.**

FRIDAY, NOVEMBER 21

R.I.B.A., 9 Conduit Street, W.1. Intermediate Examination. Until November 27.

SATURDAY, NOVEMBER 22

Sunrise, 7.28 a.m. Sunset, 4.3 p.m.

TUESDAY, NOVEMBER 25

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, W.1. "The Construction of a Great Exhibition." By W. T. Bowman, O.B.E., F.I.A.A., M.I.STRUCT.E. Chairman: Sir William Crawford, K.B.E. **7 p.m.**

THURSDAY, NOVEMBER 27

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. At the Showroom of W. T. Lamb and Sons, 43 Shoe Lane, E.C.4. "Bricks and Tiles." By E. Valser. **7 p.m.**

FRIDAY, NOVEMBER 28

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, W.1. Fifth annual banquet to be held at the Stationers' Hall, City, E.C.

SATURDAY, NOVEMBER 29

Sunrise, 7.40 a.m. Sunset, 3.56 p.m.

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Visit to the Works of Messrs. W. T. Lamb and Sons, Worcester Park. **2 p.m.**

Secretaries of architectural and allied societies are invited to forward particulars of their forthcoming meetings and visits for publication on this page. They should be addressed to the Editor at 9 Queen Anne's Gate, S.W.1.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1*s.* 3½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour;* NAVVY, 1*s.* 3½*d. per hour;* TIMBERMAN, 1*s.* 5*d. per hour;* SCAFFOLDER, 1*s.* 4½*d. per hour;* WATCHMAN, 7*s.* 6*d. per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.
Transport hire per day:

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.
RETURN, fill, and ram, ordinary earth, per yd. £0 1 6
SPREAD and level, including wheeling, per yd. 0 1 6
FILLING into carts and carting away to a shoot or deposit, per yd. cube . 0 10 6
TRIMMING earth to slopes, per yd. sup. 0 0 6
HACKING up old grano. or similar paving, per yd. sup. . . . 0 1 3
PLANKING to excavations, per ft. sup. 0 0 5
DO. over 10 ft. deep, add for each 5 ft. in depth, 30 per cent.
IF left in, add to above prices, per ft. cube 0 2 0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup. . 0 2 1
DO. 6 in. thick, per yd. sup. . . 0 2 10
PUDDLING, per yd. cube 1 10 0
CEMENT CONCRETE, 4-2-1, per yd. cube 1 17 6
DO. 6-2-1, per yd. cube . . . 1 12 6
DO. in upper floors, add 15 per cent.
DO. in reinforced-concrete work, add 20 per cent.
DO. in underpinning, add 60 per cent.
LIAS-LIME CONCRETE, per yd. cube . £1 14 0
BREEZE CONCRETE, per yd. cube . 1 7 0
DO. in lintels, etc., per ft. cube . 0 1 6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube 0 3 9
FINE concrete benching to bottom of manholes, per ft. cube . . . 0 3 0
FINISHING surface of concrete spade face, per yd. sup. 0 0 9

DRAINER

LABOURER, 1*s.* 3½*d. per hour;* TIMBERMAN, 1*s.* 5*d. per hour;* BRICKLAYER, 1*s.* 8½*d. per hour;* PLUMBER, 1*s.* 8½*d. per hour;* WATCHMAN, 7*s.* 6*d. per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. *6 in., per ft.*	0	1	3
DO. *9 in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. *6 in., per yd.*	0	8	0

Portland cement and sand, see "Excavator" above.

Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft. . . 0 4 3
DO. 6 in., per ft. 0 5 0
DO. 9 in., per ft. 0 7 9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft. 0 8 3
DO. 6 in., per ft. 0 10 3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1*s.* 8½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour;* SCAFFOLDER, 1*s.* 4½*d. per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
White facing bricks, per M.	5	0	0
Multi-coloured facings, per M.	7	7	9
Best red facings, per M.	7	7	9
Rubbers, 9¼ in., per M.	12	0	6
Staffordshire blue, per M.	9	5	0
Firebricks, 2½ in., per M.	9	5	0
Glazed salt, white, and ivory stretchers, per M.	21	10	0
DO. *headers, per M.*	20	10	0
Colours, extra, per M.	5	10	0
Seconds, less, per M.	1	0	0

Cement and sand, see "Excavator" above.

Lime, grey stone, per ton	£2	11	6
Mixed lime mortar, per yd.	1	6	0
Dampcourse, in rolls of 4½ in., per roll	0	2	6
DO. *9 in., per roll*	0	4	9
DO. *14 in., per roll*	0	7	6
DO. *18 in., per roll*	0	9	6
BRICKWORK in stone lime mortar, Flettons, or equal, per rod	30	0	0
DO. in cement do., per rod	32	10	0

DO. in stocks, add 25 per cent. per rod.
DO. in blues, add 100 per cent. per rod.
DO. circular on plan, add 12½ per cent. per rod.
DO. in backing to masonry, add 12½ per cent. per rod.
DO. in raising on old walls, etc., add 12½ per cent. per rod.
DO. in underpinning, add 20 per cent. per rod.

HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each .	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS, fair, per ft. sup. extra .	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra . .	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra .	0	0	10
WEATHER pointing, do. do. . .	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup. . . .	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities, in finishing to steps, etc., per ft. sup. . . .	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each . .	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup. . .	0	11	0
SLATE DAMP COURSE, per ft. sup. .	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ¾ in., per yd. . .	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup. . .	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each .	0	0	3

SCALE DETAILS:
A WEEKLY SERIES

GARAGE AT ROMNEY'S HOUSE, HAMPSTEAD, N.W.

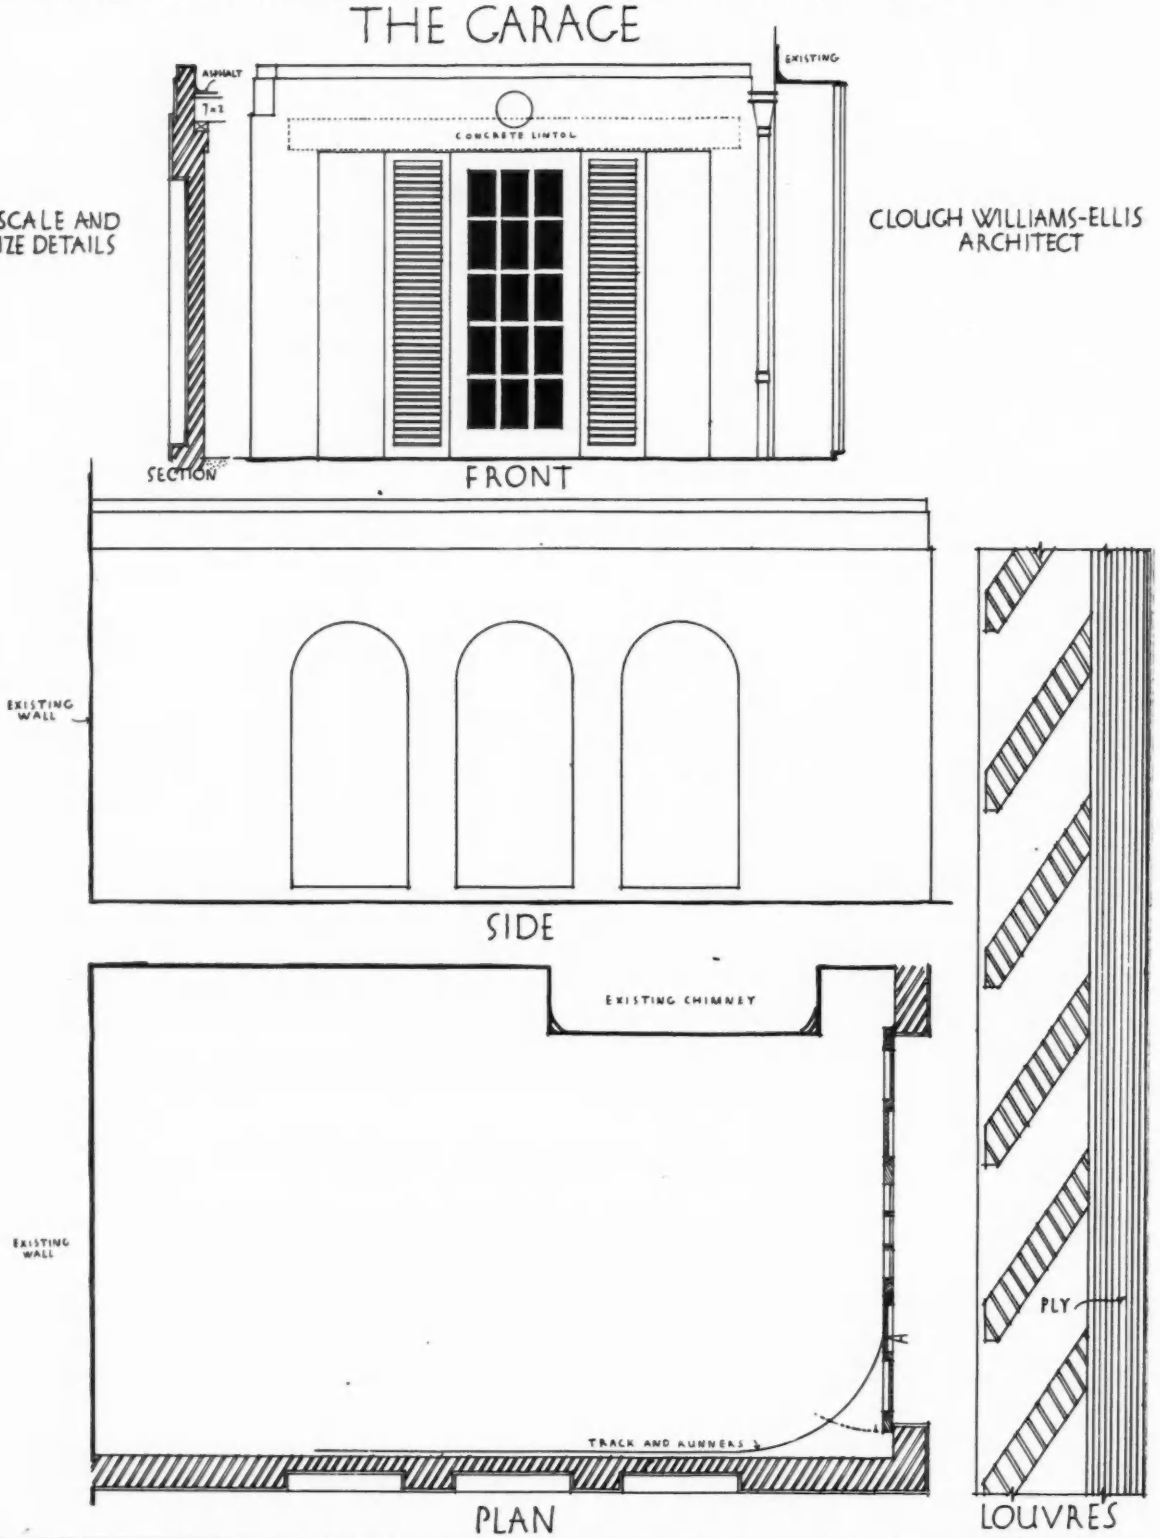
For and By

CLOUGH WILLIAMS-ELLIS

MR. CLOUGH WILLIAMS-ELLIS has recently added this garage to his own house in Hampstead, the eighteenth-century home and studio of Romney the painter, who immortalized Emma, Lady Hamilton. The design of the addition was given special consideration, with the result that it seems to "belong" to the rest of the house, and quietly takes its place in the general grouping and composition.

As will be seen from the drawing overleaf, the doors are in five leaves —opening on sliding gear—and present, when closed, a well-proportioned window, flanked by louvred shutters and a plain wall. They are enclosed in a bold opening, recessed in the end of the garage and surmounted by a concrete lintel.

The flank wall has been given considerable liveliness by the use of three arched recesses. The addition is rendered in white cement, and the joisted and boarded roof is covered with asphalt.



The drawing may be read with architects' scales (¼"; & 6" = 1 ft.)

TOWN RE-PLANNING

The Architects' Golden Opportunity

The whole world, without art and dress,
Would be but one great wilderness,
And mankind but a savage herd,
For all that nature has conferr'd.

—BUTLER

HOW strange it is that town planning as we know it today is concerned with everything that is not a town!

Look round about you anywhere in England to see where town planning has modified the growth of urbanism and you will find several large villages, and one town—Welwyn. Then ask how it comes about that town planning, professedly the science of urbanism, has been denied its province and kept lingering round the hedgerows. The answer cannot be confined to a sentence.

It takes its first beginning in a revolt from urbanism and all that the nineteenth century made of it. It was a denial of the principles of order and symmetry, because these principles had already degenerated in the towns of the industrial age into uniformity and dull repetition; so that a new movement that would revitalize the housing of the masses had to adopt a new principle of growth. Hence it came about that town planning came to stand for suburb planning, adopting principles gathered from a close examination of English village formations and cottage architecture.

Letchworth itself has no definite, no cohesive plan. Port Sunlight has none. Very few of the early efforts of town planners had any regard for the life of towns, prolonged into the night, made attractive with light, and dignified with fine, severe buildings set on a monumental plan. They were charming and quaint, and it is no disparagement to say so when one compares their setting, among trees and hedgerows, with the barren geometry of the old streets.

Looking now at the housing schemes of the pre-war period one finds how the principles of symmetry and order have reasserted themselves in one great estate after another, sometimes indeed to little effect, since a cottage is no unit for grandiose planning, and the lingering faith of the pioneers prohibits greater continuity than can be got from half a dozen such units run together.

Yet these estates are of such magnitude and have been so created at one blow that no irregular, village-like plan could hope to extend itself over their acreage, and the semblance of geometric order has crept in, leading gradually to the idea of urbanism, of streets, shops, architecture, and firm cohesive planning.

Look from this to Welwyn, the first attempt to build a town. From this again to the bad old towns; to re-plan them and do for them what Letchworth and Hampstead have done for the suburbs.

The day is indeed at hand when town planning must come into its own again. But with what weapons is it to attack its most formidable opponent? With those rustic bill-hooks that served it well in the fields? Surely not. Yet there must be weapons strong, well forged, and equal to a struggle against great interests, and for no less an ideal than the re-creation of the entire urban system of this country.

It is indeed the opportunity for which architects have been long waiting. While town planning concerned itself with zoning, regional distribution and roads, it was its own science. When now it will return to the town to take on work the nature of which is already foreshadowed in the re-planning of Leeds, Hull and other towns, then it must join forces with architects and become the noblest of all the arts.

THE PHŒNIX THEATRE:
THE CHARING CROSS ROAD FACADE

This new London theatre seats 1,200 persons. Messrs. Bertie Crewe and Cecil Masey are the architects, while Sir Giles Gilbert Scott, R.A., designed the Charing Cross Road front, illustrated above. The interior decorations are by M. Theodore Komisarjevsky, and the decorative paintings by Vladimir Polunin.

NEWS & TOPICS

ARCHITECTURAL EXHIBITION IN LIVERPOOL

ONCE again at the Autumn Exhibition at Liverpool there is a room in the main circulation devoted to architecture, hung by a committee appointed by the Liverpool Architectural Society. And a very mixed bag it is. Two cathedrals, half a dozen churches, a couple of factories, eight domestic buildings, four or five banks and offices and a handful of pubs, besides a host of miscellaneous stuff. Among the obviously "invited" work there are designs by Sir Edwin Lutyens, Mr. Guy Dawber, Sir Reginald Blomfield, Sir Giles Gilbert Scott and Mr. Walter Tapper. Most of the work exhibited by Sir Edwin Lutyens is already well known, but especial interest will be taken in the magnificent perspective drawing in Mr. Farey's best manner of the design for the new Roman Catholic Cathedral, now shown publicly for the first time. For the other Cathedral Sir Giles Gilbert Scott exhibits two line drawings which are perfect examples of meticulously accurate draughtsmanship.

★

There is a particularly delightful bank by Messrs. Willink and Dod, with skilfully handled brickwork patterns, and some very scholarly domestic work in the Georgian manner, notably a house at Wimbledon by Messrs. Shepheard and Bower, another at Noctorum (a charming name) by Messrs. Quiggin and Gee, and several views of Corporation cottages and flats by Mr. Lawrence Keay. Among the photographs of work by Messrs. Budden and Marshall there is one of a fireplace in a house at Burton which is quite a masterpiece of restraint and good proportioning.

★

The modernist movement seems to be making little headway in Liverpool, which is rather surprising, as they are inclined to pride themselves there on their progressive spirit. Certainly there is little in this exhibition to flutter any dovecots. There is a modernist flavour about the view in the courtyard of Messrs. Quiggin and Gee's Chevasse Memorial Hall, but one is not quite sure whether it is deliberate or not. Rather more than a hint of it is also apparent in some public-house interiors by Messrs. Harold E. Davies and Son, but it is most noticeable in the designs by Mr. Francis X. Velarde. There is nothing wild and woolly about any of his work, but throughout it all there is evidence of a fresh and original outlook. His "Three-dimensional Sign for Hillside" is really quite ingenious, and his sketch for a Church of Our Lady of Lourdes is one of the most interesting drawings in the Exhibition. Thoroughly modern in treatment, there is yet a suspicion of almost Oriental romanticism in it, especially in the domed tower and the double curved pediment over the narthex.

★

There is, of course, some dull stuff; that is inevitable, but it serves to show up the excellence of the more interesting work. One Victorian drawing of a castle seems to have strayed into the architectural room by mistake, and looks curiously forlorn. Only one model is exhibited, that of Mr. Grey Wornum's Haig Memorial Homes, which though very well made, is so anæmic in colouring that you could hardly believe it to bear any relation to the building itself—recently completed—which is altogether charming with its fine rich brickwork and roof-tiling.

MECHANICAL PRODUCTION

The rationalization of the building industry is likely to add still further to the total of its unemployed. High wages have brought new and more mechanistic methods into the industry, but despite these the employers are seeking to reduce wages, in face of a general slackening of trade. The negotiations will be prolonged and complicated; the more so when the full import of rationalization is understood. The last twenty-five years have seen a revolution in the industry, upsetting the whole system of craft grades and the nicely balanced division of labour.

AN ADVISORY BUILDING COUNCIL

The employers on their side are alive to the implications of the new mechanization of building. There is a growing feeling that the law relating to building construction, especially where it concerns steel, is in need of drastic amendment; while with this is felt the need for some correlation of the immense accumulation of new ideas, methods, and materials of building. Architecture has recognized the new age, tardily it is true. Building has followed, introducing new ways, but trying to fit them in with its ancient practice.

★

Now it is proposed to form an Advisory Building Council as a means of putting the industry into closer touch with twentieth-century methods, and of organizing the output of work and the employment of labour. What form this Council is to take is not yet decided, for the builders are only at the stage of seeking information and advice from various authorities and professional bodies.

★

Today every building is of steel or concrete: it employs either steel fitters or labourers where once it employed bricklayers. Joiners have become factory-hands or fitters. Painters may be paint-sprayers. The whole tendency is in the direction of mechanical production and away from the craft spirit which up to so recently has been the mainspring of its labour. The problem of the unskilled and semi-skilled man is to the fore, and this movement on the part of the employers will force the Unions to a new conception of their responsibilities to their members. It is very likely that the changes will be met by the amalgamation of Unions, a closer federation of building trade workers and a modification of the old lines of craft demarcation.

THE PASSING OF THE COUNTRY SEATS

That the Marquis of Tichfield is building a house in Welbeck Great Park, half a mile from Welbeck Abbey, seems to foreshadow the day when the Abbey, with its famous underground suite, its ballroom and pictures, will be closed, as other great houses up and down the land have been closed because of taxation and the death of agriculture.

★

What to do with these great houses that fall into the market is one of the standing problems of this democratic age, for their maintenance is an education in itself, outside the comprehension, as it is outside the purse, of most Councils. Yet the loss of their great contribution to the architectural story and the social structure of the race is hard to over-emphasize, and one wonders whether

there is not some method by which they may be given new leases of usefulness. Perhaps as industry tends to move into the country, a new town might be planned round one of these great places, using the mansion as a centre, the great lawn as a civic centre, and the tree-lined boundaries of the Great Park as the future circumference of its ultimate growth.

WESTMINSTER OLD AND NEW

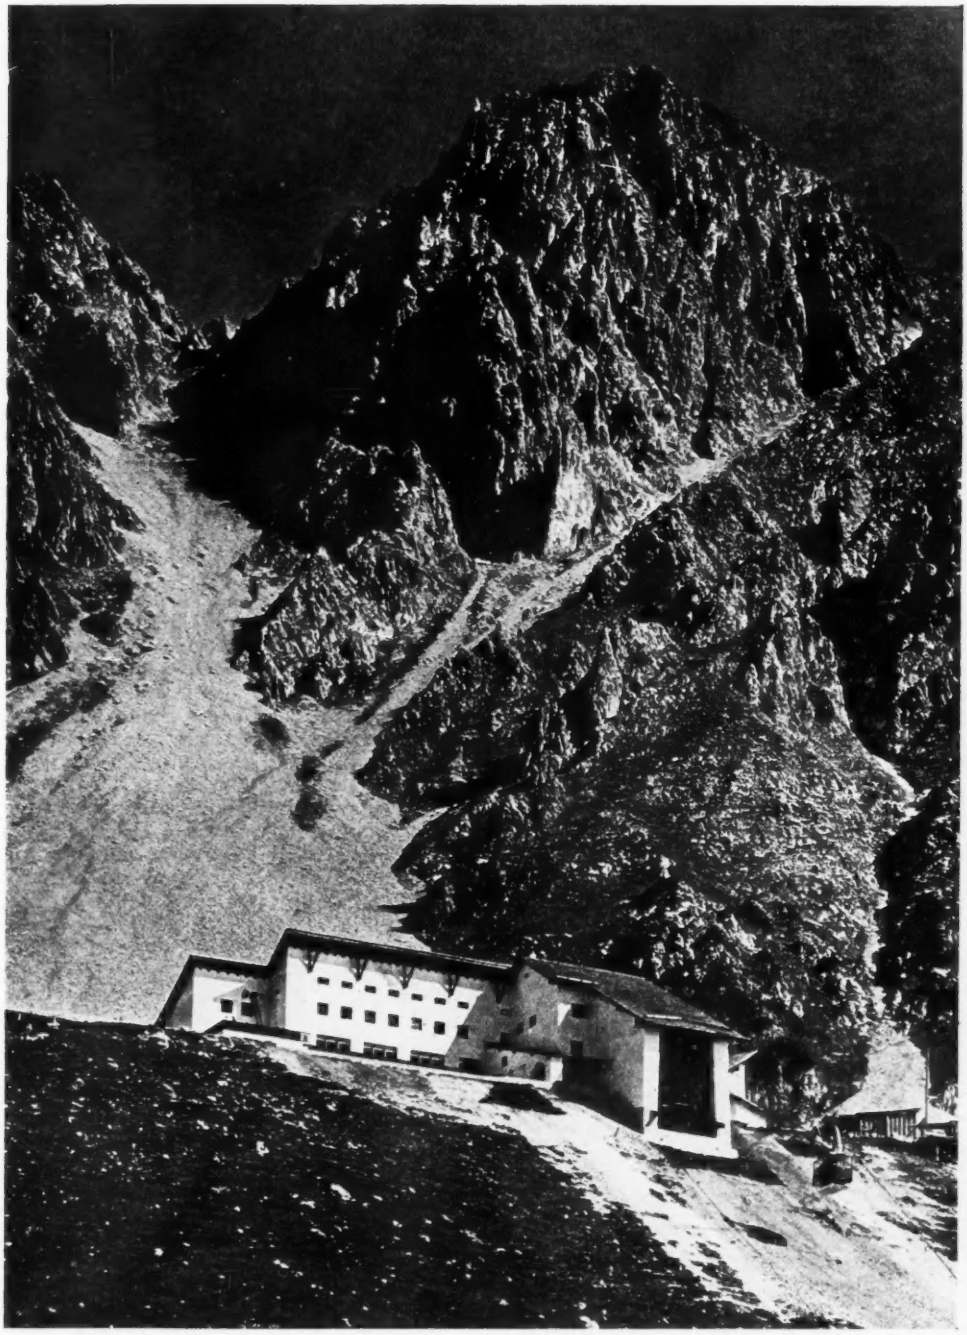
Here is a view of Westminster of the nineties that gives one the measure of the reclamation effected by the building of the Embankment wall. Here are clusters of homely houses standing above a shelving shore of shingle, with the great bulk of the Houses of Parliament thrust out into the river. One is tempted to imagine what significance might have been added if the Embankment, instead of continuing the line of the terrace, had been given a setback that left the buildings in command of the composition as seen from the river, and not, as now, contained within the rigidity of the unbroken retaining wall.

★

One must feel grateful for the gardens that occupy the site of the old foreshore, for they do keep a feeling of open space about the Houses of Parliament. But they are bad gardens, says my inner conscience, for with high railings they shut away the river from the road; and they are not furnished to be an adjunct, a foil, and a lesser instrument of Barry's fine buildings, as are the pleasant lawns that lie about the Abbey; and one cannot enter them at one end and walk to the other end, instead of walking on the pavement, as one can along Piccadilly; and one cannot see Rodin's piece of sculpture casually, as one should be able to see it. If one is a snuffy old man who divides his time between the reading-room of a public library and the dozing space of a public bench, one can shuffle along a gravel path to a place in the sun and sit enjoying what small view of large horizons this silly little garden leaves to be enjoyed. For it is indeed, as my conscience tells me truly, a poor affair.

A PALACE PAVED WITH GOLD

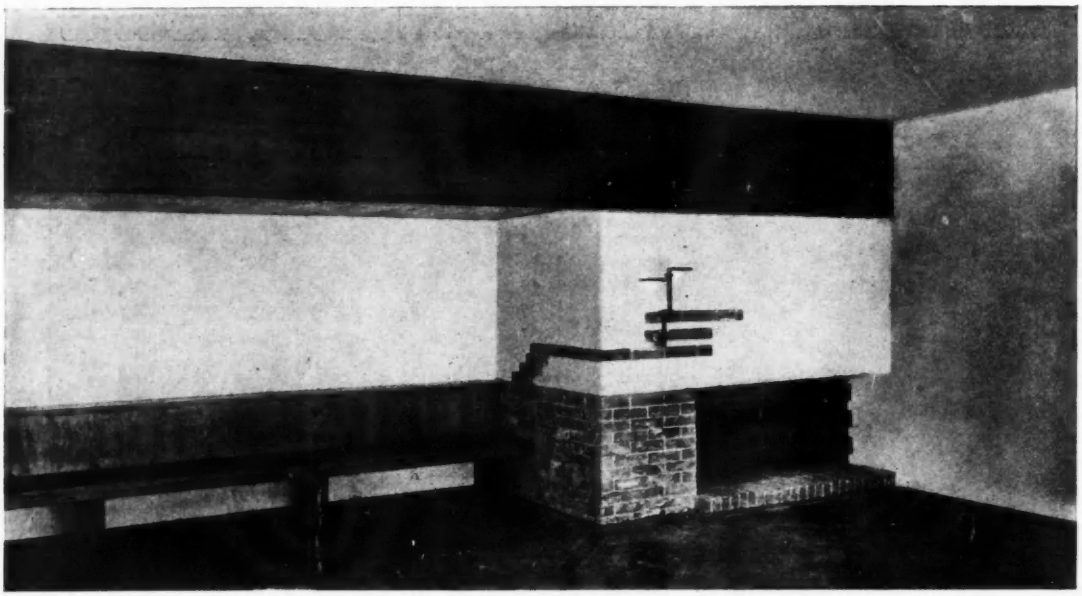
I suppose one must feel gratified that American offers for paving stones taken from underground passages at Buckingham Palace have been outbid by an English firm of contractors, though I would better like to know how much more than the already expensive paving-stone of everyday use is the royal variety. The American veneration for royalty and English aristocracy is accounted a queer thing by newspaper reporters, but one has only to go to the States to realize why. There are in the States money, rich people and old families, but the idea of "privilege," the whole fairy-tale of kings and queens, and the fine flow of blue, blue blood is so far outside the ken of the free-born American that even to a paving-stone may be ascribed powers of communication.



ASTRAGAL

This view of the Houses of Parliament, with the old Lambeth Quay in the foreground, is reproduced from a photograph taken towards the close of the nineteenth century. Since the laying down of the Thames Embankments by the old Metropolitan Board of Works, remarkable building progress has taken place along Millbank, where the new I.C.I. building and the framework of Thames House stand out in marked contrast to the old grey walls of Lambeth Palace, on the opposite side of the river.

THREE MOUNTAIN RAILWAY STATIONS, INNSBRUCK



DESIGNED BY FRANZ BAUMANN

Seegrube intermediate station, 1,905 metres above sea level.

STANDING in the wide square-like Maria-Theresa Street in Innsbruck—perhaps the most beautiful street in the world—the high steep blue mountains of the Northern Chain appear so near that the world-famous "Golden Roof" at the end of the street seems to stand at their very feet. Yet it takes thirty minutes by the new northern cable railway to reach the middle wide summit known as the Hafelekar (7,120 ft. above sea level).

It would be difficult to find a sight more awe-inspiring and yet more beautiful than those ranges of mountains lifting their great bulk to almost unbelievable heights. From the top of any one of a thousand summits one can look round on a limitless sea of white-crested peaks, all of them inviting the long and thrilling climb which was the toll they demanded before they could be conquered, until,

Chimney corner in the café of the Seegrube intermediate station.

in 1928, this railway was opened. The Hungerburg, reached in ten minutes by mountain railway from Innsbruck, is the starting-point of the cable railway. This aerial railway has three stations of interesting architectural design—the valley station at the Hungerburg, the "Seegrube" intermediate station, and the "Hafelekar" altitude station.

The style of the three buildings has been evolved from two considerations, namely, fitness for their purpose and suitability to mountain land. They provide an ideal solution to the problem, for, without attempting to be "Tyrolese," they do not lack in local aspect. The architectural scheme and the inner arrangement of the buildings are the work of the young Innsbruck architect, Franz Baumann.

Previously it had generally been the custom to place before the foreigner a building erected in the conventional hotel style of architecture or else the "shelter-house" type, but in this case a break has been made from both these styles, and the foreigner is met in the language of the country, and somehow one prefers a heavily timbered ceiling or golden wood garret to a stucco ceiling; and on the wall seat one sits just as comfortably and probably more "restfully" than in a basket chair. The old media, lime and wood, white and brown, simplicity and grandeur, have been used in a new manner adapted to modern requirements, without spectacular display, but with strength and correctness of form, in such a way as to create a new style eminently suitable to mountain building.

The valley station is characterized by its simple fitting into the wooded surround and by a particularly noteworthy system of stairs. The building is compact, with white walls and plain

Exit of the Hungerburg valley station.

The Hungerburg valley station.

wide-timbered stairs. The hall has a timbered ceiling; and instead of the walled-in girders, two strong timber beams. Around are strong fixed wooden benches and a couple of heavy wooden doors.

Here begins the journey on the cable through the air, over roaring torrents and pine-clad summits, full of crevices, past forests of stooping mountain pines, until quite close are the steep rocky peaks of the Northern Chain, and the first station, Seegrube, is reached. This intermediate station is less compact than the one at Hungerburg, but is again built in white and brown mortar, brickwork and timber. Inside the building there are both large and small rooms, with windows on the sunny side only. The benches, chairs and tables are made of golden-brown wood, and are simple and strong in design. The walls are white, strikingly in contrast to the brown floor and ceiling. The fireplaces are brick-built, and the light fittings, with their iron rods, create a homely and friendly feeling, which is in accordance with Tyrolese hospitality.

From Seegrube, the funicular railway proceeds on a steep incline to the terminus station, 350 metres higher up. This has been built on the rock in one solid piece, and is well adapted to the wild ruggedness of the peak. The arrangements are in the same style, and Baumann has succeeded in carrying the bold mountain character of the outside into the interior; it is a building subdued and made for endurance, but at the same time proud and noble, and at night its lights look like stars to the passer-by in Maria-Theresa Street.

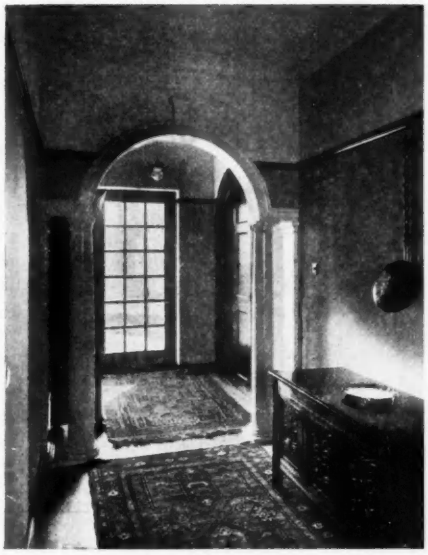
A HOUSE AT



DESIGNED BY

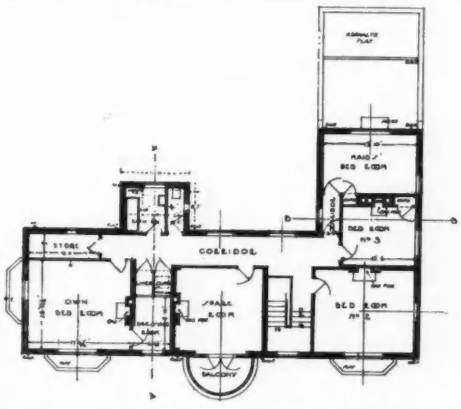
MOUNTWOOD, Addington Road, Sanderstead, has been erected on a hilly site, offering magnificent views of the surrounding district, particularly towards the south. The walls are built of multi-coloured facing bricks, and the roof is covered with hand-made sand-faced tiles; metal casement windows are fitted.

The house is planned in the shape of a letter L, and the main entrance porch is situated on the north front. All the principal rooms are on the garden side of the house; the morning-room

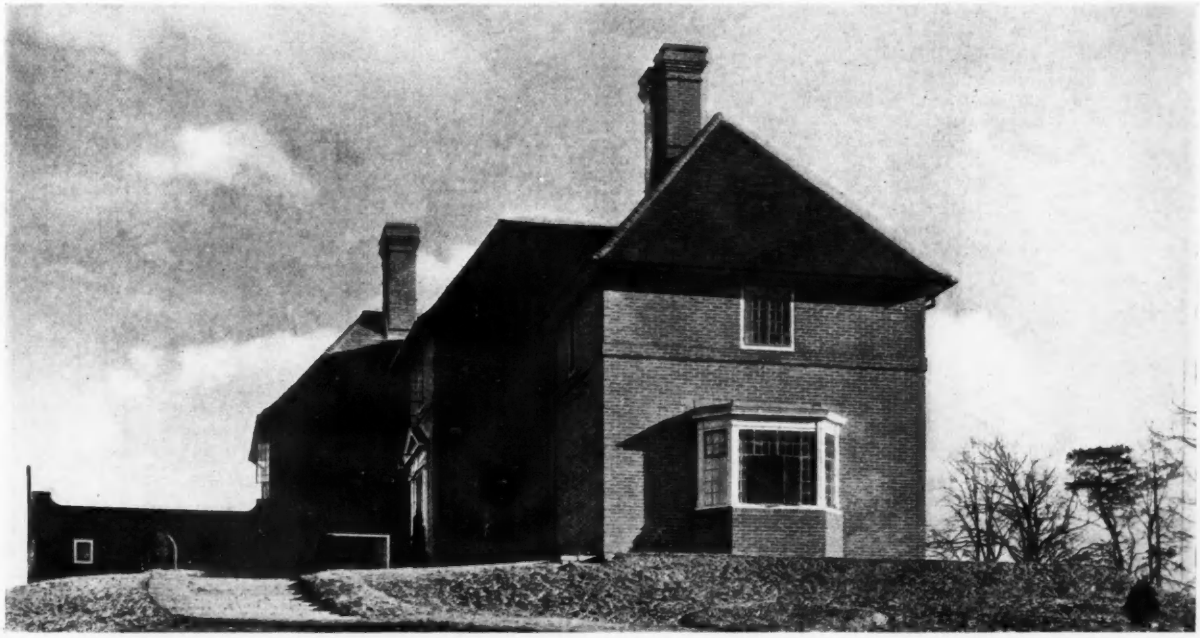
The garden side, on which the principal apartments are planned, faces south and offers extensive views of the surrounding district.

The hall, looking towards the garden front.

Part view of entrance front. The walls are built of multicoloured bricks; the roof is tiled.



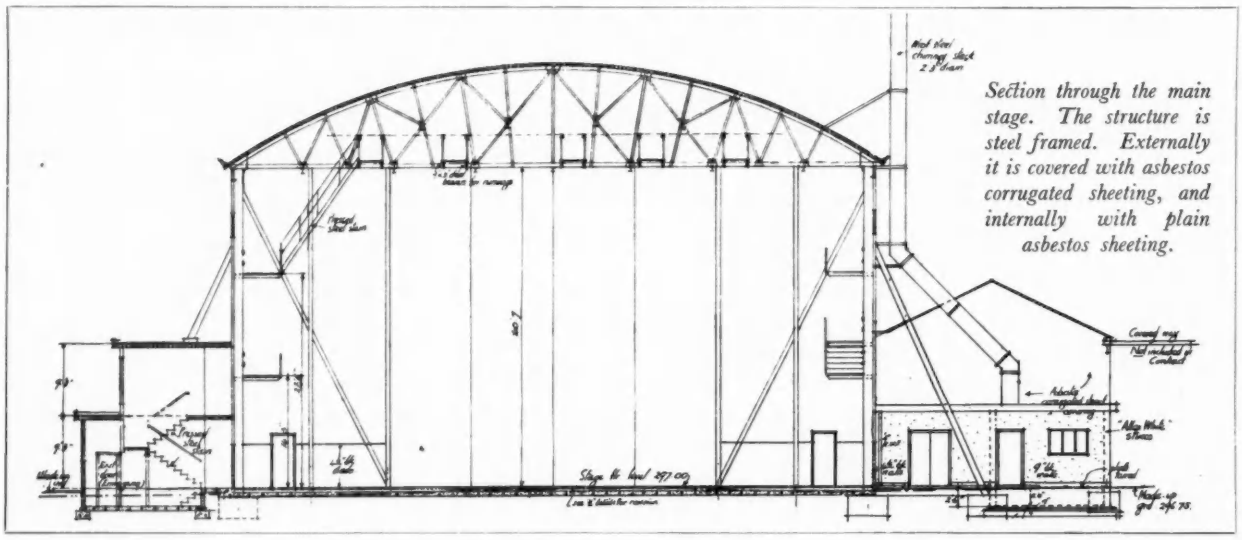
SANDERSTEAD



IMRIE AND ANGEL

is planned in the centre, and on either side are the drawing- and dining-rooms respectively. Direct access to the garden is obtained through windows in the morning-room, giving on to a porch.

The first-floor accommodation includes five bedrooms, dressing-room, bathroom, store and linen cupboards. The spare bedroom is fitted with French windows, opening on to a balcony overlooking the garden. All the rooms on the first floor are fitted with gas fires.



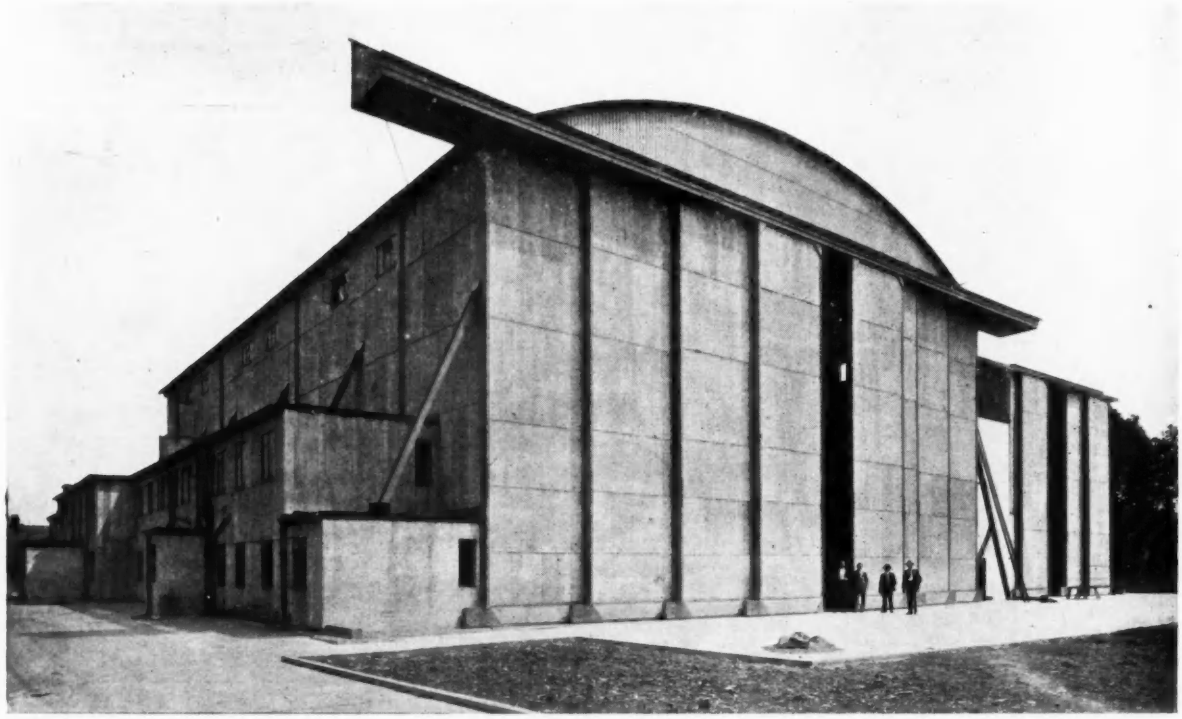
First-floor Plan

A view from the west. The bay window, which lights the drawing-room, is similar in design to those on the garden front.

D 2

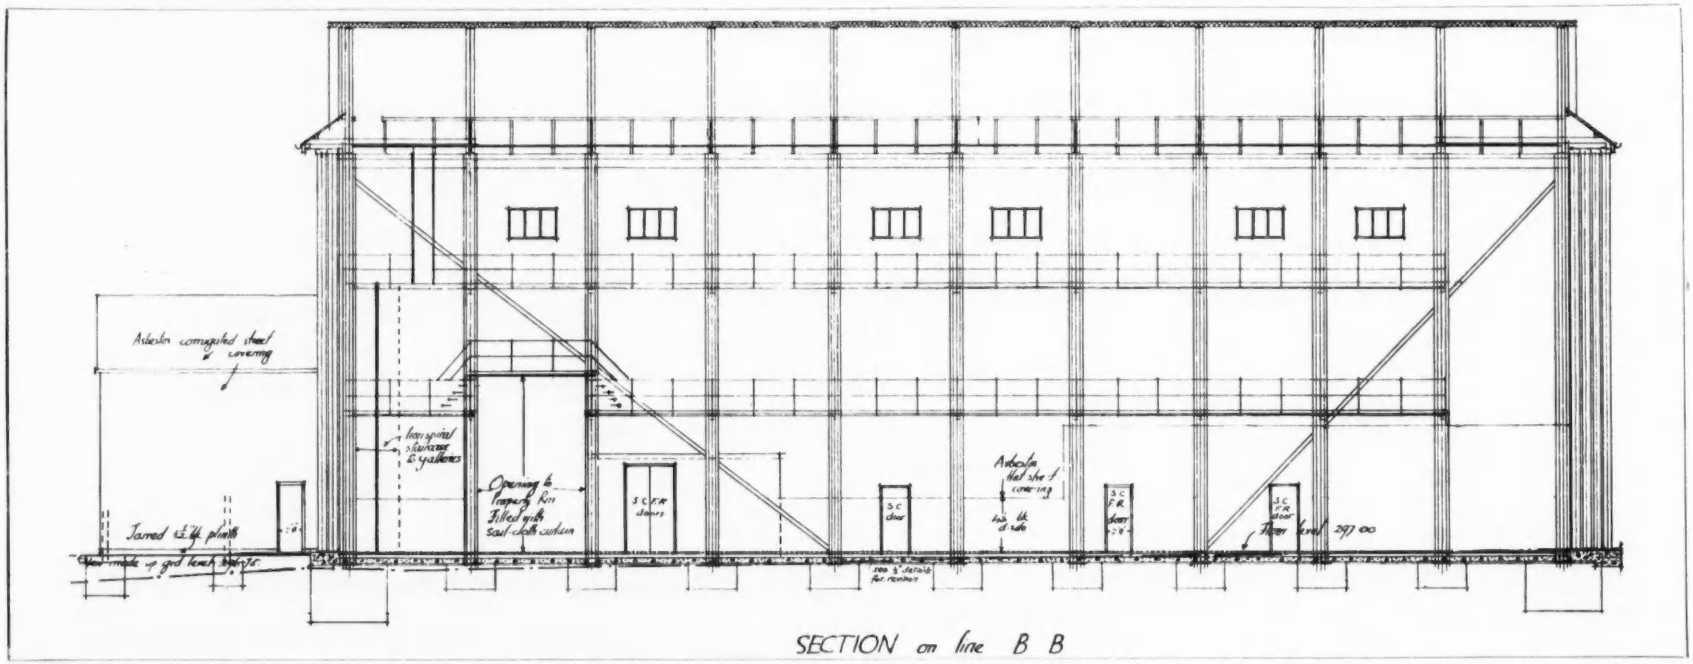
Section through the main stage. The structure is steel framed. Externally it is covered with asbestos corrugated sheeting, and internally with plain asbestos sheeting.

FILM STUDIO AT ELSTREE, HERTFORDSHIRE



DESIGNED BY LEATHART AND GRANGER

THE film studio erected at Boreham Wood, Elstree, for the Whitehall Films, Ltd., is unique in this country in that it was planned as a self-contained and completely equipped building. The chief feature is the main stage or studio. This is 120 ft. long by 80 ft. wide and is 40 ft. high from the floor to the underside of the runways. It has been so designed that many "sets" may be filmed simultaneously.



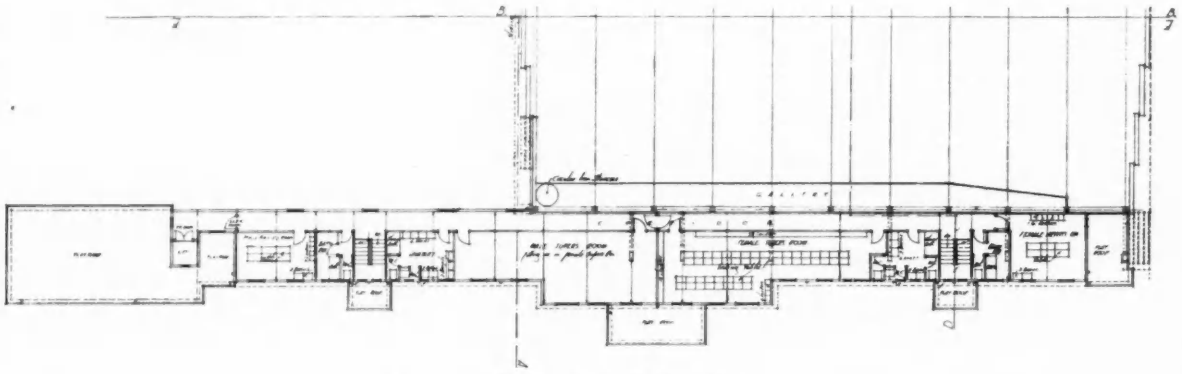
Along one side of the main stage is the administrative section, which is housed in two stories. Here, in addition to the rooms of the studio manager, scenario writer, etc., are dressing rooms for the "stars" with adjacent bathrooms and lavatories, a wardrobe room, and dressing rooms for twelve secondary artistes and one hundred "supers."

On the opposite side of the stage is a small kinema with a projection room, in which the films are examined, a smaller studio in which special portions of the pictures are photographed, the laboratory, electric dock, and the property room.

The workshops are planned in an isolated group so that work in the studios is uninterrupted by the noise made in the assembly of the "sets."

The principal front of the main stage, or studio. The sliding doors are in eight units, each 40 ft. high and 10 ft. wide. Each unit weighs 1½ tons, and is mounted on ball-bearing wheels running on railway lines to enable one man to move them.

This longitudinal section through the main stage should be compared with the photograph below. Along the side walls of the stage are two galleries for crowd and camera use.



Film Studio at Elstree.]

Plans of ground floor and part of first floor. The main stage, or studio, is 120 ft. long by 80 ft. wide, and has a clear height of 40 ft.

ENGLISH PRECEDENT No. 135

THE UNIVERSITY, EDINBURGH

The simple broad effect, severity, dignity, and massiveness of Robert Adam's design for the main front of Edinburgh University, illustrated above, differs remarkably from some of his light decorative treatments, which have been regarded as feminine and affected. This University front is bold, masculine and simple.

LETTERS FROM READERS

Official Architecture

SIR,—Judging by the report of the Olympian debate on "Official Architecture," Mr. Wynn Owen seems to be distinctly peeved with the work of our own Sir Edwin. I am not a subscriber to the modern gospel according to St. Lutyens, but I fail to see how the comparisons quoted by Mr. Owen advance his argument in the slightest degree; I think, however, that he might have extended his quotations to include the comparison of Liverpool Cathedral with that gross, vulgar, architectural abortion Waterloo Station, produced, I believe, by the official architect of a railway company.

I suggest that Mr. Owen ponders upon the fact that it is becoming increasingly common for commercial and banking houses who employ their own staff architects, to call in fashionable outside practitioners to design the elevations of their important buildings. I wonder why? J. R. LEATHART

Professional Etiquette

SIR,—I have to thank Mr. G. C. Laurence for his reply to my letter on the above subject. Naturally, "the authoritative exposition of the R.I.B.A. policy is the prerogative of the President and Council," and no one wishes to usurp it. Although this may be accepted as right, they having been elected by a majority vote of the members, it is to be hoped that their decisions are not above a little friendly criticism.

To suggest that they err on the generous side in some cases is quite reasonable and, of course, it is presumed that any such criticism is wholly inspired in the interests of the good name of the profession. It is to be hoped that a somewhat stronger antiseptic will be used in future ablutions. WILLIAM DAVIDSON

Public Control of Buildings

SIR,—Some of your readers may remember that in 1922 I was privileged to read a paper at the R.I.B.A. upon the law of building outside London, which was fully reported in that part of the Press which is interested in such matters. The Institute have now again been so good as to invite me to read a paper, and the Minister of Health has authorized my doing so. It will be on November 17, and will be called "Public Control of Building: the Position in 1930."

There are some points where I shall have to go back to my paper of 1922, if only to set out alterations in the law, but so far as possible I shall avoid repetition. In writing my paper, I feel it will be helpful if I can hear in advance of any points, which otherwise might not have occurred to me, with which your readers would like me to deal.

I shall probably be taking my annual leave when this letter appears, but letters sent to me at the Ministry will be opened in my absence, and the collecting of information needed for my paper will proceed. I will try to include anything suggested within, at any rate, three weeks of your publishing this letter. A. N. C. SHELLEY

Sheffield Recants

SIR,—Returning after an absence of several weeks, I have read the leading article "Sheffield Recants" in your issue for August 20, hence this somewhat belated commentary thereon.

Apparently, after a discussion in Council, the Sheffield City Fathers voted their official architect an honorarium in respect of his central library and art gallery.

Councillor Neal voiced the opposition to the motion in a speech based upon the fallacy that an honorarium and a fee are synonymous. A fee is a legal due solicited, while an honorarium is a gratuitous appreciation expressed in terms of £ s. d., and is not necessarily an admission that the normal remuneration of its recipient is inadequate.

The writer of the leading article has likewise been beguiled by this fallacy, as also by another regarding the relative cost of the services of an official architect and a private firm.

Official architects are a product of an economic development, which in industry and commerce is relentlessly replacing individualism by collective organization, and ascertained economy is a primary reason for his existence.

Official architects today are drawn from the same source as private practitioners as regards training, education and scholarship, and are therefore, in the aggregate, as capable of producing effective architecture, regardless of the magnitude of the work. Like private practitioners, however, they naturally vary in inherent ability. In knowledge of architecture and design there is, today, no essential difference; and both types are normally members of the same Royal Institute of British Architects.

Official engineers, legal or medical men, are regarded as being of equal status with their professional contemporaries by their respective professions, and the same attitude should prevail amongst architects.

The expression that the Sheffield City Council, by granting the honorarium has made it clear that by entrusting the design of its central library and art gallery to its official architect, "it has done something it ought never to have done" is merely a mental distortion of the true perspective of the Council's action, and the entire leading article appears to emanate from a degree of confusion regarding the meaning of words, and an almost complete delusion in respect of the actual facts relating to the entire subject of official architecture.

R. WYNN OWEN

Polytechnics and Exhibitions

SIR,—Surely certain exhibits of the polytechnics and art schools are much out of place in an exhibition of building trades. Those illustrating the varied work of students in the trade shops are of the greatest value in raising the standard of the building crafts, but when these institutions embark on the teaching of architecture, the majority judging from the exhibits—are content with a much lower standard. To display these efforts on the stands of the Exhibition is altogether out of place, and gives a false impression of the standard of architectural education in this country.

Certain day-school courses of a few polytechnics and art schools have recently been recognized by the Board of Architectural Education as up to the standard of the R.I.B.A. Intermediate Examination. Nevertheless, recognized or not, they are unable to give a student such facilities necessary for the training of an architect in all points of his profession as are offered by the recognized architectural schools throughout the country.

At the best, a rate-supported polytechnic supplies the youth of genius without money with an opportunity to get his foot on the architectural ladder, and for such, with a teaching staff able to recognize and guide merit, it is a priceless privilege. Not a few successful men to-day owe their first start to a polytechnic. But for one exceptional case there issues from the polytechnics a stream of half-educated (architecturally) young men who drift as draughtsmen in and out of offices, a floating population of casual labour without prospects, and lacking the qualifications to enable them ever to better their positions. These men might have become master craftsmen in the building trades, had they not become the innocent victims of a false snobbery fostered too often by the teaching staff of the polytechnics, who are anxious to keep up the numbers of their evening class attendances.

The remedy, it seems, lies with the public, who, as ratepayers, should forbid the waste of money on the architectural course in any polytechnic or art school, unless that school is recognized by the R.I.B.A. Board of Architecture, with a teaching staff fully qualified and approved by the Board.

POLYGNOTUS

Settling-Up Honeywood: xix

BLOGGS TO THE RESCUE

BY KARSHISH
(H. B. CRESWELL)

An offensive stuffy smell in the bedrooms, which has long been a cause of complaint by the owner, Sir Leslie Brash, and his family, has lately proved to be due to fumes from the heating furnace which, somewhere and by some means yet to be discovered, find their way into the hollow wall and are drawn into the floors where the joists bear on the inner 4½-in. wall, and thence invade the rooms.

Brash has also been concerned by proposals to build villas and bungalows right up to his boundary, and has just heard from his solicitors, Russ and Coy., advising him not to proceed against the builder, Grigblay, nor the manufacturers, the Riddoppo Company, in respect of defective painting, and for the reason that the Riddoppo Company has gone bankrupt and there is no evidence of defects being due to improper workmanship on the part of Grigblay.

The following are copies of letters enclosed to Brash by his solicitors, Russ and Coy.

(ENCLOSURE 1) RUSS TO SECRETARY, RIDDOPPO COY.

Dear Sir, 30/9/26.

We are instructed by Sir Leslie Brash, of Honeywood Grange, Marlford, Kent, that certain paint manufactured and supplied by your Company to Mr. Marston Grigblay, builder, of Maidstone, for the decoration of Honeywood Grange, has proved seriously defective; and have to say that unless you can make satisfactory explanation showing the said defects not to be due to any fault in the paint you supplied or, alternatively, will at once give an undertaking to restore, renew or repaint as may be necessary for the proper completion of the work, we are instructed to take action against you for breach of warranty.

Yours faithfully,

(ENCLOSURE 2) RIDDOPPO TO RUSS

Dear Sir, 2/10/26.

The paint we supplied to Mr. Grigblay a year ago, which we understand is the cause of complaint, was our well-known new novelty Riddoppo Super-Paint (Matt) and was in perfect condition as taken out of stock and same as supplied to others. We can demonstrate the superior quality of our Riddoppo Super-Paint, and produce evidence of painting carried out with paint taken from our stock before and after same supplied to Mr. Grigblay.

The defects are due to neglect of painters to follow instructions, which we now enclose as sent to Mr. Grigblay and all others and clearly printed on the tins.

We have no intention to renew defects, as same are due to neglect to follow instructions and not to Riddoppo Super-Paint, and which is no business of ours.

Yours faithfully,

(ENCLOSURE 2A) PRINTED LEAFLET

NEW NOVELTY "RIDDOPPO" SUPER-PAINT

IMPORTANT. See the word "RIDDOPPO" (with 2 "d's" and 2 "p's") on every tin. NO OTHER GENUINE and if noticed should be notified at once.

N.B. These instructions must be followed if best results desired.

INSTRUCTIONS FOR USING RIDDOPPO

1. Use at a temperature of 55 degrees or over which should not be less than 40 degrees but in damp weather a higher temperature gives best results particularly for last.

2. Keep air-tight lid hermetically sealed and well stir before transferring and at once replace.

3. If copper-bound tools are used must be protected as RIDDOPPO acts as solvent and same may affect appearance.

4. All tools to be used first immerse and thoroughly cleanse in "RIDOP" (pink tin) supplied with all orders only after careful drying.

5. No paint must on any account be returned but specially in damp weather and if left overnight to be removed from pot carefully cleansed after with "RIDOP" (pink tin) and dried before same is again re-used.

6. As damp takes longer to dry close windows or similarly open and shade from sun if same is not.

7. If ropy add "RIDOP" (pink tin) unless affected by frost though only a small amount and not otherwise or results will be unsatisfactory.

ALL TINS ARE THE PROPERTY OF THE RIDDOPPO COMPANY WHICH WHEN NOT RETURNED WILL BE CHARGED 2s.

(*Issued by Riddoppo Ltd.*)

The seven golden rules of Riddoppo!

One disadvantage of a Public School and University education (however lightly faced) is that it prevents a man from understanding directions such as these, which offer no difficulties to Bloggs and his painters, and which Grigblay could probably read aright if he stood on his head to do it.

(ENCLOSURE 3) RUSS TO GRIGBLAY

Dear Sir, 4/10/26.

We are instructed by Sir Leslie Brash to point out that certain painting carried out by you at Honeywood Grange under your contract has developed serious defects, which you have declined to remedy after being required to do so.

The Riddoppo Company, who manufactured and supplied the paint in question, state that it was taken from stock and was in perfect condition, as supplied to other customers, and that they sent you full instructions for applying the paint, which instructions were also printed on the tin.

We are instructed to inform you that unless you can give a satisfactory explanation that the failure of the paintwork is not due to defective workmanship or other cause for which you are responsible; or, alternatively, will give an undertaking immediately to restore or renew the defective paintwork to the satisfaction of the architect, Sir Leslie Brash intends to have the necessary renovations carried out by some other person and to deduct the cost of such renovations, together with certain expenses he has already incurred in remedying defects, from the balance of moneys retained by him as security for the completion of your contract.

Yours faithfully,

(ENCLOSURE 4) GLAUBER AND WALSH (SOLICITORS) TO RUSS

Dear Sir, 8/10/26.

Our client, Mr. Marston Grigblay, instructs us to say, in reply to your letter to him of October 4th, that he strongly objected to use Riddoppo paint and only did so to oblige your client after receiving the written undertaking of the architect that your client accepted full responsibility for the result of the experiment; that he placed his foreman painter in charge of the work and employed only skilled decorators upon it; that the instructions supplied with the paint were exactly followed, or if not exactly followed, then followed as exactly as the ambiguous and confused wording made them possible to be understood; or, if understandable, then as exactly as painters and decorators can, or could be expected to understand and follow them; or if the said instructions were not ambiguous, then that they were redundant and fastidious and such as no practical men could observe, or if they were not, then that no warning of such defects as have occurred was given, so that these defects are not due to any failure to observe instructions, if clear instructions were given, which my client denies, but were due to the omission of necessary warnings of dangers of which my client could have no knowledge, as the paint was

composed of "new and secret ingredients."

Furthermore, my client's case is that the said instructions are worded and designed to be, and in fact are, a mere device to enable your clients to shelter themselves from liability for defects in their paint; which paint my client has evidence to prove is generally discredited by the building trade as a worthless imposture.

I am further instructed to say that my client contends that he has carried out his contract to paint in a skilful and workmanlike manner, and that he refuses to renovate or restore or renew or have anything more to do with any painting at Honeywood of any kind whatsoever or for any consideration whatsoever; and that my client regards the threat of an action by your client as the malicious attempt of a rich man to bully and browbeat a poor one, and will defend any action which your client may bring to his last penny.

Yours faithfully,

(*Here ends the correspondence enclosed by Russ to Brash.*)

As Grigblay said—"There are others who can employ solicitors besides Sir Leslie Brash." Grigblay appears to have employed a solicitor and a half.

SPINLOVE TO BRASH

Dear Sir Leslie Brash, 14/10/26.

I have been away from the office on important business and found your letters of the 8th and 10th awaiting me on my return yesterday.

I am very sorry to hear of the building activities and really do not know what to advise. I am afraid, however, that no question of infringement of your copyright arises. In the case of the block of cottages you proposed to build last year, the entire plan—which was the material part of the design—was, as you say, "purloined"; but I do not think there can be any copyright in an architectural feature, and though the villas may imitate, they cannot attempt to *reproduce* any part of your house. I am afraid, too, that you have no copyright in the word "Honeywood," as it is a place-name which was in use long before you adopted it.

As regards the proposed bungalow allotments, I do not know what to say. The only thing seems to be to buy the people out. It was, I think, considerate of them to give you the opportunity of acquiring the land. They perhaps thought you might not like to have buildings of that kind close up to your boundary.

I have received the analyst's report. He says the smells are due to fumes from the heating furnace. These must somehow get into the space of the hollow walls and are by that means distributed to remote parts of the house. I cannot understand in the least how this has happened. However, Mr. Grigblay has agreed to make no charge for putting things right, as it is a defect for which he is responsible.

I was sorry to learn the result of your negotiations for settlement of the Riddoppo dispute. I have always felt, as you know, that Grigblay could not be held responsible in view of his objection to the paint, and his consenting to use it only after you accepted responsibility for the result. This was also Mr. Chawlegger's view, you will remember, and now Mr. Russ evidently feels the same about it. It will be impossible for me to see you this week, but I will ring up early next week and arrange a meeting. I am extremely busy just now.

You asked me some time ago to let you have particulars of my charges. These I now have the pleasure of enclosing.

Yours sincerely,

This letter seems to have been written on one of the very worst of Spinlove's "bad days." Except for the directions it gives Brash on the matter of copyright, it is futile to the point of exasperation. If he had no advice to give he should have said so, instead of elaborating vacuity. Brash is well aware that he has acquired no rights in the word "Honeywood"; that he can rescue himself by "buying the people out," and that the one entirely impossible explanation of the proposal made him by Snitch is consideration for his feelings or his interests.

Spinlove's comment on the Riddoppo fiasco—"I always told you so"—and his bland assumption that the whole nuisance of the smells is satisfactorily disposed of by Grigblay's putting it right "without charge" is the very cream of tactlessness; and why he should choose this occasion of all others to tell Brash, twice over, that he is too busy to give him full attention, and to send him particulars of his charges, is beyond understanding.

As regards this matter of architectural copyright, it is only in recent years that the thing has been recognized in English Law; and there have not been enough judgments to determine how the Courts apply the test of "colourable imitation"—which establishes infringement—to plans, elevations and architectural features. There are, however, from time to time claims by architects whose published designs for small houses have been adopted by private building-owners. Such claims are usually settled by the author of the design being paid substantially more than the fees he would have earned as architect for the work, and the making of them is among the most lucrative activities of architectural practice; but the generality of architects have a natural repugnance to taking advantage of simple souls whose attachment to the great ideal of getting something for nothing has been a little too fervid.

Appearances are that Spinlove is not anxious for Brash to see Pricehard's report, and no wonder!

GRIGBLAY TO SPINLOVE

Dear Sir, 14/10/26.

As promised, we wrote to our foreman Bloggs on the subject of the run of the furnace flue, and his report is as follows:

"She start off left hand pretty quick but only as far as the top of fire lump at back. . . . Then she make a sudden turn and rise up straight, but going away backwards, eight courses I reckon or may be ten, till she have nine inches to face of cellar wall. . . ."

Bloggs says this was done by your orders to prevent wine from getting chilled, and that it makes the flue very tight just above, and he had difficulty in getting it round. He goes on:

"After that she start off, and away she go left hand over the door of fuel and past soot door till that girder under kitchen hearth stop her; but she just lean over right hand to clear and off she go again nice and quiet right up to stalk and a good one for a brush all the way after she pass the soot door. She was a bit tight below I admit, but I did the best I could, and she swept beautiful and draw a treat and so I left her and do not know what the trouble can be since."

We are afraid the above does not help us much, but Mr. Grigblay is arranging to go over to Honeywood with the plans on Thursday and see what he can make.

Yours faithfully,

It is apparent that Bloggs's authentic chirp is in part lost to us by the editorial conscience of the typist. I picture the omitted passages as recording Bloggs's views of the architect's requirements.

He speaks of the flue as "she" out of respect and affection for flues, and for somewhat different reasons than when he used the same word to designate Lady Brash.

SPINLOVE TO GRIGBLAY

Dear Sir, 15/10/26.

I write to confirm telephone message. Mr. Grigblay to postpone visit Honeywood till further communication from Mr. Spinlove.

Yours faithfully,

R. S. PINTLE

Pintle is Spinlove's assistant and is presumably acting on instructions Spinlove gave before he went away on this "important business" of his. Brash's threat to have Grigblay "thrown out into the road" if he came again to the house would seem to make this intervention by Spinlove no more than merciful. What, however, must quite properly have weighed with Spinlove is that Brash has still to unburden himself of some deep grievance against Grigblay, and that being so Spinlove cannot be a party to an

act by Grigblay which Brash for any reason has said he will not tolerate. In human affairs things are not unimportant because they are childish and silly: in fact, the chief burden of life is the importance of trivialities.

GLAUBER AND WALSH TO SPINLOVE

Dear Sir, 18/10/26.

We are instructed by Mr. Marston Grigblay to call your attention to the fact that the final balance under our client's contract with Sir Leslie Brash fell due on the 10th of this month and to request that you will at once issue the necessary certificate for the amount of £1,242 11s. 9d., as shown in the Statement of Account agreed by you on behalf of Sir Leslie Brash.

Yours faithfully,

As Grigblay has been called upon by Spinlove to make good the defect to which the escaping fumes are due, he is not entitled to this certificate for final balance which only becomes due after he has completed his covenant to make good defects; and as Grigblay has agreed to make good the defect and is aware that Spinlove is not entitled to draw the certificate until he has done so, it must be assumed that his solicitors wrote this letter on instructions Grigblay gave them before the defect was established. Grigblay no doubt so instructed Glauber and Walsh at the time he employed them to answer Russ's threatening letter, for the withholding of the certificate by Spinlove, or the refusal by Brash to honour it, would bring the Riddoppo conflict to a head. Such a letter would also compel Spinlove either to range himself in opposition to Brash by drawing the certificate and signalizing his decision that Grigblay was not responsible for the Riddoppo failure; or to join issues against Grigblay by deciding that he is responsible and refusing the certificate.

SPINLOVE TO GLAUBER AND WALSH

Dear Sirs, 21/10/26.

I am unable to draw certificate for final balance under Mr. Grigblay's Honeywood contract as there are still outstanding defects which he has been called upon to make good.

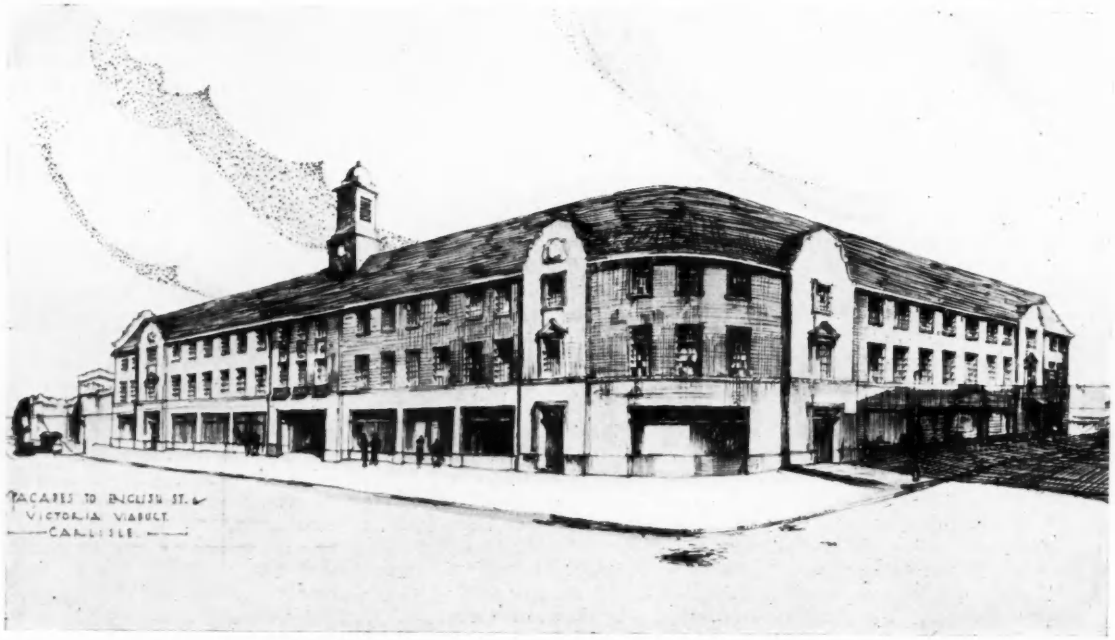
Yours faithfully,

This letter is either clever to the point of being cunning, or it is merely the result of shortsightedness; and from what we have seen of Spinlove the latter explanation seems the more likely. If Spinlove perceived that Glauber and Walsh wrote in ignorance of the fumes defect, and for the purpose of bringing the Riddoppo dispute to a head, his reply is a most adroit evasion: for had he stated plainly that the defect which prevented his issuing the certificate was that of the fumes, he would have implied that the Riddoppo defect was not an obstacle to the issue. He has answered Glauber and Walsh and still retains his firm position on the fence.

[NEXT WEEK: XX—FAT IN THE FIRE.]

CARLISLE STREET FAÇADES COMPETITION

THE awards in the Carlisle Street Façades Competition have been made as follows:—



1st, Thomas George Richards, of London.

2nd, R. A. Cordingley, M.A., A.R.I.B.A., of Durham.

3rd, divided between *a*: Frank Morrall Maddox, of Burslem, Stoke-on-Trent; and *b*: Cyril Farey, A.R.I.B.A.; A. S. Knott, A.R.I.B.A.; and Miss Edna Mosely, A.R.I.B.A., of London.

Mr. Francis Jones, F.R.I.B.A., the assessor, in his report, said: "After very careful consideration I have placed first design No. 49. It is a nice, quiet, market-town manner of building, and the author is evidently a man who could handle the actual building well. The long frontage to English Street has been treated in a quiet, dignified manner, but devoid of the monotony I have found in so many of the designs submitted. He has shown, in the centre, a group of windows over an opening which could either be into a large shop or restaurant, or into an arcade if it were decided to build one, and he marks the centre of the building by a very nicely designed little clock turret in the roof. At either end, but not at the extreme end, he has a doorway with a friendly gable above it. . . . The design is thoroughly capably handled, and I feel sure could be adapted to the actual requirements of the buildings when they are built."

The three premiums offered were £300, £200 and £100, respectively.

Carlisle Street Façades Competition: The First Premiated Design, by T. G. Richards.

QUESTIONS THAT ARISE

Cement Tests

T. E. writes : "*I am carrying out a large contract, in which there is a considerable amount of reinforced concrete work. Would it be sufficient for the makers to send to the testers a sample of the brand of cement selected, or will it be necessary to make tests from the consignments as they arrive on the works?*"

In buildings where there is a large amount of reinforced concrete work, or for any work of good class, provision should be made for samples of cement to be taken for testing purposes.

The average firm who make a good brand of Portland cement can be relied upon to supply the material stipulated by the architect, but there is nothing to stop an unscrupulous builder from sending on to the works a foreign cement in the required makers' bags, if the sample of cement is not taken from the makers' bags on the works.

Therefore, the samples of cement should not be sent by the maker, but taken from the supply on the works.

A consignment of cement of about ten tons should be dispatched to the works as soon as possible after the commencement of the job, so that no delay occurs in the progress of the work.

A report will be received from the testers about a week after the dispatch of the cement.

I do not consider it necessary to take samples from each consignment. They should be taken at periods so that the builder will never know when he will be asked to furnish the amount required for a test. W. A. D.

Plywood Dados

W. R. writes : "*I have been considering using plywood for dados to some of the principal rooms in a new building, to lessen the cost, in lieu of dados framed in pine. I had thought of forming the panels of plywood and covering the joints with moulded fillets, finished with a capping. So far I have used plywood only for panelling to internal doors. Is there any possibility of the panelling shrinking or splitting by its nearness to new brick walling? Are there any precautionary measures I can adopt to ensure protection to the wood? The building will have central heating and radiators will be fixed 6 ins. clear of the panelling.*"

I have used panelling for dados in a public institution, and am well satisfied with the result.

It should, however, be borne in mind that there are a considerable number of plywoods on the market, and to secure a good job it is necessary for your correspondent to see that the material is obtained from a maker of repute.

The better makes are of wood throughout, the three or more layers being cemented together by means of a secret process.

For dados, plywood of ½ in. thick should be used, fixed to creosoted battens.

It is essential that a through current of air is obtained between the plywood and the general wall face, and gaps should be left between the lengths of battening to ensure this. The back of the plywood should be coated with a good damp-resisting solution. If these measures are taken, the dampness drying out of the new walling will have no effect on a good make of plywood. A. B.

Connection to Sewer

M. writes : "*My client owns a block of houses which drain into an existing public sewer in the adjoining road. Under a new sewerage system now being laid throughout the district a new sewer is to be laid in the road. Can the local authorities compel my clients to reconnect to the new sewer, or must they bear the cost?*"

Unless the drains are certified to be in bad order, or defective, the local authorities cannot compel the frontagers to connect to the new sewer. The local authority themselves must bear the cost of the connection under section 24 of the Public Health Act, 1875. R. W. M.

Plastering Steel Joists

J. D. writes : "*I am having a number of steel joists plastered. They are not to be encased with concrete, but are to have fir cradling fixed to the webs and covered with expanded metal. Will a good enough key be obtained for the plaster, by carrying the expanded metal round the underside of the bottom flanges, and plastering direct, or will it be necessary to bolt fir plates to the underside of the bottom flanges to keep the mesh clear?*"

Where steel joists are not encased in concrete, the expanded metal to receive the plaster work must be kept clear of the smooth face of the steelwork.

The most satisfactory method I have found is to secure a ½-in. mild steel rod to the centre of the bottom flange. This rod should run for the whole length of the beam, and be secured with metal clips at about 4-ft. centres. The expanded metal lathing fixed to the fir bracketing at the sides can then be carried round the bottom flange, the rod keeping the lathing clear, and affording a key.

This, of course, is a cheaper method of executing this work than bolting fir plates to the underside of the flange to take the mesh. S. V. J.

Rubber Floor

A. V. writes : "*I propose laying rubber tiles over an old, rather badly worn, wood floor of a shop, to smarten up the appearance and make a silent floor for customers. I have been told, however, that the lines of the boards will show through the rubber, even though the surface of the floor is planed off. Is there any satisfactory method which has been used to prepare for a floor of this type?*"

It is essential that the sub-floor for rubber tiling must be smooth, and it has been suggested that sheets of plywood nailed down on existing boards will form a satisfactory layer.

A better way, however, is to lay a thin surface of patent magnesite floor on the wood boards. Leave this to harden and dry for about six days, and the rubber tiles can be placed on the surface without ill consequences. The best adhesive to use for this purpose is rubber solution, which should be applied in two coats. The first coat should be allowed to dry before the second is applied, and when the benzene has evaporated from this, the rubber blocks can be laid in and well pressed down. W. H.

OBITUARY

ARTHUR H. TENISON : 1861-1930

We regret to record the death of Mr. Arthur Heron Ryan Tenison, F.R.I.B.A., F.R.S.A., after a heart seizure, on Monday, September 22, at the age of sixty-nine.

He was articled to E. Swinfen Harris, F.R.I.B.A., and studied on the Continent. Mr. Tenison was responsible for the design of about twenty new schools and about 200 alterations and enlargements to existing schools (private and public).

Among his works are the new school and science wing at Radley College, Sir Walter St. John's Schools, Battersea, and the remodelling of Goldsmiths' College, New Cross, and of St. John's College, Battersea. He also designed new churches at Beckton, E., Willian, Letchworth, and Arlesey, Bedfordshire, as well as alterations to various churches and college chapels, principally Minterne Burmarsh, and St. Mary's, Peckham. He designed the Royal Navy submarine memorials on the Victoria Embankment and at Shotley, and some twenty other memorials.

THE SPECIFICATION WRITER

Garden Walls and Fences

BY A. T. ALLEN, C.R.S.I.

THE purpose of walls and fences is to mark a division between properties, and to afford protection from cattle or other intruders. In this article garden walls and fences only are considered.

It is worth remembering that there is no such thing as an insurmountable fence, suitable for a garden division: only to animals is a fence a physical barrier. To human beings it has only a moral effect.

The life of a fence, which is often lost sight of, is dependent on many factors, viz.: the materials comprising it; the manner of their erection; the situation; the treatment it receives; and the periodical attention given to it.

Generally, only the first is within the control of the fencing manufacturer. It is therefore advisable that a rigid specification should be drawn up for whatever fence is required. This is the more important in the case where wire fencing is used, as fencing is bought reluctantly, and there would be less frequent need of renewal and repair if builders only bought such fencing after it had been subjected to laboratory test.

Prices of galvanized wire fencing have a wide variation. Imported material is sometimes as much as 50 per cent. cheaper than English produce. Since only physical and chemical tests can indicate its resistance to corrosion, etc., the landowner who has not the means at hand to determine this for himself is at a serious disadvantage when he enters the market to make a purchase.

WALLS

Boundary walls, whether of brick, stone or rubble, require a foundation, and are therefore expensive in construction. Many people seem to think a brick wall the proper thing for a garden boundary; and a dwarf brick wall with an iron or stone coping, surmounted by a low ornamental iron railing, is the correct thing for a front forecourt wall, but this cannot be defended nowadays, either on the score of economy or beauty. A wall, if it is to stand, must be strongly built of bricks and mortar. Brickwork itself is costly with the price of bricks ranging from 80s. to 120s. per 1,000.

A garden wall of 9-in. brickwork is better built with one course of headers to four or five courses of stretchers, because of the difficulty in getting the headers of the right length to go through the wall and be flush on both sides. Garden walls are built in all kinds of bonds.

In all new housing schemes the Ministry of Health is opposed to brick walls as boundaries. Their omission, and the substitution of fences, was made by the Ministry when the specification for new houses was modified to effect economy, but the system adopted, viz., that of a post and two wires, cannot be considered of a protective nature.

WOOD FENCES

Creosoted boarded fences are excellent for some purposes, such as protecting garden crops against winds. The decrease in the timber supply, and the increase in its cost, however, make it advisable for builders to use a substitute. For this same reason a post-and-rail fence is not recommended. The posts have to be of a substantial size and require to be exceptionally long to allow planting several feet below the ground level, otherwise however firmly the pales may be fixed the fence is liable to be blown down and damaged.

Consideration should be given to a lighter kind of fence, such as of cleft chestnut, which is easily fixed by unskilled labour and requires no periodical painting. For small property this is an ideal fencing. It can be obtained in several different styles and heights. Chestnut is a very tough, close-grained wood, which is second only to oak in lasting properties, and it is practically waterproof. No useful purpose, other than colouring, is served by immersing chestnut in creosote or other wood-preservative. A fence comprising cleft chestnut pales and oak or larch posts should last a lifetime. This has not been the experience hitherto, because of the wire used to bind the pales to each other. In the production of the fencing the wire is subject to torsion; unless, therefore, there is perfect cohesion between the spelter and the steel of the galvanized wire used, the spelter coating will crack and flake.

By using what is known as "wiped" galvanized wire the cracking and flaking of the spelter is reduced, because the cohesion between the spelter and steel in this class of wire is practically perfect; but this perfect cohesion is only obtained *by wiping part of the spelter off the wire as it emerges from the galvanizing bath*; consequently the underlying steel has very little protection.

Wire can be galvanized by a method known as the Crapo process, for which patents were granted in 1924 and 1925. It carries considerably more spelter than "wiped" galvanized wire, and it can be bent acutely, twisted and flattened, without breaking the spelter or causing it to flake or peel.

Cleft chestnut fencing should be split only from poles which will provide pales of not less than 2 ins. on the face and 1½ ins. on each arris, and the pales should be fastened to each other with four strands of 13-gauge English drawn galvanized wire.

IRON AND WIRE FENCES

A fence of either iron or wire is a substitute for wood. Though such fences can be erected at a low cost, unless the panels are strongly fixed to posts the fence will be short-lived, and instead of being economical may prove expensive. If wood posts are used these should be treated with creosote. Concrete posts may be substituted for wood posts, but owing to their excessive weight and the careful handling they require the fencing will take longer to fix.

A pointed bar fence is not considered safe where there are children.

The appearance of a strained wire fence naturally gives the impression of cheapness, but it must be borne in mind that the fixing of such a fence requires considerable attention and time to get the wires tight enough to withstand pressure. It is absolutely necessary that all end, corner and line posts should be placed so that the ground will have time to settle and harden around them before the fence is strung. It is more essential that the end and corner posts be placed some time previous to the stringing of the wire. The posts should never be fixed during frosty weather. The wire can be strung whenever there is time for this work after the ground has become thoroughly consolidated. Whether the posts are set or driven they should be kept in a straight line with the ends of the fence.

COMPARISON OF COSTS

Wall built in stock bricks with lime mortar: 14-in. piers, with panels in 4½-in. brickwork; height of wall above ground level, 4 ft. 6 ins.:

12s. to 15s. per lineal yard.

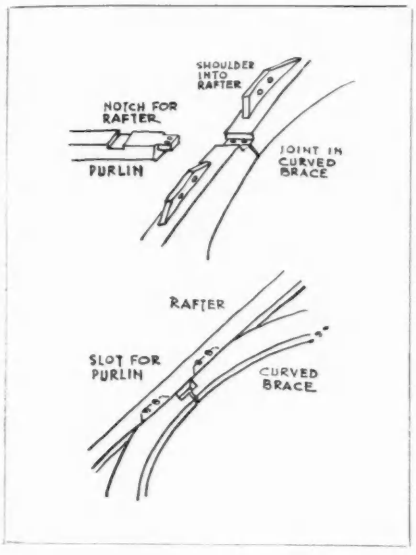
Cleft oak boarded fencing, in 9-ft. panels, with oak posts 7 ft. long, 5-in. by 4-in. butts, 2 ft. 6 ins. long, oak arris rails ex 3-in. by 3-in., two to each panel, oak gravel plank, 6-in. by 1¼-in., with oak centre stump, 2-in. by 2-in., oak counter rails, 2-in. by 1¼-in., with oak capping 2½-in. by 1½-in., and cleft oak pales 4 ft. long; sufficient oak pins (two to each post for pinning top rails), and the necessary 1½-in., 2½-in. and 3-in. galvanized rose-head nails; posts morticed and rails ended; 4 ft. 6 ins. high:

10s. to 12s. per lineal yard complete.

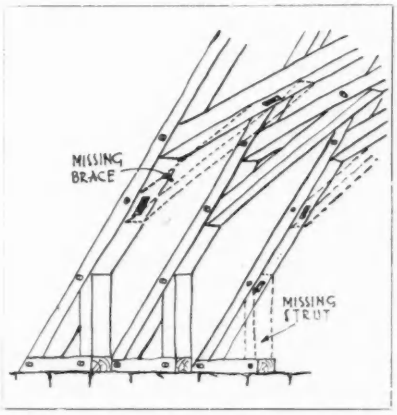
Open palisade fencing, in 9-ft. panels, with larch posts, 7 ft., 5-in. by 4-in., sawn 4 ft. 6 ins., fir arris rails ex 3-in. by 3-in., two to each panel, and fir

palisades, pointed, 4 ft. 6 ins. long, 3-in. by ¾-in. (for spacing 3 ins. apart) necessary pins, and 2-in. wire nails; posts morticed and rails ended :

4s. 6d. to 6s. 6d. per lineal yard complete.



Note : A saving of 1s. 6d. per yd. could be effected by the substitution of a lighter type.



A continuous iron fence with either blunt or spear heads varies considerably in price according to the sizes of the bars and standards, but a wrought-iron fence, 4 ft. 6 ins. high, in 9-ft. panels, constructed with ⅝-in. round uprights at 4⅞-in. centres, 1½-in. by ⅜-in. horizontals and standards, standards with pronged feet and each with side stay, 2 supports under each bottom horizontal rail, complete with necessary bolts and nuts for fixing, could be purchased for :

From 7s. to 8s. per yard.

The Repair of Old Roofs

IN writing a specification for repairs to old roofs, it must be borne in mind that the ultimate object of such work is the preservation of existing work rather than its replacement with new. To strip and entirely rebuild is often the line of least resistance, and one that is specially tempting to the specification writer. It saves him the labour of long and difficult descriptions and minute detailing, and allows him to fall back on such phrases as " strip and give credit for all old tiling," and " replace with new all decayed and defective rafters." Before writing any part of a specification, a full and detailed survey should be made, and notes, and if possible sketches, taken of all joists, connections and special constructional peculiarities. Inquiries into the present local practice

and the comparison of present with old local materials will often help to determine whether it is safe to allow the traditional methods to be practised, or whether a detailed description must be given in the specification of some old method of work that is to be followed in the repairs.

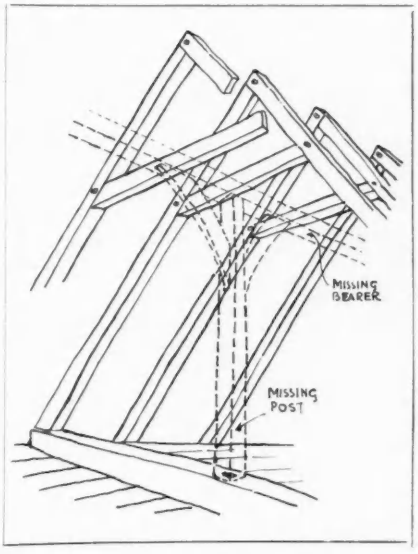
Failure in the structure of old timber roofs is generally due to :

1 : The decay of the material of the members.

2 : The removal in the past of some apparently valueless but really vital part of the structure.

In spite of the magnificence of the ornamental roofs of the Late Middle Ages, the science of construction was little understood, and the carpenter lagged far behind the mason in the mechanics of building. Many old roofs rely for stability on the enormous margin of safety of the timbers, reinforced by the generous thickness of old walls.

MISSING PARTS



The simple beam roofs, which are really nothing more than a flat firred up from the joists, present but slight difficulties, and it is only the covering, which is usually of lead, that need be carefully specified. Couple roofs were often erected without ties of any kind, and even when a collar is apparently old an examination of the foot of the rafters may show that the wall plate had already been pushed nearly off the wall before it was inserted. In repairing these roofs a collar should be added to every fourth or fifth pair of rafters, as low down as possible, and if the walls are out of plumb some form of tie rods should be inserted at intervals.

In a roof of the braced type the braces under the collars have sometimes been removed, but the mortice holes should be visible on the inside of the rafters and the restoration should be required of all braces.

Another support that may be missing is the vertical post on the inside face of the wall. This is not the main plate, for on thick walls two plates were often laid—one near the outer edge and the other flush with the inner face. The rafters rest on the outer wall plate, and on the inner is placed the short post mentioned above. The two wall plates are connected together at intervals by cross-pieces, halved on to them. A variant of this construction, which is probably an improvement, has only a single wall plate fixed near the centre of the wall, and the rafter and vertical post are housed into a cross-piece, which is notched over the plate. This gives a wide and strong bearing to the feet of the rafters.

Sometimes the vertical parts are replaced by curved members which rise as high as the purlins. The purlin is slotted through this at the point where it is connected to another curved member completing the arch form and replacing the straight collar. This is a weak type of roof, as the cross brace is too high up the rafter; and if there are signs of spreading, a rod of stainless steel should be inserted as low down the rafters as possible.

In some old houses the enormous beams across the bedroom ceilings have given rise to the legend that the lofts above were once the hiding-place of smugglers. The stories may or may not be true, but in any case before specifying the restoration of such a roof a careful examination should be made of the upper sides of these beams. Any signs of mortice holes will probably mean that old king or queen posts have been removed. It must always be remembered that the tie beams of old roofs performed a duty different from their descendants. As its name implies, the modern tie beam is a member chiefly in tension, but the old tie beam was often responsible for supporting a direct load at the centre transmitted to

it by a sturdy king post, which in its turn supported a longitudinal beam under the collars, or even directly below the rafter heads. One should always notice if the tie beam has dropped, for if it has, the whole system of support for the rafters becomes inoperative. Frequently one finds the foot of the king post pulled out of the mortice, and the extra weight thrown on to the adjoining beams. After making the ends of the tie beam secure, a longer king post should be inserted and wedged up tightly. Never try and pull up the tie to the foot of the loose post as in modern trusses; this only increases the damage already done, for the roof is not a scientifically constructed truss.

The curved wind braces under the purlins are frequently missing, and should be replaced, as they stiffen the structure against gales.

If no old timbers are available to replace the missing parts, seasoned timber, park grown and winter felled, should be specified, and if it is possible to leave it six months after being cut to the scantlings all the better. Never replace old timber by new of smaller dimensions; the economist may grudge the unnecessary cubic feet of good oak, but, as has been said, old roofs are not scientifically constructed, and one never can tell what unexpected stress may suddenly come upon a member.

DECAYED TIMBERS

When roofs have failed through decay, it is usually by dry rot or the worm now notorious as the Death Watch beetle. Dry rot will attack the confined portion of the structure, such as the ends of tie beams and rafter feet. These beetles, or rather their offspring, are more adventurous and cunning. These grubs make their attack from the inside of the beams, so that, like a decayed tooth, the timber which appears sound on the outside is nothing more than a hollow shell.

After the discovery of the damage done to Westminster Hall roof by the beetle, its suspected presence is a serious cause for alarm, but timbers which show signs of the ravages should be examined to see if the pest is still active. In a hidden roof, a good dressing of creosote or other preservative to be well brushed in should be specified, but it must be remembered that many of these compounds stain the wood, and are therefore unsuitable for open timber roofs. Against dry rot, carbolic acid or corrosive sublimate may be used, but this latter is such a deadly poison that only expert men should be allowed to handle it. On the Westminster Hall roof a liquid formed of sulphur dioxide and camphor was used which was found satisfactory, and was stated to penetrate without staining the wood.

It is seldom necessary to dismantle a whole roof or to reject members that have partly decayed. A rotten end to a rafter or tie beam can be cut off and a new piece scarfed on, the length of the scarf being about three times the greatest depth of the timber.

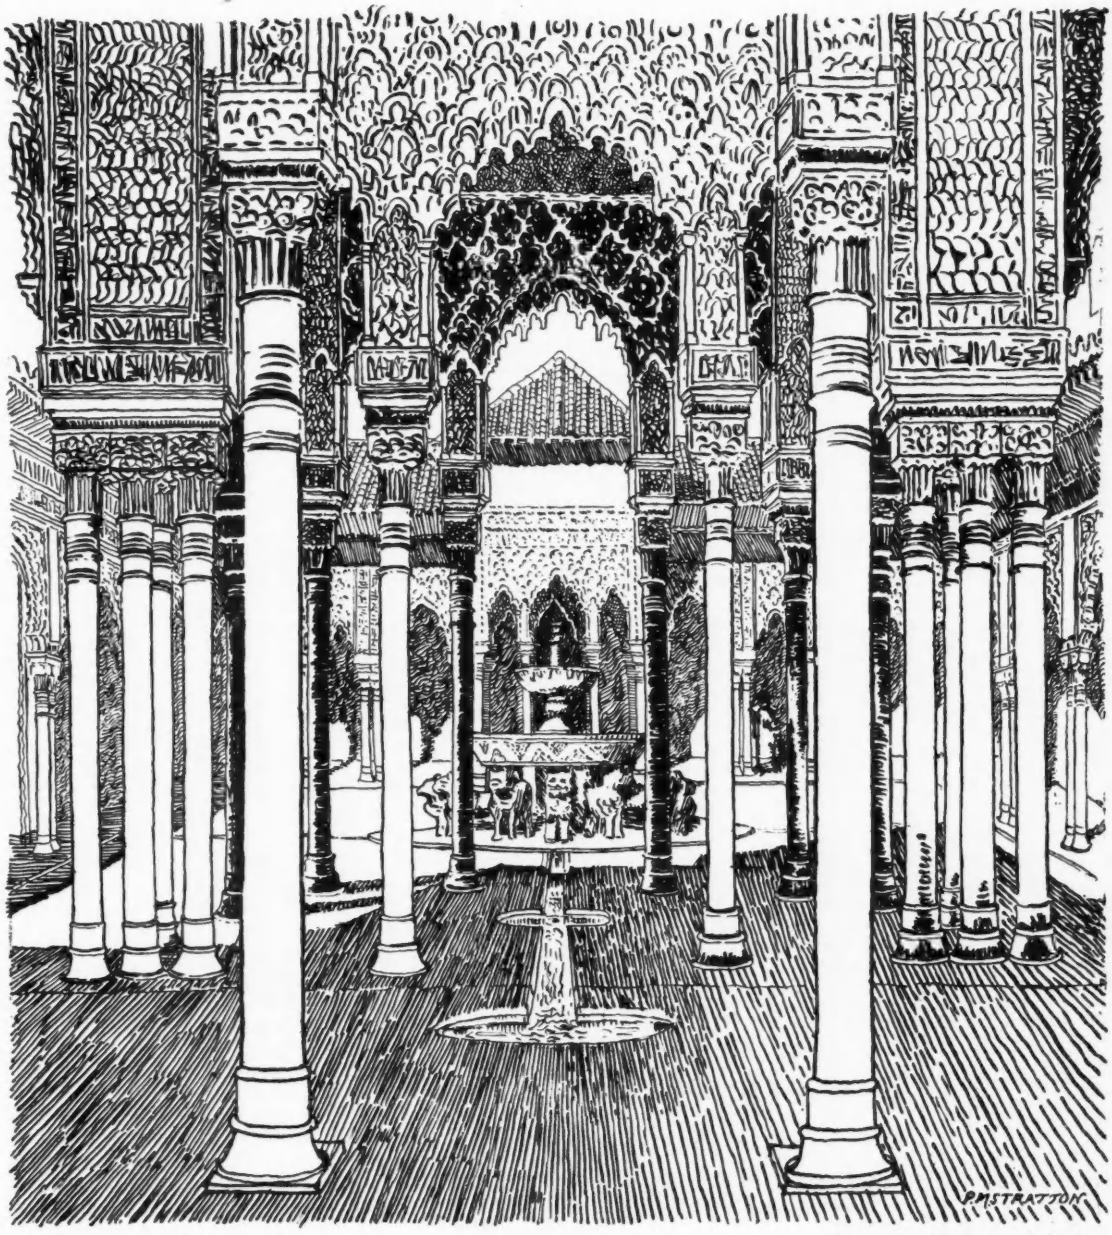
In ornamental roofs with moulded beams and purlins it is often found possible to specify that new timber shall be bolted to the rotten inside after clearing out the decayed wood, thus leaving the appearance from below undisturbed. The condition of all joists should be thoroughly examined; often the tenons are rotten, pins loose, and the member otherwise sound becomes merely inert instead of doing the job for which it was shaped. Old timbers were always pegged, and in repairs this method should be continued. Another point to look for in making an inspection is the carpenter's marking of the joists. If the roughly-cut squares or circles agree on the two pieces of timber that have been brought together, there is no doubt that it is the original timbers that are being dealt with; but if the joist markings do not tally, it is probable that the roof has been rebuilt at a later date, and may in fact have been transported from another building. LL. E. W.

Dinner to Dr. Sabine

IN spite of the very short time available to make the necessary arrangements, a very successful dinner was given to Dr. Paul E. Sabine, at the Hotel Metropole, on Tuesday evening of last week. The research work initiated by his uncle, Prof. Wallace Sabine, and so ably carried on by him, is still the basis on which all acoustical work, both theoretical and practical, rests.

Mr. A. G. Huntley, who has been closely associated, on the practical side, with most of the acoustical work carried out in this country, and his friends are to be congratulated on seizing the opportunity to show this country's appreciation of the work of Dr. Sabine on his first visit to London. Dr. Sabine is on his way back to America after delivering lectures to the Architectural Congress at Budapest, and only spent a few days in London.

Dr. Sabine, during the dinner, said that acoustical demands need not impose serious limitations on the architect's freedom of expression. In fact, rooms designed primarily with acoustics in mind were not only architecturally queer but more often than not they were acoustically disappointing. Certain forms were known to be acoustically bad and should be avoided, or if used, should be modified to alleviate their defects.



A few were cited as follows: 1: The cruciform Gothic type of structure for non-liturgical churches. 2: Circular or semicircular plans surmounted by spherical domes, with centres or axes of curvatures falling close to the head level of the audience. 3: Barrel vault ceiling with curvatures such that sound reflected from the ceiling would be focussed in any portion of the audience. 4: Monumental buildings to be used primarily for audience purposes.

These were the more important restrictions which good acoustics placed on design and these need not rule out entirely designs which, broadly speaking, would come under those descriptions. Thus, all of the older types of opera house were essentially circular in plan. They were, almost without exception, acoustically good, due to the fact that the encircling tiers of boxes and galleries provided openings from which sound was not reflected, with the result that sound which would be reflected from a continuous surface causing reverberation, was absorbed by the clothing of the auditors and the furnishings of the galleries.

The other two factors in the acoustic properties of rooms were size and the character of the finished surface, both of which affected the reverberation in rooms. It was the outstanding feature of W. C. Sabine's pioneer work to show that within very wide limits these two factors could be controlled so that any desired degree of reverberation might be secured, and this had been shown to be the most important single factor in the acoustic properties of rooms. Reverberation increased with volume or cubic contents and decreased with sound-absorbing power. The part played by the acoustic specialist was largely in helping the architect to make this adjustment in any proposed room. The development of materials that possessed the property of absorbing sound, and were suitable for exposed finished surfaces, was a matter of recent years. Today, the architect had at his disposal a considerable number of materials, fireproof and structural and without serious limitations as to possibilities of decoration, and which might be used for the control of reverberation.

The part of the acoustic specialist was not to dictate design but to modify details and to recommend means of avoiding acoustical disaster. To do this he must have a scientific knowledge of the absorption properties of materials. Laboratories for securing this data were now available. It was important that the methods of measuring absorption coefficients should yield results that were applicable to problems of reverberation. In other words, the reverberation method devised by Sabine, of determining absorption properties of materials, should be employed.

[A list of those present appears on page 528.]

THE BUILDING EXHIBITION

SUPPLEMENT THE THIRD

FLOORS AND PAVING

The Importance of Non-Slip Materials

BY KENNETH M. B. CROSS

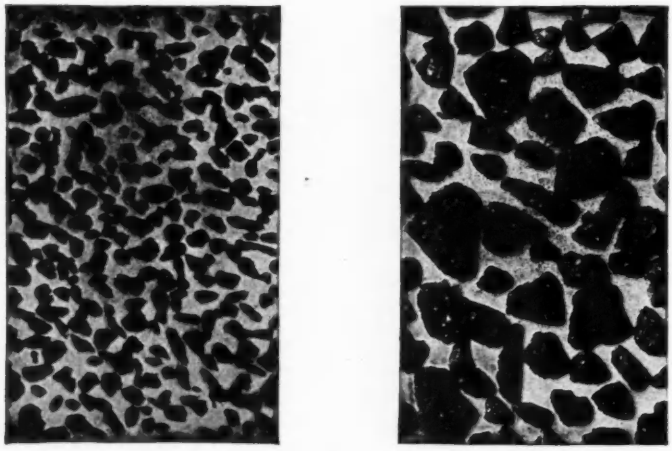
ONE of the most difficult problems which architects are called upon to solve is the provision of durable, impervious, non-slippery and attractive pavings for the various purposes required in modern public buildings. Pavings that will not be affected by changes in temperature brought about by artificial heating methods, that will not crack, chip, craze nor fall into a premature decay through heavy usage, pavings that will retain their impervious nature, their colour and their texture, are required under conditions that are increasingly exacting as the speed, congestion and pressure of modern life increase.

In the consideration of finishings of a building, whether the walls, floors or ceilings, it must be presumed that the main structure will be reasonably free from movement. Where reinforced concrete construction is employed for the bridging of large spans, expansion and contraction are almost inevitable.

In steel-framed buildings the movement is less perceptible. If the main structure is not entirely rigid, cracks and defects in finishings which possess no elasticity are inevitable.

Messrs. the Kleine Patent Fire Resisting Flooring Syndicate, Ltd., at their stand at Olympia exhibit the methods adopted in the construction of their well-known patent floors. Many advantages are claimed for their various patented components.

The fact that over 3,000,000 yards of these patent floors have been used in modern buildings throughout the country is in itself evidence that architects, surveyors and engineers put implicit faith in this system.



The floors are designed to form an integral and cohesive part in the modern steel-frame building, and it is claimed that they are completely fire resisting. The steel reinforcing rods are completely cased in concrete, which protects them from heat in case of fire and which effectively insulates them from the ordinary atmospheric effects which might otherwise be detrimental to the steel through the formation of condensation and ultimately of rust. For speed of erection, economy consistent with efficiency, and for covering large spans, these floors justly earned the reputation which they enjoy.

Messrs. Kleine's stand is lined with the patent surface flooring material known as Duromit. This floor is, it is claimed, dustless, hard-wearing and non-slippery. One of the greatest difficulties experienced with impervious floors which are called upon to resist the wear and tear associated with modern industrial conditions is that they have been found liable to disintegration. Small particles have in the course of time become detached and have formed a film of dust which has in some instances had a detrimental effect on costly and elaborate machinery. It is of course vital that in certain factories where instruments of precision are made or where there is delicate and elaborate machinery the atmosphere should be entirely free from dust if damage to the extent of some hundreds of pounds is to be avoided. It is generally recognized that few of the surfaces employed at the present time for floors, pavements, platforms, roads, etc., subject to hard wear are really lastingly satisfactory. Duromit floors are composed of crystals and crystalloids which according to the Mohs scale approximate to the ninth degree of hardness and are second only to diamonds in this respect. It is claimed that they are harder than iron or steel and approximately equal to the hardness of sapphires and corundum. The manufacturers state that such a floor will withstand the heaviest traffic, remain free from dust, waterproof and non-slippery whether laid under cover or in the open.

The Duromit surface may either be laid *in situ* on a cement and sand screeding or it can be used as a surface by slab makers. The largest of the small particles employed will pass a $\frac{1}{12}$-in. mesh and the material accordingly works very easily; the surface thickness varies from $\frac{1}{4}$ in. to $\frac{3}{8}$ in. according to the nature of the traffic it is likely to be called upon to withstand. The minimum thickness of the screeding should be $\frac{3}{4}$ in.

Messrs. Kleine also manufacture the Silentium sound-proof floors. With the increasing and tumultuous din, apparently inseparable from modern civilization, caused by various forms of "music" mechanically reproduced, traffic with grinding gears and solid tyres, pneumatic drills and other impediments to quiet and concentrated thought, no adequate and efficient method of mitigating the effects of such phenomena can be ignored. In any building quiet and silence are desirable; in buildings in which any form of mental work takes place they are essential.

The Safety Tread Syndicate have specialized in the manufacture of stair-treads known as Mason's patent non-slipping stair treads. The medium more generally used in these treads is of two kinds, viz., lead and carborundum used either separately or together. Carborundum gives an excellent grip, but when sprinkled on the concrete in the ordinary way it has a tendency to cut up the concrete when the granules are released by wear. The patent composition used in these treads, on the other hand, holds the grit more effectively. Steel and lead are also used in combination, the steel being grooved; but in our opinion the patent grooveless non-slipping hygienic tread, which consists of alternately arranged fittings of lead and carborundum, is excellent in every way where rough wear is to be anticipated.

Floor finishings, with fine, and coarse Alundum aggregates.

Diamond tread in brass frame.

Diamond tread in aluminium frame.

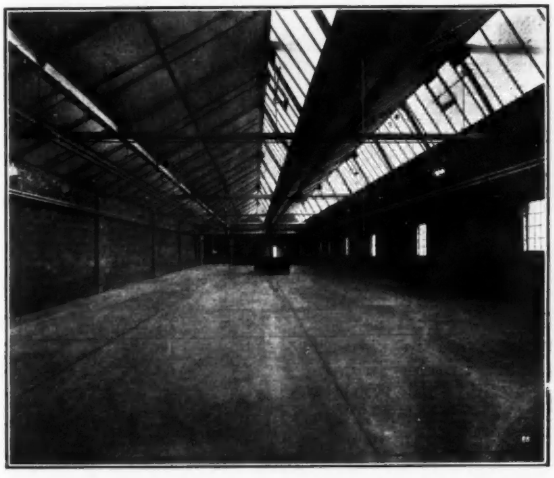
One further product of the Safety Tread Syndicate deserving of special note is their silent interchangeable rubber stairtread. Small squares of rubber are inserted in a steel frame, and they possess the merit of being easily renewable. Less harsh to the tread and silent, they are more suitable for offices than are what may be termed the heavier types of tread referred to above.

The Diamond Tread Company exhibit at Olympia sections of their grooved and grooveless stairtreads, consisting of steel or cast iron, brass or aluminium framings, filled in with patent non-slipping material. The grooved sections vary in width from 5 ins. to 1½ ins., and the grooveless sections present an unbroken upper surface of patent non-slipping material. "L" section treads are also supplied in aluminium or brass framing and are suitable for hotels, shops and restaurants. A special section is designed for steep staircases where the nosing is chiefly used.

Diamond non-slipping tiles and mosaics deserve attention, being composed of sparkling grit and hard cement which, when combined with ordinary tiling and mosaic, make an attractive and extremely practical floor which will not become slippery when wet.

Ferodo fabric steel stairtreads are applicable to wooden or concrete steps. Made in a standard width of 4 ins. the secret of their safety lies in the closely woven fabric bonded by the same special process as the well-known Ferodo brake and clutch linings. They are ready drilled and are accordingly quickly fixed.

Special white fabric stairtreads are made by the same firm for fixing to ordinary pile stair carpets as a means of ensuring safety and also protection to the carpet at the vital spot.



"Alundum" floor finishings are quickly earning the popularity in this country which their extensive use in the United States has promised. The pavings are in various forms to meet varying requirements; for instance, they can be laid in the form of terrazzo, giving a continuous surface and enabling core skirtings and angles to be worked at the junctions of walls and floors. Alternatively "Alundum" floors may be laid in the form of small tesseræ of varying colours of approximately 1 in. square, laid either with straight joints or to break joint. A carefully designed floor of this type is of a most attractive appearance, and in this respect is frequently superior to terrazzo. The tesseræ can also be supplied in hexagonal form. A final alternative in "Alundum" floor finishings is in the form of flooring tiles made in the usual building sizes.

The trade mark "Alundum" designates special brands of electrically fused alumina and of products made from these materials. The flooring, whether of terrazzo, mosaic or tile, is extremely durable, wear-resisting and non-slippery, wet or dry. It is claimed that no amount of traffic will wear these floors smooth though the surface is without grooves or corrugations.

In the construction of such buildings as swimming baths, whether public or private, open air or closed, where water is likely to be splashed on the surrounding bath platform or side-walk, it is essential that every precaution should be taken to avoid slipping. This is of the greatest importance at the nosing of the pond from which divers take off, and neglect of this matter has led to serious accidents. Floor finishings of the type referred to offer a safe and firm foothold to bathers under all conditions.

The Adamite Co., who market "Alundum" in this country, exhibit at Olympia details of fifteen special treads for staircases, which are claimed to be non-slipping and wear-proof, by the use of "Alundum" in the form of round-nosed tiles, straight-edged tiles, ceramic mosaic tiles and crushed "Alundum" aggregates.

Few floor coverings are more useful and attractive for offices, public buildings, steamships and certain portions of domestic houses than rubber either laid in continuous lengths or in the form of tiles. If a soft, impervious and easily-cleaned floor is required it is obtainable in rubber—any colouring is procurable and all forms of geometrical pattern can be easily made. The use of rubber for floors is com-

Duromit floor in Jacobs' new biscuit factory at Leeds.

paratively in its infancy at the present time; it is silent, economical, easily cleaned, impervious and attractive in appearance, and, moreover, when laid by the manufacturers it will be guaranteed under proper usage not to "come up." Clean, quiet and sanitary, practically everlasting, resilient and comfortable, such floors for general purposes are unrivalled.

Messrs. Leyland exhibit the specimens of their well-known rubber flooring, which should be inspected by all interested in progressive building.

The St. Helens Rubber and Tiling Co. show samples of rubber floor coverings which are supplied in all colours in the form of tiles and which can be made up in continuous lengths to any geometrical pattern required. The machine-cut rubber tiles supplied by this firm have slightly concave edges which allow the fixing cement to enter between the tiles and form a homogeneous hair-line joint on the surface. It is claimed on this account that the tiling will not creep, curl or lift, and that it is thoroughly waterproof.

The St. Helens rubber tiling is solid rubber throughout, thus ensuring that the life of the material is multiplied many times. Full advantage is taken of the resiliency of the rubber, and the colours are not superficial but are continuous throughout the thickness of the flooring.

The Ioco Rubber and Waterproofing Company have installed rubber flooring in many of the most important buildings in London, Birmingham, Glasgow, Edinburgh and Dublin. It is made in thicknesses of $\frac{1}{8}$ in. upwards, and on account of its durability it is claimed to be the most economical type of flooring in use. It is resilient, silent, easy to clean and hygienic, and merits the favourable consideration of all architects and others interested in the design of modern buildings.

The Cork Insulation Company are makers of the Eldorado cork tile for flooring purposes. Such floors are durable, noiseless and pleasant to walk upon. They are non-slippery, warm to the touch and dustless. The cork as it comes from the tree is ground, cleaned and compressed into blocks, and then baked; the latter process cements the particles into a firm mass by liquifying the natural gum in the cork. The baking also imparts a rich brown colour to the cork, which is permanent and which varies in shade in proportion to the duration of the heating process. The tiles are supplied in two thicknesses, $\frac{9}{16}$ in. and $\frac{3}{8}$ in., and in varying sizes, so that considerable variety in pattern effects is obtainable. The tiles are hygienic, silent, non-slippery, and when polished are most attractive in appearance; moreover, they are not expensive.

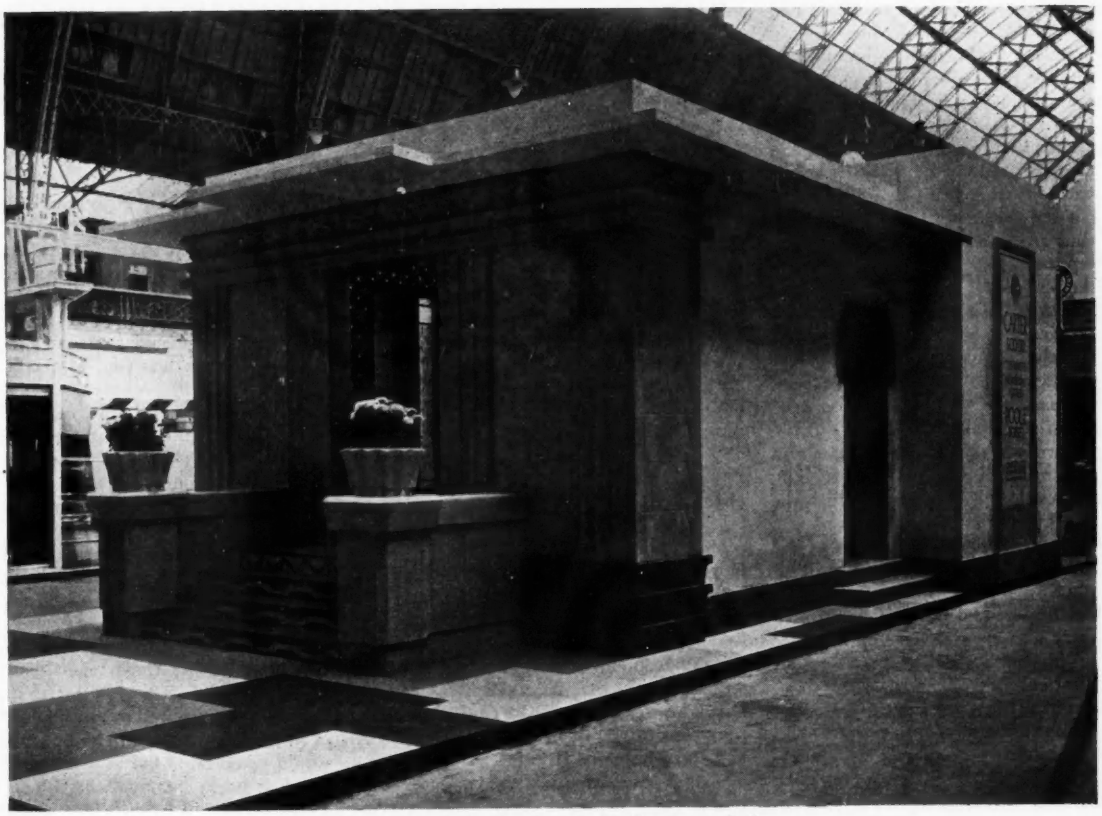
LONDON'S BUILDING ACTS: ii

The Need for Revision

BY H. D. SEARLES-WOOD

IN July, 1930, a conference was called at the R.I.B.A., when the following bodies were represented: The R.I.B.A., British Steelwork Association, Building Industry Council of Review, Institution of Structural Engineers, London Master Builders' Association, London Employers' Association, National Federation of Building Trades Operatives, Incorporated Association of Retail Distributors, and the Hotel and Restaurants Association.

A deputation waited on the Minister of Health, the Rt. Hon. A. Greenwood, at the House of Commons and was introduced by Mr. J. Walker, M.P.



Mr. Louis Smith made the following statement, and his views were supported by Mr. Maurice Webb, Sir Woodman Burbidge, Mr. Coppock, Lord Ebury, Mr. Kavanagh, and Sir Francis Towle.

We wish to call attention to the extent to which the control of building, especially in London, has become a serious menace to enterprise and employment not only in the building trades but in the vast number of ancillary trades whose welfare is vitally dependent upon the building industry. There is no doubt that the cumbrous and bureaucratic control so often exercised far exceeds the limits necessary to safeguard public health and safety which we, no less than the authorities concerned, consider it our business to secure. This control, especially in the sphere of commercial and industrial buildings, is exercised under Acts which in many cases date back to the last century, imposes very serious restrictions upon the use of modern materials and methods of construction, and has given place to the growth of administrative machinery which needs drastic simplification.

If the revolution in building construction which has occurred during the last thirty years, due to the introduction of steel and reinforced concrete, to the vastly improved methods of sanitary services, and to the invention of new and improved building methods and materials, continues at the same rate in the future—and who shall say

The stand of Messrs. Candy and Company, Ltd.

The stand of Messrs. Carter & Company, Ltd.

The stand of the Anglo-Colonial Trading Corporation, Ltd.

that it will not?—no Act of Parliament can be kept up to date unless wide discretionary powers are given to those who administer it. In the use of these discretionary powers, complex and inelastic methods are almost bound to creep in, and while a relaxation of provisions in the Act suitable for the time it was passed may be granted, this is apt to lead to further restrictive regulations which not only were not contemplated in the Act but are in many cases unnecessary.

This deputation suggests, therefore, that as a first essential the law in London ought to be as susceptible to constant revision as in the provinces, otherwise it will become out of date almost as soon as drafted.

We are conscious that a great deal has been done towards simplification and uniformity of control in the limited field open to the Ministry through the model bylaws and otherwise, and we see no reason why statutory revision should not now be considered by Parliament to bring such control as is deemed necessary in the public interest into tune with the times, afford all local authorities a guide to securing public safety and health, and simultaneously give the industry a chance to develop as other industries by uniformity of practice and standardization.

The Building Industry Council of Review was recently formed to investigate and report on the lines upon which a rationalization of the building industry may be achieved, but we feel it necessary to emphasize that the reorganization and readjustment of the industry is rendered difficult if not impossible so long as the law is not co-ordinated for the whole country. The building industry represents not only a vast field for employment, but building costs are a first charge upon every form of commercial and industrial activity, and in assisting the industry to operate upon business lines rather than upon too rigid a regulation basis the Government can make a valuable contribution to the reduction of unemployment and clear the way for the industry to deal with the other vital aspects of building such as reorganization, standardization and finance with which it is faced.

Those bodies which now urge a reform and which are represented today have set up a Central Committee to co-ordinate the reports and recommendations at their disposal, and are prepared in conference with your Ministry to suggest lines upon which a solution of many of the existing difficulties and anomalies may be found. Their investigations have to a great extent been directed to close scrutiny of the conditions obtaining in the London area, where all building is controlled by Act of Parliament, is administered by different authorities, is subject to varying interpretations, and results in a degree of confusion and lack of uniformity which it is necessary to dispel.

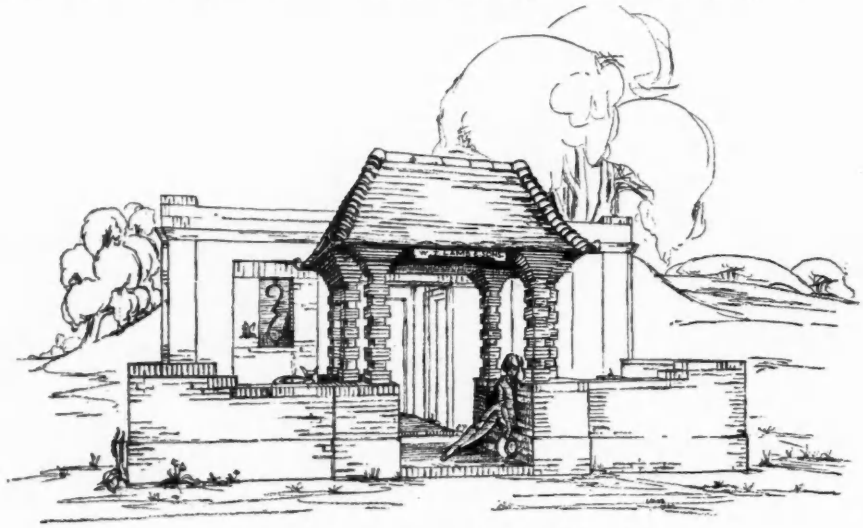
Miss Susan Lawrence has stated in a letter addressed to Mr. A. M. Samuel, M.P., that representations from professional societies in regard to the London building regulations have been lacking. The R.I.B.A. have been urging the amendment of the London Building Acts on the London County Council for ten years, and representations were made jointly by the R.I.B.A., the Institution of Civil Engineers, the Institution of Structural Engineers, and the Surveyors' Institution.

This deputation is of the opinion that building legislation should now be considered on a national basis, and should be confined so far as possible to broad questions of principle.

If the Government is in agreement with our views, the building industry would be prepared to set up a technical and economic advisory council which would review and report upon all aspects of building construction and control which are from time to time deemed necessary to meet the constantly changing conditions. Such a council would make the fullest use of our research and technical and standardization institutes, and would maintain a constant touch with the Ministry with a view to giving every assistance in maintaining a flexible and up-to-date code. At a time of such serious unemployment and industrial distress we urge that this vital question is ripe for review by the Government.

The Minister said in reply that he gathered that the difficulties of which the deputation complained were experienced chiefly in London, and that comparatively little difficulty had been encountered in the provinces. But in so far as Scotland was concerned, he would see that a report of the proceedings was sent to the Secretary of State.

As regards London, the matter was, of course, one for the London County Council to consider. Obviously he could not express any definite opinion until he had heard the views of the Council, but he could certainly assure the deputation that he so far sympathized with their representations that he would himself undertake to discuss the position with the London County Council. He was aware that, as Mr. Kavanagh had stated, a technical committee of the Department of Scientific and Industrial Research were about to issue an interim report on the technique of steel construction, and he hoped that this would facilitate the standardization of building practice throughout the country.



It is proposed to make suggestions for the consideration of the Minister on the following lines :

1 : By converting provisions of Local Acts into bylaws.

2 : By extending section 55 of the London Building Acts, 1930, for steel as for reinforced concrete.

3 : By empowering the Minister of Health to hear and decide appeals.

4 : By including a code of building practice in the Ministry of Health Model Bylaws.

A sketch of the stand of W. T. Lamb and Sons.

NOTABLE EXHIBITS: iii

THE stand of the ANGLO-COLONIAL TRADING CORPORATION, LTD. (Row S, 291), is built with the products of which the firm are the sole distributors. The exhibit is in three sections. In the first, Sheetrock gypsum wall and ceiling boards are applied, and the method adapted to join the boards together is illustrated. The surface of the boards may be decorated immediately the boards are fixed, either with distemper, paint or wallpapers. The walls of this section are decorated with Textone plastic paint, and the ceiling is distempered. The second section is devoted to Donnacona insulating wall and ceiling boards, a product of Price Bros., Ltd., of Quebec, Canada. It is of spruce fibre board, ½ in. thickness, and has two distinct surface finishes: as a base for plastering, or for conditions where wallpaper is to be used. One surface has a textured surface, which can be decorated with only one coat of distemper or paint. The third section consists of sound-proof rooms, constructed with the wall-board materials mentioned above and Riverbank eel-grass quilted blanket. Among other building specialities which the firm are distributing are Numetal weather strips, Silver Fleece steel wood, and Robras radiators.

*

The exhibit of THE SOMERSET TRADING CO., LTD. (Row E, 96), consists of a hipped roof tiled with Somerset patent interlocking tiles, made under the latest scientific methods at Bridgwater; the Somerset interlocking tile, in natural red, dun and brown; and the improved Somerset interlocking tile. Other products of the company shown are: Marseilles tiles; machine-made and hand-made sand-faced pantiles; double Roman tiles, ordinary pattern and interlocking; Abbey tiles, an attractive tile of old Spanish pattern; also pantiles and ridge tiles.

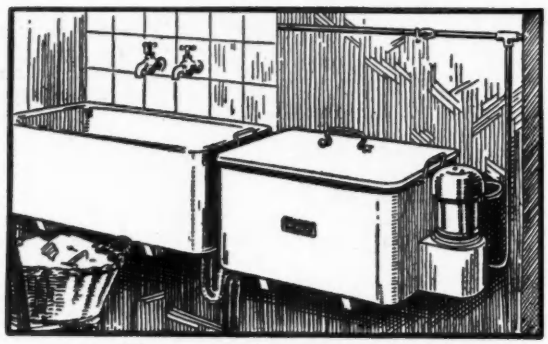
*

The exhibit of WHEATLY & CO. (Row D, 72) takes the form of a small building comprising eight main and six intermediate piers, built of red and brindled briquettes in varying colours. These piers support a hipped roof covered with red and brindled hand-made sand-faced roofing tiles, with projecting dormers in the centres of the side roofs. Underneath the dormers are the entrances to the stand which are placed between the centre piers on either side of the exhibit. A feature of the roof is the new pattern small close-fitting rounded hip tile. Between the piers, at a height of about 4 ft. from the ground, a quarry sill is fixed, constructed of 9 in. by 9 in. red round-nosed quarries. Above the sill the intermediate piers are composed of 6 in. by 6 in. multicoloured sand-faced octagon quarries up to the wall plate. Below the sill quarries and between the main and intermediate piers both inside and outside the stand on three sides are fixed vertical panels showing the different colours and qualities of roofing tiles made at the works. There are twenty of these panels, in every one of which different roofing tiles are shown, and two further panels are given up to the display of wall tiles which can be used on the outer walls of buildings as a protection against damp, and simulating ordinary facing brickwork. The centre space of the interior forms a gangway between the two entrances, the floor being covered with 8 in. by 8 in. red quarries with ½-in. joints. Underneath the hip end is a public space in which the different kinds of roofing-tile panels can be inspected. At the other end of the building is a space set out for use as an office, the floor being paved with 6 in. by 6 in. red octagon quarries, with blue dots and a blue strip border. The entrance to this office from the centre space is between two short piers, and on either side of the panels so formed are displayed various colours of pantiles. Other specialities of the firm exhibited on the stand include flooring quarries, garden edging tiles, ridge tiles, channel bricks, coping bricks, window-sill bricks, quarry fittings, air bricks, etc., in a wide range of sizes, colours and designs.

*

On the stand of SAMUEL ELLIOTT AND SONS (READING), LTD. (Row J, 179), a columned entrance leads to a central lobby, on the right hand of which is an oak-panelled room with ingle seats, a stone fireplace and an oak staircase with twisted balusters. The ceiling beams are of great age, having been recovered from the bed of the Thames when old Caversham Bridge was rebuilt. The floor is of elm boards of irregular width. The whole room is a fine example of domestic architecture of the sixteenth century. The room on the left of the central lobby is panelled in Early Georgian style with yellow pine, finished in the mellow tone that can be seen in work of the same date in South Kensington Museum. The central lobby has specimens of panelling. The exterior panels contain photographs and specimens of interlocking rail system panelling in oak and other colonial woods. There are also exhibits of work in hand, notably a reproduction of an old doorway to be fixed at the new police offices in Old Jewry.

*



RHODES CHAINS, LTD. (Row C, 43), are patentees and manufacturers of patent pulleys and improved sash chain for hanging all sizes of window sashes, shop fronts, lifts, blackboards, etc.; round-backed chains for running over ordinary round-grooved axle pulleys; patent ball-bearing cog and grooved wheel pulleys; patent sleeve-bearing axle pulleys, with solid brass face plates and rustproof frames, with round or square grooved wheels; steel, copper and brass chains for suspending, driving and lifting purposes; and sling, coil and ornamental fencing chains. This firm controls Greenwood's Ventilating Co., Ltd., who exhibit patent cast-iron larder lights; skylight ventilators, providing permanent ventilation with lighting; skylights, and deadlights; also patent Hoppa, louvra and Sheringham ventilators, and airbricks. They claim that their ventilating windows and skylights, made in cast iron, steel galvanized, zinc and copper, provide for efficient and permanent ventilation with lighting at low cost.

*

The main exhibits on the stand of L. G HAWKINS & CO., LTD. (Gal. 35), are the Hera electric washing machine and the Sprayit electric and petrol engine spraying equipments. The Hera electric washing machine is being largely specified by builders and architects as a standard feature on new estates. Several of the largest estates throughout London and the suburbs, also in the provinces, are already equipped with this labour-saving product, which can be installed at a low price. It is of a suitable shape and size to fit alongside of the sink, and the plumbing work necessary is inconsiderable. From a

Wood panelling by Samuel Elliott and Sons, Ltd.

The Hera electric washing machine.

housewife's point of view the Hera electric washing machine eliminates wash-day drudgery, for all that it is necessary to do, it is claimed, is to switch on, and the electric pump attached to the motor does the laundry work without rubbing or scrubbing, and without damage to the most delicate fabrics. The operating cost is approximately one penny per hour. The Hera can also be used as a boiler. With the Sprayit equipment it is possible to spray up to 1,200 sq. ft. per hour, thereby it is claimed cutting down application costs anything from 25 to 60 per cent. In addition to the two lines mentioned above, this company is showing examples of lighting fixtures which are already being installed by various builders as standard equipment.

★

MESSRS. GIRLING's main exhibit (Row H, 163) is reconstructed stone (Girlingstone), which is shown in the form of the lower portion of a bank front (by kind permission of Messrs. North, Robin and Wilsdon). The firm's representatives will be pleased to give all the necessary information in connection with its weather-resisting properties, density, absorption, resistance to frost and crushing strength. A further exhibit is Granostone steps, which have been extensively used in London's public buildings, cinemas, theatres, etc., and throughout the country. Resistance to hard wear is the main feature in this class of product. A small portion of a balcony is also shown, incorporating precast balcony steppings, as used on many of London's theatres. It is claimed that the rapidity and ease with which the units can be supplied and fixed make this product most valuable in the modern methods of speedy construction.

★

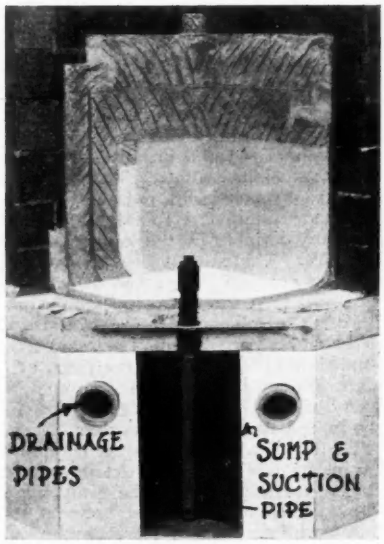
THE NORTH BRITISH RUBBER CO., LTD. (Row O, 269), are making a special display of rubber flooring. North British rubber flooring is to be found in many important buildings throughout the country. This flooring is made in a very large range of colourings, with plain, marbled and grained effects. Many new colours have been added to the range, enabling the flooring to harmonize with almost any scheme of decoration. North British rubber flooring, whilst it is clean and silent, has an added advantage in comfort and lasting wear. Other North British exhibits include hose, belting, sheet, diaphragms, and every kind of rubber equipment suitable for the building industry.

F. A. HUGHES & CO., LTD. (Row O, 253), exhibit their Triolin cellulose flooring for which the following claims are made: it is not a composition, is non-porous, contains no magnesite, will not oxidize or ignite from sparks. The cellulose constitution of Triolin combines great durability with a non-cracking flexibility. It has a smooth but non-slippery surface with a natural polish. It is unharmed by water, weak acids, alkalis or oil. Trio-Lincrusta is also shown. This is a washable wall covering with a strong, firm surface, and is made in a large range of designs and colours.

★

The joinery exhibited on the stand (Row F, 109) of BOULTON AND PAUL, LTD., in the main consists of standard doors, windows, gates, dresser, stairs and mouldings of the type extensively supplied for housing schemes and villas. Specimens of distinctive hardwood doors are shown to demonstrate the variety of the work manufactured. Estimates can be given for joinery to architect's details. All timber is seasoned in their own drying sheds, and all doors are morticed, tenoned and wedged together.

★



Models and tests are provided by KERNER-GREENWOOD & CO., LTD. (Row C, 42), to give proof of the effective protection against dampness which can be obtained by rendering walls with ordinary Portland cement and sand mortar, when these are mixed with a small proportion of Pudlo brand waterproofing powder. A wall of porous coke breeze concrete slabs is rendered, in two coats, to a stucco surface with sand and cement, waterproofed with Pudlo brand powder. A stream of water runs continually down the waterproofed cement surface the whole day long, and will run every day during the exhibition. This is a far more stringent test than any actual wall surface is likely to be called upon to withstand. The value of cement renderings waterproofed with Pudlo brand powder for the lining of water-containing structures is shown by a lily pool, actually built upon the floor of the exhibition hall. There are also model walls with renderings of waterproofed cement which serve as vertical damp-proof courses. Among many other interesting exhibits is a model showing how the renderings of waterproofed cement mortar are finished at the angles of the walls and at their junction with the floor to a basement in order to keep out flood water. The same principles of construction are followed when the renderings are used as internal linings to tanks or reservoirs.

★

On Stands 76 and 77, Row D, the UNITED STEEL COMPANIES, LTD., are exhibiting the products of various constituent companies, including: United Strip and Bar Mills, who specialize in ferro-concrete bars, plain, shaped, hooked or bundled, ready for fixing on site; Frodingham Iron and Steel Co., Ltd., makers of steel sections for constructional work, angles, beams, bulb angles, channels, flats, rounds, tees and zeds, also special sections for reinforced concrete flooring, and steel piling; Appleby Iron Co., Ltd., who exhibit steel plates; Samuel Fox & Co., Ltd., who make steel strip—cold-rolled, including stainless and non-corroding steel for shop-fitting and decoration.

★

To meet the growing tendency for cleanliness in the home and to ensure still greater economy in fuel consumption, SMITH AND WELLSTOOD, LTD. (Row L, 221), are displaying examples of their many popular lines. Excessive heat radiation from a coal cooker means an over-heated kitchen and a waste of fuel. Smith and Wellstood claim that a polished hot plate only radiates half the heat which a rough top plate radiates, and therefore there is a very considerable reduction in fuel consumption if the top plate is polished. The firm also claim that the enamelling of the body of a cooker also makes a marked difference in the heat radiation, resulting in a cleaner and cooler kitchen, and a further considerable saving in fuel consumption. Wellstood ranges and Columbian cookers are displayed in this new finish, and water-heaters of the Hydresse and Raydesse type are shown similarly finished. There is a big display of the Esse and

Kerner-Greenwood & Co.'s cellar-drainer, showing the manner in which the corner of a flooded cellar is treated. Water is collected into a sump underneath the floor which has a permanent suction pipe connected to a pump.

Chaudesse stoves. Samples of the Esse-Dura and Esse-Vista stoves will also attract attention, because these stoves are designed to burn any kind of solid fuel. The New Leader range and the Cow Brand portable boiler will interest those who are concerned in tenement property. A test of the last-named boiler, which burns coke or coal, is claimed to prove that one pennyworth of coal or smokeless coke will give as much heat as three-pennyworth of gas in a gas copper. Refuse of the house can be burnt in the Cow Brand copper.

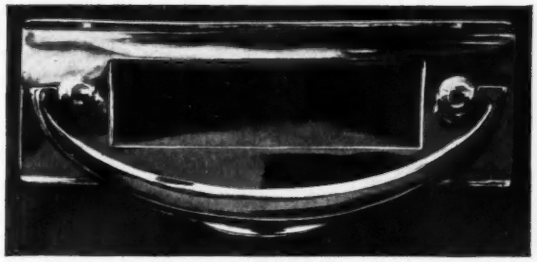
*

Among the materials which THOMAS AND BISHOP, LTD. (Row C, 33), show on their stand are the following : Cling-surface belt and rope treatment in liquid and paste form, Permac metal-to-metal jointing material for joints of all kinds, Savac wire rope and metal treatment, Flexo grease, a lubricant manufactured in nine densities, also various types of lubricators, Flexo leather and textile belting, Flexo refractory cements " A," " B " and " C " for building, repairing and bonding all brickwork in furnaces and boilers, Flexo tinning compound which is claimed to clean and tin in one operation, " aXo " radiator liquid for all repairs to radiators, and Cowell's patent mortice locks.

*

THE MIDDLETON FIRECLAY CO. (Row E, 93), are manufacturers of glazed bricks, tiles, partition bricks, white glazed fireclay, and sanitary ware. They also exhibit terra-cotta, plain or vitreous, in white, cream, mottled or colours, glossy or matt finish. Samples of tiles, scum channelling, graduated coring, spittoons, etc., are also on view.

*



One of the principal exhibits of WILLIAM BRIGGS AND SONS, LTD. (Row L, 220), is a new product called T.U.F. (Tenax Untearable Felt). It is an underslating felt which is claimed to be not only untearable, but thoroughly waterproof and to act as a " second line roof." The application of the material is demonstrated on the roof of a kiosk in the stand. Briggs' Challenge composite flat roofing system is to be seen on an actual flat roof, showing the formation of the flashings and the finish at the eaves and verges. Briggs' anti-corrosive bituminous solutions are shown in their four colours—black, red, grey and green. As usual, Briggs' dampcourses, Aqualite, Plastique and Challenge, form a feature of the exhibit.

*

Among the exhibits on the stand (Row M, 225) of GOODLASS, WALL & CO., LTD., is their Swansdown superfine enamel, which they claim works freely and flows out well; dries hard in twenty-four hours, has great elasticity and is exceedingly durable on exterior or interior work. It is used on the Cunarders and other work throughout the world. The following advantages are claimed for other exhibits : Valspar varnish, which will not turn white, successfully withstands the boiling-water test; is unaffected by exposure to sun, rain or snow, and dries dust-free in a few hours. Combinol flat-drying oil paint, which is a fine wall finish for all interior decoration. Two coats only are necessary. Combinol hard-drying gloss paint, which possesses great hard-wearing properties for inside or outside work and dries hard overnight. Goodlass' Brustane, a semi-transparent stain which simply requires thinning with turpentine, is very easy to apply, and faithfully reproduces natural woods. Pintesco washable water paint, a genuine pigment water paint that is perfectly bound and only requires thinning with water. Several panels are shown demonstrating Goodlass' privet greens, and all shades of Goodlass' fast red, of which the firm are the originators; also Galoxide applied on new corrugated iron, and Sealapore coating on new Portland cement.

*

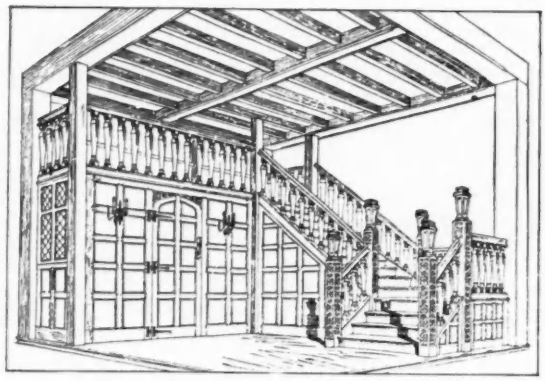
A door-knocker in Semprax, a new cast stainless steel.

Door, window and internal fittings in a new cast stainless steel, marketed under the name of Semprax, are outstanding features on the stand of NETTLEFOLD AND SONS, LTD. (Row H, 147). This steel is made by a new process, rendering it possible to cast practically any article which can be cast in brass. Fittings produced in Semprax have a brilliant mirror-like polish which, it is claimed, remains unaffected by weather conditions. They should be particularly suitable for public buildings, hospitals and offices, as well as private dwellings. Another interesting exhibit is the Nettleson friction pivot, now being used for school buildings by several education authorities in different parts of the country. J.B. window gearing, which has been supplied to many important public buildings, is shown in various types and finishes. This gearing, as well as panic bolts, a special rack bolt lock for banks, the Bardsley door spring and the Nettleson cleaning hinge for casement windows, are made in the firm's own works at Wolverhampton.

*

FRIGIDAIRE, LTD. (incorporated in Canada) (Row O, 257), exhibit the multiple system of refrigeration by means of which up to twenty-four cabinets can be operated by one compressor. The compressor is installed in the basement or any other convenient place. The firm claim that there are hundreds of thousands of residential flat tenants in seventy-eight countries receiving satisfactory refrigeration service from Frigidaire multiple refrigeration systems. When installed as a complete self-contained unit, the Frigidaire cabinet and compressor are both placed in the kitchen, pantry or larder. The compressor can be fitted in the base of the cabinet, or an enclosed compressor can be installed under the sink, or in any convenient position. The Frigidaire unit can be plugged into any convenient electric outlet. The new all porcelain Frigidaire cabinets are shown in a range of models from 4 to 18 cubic ft. These cabinets have an all porcelain exterior of silver-grey and white and with each the Frigidaire hydrator and cold control are standard. Frigidaire standard cold rooms, service cabinets, and wine coolers are also shown.

*



The 1930 exhibit of EASIWORK, LTD. (Row L, 216), should be inspected by all domestic architects and builders. Many housewives desire an Easiwork kitchen cabinet as part of the equipment of a labour-saving home. With the wide range of models now available, the designer of a kitchen can, it is claimed, by incorporating an Easiwork, add that extra efficiency obtainable only by large-scale organization and minute detail. Easiwork kitchen cabinets are being installed as standard equipment in houses selling from £475 upwards. One of the features of this year's Easiwork display is the exhibit of coloured kitchen suites which architects will find useful when making out original colour schemes. The suite consists of an Easiwork kitchen cabinet with extra storage units for all groceries and cooking requirements. A wireless loud-speaker is also incorporated. A modern sink with self-container, drainer and splash board; a gas range with many special features, an electrical refrigerator, and a china dresser, table and chair to match if desired. The suite is supplied in cream, green, blue or white.

*

Special features on the stand of J. H. SANKEY AND SON, LTD. (Row O, 261), are : Sankey's Pyruma plastic fire cement, the modern firebrick bond, for setting and repairing all kinds of firebrick structures. Pyruma, it is claimed, sets as hard as

A Frigidaire cabinet.

The stand of Messrs. John Sadd and Sons, Ltd.

Portland cement with or without heat, and resists high and intermittent temperatures without cracking or crumbling away. The New Improved Sankey down-draught preventing pot, a scientifically built and tested chimney-pot which traps the wind blowing from any direction. Fosalsil Moler insulating partition blocks, which provide the utmost insulation against heat, cold and sound. Sankmar, a plastic paint, is also exhibited.

*

The POWELL DUFFRYN STEAM COAL COMPANY, LIMITED (Row D, Stand 49) (sole vendors: Stephenson Clarke and Associated Companies, Ltd.), exhibit Presotim for all classes of wood and furniture. This is a British coal-tar product which is claimed to penetrate to the heart of the wood, thereby preventing decay. It colours the surface and displays the natural grain of the timber. Presomet, a bituminous black paint, is applied to any surface to protect metalwork against rust and corrosion. It is claimed to be acid proof and not to blister or peel off when exposed to the elements. Clay goods exhibited include salt-glazed stoneware pipes and fittings, 2 ins. to 18 ins. diameter, salt-glazed stoneware yard and street gullies up to 18 ins. diameter, buff chimney-pots of various designs and sizes, fireclay flue linings, burrs and slabs of various sizes, firebricks and common building bricks, pressed and wirecut.

*

The exhibit of JOHN SADD AND SONS, LTD. (Row N, Stand 234), takes the form of a faithful reproduction of a Jacobean hall and staircase in English oak. The woodwork is Essex grown oak, selected, and constructed in their Maldon shops. The panelling is framed and tenoned together by means of oak dowels. The electric light fittings have been specially designed to be in harmony with the surroundings, but of course, carrying "lights in bottles" (as the electric light was first described) instead of candles. These fittings have been made by Falk, Stadelmann & Co. The leaded lights are the work of Kent, Blaxill & Co., Ltd., of Colchester. The stand and fittings were designed by Mr. George Coles, F.R.I.B.A. Messrs. Sadd and Sons have been converting English oak at Maldon for over one hundred years.

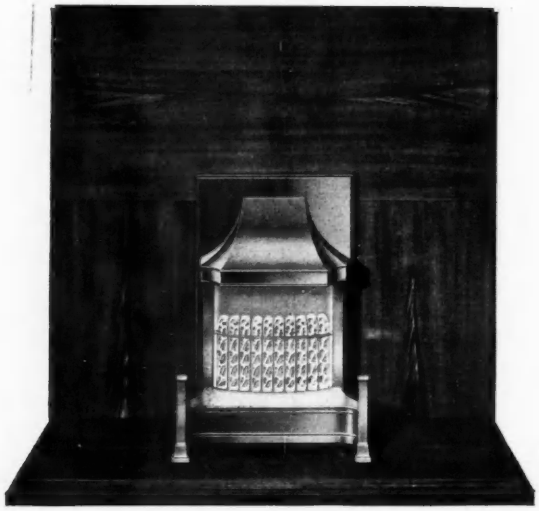
*

The stand of CANDY & CO., LTD. (Row H, 150), is in the form of a pavilion, in which exterior faience, glazed roof tiles, wall tiling and paving stones are incorporated. Inside are exhibited their Devon fires in various designs and colours. These briquette tile fireplaces can be had with or without a wood mantel, and it is claimed that there are over 100 different styles of Devon fire and 500 different colours. Samples of Wescontree ware are also on view.

*

OSTENS (BYFLEET), LTD., on their Stand 30 (Gallery), exhibit their Servway, a serving hatch so designed that the opening of one side automatically locks the other. It is claimed that it is impossible to see or overhear from kitchen to dining-room, and that there is no possibility of draughts or the infiltration of cooking odours. It saves walking, and serves food "oven-hot." The hatch is lined with Silveroid stainless metal. It is made in various distinctive styles to harmonize with different interiors, and can be used as a carving table and emergency safe.

*



J. GLIKSTEN AND SON, LTD. (Row E, 92), are specialists in thoroughly seasoned hardwoods of all descriptions, specially selected for the building trades; and hold one of the largest and choicest stocks in Great Britain. They exhibit various classes of mahogany, oak, walnut, teak, whitewood, etc., among which is a log of Cuba mahogany of exceptional quality and size. Their subsidiary companies are the National Plywood Corporation, Ltd.: specialists in plywood of every description for the building trades, who display sample sheets of various qualities taken at random from their vast and comprehensive stock. Gliksten Doors, Ltd., specialists in Columbian pine and Swedish redwood doors, show a range of Gliksten doors, union label. Messrs. Gliksten are sole distributors for Great Britain and Ireland of B.P., the all-British insulating board, the material for all forms of insulation and accoustical correction.

*

THE DAVIS GAS STOVE CO. (Row O, 268) have on view four complete gas fire settings —two of which are connected with gas and shown as if *in situ* in the apartment. Other exhibits include geysers, some connected; a complete kitchen suite, with Nautilus coke boiler and gas cooker; coke boilers, together with wash coppers; Nautilus coal grate in complete setting; cast concrete Economy flue block; and Marblate gas suites.

A Devon fire

A Davis gas fire.

OFFICIAL ARCHITECTURE

The Debate at Olympia

FOLLOWING is a report of some of the speeches made during the debate at Olympia on "Official Architecture." The debate was held under the auspices of the Association of Architects, Surveyors and Technical Assistants, and under the chairmanship of the Rt. Hon. Lord Riddell. The principal speakers were Mr. R. Wynn Owen, F.R.I.B.A. (architect, L.M.S. Railway), who moved " That the cause of architecture was served equally by the official architect and the private practitioner "; and Mr. H. V. Lanchester, who opposed the resolution. A report of the speeches made by Messrs. Wynn Owen and Lanchester appeared in our last issue.

Control of Territory Necessary

Mr. V. L. Nash, A.R.I.B.A., in support of the motion, said he was glad that Mr. Owen had made the necessary premise that official architects and private practitioners started from the same mark as regards training and competence, because that was a point which was frequently overlooked in discussions on the subject.

They start, he said, by saying that architecture is the most noble pursuit; they go on to say that the quality of a nation's architecture has a direct bearing on the quality of that nation's culture, and they give one to understand that on the part of many architects there is a passionate desire to see this country beautified. They give one the impression that they are architects first and men afterwards, and that they are better men afterwards for it.

Architecture is the most important thing in the world, and one wonders sometimes if this sentiment is not in fact an over-statement of the case. If you consider London today, you have slums still in existence, you have speculative builders erecting increasing quantities of badly designed houses, you have a traffic muddle, and in the rural areas you have a complete and increasing degradation, until you really ask yourself whether architects are really so passionately keen on this beautiful England they talk of. It begins to strike one that this sort of thing can be perfect, and we know that the future can hold a much more beautiful England, because we think we have laid our finger on the cause of the chaos which is to be seen about today.

Most people will agree that what we essentially need today is some sort of control. It seems absurd to suggest that we as a civilized nation should continue to sit still while people propagate ugliness. It is only too true to say that, as a mass and speaking architecturally, we are an ignorant nation. We cannot expect much from the public. We want to control not only elevations to streets, but we need to control whole towns, whole tracts of territory. The freedom of the official architect with his own designs was certainly equal to that exercised by the private practitioner. The former had to observe economy, and this he did to the credit of his buildings; the simpler the building the better the style of architecture. After all, the one thing that appalled them about the jerry-builder's houses was the encyclopædic lack of knowledge displayed.

Therefore, from this point of view there was a purer style, a more economic, a secondary architectural style being evolved from the office of the official architect than there was generally among private practitioners. Again, there was a quite definite cleanness and economy of motives in most of the works done by the Office of Works. To all real lovers of architecture he would suggest that they must feel that the type of architecture which was being produced by the official architect today was more clean, more rational, and more applicable to the standards of today than that produced by the private practising architect. To his mind, the private practice was largely gained through patronage.

Competition System Invaluable

Mr. H. D. Searles-Wood, F.R.I.B.A., opposing the resolution, said the leading article in *The Times* the previous week said the present-day ideas about the Civil Servant or other public official fluctuated between wide extremes. Some saw him as an efficient and far-sighted bureaucrat, quietly but ruthlessly gathering into his own hands all the threads of power. To others, or to the same people at other times, he appeared as a presumably well-meaning gentleman, floundering helplessly, a modern Laocoon, in strangling coils of red tape. But even an official should not be condemned unheard; if he were encouraged to speak, he might have quite a lot to say in his own excuse.

He would point out with truth that he could no more apply the same simplicity and light-heartedness to the conduct of public business than the private architect did in his practice. That he must, at all times, be ready and able to render an exact account of his stewardship and to give a full explanation of all that he had done or refrained from doing, not only to his superior officers but also, through them, to their master and his—the public. He must, even at some sacrifice of force and speed, put safety first. Hence detailed entries of receipt and dispatch, scientific filing, well-planned storage, full record of conversations, conferences and the why and wherefore of decisions—in fact, red tape. Therein lay the little tragedy—the machine waged its secular warfare against the spirit which gave it being. It did its best to mechanize the man. But there could be no doubt that for such buildings as post offices, barracks, prisons, railway stations, etc., where the special planning was constantly under revision and improvement, the official architect was in a very strong position with the accumulated experience and funds of information which were only to a limited extent available to the private architect.

He said he had a great appreciation of the official architect and the work he had done, but he supported Mr. Lanchester from the educational point of view. He thought that the competition system was a most valuable means of letting the private architect come into his proper position.

Official Architecture Justified

Mr. Sydney Perks, F.R.I.B.A., said he resented very strongly the slur often hurled at official architects that they did not do their own work. As far as his own experience went that was not true. He said he had served three years on a committee dealing with this most difficult matter, and the report that had been compiled was of intense interest, but although it had been presented to the Council of the R.I.B.A., they had not seen fit to print it. He thought that if the R.I.B.A. would print the report it would be a very good thing.

Mr. R. Coppock, J.P., L.C.C. (general secretary, N.F.B.T.O.), said he felt there was a considerable weight on the side of the official architect, especially in the way of providing the details, because the people who were responsible for him were desirous of seeing the job go with a swing, and in the main the details requisite for the building were executed with greater precision than by the individual architect. He said by profession he was a bricklayer, hence he knew the difficulties of waiting for details. The services rendered by both categories were quite good, but he did not know why the official architect should not stand on the same plane as the individual architect: both had created abortions and both had created magnificent buildings. It was true that the public were swayed by names, and it was equally true to say that the individual architect who got the name was so loaded with work that it was impossible to apply his particular skill on the work that was loaded upon him. It was not

so with the official architect, because he was responsible usually to a committee. If it was a municipality, its representatives were interested in the æsthetics of their town. There was something in a municipality that was not always in a private company. It was quite possible that it would be said that they were not spending their own money, but they were desirous of improving the town or city; but if it was a private company, they were desirous of putting up a building which would create attraction. None could say that the Imperial Chemical Industries building had deteriorated as a consequence of an official architect being employed. To his mind it was a magnificent structure. He thought that some of their best men had been compelled to take over official architectural positions because very few architects were good business men, and they were compelled as a consequence to take refuge where they need not become a commercial traveller, and where they could develop their art and their desires in a bigger and more satisfying way. Broadly speaking, architecture today was saddled to machinery.

The Influence of Machine Production

Machine production was determining a new type of architecture, and the individual architect had not got the opportunity, as a consequence of his training, to fit himself to the new machine productions that were at his disposal. He was pleased to open one of the technical journals that morning and see a wonderful perspective of the new cathedral in Liverpool; but let them remember this, that machine production was making standardization in the building trade a certainty. Therefore, there was little or no difference in the status of the official architect and the individual architect. He knew of buildings that had been erected by official architects whose standing was quite equal to the individual architect. There were bound to be men of outstanding ability that one could not associate with either official or individual work. He felt that for service the official architect gave equal service with the individual architect. There was a tendency amongst companies to employ their own architect and building staffs, not that it was cheaper, but that they were more mobile: the whole thing depended entirely upon the economic position.

After some further discussion, Mr. Lanchester said he had directed his argument not to the comparative merits of the official or individual architect at all, but to the ultimate tendency of the two systems. It seemed to him that the extension of the official system did make very markedly for a diminution in the progress of architecture, because, as he had said, competition was absolutely necessary. He personally had found architecture a very amusing job as a free-lance, and he would be very unwilling to exchange that position as a free-lance for a position in which he would be established for life in a definite function; but that might be a matter of personal temperament. It did seem to him that if architecture was made an official function and the individual architect was thereby extinguished then the inevitable result would be stagnation. His own experience of public and official bodies had been that once they had established a routine method of design they were difficult to move. It seemed to him that it would be found to slow down progress in architecture if the independent architect was eliminated and the official architect substituted in his place. In conclusion, he reiterated that his argument was solely directed to the tendency that would be produced by the establishment of architecture as an official function instead of allowing a large proportion of it to be carried out by competitive and independent methods.

Mr. Wynn Owen said it seemed to him that Mr. Lanchester had inferred that the successful architect should have the spur as a reward. If a man was a keen architect it should not make the slightest difference to his effort. Personally, it did not make the slightest difference to him; if he got a job and he was interested in it the idea of remuneration or reward did not affect him in the slightest degree. Reference had been made to the fact that an official architect when he attains to an official position becomes so submerged with the business side that he has no time to attend to his work. That state of affairs he knew could apply to the private practitioner.

With regard to the competition system, in his experience as a private practitioner he entered whole-heartedly into it because he felt it was the only means by which a young man could get a job.

Continuing, Mr. Owen said, as a last word, he would like to remind all architects, whether they be official architects or private practitioners, that as architects they were professional brethren worshipping at the same shrine, serving the same mistress, and whatever view they might take of each other, in the long run, in the words of Kipling:

> Only the Master shall praise us,
> and only the Master shall blame.
> But each for the joy of the working,
> and each, in his separate star,
> Shall draw the thing as he sees it for
> the God of Things as they are.

At this juncture the resolution was put to the meeting and was carried by a small majority.

Mr. Hamlyn, A.R.I.B.A., President of the A.A.S.T.A., said that before he formally moved a vote of thanks to the chairman, he would take the opportunity of making a few references to the association, which, with the help of Mr. Montgomery, had arranged the meeting. For many years, he said, the A.A.S.T.A. had been studying a problem which had become a vital one in the profession of architecture, e.g. the increasing employment of architects upon a salaried and official basis. Among the older institutions, this rapid development had, until recently, been neglected, but during the past two years a more energetic and constructive view had been taken, and, mainly through the efforts of the A.A.S.T.A., machinery had been inaugurated to deal with the problem. One of the main units in that machinery was the Salaried Members Committee of the R.I.B.A. One of the Association's principal aims was to encourage co-operation, and it was with that object in view that the meeting had been held. They hoped that by a free discussion of official architecture something would emerge whereby an agreed policy could be arrived at. They were convinced that no satisfactory result could be found under the present antagonistic conditions. He trusted that the meeting would set an example of how to tackle their problems, and that in future a frank and open discussion among those concerned would ensue rather than a prolonged bickering from behind "party walls."

Mr. Hamlyn said he now came to the most pleasant part of his duty—to propose a vote of thanks to the chairman; and he would like him to understand that on no occasion had a vote of thanks been proposed with greater sincerity. They were fortunate in having in the chairman a layman who was also an Honorary Associate of the R.I.B.A. He trusted that this would not be the last of his Association's activities at which Lord Riddell would give the stimulating support of his presence.

More Official Architecture

A writer in *The Sheffield Telegraph*, discussing the proposed erection of Government buildings on the Calton Jail site, Edinburgh, says: "We wonder what special fee, or whether any special fee, is being paid by the Government to those officials in the Office of Works who made the plans.

"According to the City Council *Year Book*, the City Architect's salary is £1,250 a year. It is a substantial salary, though we cannot say that he is overpaid considering the vast amount of work the Corporation is piling on to him. We should not like to say that even the £1,750 he will receive during the next two years (£1,250 salary plus

£500 special fee) is more than the work he is doing is worth. Nor are we among the critics of his design. On the contrary, we regard it as a sound and effective piece of work.

"But we are not at all impressed with the arrangement that has been made nor with the attitude adopted by the City Council. If the City Architect is to receive a fee for his plans, his design should have been placed in competition with those of other architects. If, on the other hand, he was instructed to make the plans as part of the ordinary work of his office, then it seems difficult to justify the extra fee."

DIRECT LABOUR

A WARNING that the Sheffield Direct Labour Department was being asked to do a vast amount of work, without any responsible head, was uttered by Councillor Arthur Neal at a recent meeting of the Sheffield Education Committee during a discussion on the erection of the proposed council school at Ben Lane, Wadsley. The Buildings Sub-committee recommended that the Direct Labour Department be entrusted with the building of the school, but an amendment referring the matter back, with a view to private tenders being invited, was defeated by 16 votes to 11.

Councillor Arthur Neal said he had never opposed direct labour, but if anything could induce him to do so it was the change of policy that had now been seen. If they had not competitive tenders, how could it be known whether or no the city was saving money? "We are simply asked," he said, "to hand over nearly £17,000, as a first instalment of £51,000, without the least idea whether or not that is a reasonable price." No business man would listen to any proposition of that kind.

"We are loading this department with a vast amount of work without any responsible head at all. Of course, I don't for one moment suggest that in the City Architect we have not got a most competent and excellent official, but he is an architect and not a builder, and between the two there is a great gap. If we are to put on to that department work at the present rate, it seems imperative that we should have a competent manager in that department, as we have in other departments."

[The above report has been taken from *The Sheffield Telegraph*.]

ARCHITECTS' WILLS

Mr. Frank Herbert Gorst, of Blackpool, Lancs., architect and surveyor, left £17,941, net personalty £11,796.

Mr. Samuel Wesley Bradshaw, L.R.I.B.A., of Moston Lane, Blackley, left £4,125, net personalty £3,761.

LAW REPORT

ALLEGED MISREPRESENTATION

Vineberg and Wife v. *Smelt. Chancery Division. Before Mr. Justice Bennett*

IN this case Mr. and Mrs. David Vineberg, sued Mr. Henry T. Smelt, builder, of Wickham, Durham, for the rescission of an agreement, and they sought an order for the reconveyance to defendant of property purchased by the plaintiffs and for repayment of £1,325. In the alternative, plaintiffs asked for damages for alleged misrepresentation. Defendant denied misrepresentation, and repudiated plaintiffs' allegations.

Mr. Turner Samuels, for the plaintiffs, said in December, 1928, his clients purchased a shop and dwelling-house at the corner of Hadrian Road and Baxter Avenue, Newcastle-on-Tyne, part of the Milvain Estate. Plaintiffs were assured by the defendant that no other shop would be built on the estate, and that they would have it all to themselves. The plaintiffs paid £1,325 for premises. Later, plaintiffs alleged, defendant erected another shop next door, and the result was that plaintiffs suffered considerable damage. Plaintiffs observed, by the completion of the sale to him, that defendant had put in an iron girder in the adjoining house, and he mentioned it to defendant and defendant assured him that it was not his intention to erect another shop next door. Without the plaintiffs' knowledge, and a few days before the completion of the purchase, defendant, said counsel, went to the Town Council and had the plan of the estate altered to include a shop on the piece of land adjoining plaintiffs' premises. The shop had been erected, and was now occupied by people who traded in articles similar to plaintiffs.

Mr. and Mrs. Vineberg gave evidence, and stated that defendant assured them that no other shop would be erected within a radius of three or four hundred yards of their premises.

Defendant denied that he ever gave the plaintiffs any such assurance as they alleged. He produced notice boards which he said he exhibited on the site adjoining plaintiffs, which said that a house or house and shop could be erected on the site to suit a purchaser.

His lordship, in giving judgment, said to his mind plaintiffs had failed to establish the warranties on which they relied. The evidence all had relation to conversations which occurred two years ago. He made no reflection on the witnesses, but he held the opinion that people could easily be mistaken or have imperfect recollection about what happened, or was said, all that time ago. Plaintiffs put forward a plan which they said was shown them when they decided to purchase, and which showed that the building to be erected next door would only be a dwelling house. He (his lordship) came to the conclusion that when the defendant showed the plaintiffs the plan he did not intend to make any such representation in respect to the building to go up adjoining the plaintiffs'. The defendant's denials that he gave the assurance relied upon by the plaintiffs was corroborated by the evidence of his daughter, who had heard the conversations that took place prior to the making of the contract. He therefore accepted the defendant's evidence as to what happened when the contract was made.

His lordship added that the suggested warranty that plaintiffs would have the place all to themselves was too vague to avail the plaintiffs in their claim. With regard to the notice boards, he was of opinion that the announcements that the plot next to the plaintiffs' would contain a shop and house were placed for everybody to see in October, 1928, which was some months before the completion of the purchase by the plaintiffs. He therefore dismissed the plaintiffs' action with costs.

SOCIETIES AND INSTITUTIONS

SMOKE ABATEMENT

THE annual conference of the National Smoke Abatement Society was held at Leicester last week.

Striking instances of atmospheric pollution over great distances by industrial areas were given by Mr. M. G. Bennett, assistant superintendent of the Meteorological Office of the Air Ministry, who said that observations at Falkirk showed that a wind from any of the directions in which industrial areas were situated would reduce visibility from a calculated 250 miles to 20 miles.

Mr. F. Entwistle, superintendent of the aviation services division of the Meteorological Office, pointed out that if all smoke could be removed from this country many more flying days per year would be possible. Pilots flying between Scotland and the South of England frequently encountered smoke haze from the Black Country when over Southern Yorkshire. On the London–Continental route an appreciable haze due to the smoke of London was met with over the Channel some miles from the Kent coast. With easterly winds, smoke haze from the industrial districts of Germany was carried over Southern England.

Smoke, Mr. Entwistle said, raised important problems in connection with the selection of sites for municipal and

other aerodromes, particularly in the vicinity of industrial areas. Other factors being equal, the aerodrome should always be placed on the side of the town from which the prevailing wind blew—usually the west or south-west.

Mr. Arnold Marsh, secretary of the society, said that smoke was causing a wastage of £150 every minute in material values, but there was the even greater question of its effect upon public health. The society was not without hope of an England with pure, clean air and a real warm sun.

Dr. Margaret Fishenden, D.SC., F.INST.P., of the Department of Scientific and Industrial Research, discussed recent investigations in connection with various classes of fuels, both for industrial and domestic purposes.

Mrs. Millicent Jast, of Manchester, dealt with the question from the domestic point of view, emphasizing the vast amount of toil which was inflicted upon the housewife in consequence of smoke in the atmosphere.

Dr. C. Killick Millard, Medical Officer of Health for Leicester, said that it was impossible to exaggerate the importance of and the need for scientific research. Research which had already been carried out showed that one way to economy and reform was the substitution of some form of solid smokeless fuel for raw coal.

PRIZES FOR SECONDARY SCHOOLS

The Council of the R.I.B.A. has decided to increase the annual value of the R.I.B.A. prizes for secondary schools from £5 to £10 10s.

The prizes are offered annually by the R.I.B.A. for competition between boys and girls in secondary schools, and are intended to encourage interest in architecture.

R.I.B.A. (ARCHIBALD DAWNAY) SCHOLARSHIPS, 1930–31

In accordance with the terms of the will of the late Sir Archibald Dawnay, the R.I.B.A. have awarded one scholarship of £75 for the academical year 1930–31 to Mr. J. A. Pinckheard, of the Department of Architecture, Surveying and Building of the Northern Polytechnic, London, N., and one scholarship of £50 for the academical year 1930–31 to Mr. Arthur Roberts, of the Liverpool School of Architecture, University of Liverpool.

Mr. F. J. M. Ormrod, of the Liverpool School of Architecture, University of Liverpool, who was awarded a scholarship of £75 for the academical year 1929–30, and Mr. J. P. Ward, of the Welsh School of Architecture, the Technical College, Cardiff, who was awarded a scholarship of £50 for the academical year 1929–30, have been granted renewals of their scholarships for the year 1930–31.

The scholarships are intended to foster the advanced study of construction, and the improvement generally of constructional methods and materials and their influence on design.

R.I.B.A. EXAMINATIONS

Following are the dates on which the R.I.B.A. Examinations are to be held :

Intermediate Examination : November 21, 22, 24, 25 and 27, 1930 (last day for receiving applications : October 7, 1930); June 5, 6, 8, 9 and 11, 1931 (last day for receiving applications : May 5, 1931); November 20, 21, 23, 24 and 26, 1931 (last day for receiving applications : October 20, 1931).

Final Examination : December 3, 4, 5, 6, 8, 9, 10 and 11, 1930 (last day for receiving applications : November 3, 1930); July 8, 9, 10, 11, 13, 14 and 16, 1931 (last day for receiving applications : June 8, 1931); December 2, 3, 4, 5, 7, 8 and 10, 1931 (last day for receiving applications : November 2, 1931).

Special Examination : December 3, 4, 5, 6, 8 and 9, 1930 (last day for receiving applications : November 3, 1930); July 8, 9, 10, 11, 13 and 14, 1931 (last day for receiving applications : June 8, 1931); December 2, 3, 4, 5, 7 and 8, 1931 (last day for receiving applications : November 2, 1931).

Special Examination in Design for former Members of the Society of Architects : December 3, 4, 5, 6 and 8, 1930 (last day for receiving applications : November 3, 1930); July 8, 9, 10, 11 and 13, 1931 (last day for receiving applications : June 8, 1931); December 2, 3, 4, 5 and 7, 1931 (last day for receiving applications : November 2, 1931).

Special Examination of Licentiates to qualify as Fellows : November 17, 18, 19, 20 and 21, 1930 (last day for receiving applications : October 17, 1930); April 20, 21, 22, 23 and 24, 1931 (last day for receiving applications : March 20, 1931); November 16, 17, 18, 19 and 20, 1931 (last day for receiving applications : October 16, 1931).

Statutory Examination for District Surveyor and the Examination for Building Surveyor : October 15, 16 and 17, 1930 (last day for receiving applications : September 24, 1930); May 6, 7 and 8, 1931 (last day for receiving applications : April 15, 1931); October 14, 15, and 16, 1931 (last day for receiving applications : September 23, 1931).

Town Planning Examination : June 24, 25, 26 and 29, 1931 (last day for receiving applications : March 2, 1931).

UNIVERSITY OF LONDON LECTURES

A varied and interesting programme of University Extension Lectures for the coming Session has just been issued by the University of London, South Kensington. Courses will be delivered not only in the City, but also at over fifty local centres in different parts of London and the suburbs, and the subjects cover a wide range. Among the lecturers who will be delivering courses are : Dr. A. Compton-Rickett, Sir Banister Fletcher, P.R.I.B.A., Professor E. A. Gardner, Mr. C. E. M. Joad, Rev. Father McNabb, Sir John Marriott, The Master of the Temple, and Professor D. M. S. Watson.

COMPETITIONS OPEN

October 20.—The Maternity and Child Welfare Committee of the City of Birmingham invites architects to submit competitive designs for two infant welfare centres, one at Warren Farm Road, Kingstanding (Perry Barr), and the other at Trittiford Road (Billesley). Competitors must have occupied offices in Birmingham as their head office for six months prior to July 19, 1930. Assessor : A. T. Butler, F.R.I.B.A. Premiums, £100 in respect of each centre. Conditions of competition and plans of the sites may be obtained on application to Herbert H. Humphries, M.INST.C.E., City Engineer and Surveyor, the Council House, Birmingham. Deposit £1 1s. for each centre. Latest date for submission of designs : October 20.

October 30.—The General Building Syndicate, Ltd., invites architects to submit competitive schemes for the development of a site at Liverpool, fronting St. John's Lane, Queen Square and Rose Street. Premiums : £250, £100 and £50, for first, second and third prizes, respectively. Particulars, etc., are obtainable on application to the Secretary, the General Building Syndicate, Ltd., 36 St. Martin's Lane, W.C.2. Latest date for submission of designs : October 30.

November 30.—The Burton-on-Trent Local Education Authority invites architects to submit competitive designs for a proposed new Council school to accommodate approximately 800 children, to be erected on a site in Clarence Street. Assessor : H. T. Buckland, F.R.I.B.A. Premiums : £150, £100 and £50 for the designs placed 1st, 2nd and 3rd, respectively. Applications for the conditions of the competition and site plan should have been made before September 8 to L. E. Burgess, Secretary and Director of Education, Education Offices, Guild Street, Burton-on-Trent. Latest date for submission of designs : November 30.

November 30.—The Guildford Cathedral Committee invites any architect, who has been engaged in the design of cathedrals or churches, to submit for examination drawings and other illustrations of his works; or a design for a cathedral. Not more than three sets of drawings may be submitted, packed in one large portfolio. The Committee, with the assistance of Mr. Walter Tapper, A.R.A., will examine the portfolios, and select a limited number of architects for the Final Competition. Each architect selected for the final competition will receive 500 guineas, whether his design is accepted or not. Portfolios should be addressed to The Venerable the Archdeacon of Surrey, The Diocesan Office, Lloyds Bank Chambers, Guildford, not later than November 30.

December 25.—A prospectus giving full particulars of the international competition for the Ukrainian State Theatre, organized by the Kharkov Town Council, Russia, has recently been issued. The theatre is to be erected in the centre of Kharkov, on the site of the present Comsomolsky Square (Young

Communist Square), and will contain a mass musical stage and seating capacity for 4,000 persons. The competition will be assessed by a jury comprising a president, vice-president and fifty-six members. Prizes: 1st, 10,000 rub.; 2nd, 8,000 rub.; 3rd, 6,000 rub.; 4th, 5,000 rub.; 5th, 4,000 rub.; 6th, 3,000 rub.; 7th, 8th and 9th, 2,000 rub.; 10th, 11th, 12th, 1,500 rub. Drawings should be sent to the Kharkov Town Council on or before December 25. Copies of the prospectus are obtainable from the Embassy of the Union of Soviet Socialist Republics, Harrington House, 13 Kensington Palace Gardens, London, W.8.

December 31.—The Incorporated Association of Architects and Surveyors invites competitive designs for a Model Petrol Filling and Service Depot. The competition has the full support of the Automobile Association, the Scapa Society and other bodies which have at heart the preservation of the countryside, as well as the principal motor-trade journals. Assessors: Alfred Stephens Cross, M.A. (CANTAB.), V-P., I.A.A.S.; Edward H. Fryer, Deputy Secretary of the Automobile Association; and Walter Groves, Editor of *The Motor*. Prizes: 50 guineas, 20 guineas and 10 guineas for first, second and third places, respectively. Smaller awards may also be made on the advice of the assessors, and at the discretion of the Council of the Association. In addition a prize of 10 guineas and two prizes of 5 guineas each will be awarded to laymen for the best suggestions submitted with or without sketches. Full particulars, etc., are obtainable from the Secretary, the Incorporated Association of Architects and Surveyors, 1 Wilbraham Place, London, S.W.1. Latest date for submission of designs: December 31, 1930.

February 1.—The Norwich Corporation invite architects practising in Norwich and in the County of Norfolk to submit competitive designs for a proposed new fire station to be erected on a site in Bethel Street, Norwich. Conditions of the competition are obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. Deposit, £1 1s. Latest date for submission of designs: February 1, 1931.

No date.—The Committee of the Foundation Hospital and the Rectorate of the Royal Yugoslavian University of Zagreb invites competitive designs for the general rebuilding plans of the Foundation and Clinic Hospital of Zagreb. Assessors: 1. Dr. Srkulj Stjepan, Burgomaster and Chairman of the Foundation, as president of the jury. 2. Henauer, W., architect, of Zurich (or his representative, Ch. Thevenaz, architect, of Lausanne), for the Swiss Engineers' Association of Germany. 3. Dr. Ing. Kreis Wilhelm, of Dresden, for the Engineers' Association of France. 4. Arch. Expert H.R., of Paris, for the Engineers' and Architects' Association of France. 5. Dr. Culumovic Pavao, Primarius, for the Medical Association of Zagreb. 6. Ing. Gabric Franjo, for the Yugoslavian Association of Engineers and Architects, Zagreb section. 7. Dr. Rasuhin Josip, deputy for the Directors of the Institute of Hygiene Foundation Hospital of Zagreb 8. Prof. Dr. Prasek Emil, for the medical faculty of Zagreb. 9. Dr. Durst Franjo, for the medical faculty of Zagreb. 10. Arch. Heinzel Vjekoslav, Alderman of the City of Zagreb. Committee representative of the jury: Ing. Jurkovic Mato, Stadtbaurat in Zagreb. Prizes: 1st, 20,000 Swiss francs; 2nd, 15,000 Swiss francs; 3rd, 10,000 Swiss francs. 15,000 Swiss francs have been set aside for any further work which may be required. Programme and particulars of the competition will be sent on or after August 15, 1930, on application to the Stadtvorstand of Zagreb (Mr. Matica, secretary), Room No. 70, 2nd floor, on payment of 200 dinar. Latest date for submission of designs: January 15, 1931.

THE ARCHITECTS' DIARY

WEDNESDAY, OCTOBER 1

HOUSING AND HEALTH EXHIBITION, Kelvin Hall, Glasgow. Until October 18. 10 a.m. to 10 p.m. **10 a.m.**

INSTITUTION OF SANITARY ENGINEERS, 120 Victoria Street, S.W.1. Opening Sessional Meeting, to be held at the Cabins Restaurant, Caxton House, Tothill Street, S.W.1. Reception, 7.30 p.m. **7.30 p.m.**

BURTON-ON-TRENT SCHOOL COMPETITION. Latest date for submission of designs.

THURSDAY, OCTOBER 2

ROYAL ACADEMY, Burlington House, S.W.1. First of a series of ten lectures on "Anatomy." By Professor Arthur Thompson, F.R.C.S., LL.D. **4.30 p.m.**

FRIDAY, OCTOBER 3

TOWN PLANNING INSTITUTE. Twelfth Annual Country Meeting, to be held at Leicester. Until October 5, under the presidency of F. W. Platt, F.S.I. The inaugural meeting will be held in the Council Chamber of the Town Hall, by invitation of the Lord Mayor (Councillor W. E. Hincks, O.B.E., J.P.) and Corporation of Leicester. An address will be given on the "Development of the City, Historically and otherwise," by H. A. Pritchard, followed by a paper on the "Town Planning of Leicester and its Surroundings," by A. T. Gooseman, M.INST.C.E., M.T.P.I.

SATURDAY, OCTOBER 4

Sunrise, 7.4 a.m. Sunset, 6.53 p.m.

TOWN PLANNING INSTITUTE. Twelfth annual county meeting at Leicester. Institute Dinner to be held at the Bell Hotel.

MONDAY, OCTOBER 6

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Commencement of Winter Term.

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Motor Coach Excursion: Special Visit to Greenhithe Cement Works. Leave Portland House, Tothill Street, Westminster, S.W.1, at 1.45 p.m. Tickets obtainable from the Secretary of the Society. **1.45 p.m.**

WELSH SCHOOL OF ARCHITECTURE, Technical College, Cardiff. Commencement of School Year.

ROYAL SANITARY INSTITUTE, 90 Buckingham Palace Road, S.W.1. Commencement of Smoke Inspectors' Course. **6 p.m.**

TUESDAY, OCTOBER 7

R.I.B.A., 9 Conduit Street, W.1. Closing date for applications for admission to the Intermediate Examination.

THURSDAY, OCTOBER 9

C.P.R.E. Third Annual Conference, to be held at Welwyn Garden City. Until October 11. Among the papers to be read are the following: "The Preservation of Commons, Parks, Open Spaces and Nature Reserves, and the Provision of Playing Fields." By Sir Lawrence Chubb. "Town and Regional Planning in their Relation to the Objects of the C.P.R.E." By Sir Theodore Chambers, K.B.E., F.S.I. "Education and Citizenship in their Relation to the Safeguarding of the Countryside, etc.," and "Flora and Fauna, including the Preservation of Trees, Wild Flowers, Roadside Plants and the Protection of Birds." Each paper will be open to discussion.

INSTITUTION OF WELDING ENGINEERS. At the Engineers' Club, Manchester. "The Training of Operatives in the Welding and Cutting Industries." By J. Ryder.

FRIDAY, OCTOBER 10

ROYAL SANITARY INSTITUTE, 90 Buckingham Palace Road, S.W.1. Sessional Meeting to be held at the Guildhall, Nottingham. Welcome by Councillor E. H. Lee, Chairman of the Health Committee, followed by tea, 4 p.m. A Discussion will take place on "River Pollution," to be opened by Alderman A. R. Atkey, J.P. 4.30 p.m. Chairman: Charles Porter, M.D., B.SC., etc. **4 p.m.**

SATURDAY, OCTOBER 11

ROYAL SANITARY INSTITUTE, 90 Buckingham Palace Road, S.W.1. Meet at the Guildhall, Nottingham, at 9.15 a.m. for visits to the Factory and Welfare Department of Boots Pure Drug Company, Ltd. Followed by an inspection of the New Council House at 11.30 a.m. **9.15 a.m.**

THURSDAY, OCTOBER 16

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Visit to Cement Marketing Company's Laboratory, Portland House, Tothill Street, Westminster, S.W.1. (Party limited to 30.) **7 p.m.**

MONDAY, OCTOBER 20

BIRMINGHAM WELFARE CENTRES COMPETITION. Latest date for submission of designs.

TUESDAY, OCTOBER 21

MORLEY COLLEGE, Westminster Bridge Road, S.E.1. "Art." By Gui St. Bernard. **8 p.m.**

WEDNESDAY, OCTOBER 22

INSTITUTE OF FUEL. Annual Conference to be held at the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, W.C.2, until October 23. Evening: Annual Dinner to be held at the Connaught Rooms, Great Queen Street, W.C.2, at 6.45 p.m.

THURSDAY, OCTOBER 23

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Lecture by T. J. Clark, A.I.STRUCT.E., of the British Portland Cement Association. **7.30 p.m.**

SATURDAY, OCTOBER 25

Sunrise, 6.40 a.m. Sunset, 4.48 p.m.

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Visit to the works of Messrs. Johnson, Dartford. **2 p.m.**

TUESDAY, OCTOBER 28

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, S.W.1. "English Ironwork." By Edward Yates. **7 p.m.**

MORLEY COLLEGE, Westminster Bridge Road, S.E.1. "Architecture: the Citizen's Part." By Clough Williams-Ellis, F.R.I.B.A. **8 p.m.**

THURSDAY, OCTOBER 30

BURTON-ON-TRENT COUNCIL SCHOOL COMPETITION. Latest date for submission of designs.

TUESDAY, NOVEMBER 4

MORLEY COLLEGE, Westminster Bridge Road, S.E.1. "Industry." By Sir Walter Layton, C.H. **8 p.m.**

THURSDAY, NOVEMBER 6

VICTORIA AND ALBERT MUSEUM, Cromwell Road, South Kensington, S.W.7. Lecture Theatre. "English Mediæval Building: its Sculpture and Painting." By Professor E. S. Prior. (Lantern Illustrations.) **5.30 p.m.**

TUESDAY, NOVEMBER 11

MORLEY COLLEGE, Westminster Bridge Road. S.E.1. "Life and the Countryside." By J. W. Robertson Scott. **8 p.m.**

WEDNESDAY, NOVEMBER 12

ROYAL ACADEMY, Burlington House, W.1. "Rembrandt and his Pupils." (Illustrated by magnified photographs from Continental Galleries.) By A. P. Laurie, D.SC. **4 p.m.**

THURSDAY, NOVEMBER 13

ROYAL ACADEMY, Burlington House, W.1. "Modern Pigments: Their Proper Selection and Use." By A. P. Laurie, D.SC. **4 p.m.**

VICTORIA AND ALBERT MUSEUM, Cromwel Road, South Kensington, S.W.7. Lecture Theatre, "English Mediæval Painting." By W. G. Constable, F.S.A. (Lantern Illustrations.) **5.30 p.m.**

FRIDAY, NOVEMBER 14

ROYAL ACADEMY, Burlington House, W.1. "Painting Media: Oils, Varnishes and Tempera." By A. P. Laurie, D.SC. **4 p.m.**

SATURDAY, NOVEMBER 15

Sunrise, 7.16 a.m. Sunset, 4.12 p.m.

MONDAY, NOVEMBER 17

ROYAL ACADEMY, Burlington House, W.1. "Methods of Wall Paintings." By A. P. Laurie, D.SC. **4 p.m.**

TUESDAY, NOVEMBER 18

ROYAL ACADEMY, Burlington House, W.1. "The Theory of Colour and its Application to Painting." By A. P. Laurie, D.SC. **4 p.m.**

WEDNESDAY, NOVEMBER 19

ROYAL ACADEMY, Burlington House, W.1. "Early Methods of Oil Painting." By A. P. Laurie, D.SC. **4 p.m.**

THURSDAY, NOVEMBER 20

VICTORIA AND ALBERT MUSEUM, Cromwell Road, South Kensington, S.W.7. Lecture Theatre: "English Alabaster Carvings." By W. L. Hildburgh, F.S.A. (Lantern Illustrations.) **5.30 p.m.**

FRIDAY, NOVEMBER 21

R.I.B.A., 9 Conduit Street. W.1. Intermediate Examination. Until November 27.

SATURDAY, NOVEMBER 22

Sunrise, 7.28 a.m. Sunset, 4.3 p.m.

TUESDAY, NOVEMBER 25

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, W.1. "The Construction of a Great Exhibition." By W. T. Bowman, O.B.E., F.I.A.A., M.I.STRUCT.E. Chairman: Sir William Crawford, K.B.E. **7 p.m.**

THURSDAY, NOVEMBER 27

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. At the Showroom of W. T. Lamb and Sons, 43 Shoe Lane, E.C.4. "Bricks and Tiles." By E. Valser. **7 p.m.**

VICTORIA AND ALBERT MUSEUM, Cromwell Road, South Kensington, S.W.7. Lecture Theatre. "English Mediæval Sculpture." By Arthur Gardner. (Lantern Illustrations.) **5.30 p.m.**

FRIDAY, NOVEMBER 28

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, W.1. Fifth Annual Banquet to be held at the Stationers' Hall, City, E.C.

SATURDAY, NOVEMBER 29

Sunrise, 7.40 a.m. Sunset, 3.56 p.m.

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Visit to the Works of Messrs. W. T. Lamb and Sons, Worcester Park. **2 p.m.**

HOLOPHANE CONFERENCE

A conference of architects arranged by Messrs. Holophane was held at the company's conference hall, in Elverton Street, Westminster, on Wednesday last, at which Mr. H. Thompson, in his address of welcome to the visitors, made a strong plea for closer and more timely co-operation between the architect and the illuminating engineer in the preparation of artificial lighting schemes.

The papers read during the morning session were : "Developments in Artificial Illumination," by Mr. J. S. Dow, editor of *The Illuminating Engineer* ; "Holophane Policy," by Mr. W. T. Dean; "Holophane Developments," by Mr. E. Stroud; "Glass and its Properties," by Dr. S. English; and "Practical Applications of Holophane," by Mr. L. M. Tye.

Mr. R. G. Williams opened the afternoon session with a remarkable demonstration of colour as applied to lighting, after which he delivered a paper on "Cinema and Theatre Lighting." The concluding papers were "Ancient Lights,—and Ultra Violet Ray Glass," by Dr. S. English; and "Industrial Lighting," by Mr. L. M. Tye.

The conference gave rise to many expressions of appreciation from the visitors, among whom were several architects from the provinces, of the great value to the profession of the research work in which the technical experts of the company were continually engaged.

Mr. R. G. Williams, in his paper on "Cinema and Theatre Lighting," said that the fundamental fact to be grasped when considering colour lighting, in any of its applications, was that white light was the optical result of a combination of light rays of such wave lengths as corresponded to the colours seen in the spectrum. Because colour was essentially optical, the apparent colour of an object was largely influenced by a number of factors. First among these was the colour of the light under which the object was seen. Secondly, the colour of an object was influenced by the colours of other objects in its close vicinity—this factor being named "colour contrast." Thirdly, the intensity of the light und r which an object was seen affected the colour. Fourthly, there was the factor of simultaneous contrast which dealt with the after images held by the eye when looking from one colour to another quickly.

The human eye was accustomed to operating under white light—which was a combination of the colours of the spectrum. If the eye was exposed to light of some unusual colour—say pure red or green light—there would be a corresponding reaction. This reaction was not only psychological but physiological. For the purposes of entertainment, therefore, there were vast potentialities in the skilful use of coloured light, as the ordinary public with which they had to deal were normally used to viewing everything under white light.

When dealing with stage lighting, he said, besides the question of the colour or hue, etc., of the light, there was the question of light intensity. Where varnished or sprayed lamps were used in white enamel troughs—i.e. open type equipment—the intensity from a given current consumption was very poor.

There was little doubt that one of the reasons why, generally speaking, coloured light was not employed very often on the theatre stage was that, until recently, the lighting equipment had been so crude and inefficient that coloured light had been useless for stage illumination and useless to provide colour tones other than red, poor mauves and poor blues (and sometimes amber). Producers had, therefore, become accustomed to the use of white light only, or coloured light provided by perches (i.e. arcs in the stage wings) or spot-lights.

Among those present were the following :

Messrs. Paul Phipps, B.A., F.R.I.B.A.; Kenneth Wray; John Bennett, City Architect, Exeter; P. J. Thomas; Stewart Kaye, A.R.I.B.A., F.S.A.; J. W. Weddell; A. J. Hislop; A. G. Henderson, A.R.I.B.A.; J. Gomersall; J. A. Chisholm Taylor, A.R.I.B.A.; J. E. Taylor, L.R.I.B.A.; T. W. Birkett; T. C. Howitt, A.R.I.B.A.; N. A. Whitham; J. Sydney Athron; W. G. Fryer; C. Sunderland, A.R.I.B.A.; J. Burton; Bertram Butler, A.R.I.B.A., A.M.T.P.I.; C. Slater, L.R.I.B.A.; Hurley Robinson, F.R.I.B.A.; A. F. Hendy; E. J. Davidson; A. Eaton; and Frederick Chatterton, F.R.I.B.A.

TRADE NOTE

A notable event in the history of Messrs. Archibald D. Dawnay and Sons, Ltd., the well-known constructional engineers, took place on Saturday, September 27, when a luncheon was given to Mr. Ernest A. Willson, the chairman and managing director, in honour of his having been associated with the firm continuously for fifty years. This took place at the Grosvenor Hotel, Victoria, when nearly fifty representatives of the directorate, staff and workmen met to celebrate the occasion. After a very enjoyable luncheon, Mr. H. Thorne, a director, on behalf of his colleagues and the employees of the company, presented to Mr. Willson a gold cigar box, together with a book containing the signatures of every member of the firm. In so doing, he mentioned that Mr. Willson joined the late Sir Archibald D. Dawnay on September 5, 1880. There were then only four members, while at the present time there are nearly 1,000 people engaged, with five large works at Battersea, Welwyn Garden City, Cardiff, Swansea and Norwich. Mr. Willson, who received a great ovation, in acknowledging the gift, briefly reviewed the history of the firm from the time he joined it until the present, and said how greatly he appreciated the thoughtfulness and regard which prompted the gift. Messrs. Dawnays have executed some of the most important steelwork contracts carried out in this country, recently that of the Masonic Peace Memorial in Great Queen Street, W.C.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents, and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated, readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATION

26974. Gass, J. E. Securing brickwork, etc., walls of steel-framed buildings. September 9.

SPECIFICATION PUBLISHED

314354. Naamlooze Vennootschap De Nieuwe Isoleer Maatschappij De Nim. Plates, slabs, tiles and the like for building and sound or heat insulating purposes.

Dinner to Dr. Sabine

Among those present at the dinner to Dr. Sabine, reported on page 512 of this issue, were the following :

Sir A. Brumwell Thomas, F.R.I.B.A.; Hope Bagenal, F.R.I.B.A.; Laurence M. Gotch, F.R.I.B.A.; J. Murray Easton, F.R.I.B.A.; Paul Phipps, F.R.I.B.A.; Guy Church, F.R.I.B.A.; A. Smithers, F.R.I.B.A.; C. Nicholas, F.R.I.B.A.; H. Rogers Houchin, F.R.I.B.A.; S. Tatchell, F.R.I.B.A.; E. Maufe, M.A., F.R.I.B.A.; J. Emberton, A.R.I.B.A.; E. Bird, A.R.I.B.A.; F. Cox, L.R.I.B.A.; E. A. Stone, F.S.I.; P. Rogers Cooke; T. A. Scott; H. M. Wood; E. Schaufelberg; A. C. Jamieson Green; Dr. O. Faber, O.B.E., M.I.C.E.; Dr. G. W. C. Kaye (National Physical Laboratory); R. W. Barnett (Industrial Research Board); A. M. Hallawell (Gramophone Co. Laboratory); Col. M. G. Bland, O.B.E.; F. Chatterton, F.R.I.B.A. (Editor *Specification*); Maurice Webb, F.R.I.B.A.; H. Austen Hall, F.R.I.B.A.; H. Lidbetter, F.R.I.B.A.; G. Drysdale, F.R.I.B.A.; T. P. Bennett, F.R.I.B.A.; W. E. Vernon Crompton, F.R.I.B.A.; J. R. Leathart, F.R.I.B.A.; J. E. Dixon-Spain, F.R.I.B.A.; H. P. G. Maule, F.R.I.B.A.; F. J. Wills, F.R.I.B.A.; T. R. Somerford, A.R.I.B.A.; F. R. Jelley, A.R.I.B.A.; H. A. Dawson, A.R.I.B.A.; Douglas Wood, O.B.E., F.R.I.B.A., F.S.I.; T. S. Tait; A. F. B. Anderson, S.A.D.G.; T. S. Darbyshire; S. B. Pritlove; Christopher Green, M.A.; Dr. G. A. Sutherland, M.A.; A. G. Ramsey (H.M. Office of Works); Dr. A. H. Davis (National Physical Laboratory); F. Ingham (B.B.C. Research Station); A. G. West (Gramophone Co. Laboratory); G. F. Dutton (Gramophone Co. Laboratory); Capt. A. F. Hancock; and Harold Tomlinson.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The BARKING U.D.C. has decided to obtain tenders for the erection of an infectious diseases hospital.

Mr. F. W. Albon is to erect three shops, flats and garages in Longbridge Road, BARKING.

The BARKING Education Committee is to erect, by direct labour, two temporary schools on the Becontree estate.

Messrs. Intrade, Ltd., are to erect a celluloid store in Highbridge Road, BARKING.

The BARKING U.D.C. has passed plans for the layout of 2,197 houses on the Becontree estate, for the L.C.C.

Messrs. Montague Burton are to erect premises in East Street and Broadway Corner, BARKING.

The BERMONDSEY B.C. proposes to proceed with schemes for the reconstruction of three areas of land in Rotherhithe Street, Vaughan Street and Gilhams Court.

The BERMONDSEY B.C. is to erect cottages and flats at the Grange and in Bermondsey Street, by direct labour, at a cost of £24,300.

Terms have been arranged between the Grand Union Canal Co., the Ministry of Transport, and the St. Pancras B.C. for the reconstruction of Albert Road canal bridge, CAMDEN TOWN. The scheme is estimated to cost £12,000.

Messrs. F. T. Wooding and Son are to erect houses in Holmside Road, Thurleigh Avenue, and Nightingale Lane, CLAPHAM.

Messrs. T. P. Bennett and Sons, architects, have prepared plans for the development of the Cedars estate, EAST SHEEN.

Plans have been passed by the L.C.C. for the reconstruction of EUSTON SQUARE railway station.

The FULHAM B.C. has adopted a revised scheme for town hall extensions, and recommends the appointment of Mr. Walter Cave to carry out the designs.

The Walham Green Laundries, Ltd., are to erect premises on a site at the corner of Fulham Road and Garden Row, FULHAM.

The FULHAM B.C. is to commence the development of the Swan Brewery housing scheme.

The GREENWICH Hippodrome is to be reconstructed into a cinema, from plans prepared by Mr. George Coles.

Mr. G. G. Wimbourne is to erect lock-up shops and garages at the rear of 85 Dalston Lane, HACKNEY.

The HACKNEY B.C. has decided to proceed, by private Bill, to secure powers to acquire land for the extension of the town hall.

Messrs. Hobden and Porri, architects, have prepared plans for the erection of premises on the site of 124–6 Shacklewell Lane, HACKNEY.

The PADDINGTON B.C. is considering a scheme for the erection of a public hall in Porchester Street, at a cost of £40,000.

The POPLAR B.C. is to erect twenty-six flats on a site near Violet Road, Bromley, at a cost of £15,800.

The POPLAR B.C. is to erect twelve flats in Smeed Road, at a cost of £7,500.

The POPLAR B.C. is to obtain a site in the St. Michael's district for the provision of washhouses.

The ST. PANCRAS B.C. has under consideration a scheme for the construction of an open-air swimming-bath at Primrose Hill.

The ST. PANCRAS B.C. is being urged to provide further library facilities within the borough.

The L.C.C. is to provide additional elementary school accommodation for about 720 children at Mount Pleasant Lane, and for about 440 children at STAMFORD HILL.

The STOKE NEWINGTON B.C. proposes to proceed with the erection of municipal offices on the Glebe Place site, at a cost of £77,500, from plans prepared by Messrs. Hobden and Porri.

The L.C.C. Education Committee is to erect a school for 460 pupils in Tench Street, WAPPING.

The WIMBLEDON Corporation Health Committee has appointed a sub-committee to consider the question of obtaining a site for the erection of suitable accommodation for persons suffering from tuberculosis.

EASTERN COUNTIES

The HERNE BAY U.D.C. is seeking sanction for a loan of £20,000 for the erection of municipal offices and fire station.

The LOWESTOFT Corporation has approved plans, prepared by the borough surveyor, for the erection of 108 houses on the Kirkley Run housing estate, at an estimated cost of £39,960.

The SOUTHEND Corporation is considering a scheme for the extension of the Esplanade and the construction of a harbour, medicated baths and sports centre.

SOUTHERN COUNTIES

The BOURNEMOUTH Corporation has obtained sanction for a loan of £25,600 for the purchase of Hengistbury Head for pleasure grounds.

The BOURNEMOUTH Corporation Fire Brigade Committee is purchasing land at the rear of Birklands, Christchurch Road, required for an extension of the Central Fire Station.

At a meeting of the BOURNEMOUTH Corporation Housing Committee, the question of erecting Council houses by direct labour was referred to the borough engineer, who was asked to submit a report on the matter for the consideration of the Committee.

The BRIGHTON Education Committee has obtained land at Whitehawk Valley, for the erection of an elementary school.

The St. Mark's church authorities have obtained a site on the Whitehawk Valley estate, BRIGHTON, for the erection of a church hall.

The BRIGHTON Corporation has passed a revised layout plan for the erection of 197 houses on the Whitehawk Valley estate.

The BRIGHTON Corporation has approved plans, submitted by the Very Rev. Mgr. G. Wallis, for additions to St. Mary Magdalen's schools, Upper North Street.

Kemp Town Brewery, Ltd., are to build additions to the Clyde Arms, Bristol Gardens, BRIGHTON.

Alterations and additions are to be carried out at 59 London Road, BRIGHTON, for the Brighton and Preston Constitutional Club, Ltd.

Messrs. Braybons, Ltd., are to erect eleven houses on the west side of Stanmer Villas, BRIGHTON.

The SOUTHAMPTON Corporation is to erect 240 houses on the Bassett Green estate.

MIDLAND COUNTIES

Messrs. E. H. C. Inskip and Son are to erect new buildings in London Road, BEDFORD.

Messrs. T. R. Meakin and Son have prepared plans for the erection of premises for George Wilson Gasmeters, Ltd., in Foleshill Road, COVENTRY.

Messrs. Wignall and Ainsworthy have prepared plans for the erection of fifteen shops and a large café on the Salters Hall site, DROITWICH.

Mr. L. L. Jones is to erect houses in Hadfield Road, GLOSSOP.

The STOKE-ON-TRENT Corporation has passed plans and sections for the layout of land off Chatterley Street, Burslem, for the Chatterley-Whitfield Collieries, Ltd.

The STOKE-ON-TRENT Corporation has obtained sanction to borrow £51,034, for the provision of a new nurses' home at the London Road institution.

Mr. Watts, architect, is to lay out the Meir residential estate, STOKE-ON-TRENT.

Mr. Madew, architect, is developing the Harpfield Farm Estate, STOKE-ON-TRENT.

NORTHERN COUNTIES

Messrs. Francis Jones and R. A. Dalrymple have prepared plans for the District Bank, Ltd., for the erection of premises in Fountain Street and Spring Gardens, MANCHESTER.

Mr. H. Jewels is to erect sixteen houses in Lonks Road, TYNEMOUTH.

The TYNEMOUTH Education Committee is obtaining a site at Percy Main for the erection of a senior school.

SCOTLAND

The ABERDEEN Corporation has under consideration a housing programme for the erection of 2,500 houses during the next three years.

The GLASGOW Education Committee is to provide additional school accommodation in the neighbourhood of Lorne Street.

The GLASGOW Corporation is acquiring a site in Barrhead Road, for the erection of an infectious diseases hospital.

The GLASGOW Education Committee is to erect an elementary school in Smithycroft Road, Riddrie, and temporary school buildings in Knowes Avenue.

The GLASGOW Corporation is to extend the outfall sewer from Corkerhill Station to Barrhead Road, at a cost of £123,000; construct a branch sewer at Cardonald Place Road, at a cost of £42,000; and construct sewers at Crookston, at a cost of £12,000.

Mr. J. Miller is to erect motor showrooms and thirty-six houses in Craigleigh Hill, EDINBURGH.

The GLASGOW Education Committee has approved sketch plans for new schools at King's Park (Croftfoot) and St. Agnes's School annexe.

The following figures show the progress that has been made in State-aided housing schemes in SCOTLAND to August 30, 1930: 1919 Act, by local authorities, 25,129; 1919 Act, by public utility societies, 421: private subsidy schemes, 1919 Additional Powers Act, 2,324; slum clearance schemes, 11,920; under construction, 2,395; 1923 Act, by local authorities, 4,033: 1923 Act, by private enterprise, 18,432; under construction, 1,247: 1923 Act, by public utility societies, 80; 1924 Act, by local authorities, 45,345; under construction, 5,874: 1924 Act, by private enterprise, 2,205; under construction, 779: 1924 Act, by public utility societies, 127; under construction, 16; demonstration houses, 17; steel houses erected on behalf of Government by Scottish National Housing Company, 2,552; total completed, 112,585; total under construction, 10,311; total, 122,896.

WALES

The SWANSEA Corporation is to obtain expert advice regarding a proposal for the construction of an open-air swimming bath on the foreshore.

The committee of the Beechwood Club is to extend their premises in The Grove, Uplands, SWANSEA.

The SWANSEA Education Committee has forwarded plans of extensions to be carried out at Glanmor secondary school to the Board of Education for approval.

The managers of the Sketty Church of England schools, SWANSEA, are to modernize the school premises.

The SWANSEA Corporation has arranged terms with the L.M.S. for the reconstruction and widening of the railway bridge in Llansamlett Road.

The SWANSEA Corporation has agreed to co-operate with the G.W.R. in a scheme for widening the Station Road bridge at Cockett.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

• In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1*s.* 3½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour;* NAVVY, 1*s.* 3½*d. per hour;* TIMBERMAN, 1*s.* 5*d. per hour;* SCAFFOLDER, 1*s.* 4½*d. per hour;* WATCHMAN, 7*s.* 6*d. per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.

Clinker, breeze, etc., prices according to locality.			
Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1*s.* 9*d. each and credited when returned at* 1*s.* 6*d.*

Transport hire per day:

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0	1	6
SPREAD and level, including wheeling, per yd.	0	1	6
FILLING into carts and carting away to a shoot or deposit, per yd. cube	0	10	6
TRIMMING earth to slopes, per yd. sup.	0	0	6
HACKING up old grano. or similar paving, per yd. sup.	0	1	3
PLANKING to excavations, per ft. sup.	0	0	5
DO. over 10 ft. deep, add for each 5 ft. in depth, 30 per cent.			
IF left in, add to above prices, per ft. cube	0	2	0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup.	0	2	1
DO. 6 in. thick, per yd. sup.	0	2	10
PUDDLING, per yd. cube	1	10	0
CEMENT CONCRETE, 4-2-1, per yd. cube	1	17	6
DO. 6-2-1, per yd. cube	1	12	6
DO. in upper floors, add 15 per cent.			
DO. in reinforced-concrete work, add 20 per cent.			
DO. in underpinning, add 60 per cent.			
LIAS-LIME CONCRETE, per yd. cube	£1	14	0
BREEZE CONCRETE, per yd. cube	1	7	0
DO. in lintels, etc., per ft. cube	0	1	6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube	0	3	9
FINE concrete benching to bottom of manholes, per ft. cube	0	3	0
FINISHING surface of concrete spade face, per yd. sup.	0	0	9

DRAINER

LABOURER, 1*s.* 3½*d. per hour;* TIMBERMAN, 1*s.* 5*d. per hour;* BRICKLAYER, 1*s.* 8½*d. per hour;* PLUMBER, 1*s.* 8½*d. per hour;* WATCHMAN, 7*s.* 6*d. per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. 6 *in., per ft.*	0	1	3
DO. 9 *in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. 6 *in., per yd.*	0	8	0

Portland cement and sand, see "Excavator" above.

Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½
STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft.	0	4	3
DO. 6 in., per ft.	0	5	0
DO. 9 in., per ft.	0	7	9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft.	0	8	3
DO. 6 in., per ft.	0	10	3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1*s.* 8½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour;* SCAFFOLDER, 1*s.* 4½*d. per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
White facing bricks, per M.	5	0	0
Multi-coloured facings, per M.	7	7	9
Best red facings, per M.	7	7	9
Rubbers, 9½ in., per M.	12	0	6
Staffordshire blue, per M.	9	5	0
Firebricks, 2½ in., per M.	9	5	0
Glazed salt, white, and ivory stretchers, per M.	21	10	0
DO. *headers, per M.*	20	10	0
Colours, extra, per M.	5	10	0
Seconds, less, per M.	1	0	0

Cement and sand, see "Excavator" above.

Lime, grey stone, per ton	£2	11	6
Mixed lime mortar, per yd.	1	6	0
Dampcourse, in rolls of 4½ in., per roll	0	2	6
DO. 9 *in., per roll*	0	4	9
DO. 14 *in., per roll*	0	7	6
DO. 18 *in., per roll*	0	9	6
BRICKWORK in stone lime mortar, Flettons, or equal, per rod	30	0	0
DO. in cement do., per rod	32	10	0

DO. in stocks, add 25 per cent. per rod.
DO. in blues, add 100 per cent. per rod.
DO. circular on plan, add 12½ per cent. per rod.
DO. in backing to masonry, add 12½ per cent. per rod.
DO. in raising on old walls, etc., add 12½ per cent. per rod.
DO. in underpinning, add 20 per cent. per rod.

HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS, fair, per ft. sup. extra	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra	0	0	10
WEATHER pointing, do. do.	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup.	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities, in finishing to steps, etc., per ft. sup.	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup.	0	11	0
SLATE DAMP COURSE, per ft. sup.	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ¾ in., per yd.	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup.	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each	0	0	3

MASON

MASON, 1*s.* 8½*d. per hour;* DO. *fixer,* 1*s.* 9½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour;* SCAFFOLDER, 1*s.* 4½*d. per hour.*

Portland Stone:			
Whitbed, per ft. cube	£0	4	6
Basebed, per ft. cube	0	4	9
Bath stone, per ft. cube	0	3	0

Usual trade extras for large blocks.

York paving, av. 2½ in., per yd. super	0	11	0
York templates, sawn, per ft. cube	0	7	6
Slate shelves, rubbed, 1 in., per ft. sup.	0	2	6

Cement and sand, see "Excavator," etc., above.

HOISTING and setting stone, per ft. cube	£0	2	2

DO. for every 10 ft. above 30 ft. add 15 per cent.

PLAIN face Portland basis, per ft. sup.	£0	2	8
DO. circular, per ft. sup.	0	4	0
SUNK FACE, per ft. sup.	0	3	9
DO. circular, per ft. sup.	0	4	10
JOINTS, arch, per ft. sup.	0	2	6
DO. sunk, per ft. sup.	0	2	7
DO. DO. circular, per ft. sup.	0	4	6
CIRCULAR-CIRCULAR work, per ft. sup.	1	2	0
PLAIN MOULDING, straight, per inch of girth, per ft. run	0	1	1
DO. circular, do., per ft. run	0	1	4
HALF SAWING, per ft. sup.	0	1	0

Add to the foregoing prices, if in York stone, 35 per cent.
DO. Mansfield, 12½ per cent.
Deduct for Bath, 33⅓ per cent.
DO. for Chilmark, 5 per cent.

SETTING 1 in. slate shelving in cement, per ft. sup.	£0	0	6
RUBBED round nosing to do., per ft. lin.	£0	0	6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1	7	6
YORK SILLS, W. & T., ft. cub. fixed	1	10	0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0	1	3
DO. 2½ in. thick, per ft. sup.	0	1	6

SLATER AND TILER

SLATER 1*s.* 8½*d. per hour;* TILER, 1*s.* 8½*d. per hour;* SCAFFOLDER, 1*s.* 4½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour.*
N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200:

Portmadoc Ladies					£14	0	0	
Countess					23	0	0	
Duchess					32	10	0	
Old Delabole	*Med. Grey*				*Med. Green*			
24 in. × 12 in.	£42	11	3		£45	1	0	
20 in. × 10 in.	31	4	3		33	0	6	
16 in. × 10 in.	20	18	0		22	4	9	
14 in. × 8 in.	12	1	0		12	16	3	
Green Randoms, per ton					8	3	9	
Grey-green do., per ton					7	3	9	
Green peggies, 12 in. to 8 in. long, per ton					5	13	9	

In 4-ton truck loads, delivered Nine Elms station.

Clips, lead, per lb.	£0	0	6
Clips, copper, per lb.	0	2	0
Nails, compo, per cwt.	1	6	0
Nails, copper, per lb.	0	2	2

Cement and sand, see "Excavator," etc., above.

Hand-made tiles, per M.	£5	18	0
Machine-made tiles, per M.	5	8	0
Westmorland slates, large, per ton	9	0	0
DO. *Peggies, per ton*	7	5	0

SLATING, 3 in. lap, compo nails, Portmadoc or equal:

Ladies, per square	£4	0	0
Countess, per square	4	5	0
Duchess, per square	4	10	0
WESTMORLAND, in diminishing courses, per square	6	5	0
CORNISH DO., per square	6	3	0
Add, if vertical, per square approx.	0	13	0
Add, if with copper nails, per square approx.	0	2	6
Double course at eaves, per ft. approx.	0	1	0

SLATING with Old Delabole slates to a 3 in. lap with copper nails, at per square.

	Med. Grey			Med. Green		
24 in. × 12 in.	£5	0	0	£5	2	0
20 in. × 10 in.	5	5	0	5	10	0
16 in. × 10 in.	4	15	0	5	1	0
14 in. × 8 in.	4	10	0	4	15	0
Green randoms				6	7	0
Grey-green do.				5	9	0
Green peggies, 12 in. to 8 in. long				4	13	6

TILING, 4 in. gauge, every 4th course nailed, in hand-made tiles, average per square	3	17	6
DO., machine-made do., per square	3	7	6

Vertical Tiling, including pointing, add 18*s.* 0*d.* per square.

FIXING lead soakers, per dozen	£0	0	10
STRIPPING old slates and stacking for re-use, and clearing away surplus and rubbish, per square	0	10	0
LABOUR only in laying slates, but including nails, per square	1	0	0

See "Sundries" for Asbestos Tiling.

CARPENTER AND JOINER

CARPENTER, 1*s.* 8½*d. per hour;* JOINER, 1*s.* 8½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour.*

Timber, average prices at Docks, London Standard, Scandinavian, etc. (equal to 2nds):

7 × 3, per std.	£22	0	0
11 × 4, per std.	30	0	0

Memel or Equal. Slightly less than foregoing.

Flooring, P.E., 1 in., per sq.	£1	4	6
DO., *T. and G., 1 in., per sq.*	1	4	6
Planed boards, 1 in. × 11 in., per std.	30	0	0
Wainscot oak, per ft. sup. of 1 in.	0	1	6
Mahogany, Honduras, per ft. sup. of 1in.	0	1	4
DO., *Cuba, per ft. sup. of 1 in.*	0	2	6
DO., *African, per ft. sup.*	0	1	3
Teak, per ft. sup. of 1 in.	0	1	2
DO., *ft. cube*	0	14	0
FIR fixed in wall plates, lintels, sleepers, etc., per ft. cube	0	4	6
DO. framed in floors, roofs, etc., per ft. cube	0	4	6
DO. framed in trusses, etc., including ironwork, per ft. cube	0	8	6

PITCH PINE, add 33½ per cent.

FIXING only boarding in floors, roofs, etc., per sq.	0	13	6
SARKING FELT laid, 1-ply, per yd.	0	1	6
DO., 3-ply, per yd.	0	1	9
CENTERING for concrete, etc., including horsing and striking, per sq.	2	0	0
TURNING pieces to flat or segmental soffits, 4½ in. wide, per ft. run	0	0	4½
DO. 9 in. wide and over, per ft. sup.	0	1	2

[*continued overleaf*

CARPENTER AND JOINER: *continued*

SHUTTERING to face of concrete, per square	£1	10	0
DO. in narrow widths to beams, etc., per ft. sup.	0	0	6
USE and waste of timbers, allow 25 per cent. of above prices.			
SLATE BATTENING, per sq.	£0	12	6
DEAL boarding to flats, 1 in. thick and firrings to falls, per square	2	10	0
STOUT feather-edged tilting fillet to eaves, per ft. run	0	0	6
FEATHER-edged springer to trimmer arches, per ft. run	0	0	4
STOUT herringbone strutting (joists measured in), per ft. run	0	0	6
SOUND boarding, ⅞ in. thick and fillets nailed to sides of joists (joists measured over), per square	2	0	0
RUBEROID or similar quality roofing, one-ply, per yd. sup.	0	2	3
DO., two-ply, per yd. sup.	0	2	6
DO., three-ply, per yd. sup.	0	3	0
TONGUED and grooved flooring, 1¼ in. thick, laid complete with splayed headings, per square	2	5	0
DEAL skirting torus, moulded, 1¼ in. thick, including grounds and backings, per ft. sup.	0	1	0
TONGUED and mitred angles to do.	0	0	6
WOOD block flooring, standard blocks laid herringbone in mastic:			
Deal 1 in. thick, per yd. sup.	0	10	0
DO. 1¼ in. thick, per yd. sup.	0	12	0
Maple 1¼ in. thick, per yd. sup.	0	15	0
DEAL moulded sashes, 1¾ in., with moulded bars in small squares, per ft. sup.	0	2	6
DO. 2 in. do., per ft. sup.	0	2	9
DEAL cased frames, oak sills and 2 in. moulded sashes, brass-faced pulleys and iron weights, per ft. sup.	0	4	6
MOULDED horns, extra, each	0	0	3
DOORS, 4-panel square both sides, 1⅛ in. thick, per ft. sup.	0	2	6
DO. moulded both sides, per ft. sup.	0	2	9
DO. 2 in. thick, square both sides, per ft. sup.	0	2	9
DO. moulded both sides, per ft. sup.	0	3	0
DO. in 3 panels, moulded both sides, upper panel with diminished stiles with moulded bars for glass, per ft. sup.	0	3	6
If in oak, mahogany, or teak, multiply 3 times.			
DEAL frames, 4 in. × 3 in., rebated and beaded, per ft. cube	£0	15	0
Add for extra labour, per ft. run	0	0	1
STAIRCASE work:			
DEAL treads 1¼ in. and risers 1 in., tongued and grooved, including fir carriages, per ft. sup.	0	2	6
DEAL wall strings, 1⅛ in. thick, moulded, per ft. run	0	2	0
If ramped, per ft. run	0	4	6
SHORT ramps, extra, each	0	7	6
ENDS of treads and risers housed to strings, each	0	1	0
2 in. deal mopstick handrail fixed to brackets, per ft. run	0	1	6
4½ in. × 3 in. oak fully moulded handrail, per ft. run	0	5	6
1½ in. square deal bar balusters, framed in, per ft. run	0	0	6
FITTINGS:			
SHELVES and bearers, 1 in., cross-tongued, per ft. sup.	0	1	6
1½ in. beaded cupboard fronts, moulded and square, per ft. sup.	0	2	9
TEAK grooved draining boards, 1¼ in. thick, and bedding, per ft. sup.	0	4	6
IRONMONGERY:			
Fixing only (including providing screws):			
TO DEAL—			
Hinges to sashes, per pair	0	1	2
Do. to doors, per pair	0	1	7
Barrel bolts, 9 in., iron, each	0	1	0
Sash fasteners, each	0	1	0
Rim locks, each	0	1	9
Mortice locks, each	0	4	0

SMITH

SMITH, *weekly rate equals* 1*s.* 8½*d. per hour*; MATE, *do.*, 1*s.* 3½*d. per hour*; ERECTOR, 1*s.* 8½*d. per hour*; FITTER, 1*s.* 8½*d. per hour*; LABOURER, 1*s.* 3½*d. per hour.*

Mild Steel in British standard sections, per ton	£12	10	0

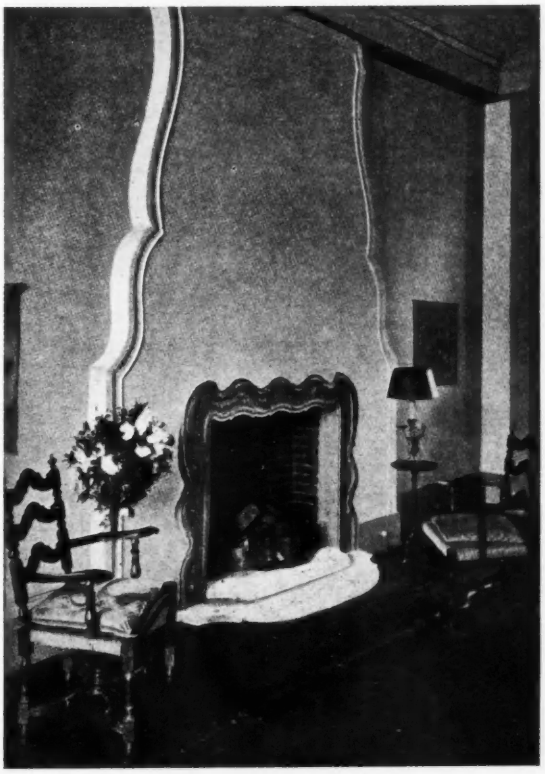
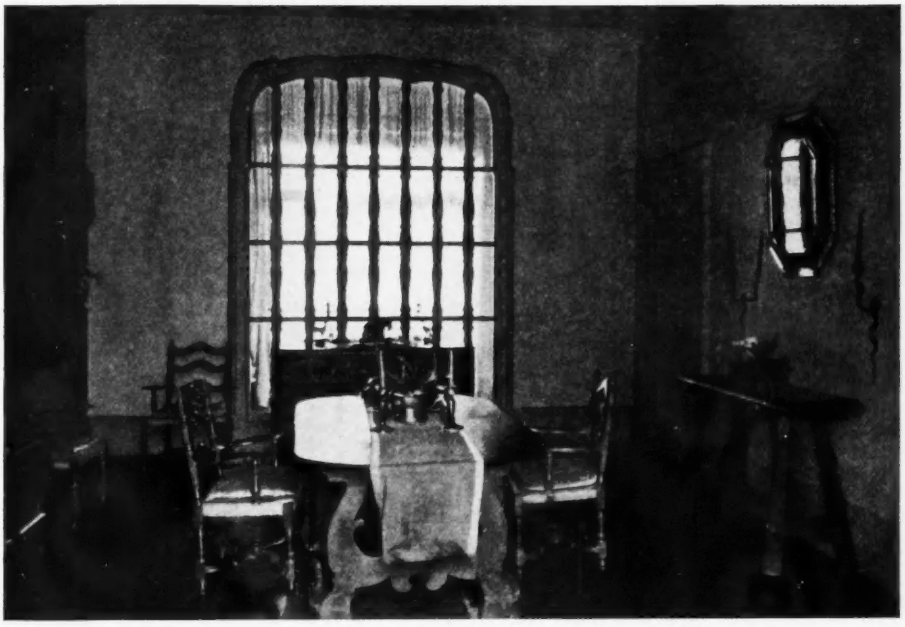
A WEEKLY SERIES



FIREPLACE; AND SCREEN:

37 HAMILTON TERRACE BY G. G. WORNUM

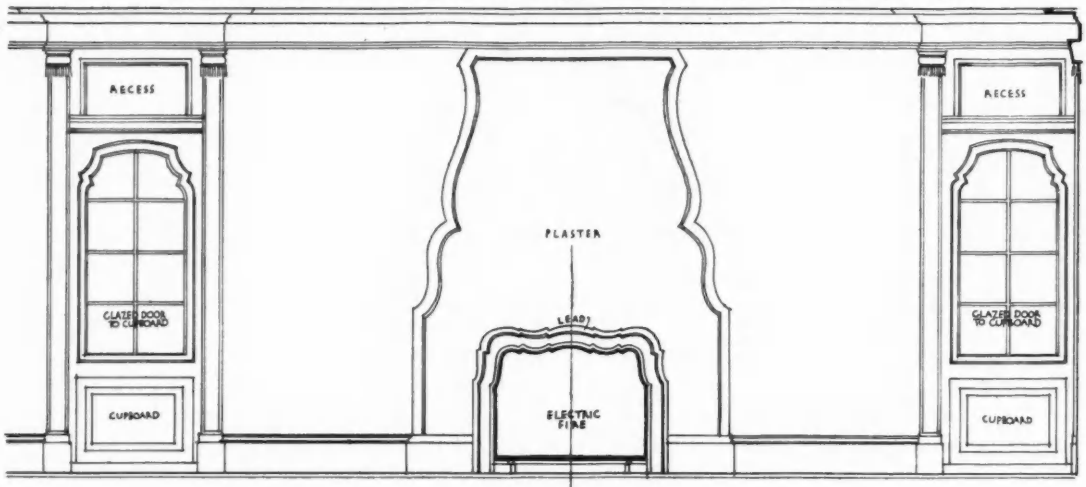


WHEN Mr. Wornum took No. 37 Hamilton Terrace, N.W., for his own occupation, he carried out a considerable amount of work, primarily of a decorative nature, to bring the inside at least of the house more into line with his own feelings.

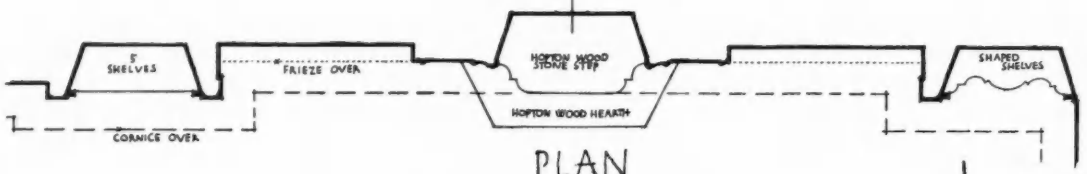
It will be seen on reference to the drawing overleaf, which shows some of this work in the dining-room and the drawing-room, that the design generally is of a highly interesting character. Particularly noteworthy are the drawing-room fireplace and the heads of the cupboards flanking it, and also the balusters (a large scale detail of part of one of which is given on the drawing) which fill the screen in the dining-room.

The photographs reproduced on this page show some variations from the working drawings in minor details, and, of course, they fail to show the colour schemes upon which much of the effect depends.

The Drawing-room Fireplace.



The Screen in the Dining-room.



The drawing may be read with architects' ordinary scales (¼ inch; and 6 inches = 1 foot).

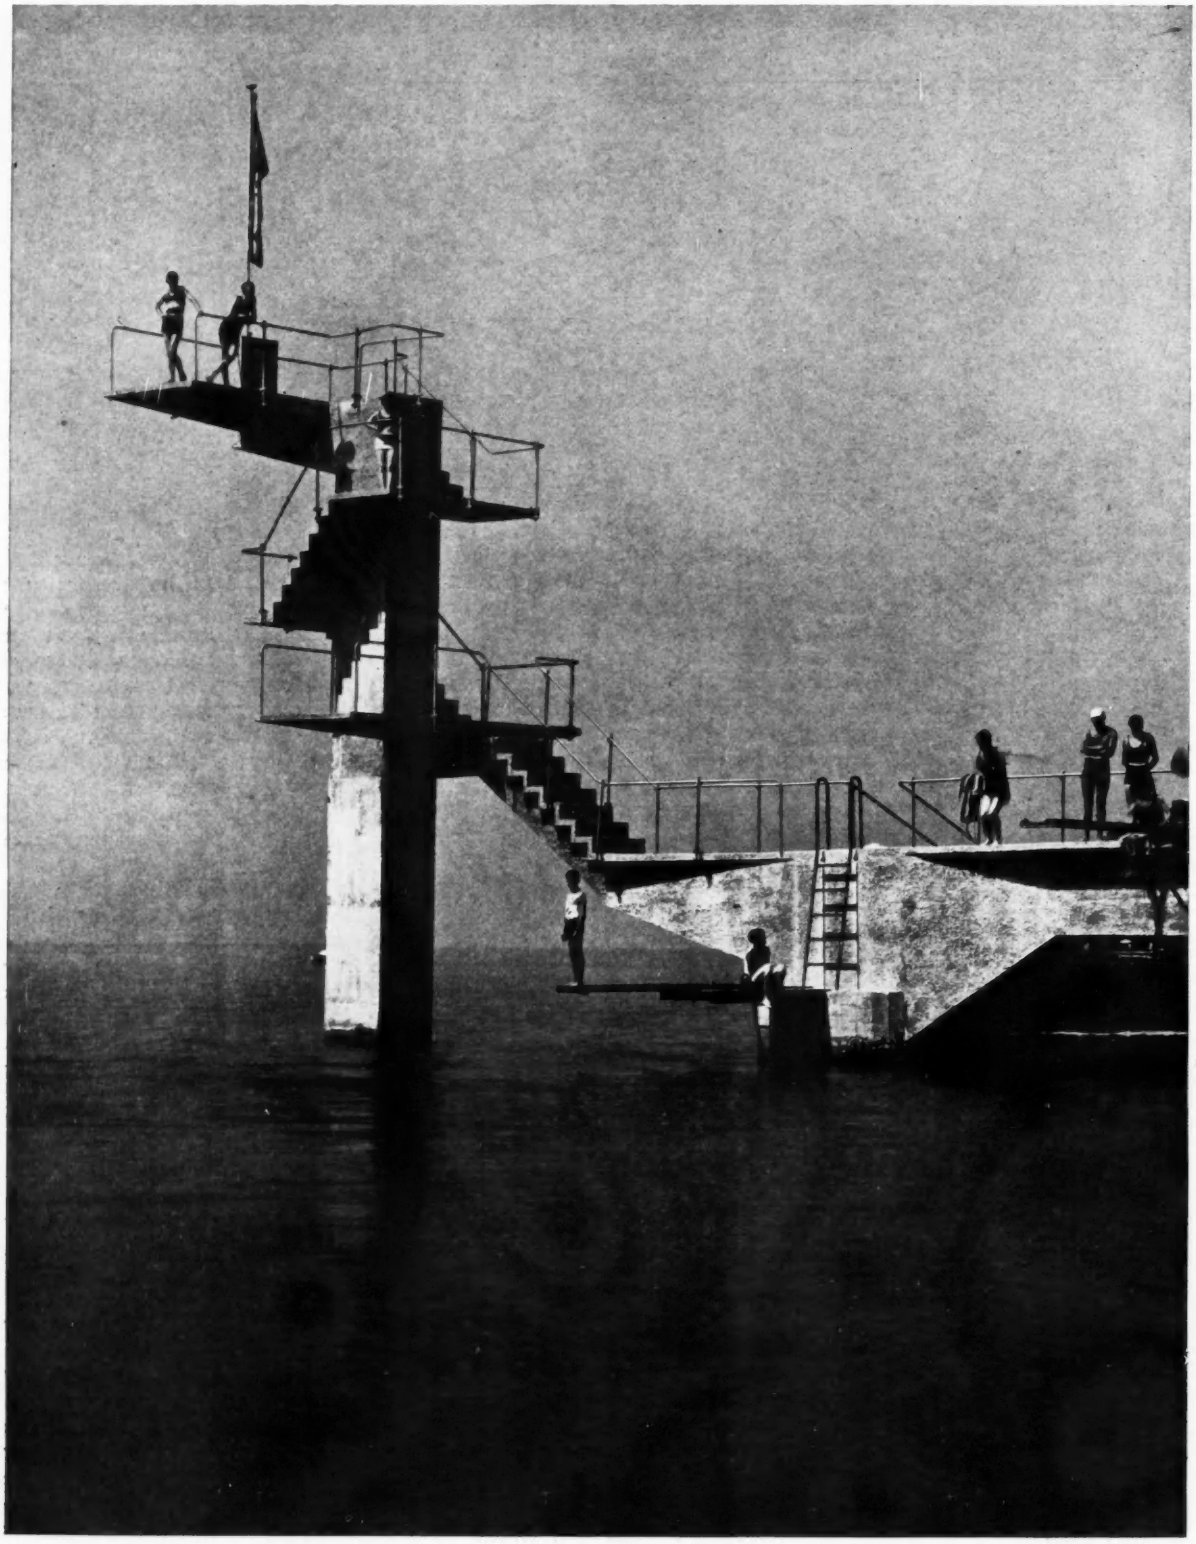
FEES—FIXED AND SLIDING

Tell me, what shall thy wages be?

—GENESIS XXIX. 15.

THE special committee appointed by the R.I.B.A. to consider the revision of the Scale of Professional Charges has done its work, and for the past fortnight Members have had an opportunity of studying its proposals. The committee has been active since April, 1927, and during its three-and-a-half years of work a good many criticisms have been expressed and much discussion entered into. The result of all this deliberation is down at last in cold print, and on October 20 the Council will formally approve the draft which will thus become a standard document of the Institute.



The most revolutionary thing about this draft is Clause *a* (iv) of Section 2, legalizing a reduction of the architect's fees in respect of work for which a consultant is employed. The reduction is not a very large one, being a matter of only 2 per cent. on the cost of the work. But a question of principle is involved which has long been the subject of acrimonious dispute. There are architects within the R.I.B.A. who hold that an architect should no more be asked to contribute to the fees payable to a consultant than to pay the cost of shop drawings prepared by a sub-contractor. There are others who agree with those public bodies who have decreed that the architect should bear the whole cost where a consultant is employed. The new draft clause will be regarded as a compromise, and we have no doubt that—provided it has secured, or will secure, the approval of the Ministry of Health and other recalcitrant bodies—it will be accepted by the profession as a sound compromise and even an advantageous one.

Apart from this clause the draft has little to say that is new. It is admirably tidied up and is brought into line with current practice on several points where hitherto this practice had been at variance with the printed word. A case in point is the clause sanctioning a 5 per cent. rate for "extensive works of a simple character." This rate has been charged on a large number of jobs since the 6 per cent. ordinary rate was instituted in 1919. But there remains one little piece of tidying which for some reason or other—possibly because of its comparative smallness and insignificance—has been overlooked. We refer to Clause *a* (ii) of Section 2, describing the scales of fees for works costing £2,000 and under.

The defect in this particular scale is so glaring and its correction so very small a matter that we are sure it only needs to be pointed out to be removed at once by the Council. A glance at the table printed on page 538 will show how the present official scale works out. How many people have ever wanted to apply it to the letter? We do not know, and it may be true that, as we have heard, most architects ignore its refinements of gradation and are content to charge their clients a round 7, 8 or 9 per cent., which is held to be "near enough." But if a scale is laid down, it should be workable, and the present scale is not.

The difficulty arises from the fact that the initial scale of 10 per cent. relates to a job costing £100, and as this cost increases to £2,000 the scale of fees is reduced in arithmetical progression from 10 per cent. to 6 per cent., after which point it remains stationary. Now, if the scale of 10 per cent. had started from the point at which the cost of the job was zero, the matter would have been delightfully simple, as then for every addition of £100 to the cost of the job the scale of the fee would be reduced by $\frac{1}{20}$ of 4 per cent., that is to say, by 0·2 per cent. Thus, for a job costing £100, the scale of the fee would be 9·6 per cent.; for £200, 9·2 per cent., and so on. The scale of the fee for a £500 job would be exactly 9 per cent.; for £1,000 exactly 8 per cent., and for £1,500 exactly 7 per cent., with even gradations between, calculated in terms of single decimal points.

In the existing authorized scale, however, for each £100 addition to the cost of the job between £100 and £2,000, the scale of fees is reduced by $\frac{4}{19}$ per cent. This is not a very convenient fraction to work with, and if we reduce it to decimals the luckless architect and his client must throw up their hands in despair, for $\frac{1}{19}$ in decimals happens to be .052631578947368421O, the last eighteen figures recurring *ad infinitum*. In view of this fact, with all due humility, it is proposed that Clause *a* (ii) be amended, and, by the simple expedient of making the 4 per cent. difference in the scale of fees relate to a difference from zero to £2,000 in the cost of the job, introduce the sensible gradation of 0·2 per cent. for every additional £100. Our excellent official scale must be rid of this pointless complication.

A DIVING STAGE ON LAKE GENEVA [*By Otto Zollinger*

The diving pool at the new Vevey-Corseaux Plage, in Switzerland. The plage nestles at the end of a bay on the shores of Lake Geneva, and includes a club house, terrace and tea-room. It is built entirely in concrete.

"Alice in Wonderland" characters have been carved on the keystones at Orchard House, now nearing completion in Oxford Street, W. (Trehearne and Norman, Preston and Co., architects)

NEWS & TOPICS

BUILDING INDUSTRY COUNCIL'S REPORT

THE interim report of the Building Industry Council of Review, of which Lord Amulree, K.C., is president, and Sir J. Tudor Walters and Sir Banister Fletcher are vice-presidents, was published last Monday (October 6). Probably an agreed report, approved by all the varied interests concerned in the industry, would never have seen the light of day if it had not been for the efforts of four distinguished members of the R.I.B.A. The chairman of the Committee, which held twenty meetings, taking evidence from many representatives of building interests, is Mr. Alfred Bossom. He has been loyally supported by Mr. Sydney Tatchell, who was nominated by the R.I.B.A. to sit on the Committee; by Mr. Howard Robertson, and by Mr. Herbert Welch. Probably every word of the report, extracts from which are to appear elsewhere in this issue, will not be approved by every member of the architectural profession; but it says much for the judgment and the tact of Mr. Tatchell and his colleagues that so many points sure to find favour with architects are included, and have been approved by such men as Sir J. Walker Smith, Mr. George Burt and Alderman Coppock.

★

Difficult days now face the industry. If it is not to be sheltered, foreign competition, which is already felt in respect of certain building materials and even in architecture, will gravely affect its present prosperity. The report indicates, in terms which are obviously drafted discreetly so as not to give offence, certain main lines along which future progress may be made. Specially noteworthy is the recommendation of the Council that building schemes should be subject to consultative architectural review and advice.

★

It is suggested that much greater use could be made of the panels of consultative architects recently established in different parts of the country by the R.I.B.A. "The advantage to be derived from advice and help of this kind is specially commended to the consideration of individual builders in all the districts where panels have been formed." The report is only an interim document. It faces up to some difficulties; it temporarily ignores others. I hope, however, that the Council may continue its work, possibly under Government ægis, as is suggested in the final recommendation.

UNDER THE THAMES; OR OVER?

Contrary to popular opinion, which is apt, after months of waiting, to take a facetious view of new Charing Cross schemes, the L.C.C. Committee will examine a number of very interesting plans of a varied nature. Although the whole thing is as complicated as it is possible to be, there seem to be only two main divisions of expert opinion on the best way of salvation—either under the river or over. For if there are to be no more embankments on the south side, and the Southern Railway are fixed in their decision either to stay at Charing Cross or to go no farther away than the Lion Brewery site, what else can be done but bury the railway below ground or elevate the stations ?

★

I very much hope that we shall be allowed to examine the evidence brought before this committee, because the wide terms of reference and the open invitation to the public are bound to produce a mass of interesting matter, all with a bearing upon town planning, upon London, upon traffic, and upon the general tendency of all these things as they apply to London. The collected evidence, abridged as necessary, should make a valuable document.

TRAM *v.* BUS

I may be wrong, but I thought I heard some mention of trackless trolleys for London. If I am right, then there is nothing I can think of, short of the entire submergence below ground of the Southern Railway, that will more largely benefit the great area of London south of the Thames, and north of the central areas on the other bank.

★

London tramcars are comfortable to travel in. They are now quite up to date, well lit, and very swift in travel; while the newly designed trams that I have seen moving grandly along the Finchley Road are marvels of modernity. But all this allowed, trams are a nuisance and they are unæsthetic; both, curiously enough, for the same reason, namely, that they occupy the centre of the road.

★

In the end their danger to traffic was bound to kill them. But what a long time they have been a-dying ! Oxford and Cambridge, two towns that suffered grievously by their presence, got rid of them long years ago, and only those that are there to see the transformation can say how absolutely damaging to all sense of spaciousness and dignity these silly vehicles are. Even towns like Liverpool and Manchester, that keep fairly efficient services on the

roads, would be better served in every way by some form of bus. One can only hope that when the trams leave London they will herald the decease of all trams, everywhere.

THE CARE OF CHURCHES

The fourth report issued by the Council for the Care of Churches is a most interesting document, as much for the good sense which it brings to bear upon its subject as for the subject itself. Who will not agree with them in finding the multiplication of wall tablets a serious disfigurement? Yet who will not still further admire their catholic taste in finding so much good in the best of periods so generally disregarded as the Victorian; in not wishing to sweep away this thing and that at the dictates of fashion? Really the most remarkable point about the report is exactly this breadth of outlook which marks it as representative of the more enlightened spirit of this time. To feel that it is better to put in clear leaded glass so as to be able to see the green fields outside is a new conception of worship, for to eschew much bad decoration in favour of sunlight is to induce the condition of a return to better and more human decoration.

LANDSCAPE GARDENING WITHOUT ARCHITECTURE—?

Reading University has established a diploma course in landscape gardening. It is a three-year course and is intended to cover every necessary phase of the subject. Art, botany, book-keeping, physics, chemistry, surveying and levelling, horticulture and building construction are included in the curriculum, but I find no mention of architecture. Why, I cannot think, for architecture is the only possible approach to the subject unless the whole thing is to be a relic of Capability Brown and his school. Architecture alone deals with proportion, form and a real understanding of solids, and to imagine that architecture has to do only with formal gardening is to think superficially of each of them. I hope I am mistaken about the curriculum.

MODERN SIGHTSEEING

At the entrance to Stonehenge, which is now being looked after by the Office of Works, may be seen during the holiday months rows of motor coaches occupied by complacent people comfortably sitting in their seats and gazing at the greatest prehistoric relic in Great Britain. Very few trouble to get out of the coaches, and fewer still to pay the small fee demanded in order to enter into the sacred circle. The other day I listened to the driver of one of these coaches, whose exact words were: "That is Stonehenge on the left—no, I mean on the right. We shall stay ten minutes here before going on to see the Rufus Stone. You can get out if you like, but you can really see all you want from here, and will save 6d." Only one man raised himself from the seat in order to take a photograph of these stones through the window of the coach. What a difference from the impression made upon Pepys when he rode out to Stonehenge from Salisbury, and afterwards wrote in his *Diary*: "Find them as prodigious as any tales I ever heard of them, and worth going to see; God knows what their use was"! Dr. Johnson's comment, after going on the same day to Salisbury Cathedral and Stonehenge, was: "Two eminent monuments of art and rudeness, exhibiting the first essay and the last perfection in architecture."

CISSBURY DOWN TO BE RE-CONDITIONED

I referred recently to the disfigurement of Cissbury Down by estate developers. Let all rejoice, and evil-doers tremble, for Sir Lawrence Chubb has announced that the letters of chalk, each of them forty-five feet long, are to be removed by the action of the Scapa Society, public opinion and the County Council!

COLD COMFORT

Architecture is frozen music—"and sure leaves us cold," said the American.

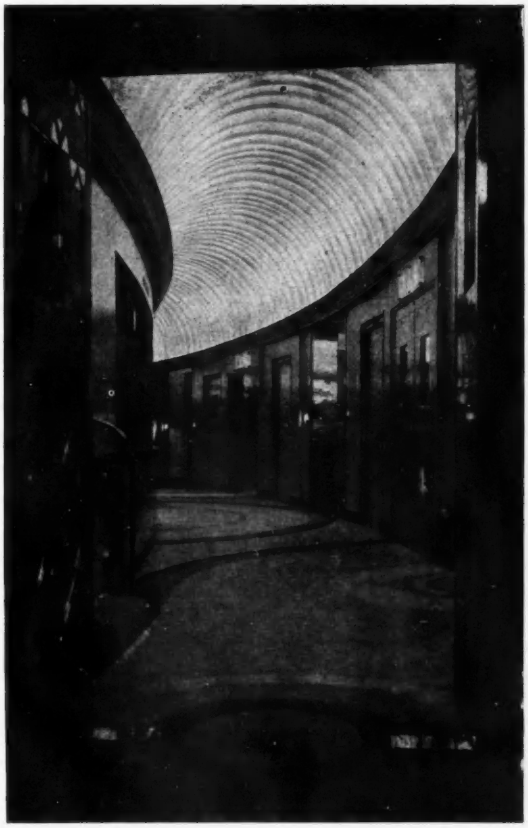
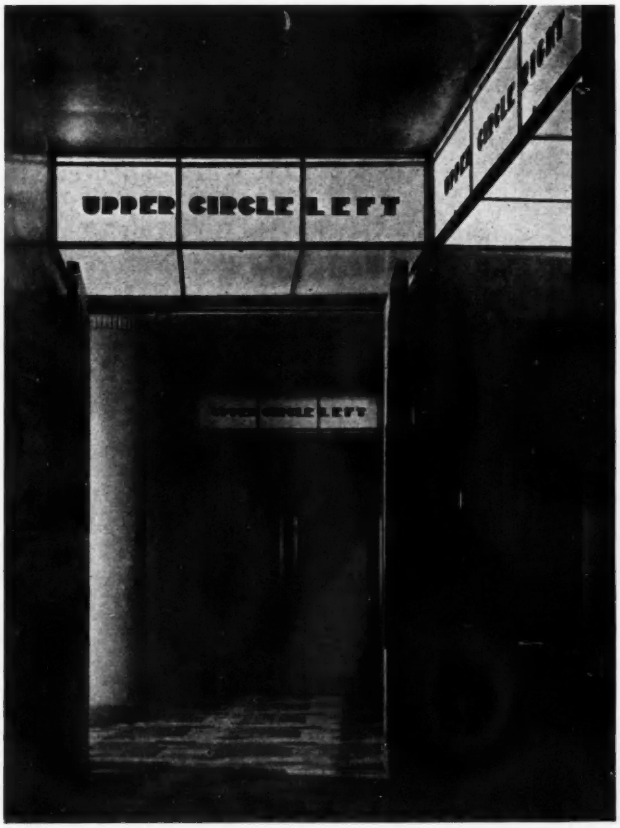
CAMBRIDGE THEATRE

DESIGNED BY



SEVEN DIALS

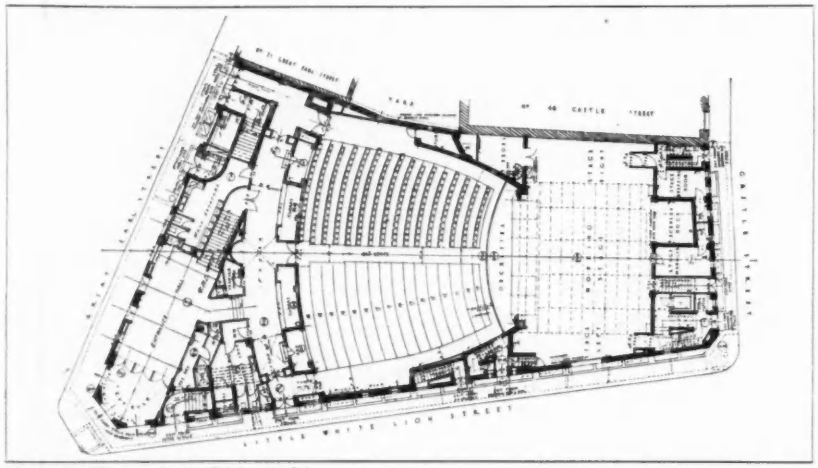
WIMPERIS, SIMPSON AND GUTHRIE



The Seven Dials frontage, as seen, floodlit with yellow light, by night. In contrast, the canopy above the corner entrance, the side signs and the tower are tinged with Cambridge blue. (A photographic study, taken by day, appeared as a frontispiece to the issue of THE ARCHITECTS' JOURNAL *for September 3 last.)*

SEVEN DIALS sounds an odd locality for a theatre. But so many new theatres are being commissioned and erected in London at the present time that it is obvious that fresh ground must be broken outside the traditional haunts of the stage. What, by the way, is to be the upshot of all this activity? Presumably the older and less convenient houses will, one by one, be pulled down. Into this particular neighbourhood a long stride was taken when the Dominion Theatre was built near the corner of Tottenham Court Road.

The stalls foyer has a ribbed ceiling, concave in section, and is equipped with concealed lighting.



The upper circle approaches, looking through the foyer. Many doors have convex double finger-plates as seen on the right.

Looking down at the stage from the upper circle. The grille at the foot of the proscenium opening conceals the orchestra pit: it is of brass. The series of roof-ribs (see also the illustration on page 542) has concealed lighting.

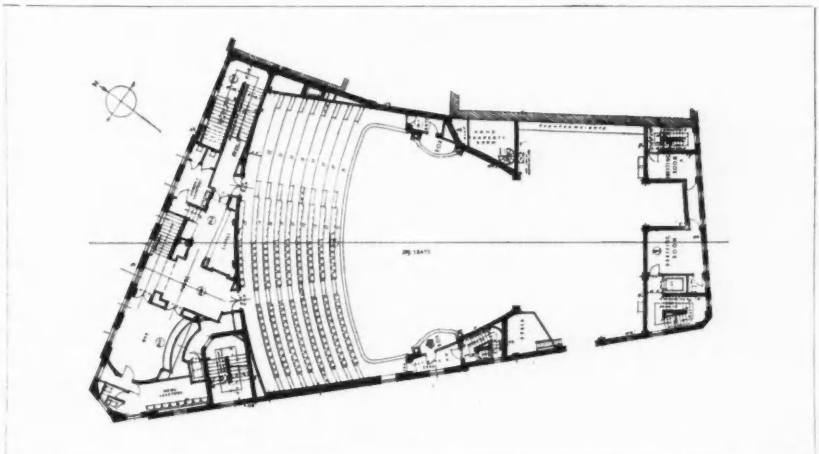
And within the last week or two the Phœnix has been completed, also within a stone's throw of Seven Dials, and, consequently, of Cambridge Circus.

But the Cambridge is really nearer the old theatreland than either of these; it is, in fact, not so many yards from the Shaftesbury. The site is a corner one, actually facing "the Dials," and that it was of an awkward irregularity a glance at the plans will show. It may be said that its configuration left no option as to what direction the main axis of the house must take; but the problem of setting out the entrance cannot have been so easily solved.

Cambridge Theatre, Seven Dials, W.C.]

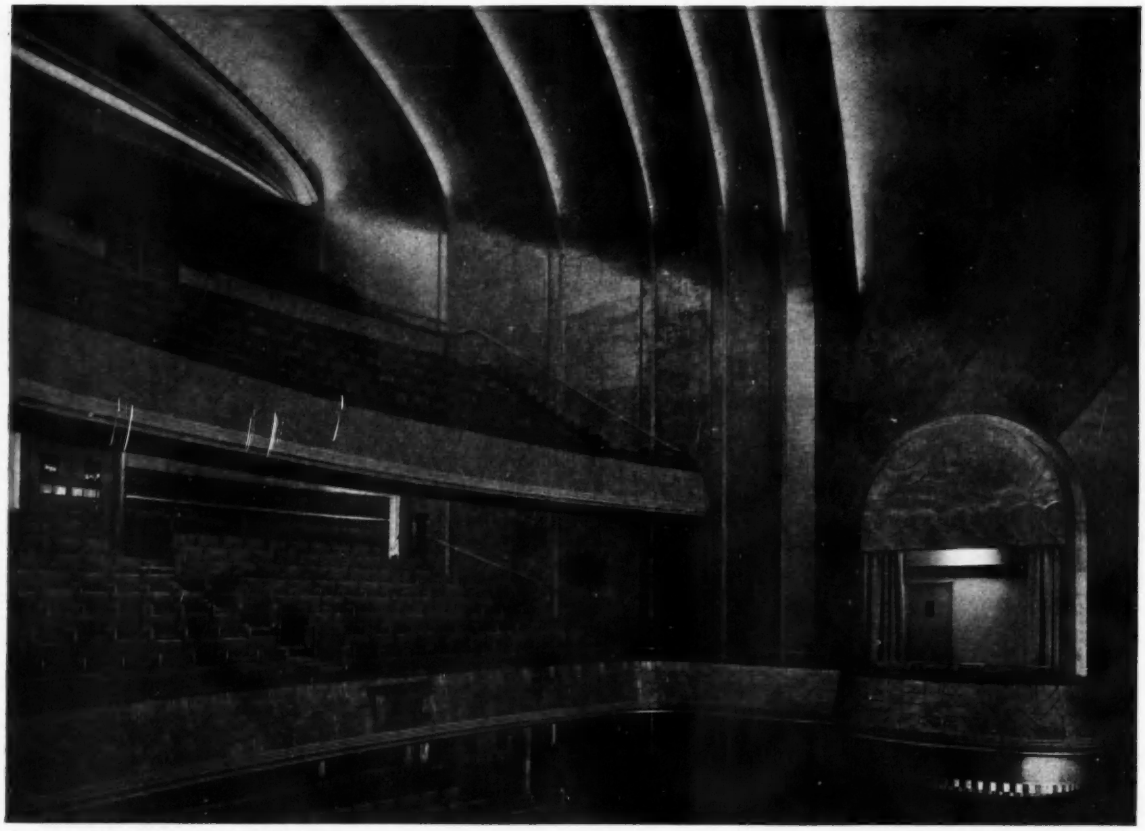
Plan of the orchestra stalls, which seat 440 persons. The manner in which much has been made of a site of unpromising irregularity is worth study: the axis of the entrance hall does not bisect the corner angle, but runs parallel with Great Earl Street.

The new building presents a symmetrical design when looking at the corner, yet the subsidiary axis of the entrance hall is actually parallel to one of the boundary walls, a fact of which, however, most visitors will remain quite unconscious. The exterior is faced mainly with stone, and the metal windows, the entrance canopy and the display signs are painted Cambridge blue, an appropriate and distinctive colour that is also made to tell when the façade is floodlit at night.



Within, the shape is unusual where theatres are concerned, especially as regards the roof, since both vertical and horizontal sections describe continuous elliptical curves. Across the ceiling a series of transverse ribs advance in increasing proximity one to another, up to the springing of the dress circle. Each contains concealed lighting playing upon the downward-dropping dome that would in any case lead the eye to the proscenium. The effect is intensified by the scheme of decoration, carried out in bands of lacquered metal-leaf, diagonally sloped and graduated

Looking across the dress circle, which is lit in a series of curves concentric with its main outline. The walls are covered with metal leaf, toned a deep gold-brown and lacquered. Tones of cinnamon and grey appear in the carpet.



from deep gold-brown to pale honey-yellow. The effect is of a quiet but rich expectancy, well calculated to prepare for, but never to compete with, the show on the stage. The only excrescences are the two boxes, but even these give the impression of being lobes of the dress circle: each has a semicircular arched opening, the tympanum of which is filled in with an embossed design finished in matt silver. The auditorium is of moderate capacity, stalls, dress and upper circles affording spacious seats for something over a thousand persons.

In the foyers, bars and other rooms and corridors outside the playhouse proper, a rather freer use has been made of the glittering decorative adjuncts offered in such profusion by modern materials. Much of the door furniture, handrails, etc., as well as the bar-stools, tables and so forth, is chromium-plated. A distinctive type of finger-plate on the doors catches the eye. Whether in brass or in chromium, its twin convex outline looks highly effective against the dully-polished walnut that is extensively employed. The carpets and rubber flooring have been specially designed, the former, in the more important parts of the theatre, displaying a "C" cipher. The foyer behind the stalls is a curving corridor, with a ribbed, arched ceiling, indirectly lit, and has an alcove immediately facing the doors to the central aisle of the stalls. The lounge and bar for this part of the house are planned beneath the street-level entrance hall, and are approached by stairs. At dress-circle level, room has been found for a separate foyer and bar, opening one from the other. The decorations throughout the house are designed by Chermayeff.

[*By Wimperis, Simpson and Guthrie*

Plan of the dress circle, which accommodates about 300 seats. At this level two boxes break the regular curves of the house. That on the right of the auditorium is the Royal box, and opens to a small retiring room. Both boxes are approached from the circle.

Cambridge Theatre, Seven Dials, W.C.] [*By Wimperis, Simpson and Guthrie.*

A view of the dress and upper circles, from the Royal box. The bands of colour on the metal-leafed and lacquered main walls are graduated from deep gold-brown to light honey. The fascias of the circles are in embossed burnished metal; the tympanum of the box bears a decorative design in low relief, and has a dull silver finish.

BUNGALOPHOBIA

AN interesting discussion concerning bungalows has been taking place recently in the pages of *The Spectator*. Mr. Stanley Casson, in an article entitled "Bungalophobia," says that he cannot understand the prejudice against bungalows. In half the British Empire, he states, Englishmen live in bungalows, and yet the moment that an Englishman in England attempts to live in one he is assailed with vituperation. My own bungalow is, I may say, quite definitely a growth, but has nothing "bungaloid" about it at all. For the termination "—oid" means "resembling," or "with the appearance of," and my bungalow neither resembles a bungalow, nor has the appearance of a bungalow. It goes straight to the point and *is* a bungalow. It is almost entirely of wood; its foundations only are of stone. Its roof is of large flat red tiles and the walls of its rooms are lined with stuff like cardboard, which I optimistically believe to be asbestos. These sheets of cardboard are held in place by "slats" of wood, which were whacked in by nails. Two red brick chimneys protrude from the red roof and the rest of the building is painted dark green. It is extremely comfortable and warm in cold weather and extraordinarily cool in summer. It faces south-west on the north Cornish coast and has been standing for ten years without any single part of it either blowing away or falling down. Nor are there any draughts in the strongest gale, and the water does not come in.

Now what would Mr. Clough Williams-Ellis suggest to me and it? It has no trace whatever of the finer elements of modern architecture. It is built for being lived in and nothing else. I have softened down its asperities; its nasty wooden slats and asbestos have all been oil-painted in one colour, its fireplaces oil-painted to match, and the whole been simplified to a single unity of mural decoration. But Mr. Williams-Ellis would want it uprooted and in its place he would ask me to build a subtle creation in Bath stone or Stonesfield slate, for which an undoubtedly expensive architect would do me the plans. To which I can only reply that I am not prepared to pay more than the price of a moderately good car for any bungalow that he may design, and that the cost of the design must be included in the total of, say, £500 or £600. Instead of damning all bungalows and their owners for building "growths," let the architects come forward and give us the ideal bungalow at the ideal price. Today there are hundreds of poor people who yearn for a country home and are either driven into buying a bad bungalow or driven off buying any for fear of buying a "growth" and incurring the wrath of the highbrows. Fortunately, my bungalow with careful treatment looks simple and practical, and it has a lovely garden, no other bungalows anywhere near, and a trout stream at the foot of the sloping hillside on whose wooded steep it stands.

The architects and divines must stop

nagging and get to business. If they don't like my "growth" and others similar to it, they must design better and even cheaper ones. And, what is very important, they must design different types for different regions. Cornish bungalows will not do for the East Coast or for the Cotswolds. Even if they are made wholly of wood they can still assume types that suit regions.

Then, again, in the types of fireplace, steps and gates, the bungalow, without extra expense, can copy the type of its district. And it can use local stone. In the granite areas it can build its foundations of granite and so automatically achieve the local style. In slate areas it will use the thick slabs of slate from local quarries for steps, fireplaces and gardens, and so on. The scheme for "regional bungalows" in which local materials are drawn upon is not one which I have as yet seen popularized by the architects.

I am tired of all this abuse of bungalows. If the alternative is to live in a boarding-house among the palms and aspidistras in the summer, then I will build any kind of bungalow.

MR. WILLIAMS-ELLIS'S REPLY

Mr. Clough Williams-Ellis, replying a week later, says: May I suggest to Mr. Casson that he read what I have actually written in my book, *England and the Octopus*? the general drift of which was as follows:

That it is entirely right and desirable that people should seek to live in the country, and it is both selfish and cynical merely to laugh at the often pathetic attempts of bungalow dwellers to achieve an imagined rusticity, so often frustrated by their own tragic ignorance of country ways and traditions as well as by the cheating exploitation of their innocence by land and building speculators.

That there obviously is nothing inherently base in a one-storied building, as countless charming old cottages can testify—nothing shameful about a stairless house. It is only the debasing of our structural currency by the "Carriage - paid - to - any - station" bungalow hawkers that has given this type of dwelling a now deservedly bad name.

I want to preserve the country *for* the towns, not *from* them; I want it protected for one reason only, that we may have it for our refreshment and enjoyment.

It is not even the shoddy individual bungalows that I deplore so much as their unskilful and anti-social placing, too often selfishly and planlessly peppered about the landscape without regard for their background or for other people's views.

That is why I plead for a National Regional Planning Scheme, for some measure of effective Amenities Control, so that in our clumsy haste we do not utterly destroy the thing that we love, yet with such shortsighted greed and so little understanding.

Ideally, I held, that would generally mean the use of the traditional local materials, but where under modern conditions these proved too costly I laid it down that it was *colour* that really mattered (especially in the roof).

I agree with Mr. Casson that the British architectural profession as a whole has failed to give guidance where guidance was so obviously needed.

As to good standard designs for really cheap little houses and bungalows for varying needs and localities, such have been freely published but little used. It is a grim thought, but the general public at present actually prefers, so it would seem, the inconvenient, tawdry, gimcrack stuff that it mostly gets—which is, I admit, the fault of us architects and propagandists, who should have taught it better.

Some time ago, with a rather baseless optimism, I offered to revise the elevations of any wholesale bungalow manufacturers who cared to send me their catalogues—merely simplifying and integrating and modifying the proportions, without adding in any way to the cost.

Several responded rather perfunctorily, frankly telling me, however, that the design of their current products was dictated by the public taste, which they as tradesmen were bound to study, and that they feared that the straightforward simplicity that I advocated would not be considered "tasty" or "artistic" enough by their customers. So one has really got to go much farther back—to education.

By his own confession it is clear that Mr. Casson has only contrived to make his own "Reach-me-down" even tolerable by pretty drastic after-treatment, and I am darkly amused to note that he claims as one of its chief amenities the fact that there are "no other bungalows anywhere near"! One often reads much the same recommendation in estate agents' advertisements—"Unspoilt country—no bungalows near"—though it is very seldom true, which is one reason why so many of us are inclined to spend our holidays elsewhere than in England.

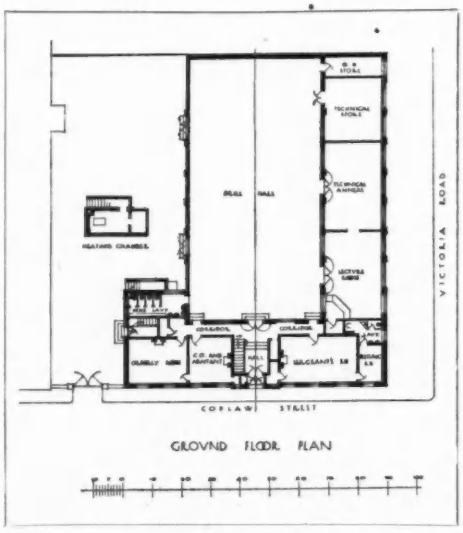
LETTER FROM MR. HARDING THOMPSON

Mr. W. Harding Thompson, in a letter to *The Spectator*, says: Mr. Stanley Casson's article probably expresses the opinion of many people who appreciate the joys of a summer bungalow by the seaside. It is interesting, therefore, to note that his sound views on the desirability of using local materials have not been put into practice in the case of the bungalow which he owns on the Cornish coast. This particular building, according to his description, is constructed of wood with a roof of "large red tiles." It is not clear whether these tiles are of clay or asbestos, but in either case the materials mentioned have been used in a region where some of the finest slate in the world is quarried, where stone and granite are plentiful, and where timber is scarce.

Few architects object to the bungalow type of dwelling provided it is well designed, but it lends itself more readily to a flimsy kind of construction, and hence is erected cheaply by the speculative builder, who easily finds a purchaser, and so is not concerned with the cost of upkeep. Experience of building with permanent materials proves that the two-story dwelling is rather more economical than the bungalow. Also every property owner knows that the cost of upkeep is an essential part of the economic factor in building, and it is futile to argue that initial cost is all that matters. It is unlikely, therefore, that the present enthusiasm for the cheap bungalow will stand the test of time.

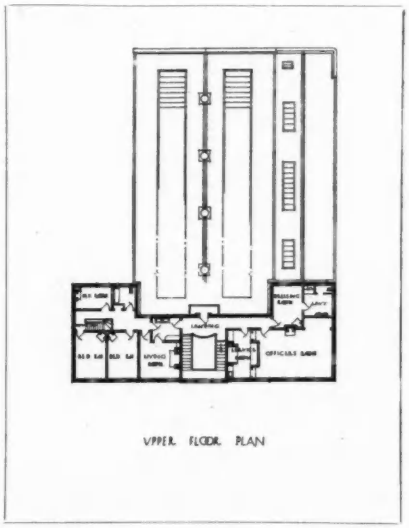
From the æsthetic point of view the colour and material of the roof of a low building is a most conspicuous element in the design. Having recently made an exhaustive survey of the Cornish coast for the Council for the Preservation of Rural England, I am convinced that the major disfigurements of that beautiful region are due to buildings out of harmony with their surroundings and the Cornish tradition—irrespective of whether such buildings are of one or more stories. Bright red tiles (especially the pink asbestos variety) on the Cornish coast conflict with the admirable grey-green local slates that harmonize so well with the low colour tones of the western landscape.

If the bungalow is to become part of the English landscape, there is no reason why it should not be as seemly in appearance as the one-story cottages that have survived from previous centuries, and whether of temporary or permanent materials it will not offend the community if it retains its simplest form, stripped of all those meaningless "embellishments" frequently used by the speculative builder.

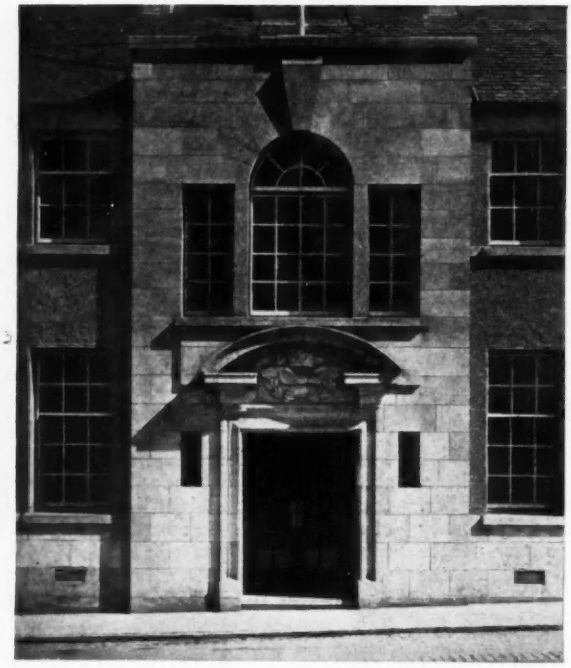


The grouping and siting of such buildings is, however, another matter which is bound up with town planning; this is just as important as the use of suitable materials; indeed, the lack of town planning foresight lies at the root of the recent public resentment against the so-called "Bungalophobia." One wonders whether Mr. Casson's summer retreat will retain his affections when a few hundred other people have built bungalows in close proximity to and in competition with his own!

AUXILIARY AIR FORCE HEADQUARTERS GLASGOW



DESIGNED BY LAUNCELOT H. ROSS



A view from the corner of Coplaw Street (left) and Victoria Road

The walls are of brick, roughcasted on the exterior in a light yellow colour and dashed with "Dorset Peas." The base of the building and the main entrance are of Auchenheath white stone, and the roof is covered with Ballahulish slates. In the instructional hall the walls are finished in red clay brick, pointed, and the floor is laid with pitch pine, edge grain. In the vestibule and corridors the floors are laid with red Ruabon quarries, and the walls are finished in tiles to a height of 4 feet 6 inches.

The main entrance in Coplaw Street.

Fireplace and alcove in the officers' mess.

LITERATURE

CONTINENTAL IRONWORK

THIS present book is the second volume of a revised edition of Mr. Starkie Gardner's great work, prepared by Mr. W. W. Watts, formerly Keeper of the Department of Metalwork of the Victoria and Albert Museum.

When Starkie Gardner wrote in 1896 he had not a great deal of information to go on, and his masterly exposition of his subject quickly became a standard work; nor can one say, glancing through the excellent bibliography of the present volume, that time has seen fit to eclipse his pre-eminence or dim the brightness of his vigorous prose.

No one who has sought to trace the rise and fall of ironworking through history can fail to notice how much more importantly it has ranked as an art in the periods when it was associated in equal measure with the purely utilitarian. Thus in the days when a sword was man's most cherished possession, the smith was all-powerful.

In Renaissance days the smith had lost his pre-eminence among craftsmen, and although the production of ironwork continued to be an index of national prosperity, the fire had largely departed from the craft and burned again under different circumstances, and at the command of men who were artists before they were craftsmen, and were never in the true sense members of a corporate and powerful guild of workers in iron.

At the present time ironwork, regarded as an art, is nearly extinct, for if one rules out the enormous production of copyistic rubbish and laborious worship of tradition, only too little remains to carry forward the story of genuine growth. There might be greater cause for regret if one omitted to remember the startling emergence of modern steelwork design from the crude forges of the preceding centuries. Count but the Forth Bridge and any great liner as a conscious work of art, and the story leaps forward to untold heights of powerful expression.

Yet we are in that peculiar quandary of being uncertain as to where our riches lie: distrustful alike of the modern machine and the clumsy hammer; nor knowing to which to give allegiance.

It is at such a time that one may best seek first causes in an attempt to define one's attitude to the job of expressing life in terms of what material comes easiest to hand and suits the civilization we live in; and here it is that Starkie Gardner, who was as aware as any today of the condition of change, may give us the key to the problem. He wrote of iron, but he wrote equally of the men who worked iron, and why and how they worked it. That is why his books are still so valuable, and why we should be grateful for a new edition to present his thoughts in a form more to our liking than the old production of 1896.

The present volume deals with Continental ironwork from mediæval days up to the Late Renaissance. A final volume will cover the same period for England alone.

Ironwork. Part II.: Continental Ironwork of the Renaissance and Later Periods. By J. Starkie Gardner. Revised and enlarged by W. W. Watts, F.S.A., Victoria and Albert Museum. Price 3s. 6d. net.

MODERN ENGLISH FURNITURE

A SURVEY of modern furniture design as comprehensive as this of Mr. Rogers' is a work for which we should be grateful. During the last few years we have felt ourselves moving into a new current of mental activity unlike any we or our ancestors before us have experienced since Gothic architecture arose out of the remains of a vanished civilization.

Surrounded by the ordinary vulgarities of urban existence, one is apt at times to miss the point of the modern revolution. Here, among the pages of this book, one can see most clearly the marks of economic pressure, the emergence of new ideas and altogether new enthusiasms for materials; and, combined and inextricably mixed with these, a stubborn, native disregard of strange logics.

What strikes one is the marked difference between the native-born furniture and the imported modernist. The one is country furniture; the other

From Modern English Furniture.] [*By John C. Rogers.*

For the small suburban or country house. Solid oak furniture of simple design to suit the slender purse. Designed by Philip Tilden and Ambrose Heal.

C

town furniture; as though English architecture were of the country house and cottage, in contrast to the eloquently urban work of foreign or Continentally-inspired designers.

This is indeed true when, after the war, we took up the story of furniture design we thought in terms of cottages and country houses. Our best designers were men who, like Ambrose Heal, directed a return towards straightforward and simple design in unvarnished oak, based upon an early tradition that had been eclipsed by the eighteenth century. Their work was sane and healthy, and we are deeply in their debt, for they have brought us a long way on the road towards an absolute interpretation of our age in terms of furniture design. The revolution is to be read in terms of plywood, laminated wood, new metals, and from these a new orientation of the real springs of design that arise always from a feeling for material. *Solids have been replaced by surfaces.* That is the kernel of modern design, and the new zest for surfaces of fine plywood built into sombre shapes that offer the cleanest expanse of surface has transformed and re-made even the furniture that clings with set purpose to whatever of the English tradition it may still rightfully inherit.

All this you may read as you turn the enthralling pages of this book. On the one hand, the luxurious suavity of Chermayeff; on the other, the gentle simplicity of John Stark and Gordon Russell; with the polite compromises of Messrs. Symonds and Lutyens taking the middle road.

It is impossible even to attempt to do justice to the wealth of material gathered within this survey. The point one would make in recommending the book is that it is comprehensive and shows *all* the currents of present-day design, so that it is not only a guide to architects and the like, but "a permanent and authoritative record of contemporary achievement." F.

Modern English Furniture. By John C. Rogers, A.R.I.B.A. London: Country Life, Ltd. Price 21s.

Dressing-room with range of fitments, providing hanging and drawer space, with shaving table and toilet basin.

BUILDING INDUSTRY COUNCIL'S REPORT

THE following are the principal recommendations of the Building Industry Council of Review, whose report was issued on October 6:

That the appropriate organizations in the industry should continue and strengthen the action already taken to secure the extensive revision of building legislation and regulations necessary to make possible the fullest development and progress of the industry. This should include the standardization of regulations—covering both technical matters and administration—as far as possible over the whole country.

That the Time and Progress Schedule system of construction should be extended on a standardized basis as widely as possible throughout the country.

That efforts should be made to impress building owners with the importance of settling all essential details before building work commences, as the indispensable condition of operating the time schedule system and securing its economies.

That the general contractor should be specifically and entirely responsible for the supervision and progress of the whole of the construction work, including that of specialist and other sub-contractors, who should be made parties to the schedule, with provision for the usual penalties for non-observance of the terms.

That the collaboration of the architect, engineer and the quantity surveyor at the earliest possible stage in any proposed building work should be encouraged.

That tenders for specialist work should be based, wherever possible, upon quantities to be incorporated in the bill of quantities.

That, wherever practicable, competitive tenders should be obtained for specialist work. (Accepted with a reservation by Sir J. Walker Smith and Mr. Arthur G. Cross.)

That the educational authorities concerned with the training of students for the building industry should consider the possibility of making arrangements to facilitate the interchange of students for varying periods and giving instruction in all the latest approved methods.

That public bodies, and builders in all districts where panels of consultative architects have been established by the R.I.B.A. should consider the advantage of the advice and help to be derived from this source.

That a comprehensive effort should be made throughout the industry and associated trades to achieve by co-operative action all the economies obtainable from standardization and simplification.

That a permanent Central Council should be set up, to be composed of representatives of all branches of the industry and associated trades, and that a fully representative conference of the various organizations concerned should be convened for the joint discussion of this proposal without delay.

[Astragal contributes observations on this report.—ED. A.J.]

ENGLISH PRECEDENT No. 136

THE JUDGE'S LODGING, ST. GILES, OXFORD

Like many buildings in Oxford, the Judge's Lodging, No. 16 St. Giles, is somewhat spoiled by the leprous flaking of the stone. The entrance, however, with its iron gates, its piers surmounted by stone urns, is simple and dignified. The door has lost its hood, but there is a fine hood over the garden entrance.

It is seldom that such houses are dated, but here the year 1702 is conveniently recorded on the leads, together with the names of the builder, Thomas Rowney, and that of his wife, Elizabeth.

LETTERS FROM READERS

Official Architecture

SIR,—Mr. Leathart has read the report of my opening speech in the debate on Official Architecture at Olympia without comprehending that I was discussing architecture and not architects; and that, somewhat reluctantly, I cited as far as possible comparable examples. It is therefore not surprising that, though an architect, he does not appreciate that a cathedral and a railway terminus are architecturally not comparable, and that consequently an invitation to compare the one with the other is merely a perhaps unconscious insult to the intelligence of an architect.

I have often pondered upon the phenomenon to which he refers, and have arrived at the considered conclusion that the answer to his question is twofold, i.e. that some "fashionable outside practitioners" must be unscrupulous poachers upon the preserves of their fellow-architects; and that the commercial and banking houses concerned most probably humour this poaching proclivity for reasons of diplomatic business policy.

This procedure, however, does not always tend to the enhancement of the architectural amenities of our cities as exemplified in at least one banking house, the elevations of which, judging from results, might with advantage have been entrusted to its able initial architect.

If commercial and banking houses do not realize it, every architect ought to know that plan, section and elevation are inseparable elements in the geometrical expression of an architectural conception; so the "fashionable outside practitioner," who butts in to design the elevations, is veritably an "outsider" and an affront to the art he professes to serve, whether his incentive be an elongated, and so distorted, opinion of his own ability or importance or the equally objectionable sordid greed of gain.

The attitude of private practitioners to each other and to their official contemporaries is "passing strange" and affords food for thought, but it does not tend to elevate the reputation of the profession in the eyes of kindred professions or of the public, as demonstrated by the deliberate omission of the architectural profession from the preliminary deliberations concerning great public improvements such as the Charing Cross Bridge scheme.

A little introspection might be salutary to some of our "fashionable private practitioners."

Mr. Leathart wrote before hearing all the evidence, so I would commend to his consideration your report of my closing remarks in your issue of October 1; and, as the inadvertent omission from the report of the second line of my final quotation from Kipling's L'envoi from "The Seven Seas" deprives the quotation of its essence, may I again quote it. Whatever view we may take of each other, in the long run :

> Only the Master shall praise us, and only the Master shall blame;
> And no one shall work for money, and no one shall work for fame,
> But each for the joy of the working, and each, in his separate star,
> Shall draw the Thing as he sees It for the God of Things as They Are !

R. WYNN OWEN

SIR,—My attention has been called to the debate held at Olympia on "Official Architecture." Now this solemn and dignified pother about the art of architecture being best served by one set of architects or the other is entirely beside the point.

It is a fact that the service of an architect is a commodity, and, as such, is one to be purchased in the cheapest market. Let us forget the fallacy that a business concern employing a staff of architects is doing so solely to advance the interests of architecture. Nothing of the kind; it is getting the design and supervision of its building schemes in the most economical manner possible—as indeed, it should.

When for £100,000 worth of building annually a business organization has to pay £6,000 in fees to an outside architect, it is bad business not to employ a staff architect at, say, £500 a year with a couple of £3 a week juniors.

As for Mr. Leathart's question at the end of his letter, that an outside practitioner is occasionally called in to design the elevations to an important building, I can satisfy his simple bewilderment. Where a building requires "titivating" up a trifle with columns and what not, the company's own architect, being hired in the cheapest market, is not considered quite up to the extra requirements of same. But there is still a substantial saving made on the debit side of the balance sheet to justify this extravagance of the employment of what Mr. Leathart terms the "fashionable architect."

"BUSINESS MAN"

SIR,—The correspondence on official architecture in the JOURNAL appears to have produced few champions of the officials themselves. Some of the statements are getting a shade reckless in consequence.

What are the facts ? Official architecture grows rapidly, therefore it is either saving my money (as a ratepayer), or our local authorities and private corporations are all fools. I believe the first case to be true.

Mr. Gotch wants it both ways : every competent assistant cannot practice himself, as strings to pull and/or private means are essential. Therefore, this man practises as near as he may in the office of a public authority.

Mr. Gotch also believes that officials do not enjoy the criticism expected by a private architect. I invite his attention to every or any local paper in the kingdom. No criticism forsooth ! Mr. Lanchester discloses another nigger in the pile, in saying that "the private architect can vary the type of assistance he might require to meet the needs of the moment." Very true : he can—and does. But assistants, competent or not, do not relish being "varied to meet the needs, etc." i.e. being discharged at short notice and irregularly engaged.

There are as competent men employed officially as elsewhere, large numbers being qualified and examined members of the Institute. These men are the subject of a silly attack on alleged socialism by good old private enterprise, under the very feeble guise of a yearning for "pure art and higher things." Summed up, official architecture gives its employees a chance, often otherwise beyond them, of attempting real architecture, of feeding themselves and their dependants regularly, and of rendering good service to the State. I am not an official myself.

A. JOHN PRICE

The Calton Site Buildings

SIR,—The Sheffield writer quoted on page 524 of your issue of October 1 is surely somewhat premature when he asks : "We wonder what special fee, or whether any special fee, is being paid by the Government to those officials in the Office of Works who made the plans"; referring to the Calton Site buildings.

When it is realized that schemes for this site have occupied the attention of the Office of Works for about seventeen years, a more useful question to ask would be : What has it cost the ratepayers to prepare the various schemes?

It was stated at one of the Edinburgh Town Council meetings that the city architect would advise the council about any necessary alterations for the so-called third scheme, at present in the hands of the Fine Art Commission.

It is surely unusual to talk about special fees for a job that, so far, has been bungled.

The first consideration in designing a building is generally understood to be : Is the site large enough to meet the

requirements, if the nature of the site is such that particular attention must be paid to questions of amenity.

This consideration has either been overlooked or ignored by the Office of Works, and it is hoped that the Fine Art Commission will stand fast on this most essential point in dealing with the third design. Edinburgh has a real tradition in town planning, and if the Office of Works are unable to handle this problem, it should be taken out of their hands without further loss of time and money.

In private practice one loses a job if he cannot handle it; but, in this case, it seems that the designers not only lose nothing of their income, but are indeed in danger of getting a bonus for mishandling the work.

WILLIAM DAVIDSON

Polytechnics and Exhibitions

SIR,—The letter signed " Polygnotus " which appeared in the last issue of the JOURNAL is misleading and untrue. There may be, and indeed are, some polytechnics professing to teach architecture, which are giving their students incomplete training and therefore adding to the inefficient members of the profession.

As I was head of the Northern Polytechnic School of Architecture, I am able to speak with personal knowledge of this particular school. The policy has always been to discourage entry into the profession of all except students who have unmistakable capability, and large numbers of boys were refused admission to the Architectural School each year.

The course of training in the school was, I submit, as complete as that of any architectural school in the country, and the greatest proof of this is shown by my experience in practice, where, broadly speaking, the most industrious and capable assistants I have had passed through the Northern Polytechnic School.

The Northern Polytechnic has one great advantage over many of the University Schools and the Architectural Association; and that is, that the whole of the students are forced to take their profession extremely seriously, as failure to succeed leaves them devoid of any means of earning their living. This atmosphere of work is of the greatest possible benefit to all concerned, and I have found that it is more universal in the Polytechnic School than in schools where the average student has never known real economic pressure.

" Polygnotus " would be entirely wrong in describing the Northern Polytechnic student as half-educated. The evening as well as the day school provides a complete system of education, and the greatest possible pressure is put on every student who enters to undertake to complete the course, and students who require odd subjects are invariably refused admission unless they can show complete efficiency in the remaining portions of their programme.

To suggest that students who might have been suitable craftsmen are induced to enter the profession of architecture is entirely misleading, and must have been made without the slightest knowledge of the extremely careful personal selection which is exercised by the head of a department such as that of the school referred to. It is ridiculous to suggest the elimination of expenditure on polytechnic education, as it is the only means of supplying real training to many of the youths who are permitted to drift into the profession by practising architects who welcome cheap labour, while these assistants are young, and give them practically no training or provision for earning a substantial salary when they are older.

I would urge " Polygnotus " to write to me personally and obtain some first-hand information of the organization of an architectural school in a polytechnic before he writes further letters to the Press.

T. P. BENNETT

Removal of Litter

SIR,—With reference to Astragal's amusing note on the change of public taste from the burning of witches to the burning of litter (September 3 issue), I think the only way we are going to stop the British public, whether motor or other picnicker, is to follow the words of the litter chanty (to the tune of " What shall we do with the drunken sailor ? ") :

What shall we do with the thoughtless tripper ?
What shall we do with the thoughtless tripper ?
What shall we do with the thoughtless tripper ?
Early in the morning.
Keep on keeping on until he's tidy, etc.

The little local experience in Bradgate Park, Leicester, has proved that putting a small litter box, where the unpleasant rubbish does not offend one because it is hidden, has led to quite a decrease in litter at Bank Holiday times. I do not think the open wire basket (which is more often than not too small) is a solution, as one instinctively avoids its unpleasant look when it contains litter.

Regarding motor cars stopping at the entrance to villages and depositing their litter, I think Astragal expects a little too much of human nature.

The secondary schools might do a bit more to help, as they train the motoring classes.

The New Forest litter raid seemed to me an excellent form of publicity.

HARRY PEACH
(HON. SECRETARY, C.P.R.E.)

Settling-Up Honeywood : xx

FAT IN THE FIRE

BY KARSHISH
(H. B. CRESWELL)

The owner, Sir Leslie Brash, and his family, are tormented with poisonous fumes from the heating furnace, which escape into the hollow space of outside walls and manifest themselves in remote parts of the house ; but neither the architect, Spinlove, nor the builder, Grigblay, has yet been able to determine what, or where, the defect is. Brash has also been baulked of satisfaction for defective painting, by the bankruptcy of the manufacturing suppliers of the paint, and is much upset at a project to develop the land adjoining his property in a layout of " Dainty Houselets." He has also just received particulars of his architect's charges.

MISS PHYLLIS BRASH TO SPINLOVE

Dear Jazz, 20/10/26.

Well really, thingys are getting a bit *too* rather, don't you think? Why not jump up and do something ! Poor Dad exploded when he got your letter the morning he went away, and knocked over his coffee. You should not do that. What did you say to upset him so? He told me the smells were fumes from the heating furnace; and since he went it has been like living in a refuse destructor here, and I had to tell the servants to let the fire out or I should not have been able to keep any of them in the house. Mum is pining in exile, and I dare not go to her for fear of finding the house empty when I got back; Dad is thoroughly displeased with you, and I do not know what he will think if he comes back and still finds nothing done. It is just as if you did not give a blow. You really ought to get a move on.

PUD.

As there is no reply to this letter in the file, we must suppose that Spinlove answered it privately. In point of fact the delay is due rather to circumstances than to any neglect on his part.

SPINLOVE TO GRIGBLAY

Dear Sir, 21/10/26.

I write to confirm telephone message asking that you will now at the first opportunity go to Honeywood with the plans, as you proposed, and find out where this defect in the

furnace flue is. Something really must be done without delay, as the inconvenience is increasing and great dissatisfaction is expressed.

Will you telephone which day Mr. Grigblay will go; and also let me know result of the investigation by wire or telephone ?

Yours faithfully,

Spinlove seems to be at last spurred to action.

SPINLOVE TO BLOGGS (TELEGRAM)

21/10/26.

Reply paid. Can you say where defect furnace flue likely to be—Spinlove.

SPINLOVE TO BLOGGS

Dear Mr. Bloggs, 21/10/26.

I wired to you today and enclose confirmation. I have seen your report on the run of the furnace flue, but what is wanted is information of the cause of the escape of fumes into the hollow wall, and of the position of the defect. Can you recall any circumstances which will throw light on the subject ?

Yours truly,

It is irregular for an architect to write personally to any servant of a builder, but as Grigblay failed to tap the appropriate vat of Bloggs's garnered memories, Spinlove, in his ambition to "get a move on," is impelled to make the attempt.

BLOGGS TO SPINLOVE (TELEGRAM)

21/10/26.

Sir try Williams sweep Thadford may likely know—Fred.

If Spinlove had no other feeling than surprise on reading that last word I do not envy him. Bloggs shows a humbleness of nature that is almost affecting. He is known to everyone about buildings as "Fred," he regards himself merely as "Fred," and he here shrinks from the assertiveness of using his patronymic.

GRIGBLAY TO SPINLOVE

Dear Sir, 21/10/26.

Mr. Grigblay will arrange to go to Honeywood Friday. Please note that delay is no fault of ours as Mr. Grigblay proposed to go over last week, but we had message from you we were to wait your further instructions.

We should like to explain that Messrs. Glauber and Walsh's letter to you of October 18th was under a misapprehension.

Yours faithfully,

Glauber and Walsh no doubt wrote to Grigblay reporting Spinlove's refusal to issue the certificate, and asking further instructions.

The following letter has been written under the conditions of extreme torment imposed by the absorbent back of an old blue print—embossed by the hobnails of someone who once stood on it—and a pen of unimaginable antecedents. Bloggs has evidently made haste to reply by return.

BLOGGS TO SPINLOVE

Sir, 22/10/26.

Now I come to think there wehre a lanky chap Williams by name come hanging about to get the job to sweep the chimblys, I sent off but two or three days after there he was come back and says her Lady ship add give him the order, well I give you the order not to touch no flews I says but I'll give you a nice esay job I says and that thire is the quick job of clearing off from wehre you have no call to be I says and wehre your not wanted I says. He sauce me and says I dursent let him has the half could never be rodded, but I dident think no more till one Tuesday dinner after the day the riging come and took the gate post, and there was the little hand cart he had standing—What's this here I ask some of them—Oh thats the chap too sweep the flwes they says and theire I found him right up the furnice acause she told him to, and grined dirty at me acause he could not pass is rods with a grate big coreing iron he had haeving and pokeing and never thinking thire wehre a soot door. It made me fare mad with half a bussel of parge and mortar he had raked down and I prety near had to frog marsh him before he would take himself off. Well thire it was been and done and had to be left you cant get inside a flwe to parge but never thouhgt no harm would come.

Yours respectfully,

"The Honeywood File" recounts how, during Brash's absence on holiday, Lady Brash became the dupe of a touting chimney-sweep ; and it now appears that the defect which has been the cause of her continued complaints, and the source of so much trouble to so many persons and for so long a time, is due to no remissness on the part of either architect or builder or of anyone else, but to the lady herself, who ignored the assurances of Spinlove and allowed the vigilance of Bloggs to be eluded. It is only fair, however, to regard the catastrophe as the lady's misfortune rather than her fault.

SPINLOVE TO WILLIAMS, CHIMNEY SWEEP, THADFORD

Dear Sir, 23/10/26.

I understand you were employed by Lady Brash to sweep chimneys at the new house at Honeywood and were stopped after you had begun on the furnace flue, and that you found an obstruction you could not clear.

I should be glad if you could tell me where the obstruction was.

Yours faithfully,

No purpose is served by Spinlove asking this question, for now it is known that the defect is probably due to violent attempts to clear the flue of an imagined obstruction, the damage is to be looked for at the place where a set-off, or bend in the flue, prevented the rods from passing. This place will probably be well above the soot door spoken of—the purpose of the door being to give access when bends in a flue prevent its being wholly swept from the fireplace opening.

SPINLOVE TO GRIGBLAY

Dear Sir, 23/10/26.

I enclose copy of letter received from Bloggs, contents of which I communicated by telephone today.

I have written to the chimney-sweep, but perhaps Mr. Grigblay will be able to get in touch with him before going to Honeywood tomorrow.

Yours faithfully,

"MR. WILLIAMS, PRACTICAL CHIMNEY-SWEEP (CHIMNEYS SWEPT)" TO SPINLOVE

Sir, 25/10/26.

Replying *re* your favour, we operated on Her Ladyship's furnace as per instructions. On endeavouring to pass 18 in. brush, obstruction was encountered after six canes. Following our usual practice with refractories, we then made attempt with No. 1 iron, but received instructions to desist from contractor's representative before desired results obtained.

Said flue belongs class 1 unsweepables, in our opinion, being carried over too sharp at six-and-a-quarter canes.

Yours respectfully,

Mr. Williams (Chimneys Swept).

GRIGBLAY TO SPINLOVE

Dear Sir, 25/10/26.

We beg to report we had furnace flue opened up yesterday and found defect due to damage by sweep employed by Sir Leslie Brash. We have left the flue opened up for your inspection and instructions.

Yours faithfully,

SPINLOVE TO GRIGBLAY

Dear Sirs, 26/10/26.

Please make all necessary repairs to flue at once, so that heating furnace may be brought into use. To be charged *extra.*

Yours faithfully,

GRIGBLAY TO SPINLOVE

Dear Sir, 27/10/26.

We must decline to restore damage to flue until we have received your acceptance on behalf of Sir Leslie Brash that we are in no way responsible for same.

Yours faithfully,

This sort of thing is the natural consequence of bringing solicitors upon the scenes : without good faith and mutual confidence in a common purpose it would scarcely be possible ever to get any building contract carried out at all. Brash, by his conduct of the Riddoppo dispute, has made it no less than necessary for Grigblay to protect himself as he does.

GRIGBLAY TO SPINLOVE (AUTOGRAPH)

Sir, 27/10/26.

I saw your letter at office today, and you will have received my reply, but I will just take leave to send you private word and ask you to have a look at that flue, for where shall I be if I build up and all evidence destroyed and only my word that the damage is no business of mine but the work of the sweep acting on your client's orders? It would be a good thing if the old gentleman had a look too, for he has been over ready to lay trouble, that is nobody's fault but his own, to other people's doors, and seeing is believing, and believing may save a few solicitors' letters of which there have been more than enough wasted already. Sir Leslie is expected back in a few days, they tell me, so no harm to wait a bit.

From what Bloggs wrote you, I broke into the flue from the scullery about five feet up in the corner, and there it was plain enough, the handy work of Mr. Williams—as he calls himself—who carefully raked away about two feet of the new parging, clawed the mortar out of the joints and punched a bit of a closer, that happened to come nice and handy, clean through into the hollow wall so as to leave a proper hole you can put your hand through comfortably without rubbing any skin off your knuckles. I never saw the like of it in all my experience: he would have ended by raking the house down if Bloggs had not stopped him. It is lucky it is an easy matter to put right, though it will mean a bit of pulling down before we can get at the job.

You will pardon me writing, but thought you ought to know how things are.

Yours faithfully,

Although a building owner has no right to expect, as some do, that an architect shall give up the better part of a day to viewing one or two insignificant defects in a completed house, it is clearly Spinlove's duty, under the special circumstances, to inspect this flue, so that he may satisfy himself that the damage is as Grigblay reports and, if it is, that there has been no contributory negligence in the building of the flue. Grigblay's reference to a "closer"—which is a small piece of brick built in for the purpose of overtaking the break of the joints and making the end brick of the course finish to a fair face—indicates that the bricklayers may have been at fault; for a closer would scarcely be rightly used in the position indicated. The defect may be the occasion, as Grigblay foresees, of adding fuel to Brash's grievances; and it is incumbent on Spinlove thoroughly to master the facts so that his apportionment of responsibility may be authoritative. Strictly speaking, he had no business to decide that the sweep was to blame—as he did when he authorized the repairs as an extra—without first satisfying himself of the fact by an inspection of the work. It would serve no purpose for Brash to view the damage, for he could not use his eyes unless someone were at hand to direct him in the evidence of them, and it is only Spinlove who could give him that direction.

BRASH TO SPINLOVE

Dear Mr. Spinlove, 2/11/26.

Your communication of the 14th reached me on the day of my departure, and I now, on my return, sit down to indite my reply in the hope that you are by this time so far relieved from the pressure of your extreme preoccupation with various other interests as not to be entirely prevented from perusing it with the attention which, as your employer, I apprehend I am entitled to expect.

My unavoidably protracted delay in replying will, I conceive, be no disadvantage to the matter I have to expound, as the extreme *insouciance* of your last communication—if I may diverge into a foreign tongue to express my sense of the inappropriateness of the epistolatory style you think fit to adopt—might have precipitated a more forcible rejoinder.

The explanations I must request you to furnish, as I have already intimated, anent your attitude to the Riddoppo dispute, and anent your approval of extortionate "profits" and "fees" added in the builder's Statement of Account, and anent also your own astonishing claim for fees—I desire to postpone to the occasion of a personal interview to be conveniently arranged at Mr. Russ's office. I now address myself to you exclusively on the subject of the noxious emanations which have continuously tormented us ever since we first took up residence at Honeywood Grange. After ten months of elusive evasion and dilatory procrastination you now inform me the house has been so built that coke fumes from the heating furnace are dispersed to all parts of it, and that we are being slowly poisoned; and you intimate with a bland assurance which—you must permit me to remark—causes me most amazed astonishment, that the whole matter is now satisfactorily disposed of *because* Mr. Grigblay has signified his willingness to carry out the necessary preventative measures "*without charge.*" You must permit me to asseverate that I cannot subscribe to any such fantastically preposterous view of the matter. As a consequence of Grigblay's contemptibly shoddy building and—you must allow me to point out—the negligent supervision of my architect, and his dilatory indifference to the appalling discomfort attendant on the disgusting effluviums of which we are the victims, Lady Brash has suffered in health, the domestic staff has been on the verge of revolt, and I have been involved in heavy disbursements on account of fees incurred by the necessity of recourse to the advice of medical practitioners and to the employment of sanitary consultants.

During these months you have had numerous intimations of the repulsive odoriferous conditions, and have repeatedly reiterated assurances that no unsavoury emanations could possibly eventuate in so carefully built a house as Honeywood, and have excused yourself from the trouble of ascertaining the cause of complaint by sending Grigblay to persuade us nothing was wrong, so that he might save himself the trouble of having to put anything right. Our complaints have been met by nothing but evasive procrastinations; and when, eventually, on my urgent insistence, you condescended to investigate and were compelled to admit the presence of olfactory effluviums, what did you do? You did nothing! After weeks of delay I return, expecting the necessary ameliorations to have been effected in the interim of my absence, and find only that, under your directions, men have knocked a hole in the scullery so that the furnace cannot be used, pushed some dirty sacks into it, and vacated the work.

The position of affairs is perfectly intolerable and beyond all bearing. I do not precisely know what my rights are, and I apprehend that, since my architect is in the opposite camp, it is not to be anticipated that he will exactly inform me of them; but it is beyond the bounds of credulity that I am to be subjected to these persistent annoyances and refractory oppositions without power to extricate myself; and unless my architect and his builder *immediately* bestir themselves to make this house a human domicile instead of a lethal chamber for cats and dogs, I shall exercise my own resources and employ others who can be depended on to carry out what they engage to perform. My eventual demands on Grigblay for compensation are a matter for contingent consideration.

Yours faithfully,

Brash is certainly deserving of sympathy, for he is gloriously unaware that the whole of the trouble is due to his wife's interferences: he also, I think, deserves sympathy in that his manful effort at self-control has not proved equal to the length of his letter, but most of our sympathy must lie with Spinlove, who has the task of answering a letter which can only be fitly described as a "stinker."

[NEXT WEEK: XXI—THE CAT JUMPS ONCE MORE]

QUESTIONS THAT ARISE

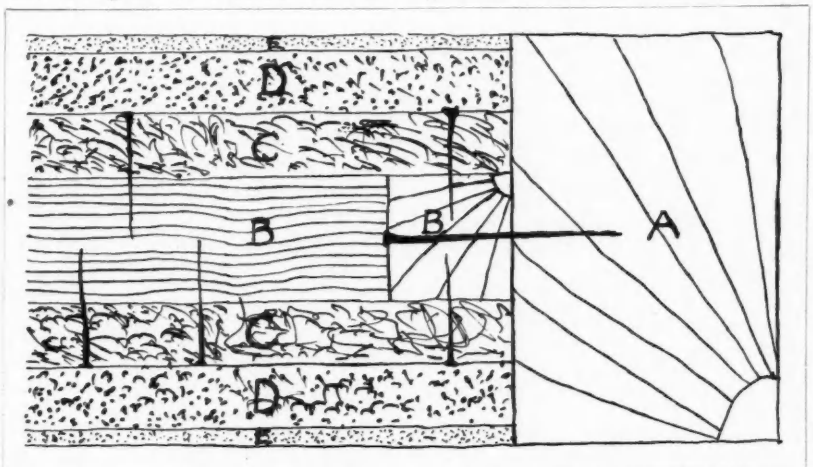
Wallboard Sheeting

N. L. writes: "*A client wishes me to specify wallboard sheets for an old house about to be repaired. It is proposed to use these: (a) on rafters, instead of rough boarding; (b) for plaster panels in oak framing, as shown on the accompanying sketch, which will give an inch of air space between the wallboards.*"

[The above query was submitted to two of our experts, who have replied as follows.]

I have frequently used a wallboard as a base for plaster, and always with complete success. I have never employed it exactly in the manner shown in the querist's drawing, but under conditions which would produce similar behaviour.

In a case where sound-proofing was important, the wallboard was used on staggered studs; in another, the penetration of a borrowed light made necessary the visible abutment of plaster and timber.



One builder stated that his experience of fibrous boards had led him to believe that buckling was inevitable owing to swelling on contact with wet plaster. An assurance was given by the vendors that the wallboard was not subject to this kind of failure, and the result converted both the architect and the builder.

Oak, of course, is liable to shrinkage, and the only weakness would appear to lie in the probability that the junction between plaster and studs would leave a gap. This may be concealed to some extent by grooving the studs to receive plaster, or, preferably, the studs should project slightly beyond the plaster face, and be grooved to receive both plaster and wallboard so that the joint is covered. A third method is to use a cover slip of oak of suitable section. The section of the cover slip will depend on the width of the studs. It should not be too thin or the edges will curl, and nails should be driven as closely as possible to the outside of the studs.

The inclusion of wallboards produces a much thicker partition or wall, and if in order to reduce this to a minimum the thickness of the studs is reduced, it is advisable to fix the intermediate members at an angle, the ends having been sawn as in herring-bone strutting to avoid splitting when the nails are driven.

Where large spans are necessary these fillets may slope from both ends towards the central stud, so preventing the centre from sagging, and making it possible to keep the cill clear of the floor. Felt underneath will prevent through draughts, and the skirtings (also slightly clear of the floor) will provide the lateral rigidity if well nailed to each stud. This procedure obviates to a large extent the sound transference which takes place when the thin diaphragm is securely anchored to floor joists continuous in both rooms.

I have had no experience of wallboard used externally, but as it provides a good key there seems to be no reason why it should not be so employed. Precautions against penetration of moisture could be taken by treating the finishing coat of plaster with a reliable waterproofing material. Wallboard is quite suitable for laying on rafters, and, when so used, its properties of non-conduction are valuable. If there is doubt about the soundness of the tiles it would be as well to put waterproof paper between the tiling battens and the wallboard, and an additional safeguard could be furnished by counter battens to prevent the water from being housed behind the horizontal battens. H. T.

A, *Oak stud.* B, *Fillets.* C, *Wallboard.* D, *Gypsum plaster.* E, *Lime plaster.*

With regard to your correspondent's two questions, I would point out that (*a*) Wallboard, used as underlining below tiles or slates forms an excellent draught-stop and insulator.

(*b*) Plaster adheres excellently to certain wallboards. Used as proposed, I should substitute cement-plaster for gypsum in the undercoating on the external side, and possibly add another waterproofing material thereto. The fillets and consequent fixing of the wallboards should not exceed 18 ins. in any direction, and it will not be overlooked that the straight joint next to the oak studs (where a close fit for fillet and wallboard sheets as shown is unlikely) may prove a source of weakness and admit wet—as in any case where filling material exposes studs both sides. E. G.

Joints in Flooring

T. G. writes: "*With reference to a query respecting the opening out of T. and G. flooring joints which was answered in your issue of September 13, I would like to state that I have recently had similar trouble in connection with a large contract, and should be obliged if you inform me where 'plastic wood' is to be obtained, and the method of applying it. I should also be glad to know if it has strong adhesive powers to the sides of the boards, or whether it can be easily picked out from floors which are not covered with carpets, etc.*

"*A remedy which has been mentioned to me is a mixture of equal parts of resin and tallow run in hot; and I should be glad to know if you or other readers have any experience of this method, and, if so, whether it has been successful after a certain period.*"

"Plastic wood" may be obtained through any reputable builders' merchant. It is applied like putty, has strong adhesive qualities, and hardens on exposure so as to form practically an integral part with the timber to which it is applied. It appears to be a cellulose composition.

I have had no experience in the use of a resin and tallow mixture for similar purpose. It sounds rather messy and likely to soften under high temperatures. F. G.

ANNOUNCEMENTS

Mr. F. E. Mennie, F.R.I.B.A., P.A.S.I., District Surveyor for Bethnal Green, has removed his offices to 1 Montfort House, Victoria Park Square, E.

The firms of Edwin T. and E. Stanley Hall, of 54 Bedford Square, W.C., and Easton and Robertson, of 36 Bedford Square, W.C., have entered into partnership under the name of Stanley Hall & Easton and Robertson. They will practise at 54 Bedford Square, W.C.

THE SKETCH CLUB

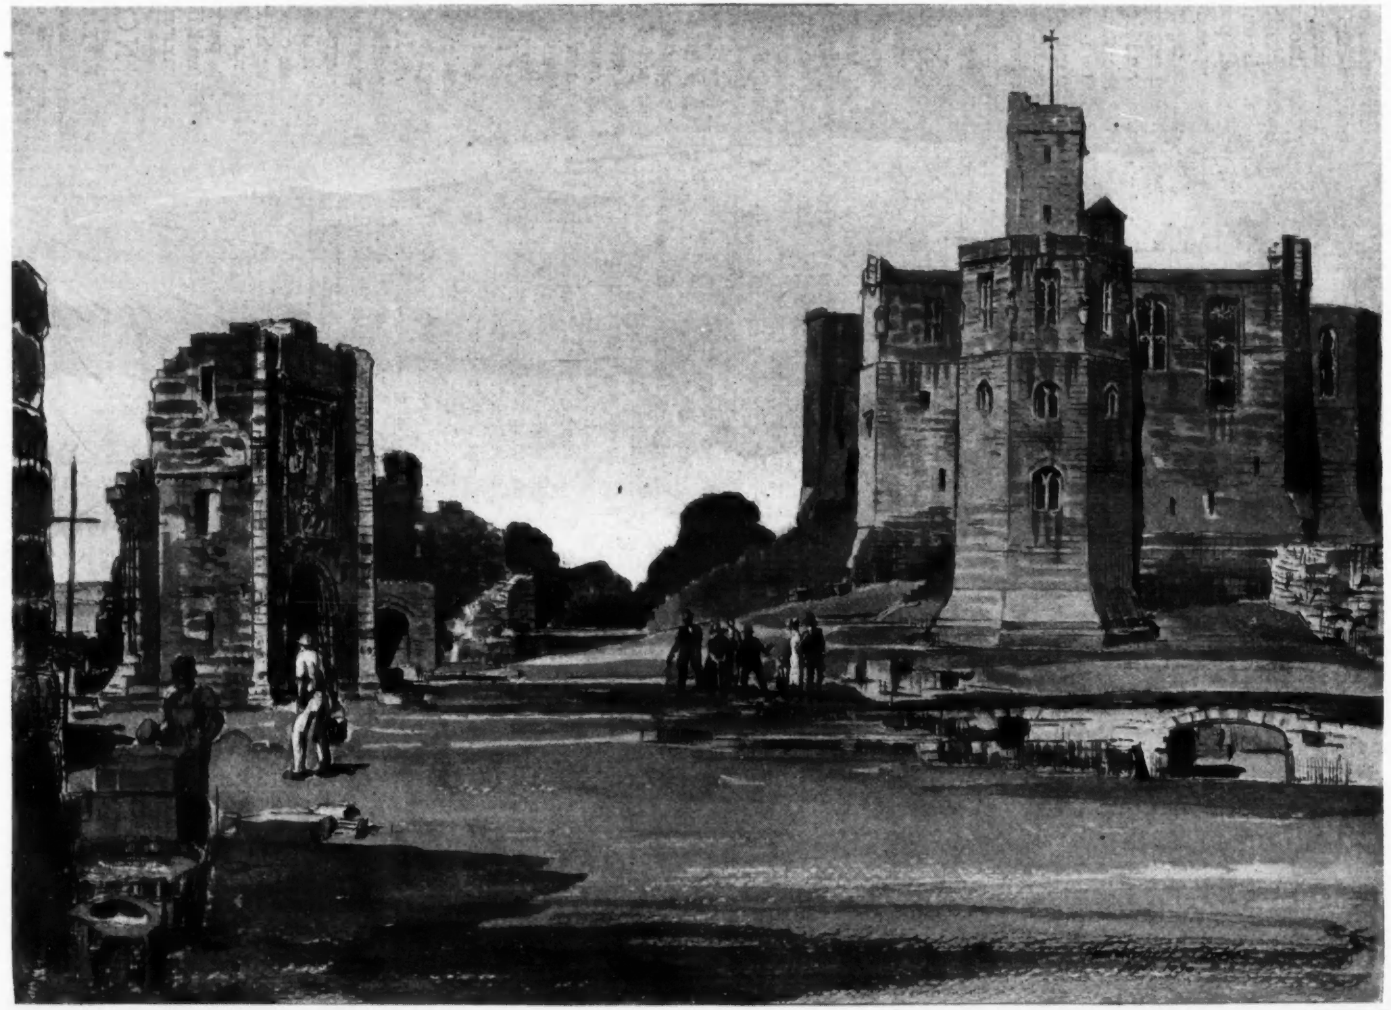
THIRTEENTH SESSION

PRIZE-WINNING DRAWINGS
in the last HOLIDAY SKETCHES Competition

AS has already been stated, the entries for the third and last Holiday Sketches Competition broke all records, and the task of adjudication was correspondingly difficult. Finally, choice for the first prize of Ten Guineas fell upon the one drawing submitted by "Mallet." On opening the sealed envelope, the identity of this competitor was revealed as :

Mr. Robert Mauchlen,
2 Collingwood Street,
Newcastle-upon-Tyne.

On this occasion two second prizes of Five Guineas each were due for allotment (one having been withheld from the last competition). These were awarded to :



Mr. E. B. Musman ("Hopeless"),
7 Carteret Street, Westminster, S.W.1,

for his watercolour of "Dinard" ; and to :

Mr. Frederick W. Baldwin ("Shadows"),
Rectory Cottage, Whapload Road, Lowestoft,

for his pencil drawing of Waterhouse, Membury, Devon.

To these competitors the Editor offers his congratulations ; and to all, his appreciation of the enthusiasm which they have displayed throughout the series of competitions.

FIRST PRIZE (TEN GUINEAS).
Workworth Castle.

By Robert Mauchlen, Newcastle-upon-Tyne
(Sepia wash : 8¾″ × 12″)

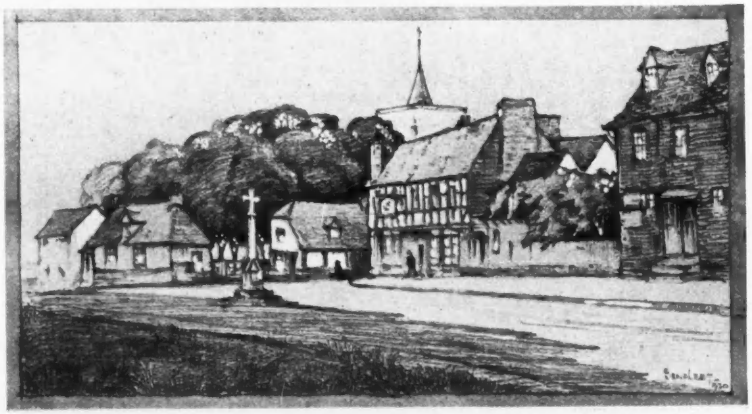
Castle.

(8¾″×12″)

ONE has only to glance at the prize-winning and other drawings submitted in competition, which are reproduced on the four pages to which, in the attempt to do them something like justice, the Sketch Club is this week expanded, to realize that the art of sketching is very far from being lost. We never thought it was, but it was not anticipated that this series of three competitions would reveal so much talent, and of so varied a nature, as the events have produced.

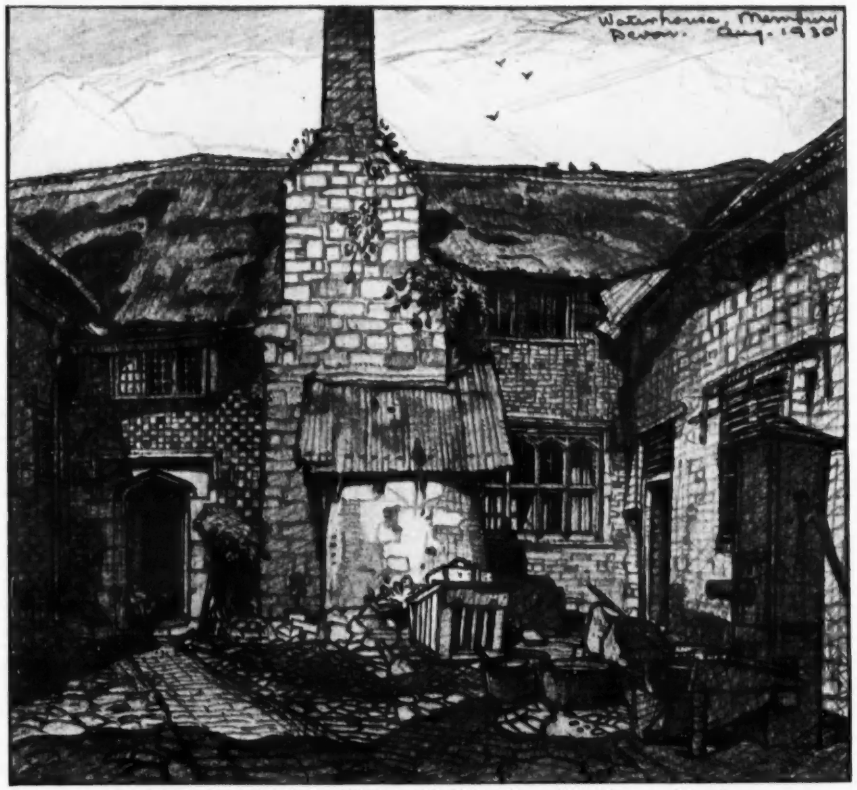
It is worth while recapitulating the leading facts. The first competition produced sixty-five entries from eighteen competitors; the second, fifty-two from fifteen; and the third, 125 from thirty-six: a grand total of 242 drawings of all shapes, sizes and kinds. The first prize-winners have been: Mr. P. J. Westwood (June) and Mr. Robert Mauchlen (August). Second prizes have been secured by Mr. Alan Sherwin (June); Mr. Ronald Knight and Mr. Vincent Warrilow (July); and Mr. E. B. Musman and Mr. Frederick W. Baldwin (August).

One of the most interesting facts noted in the course of scrutiny has been the wide diversity of media employed, even by the same competitors. Pencil, of one kind or another, is easily first favourite, but watercolour and crayon have each had their adherents; while the paper used has varied from white to buff and grey, from a dead-smooth, chalk surface to extreme and hairy roughness. The point is that in most cases the choice has obviously been dictated by the desire for "quality," in strict relation to the subject-matter. Curiously enough, the proportion of pen-drawings has been comparatively small, and there has been less evidence of mastery here.



SECOND PRIZE (A)
(FIVE GUINEAS)
Dinard, Brittany.

By E. B. Musman,
Westminster
(Watercolour: 12½″×9″)



Rock, Vale of Membury, Devon.
By Frederick W. Palmer
(Pencil: 11¾″×6″)

The Anchor Inn, S. Benfleet, Essex.
By H. M. Luyken
(Pencil: grey paper: 11¾″×6″)

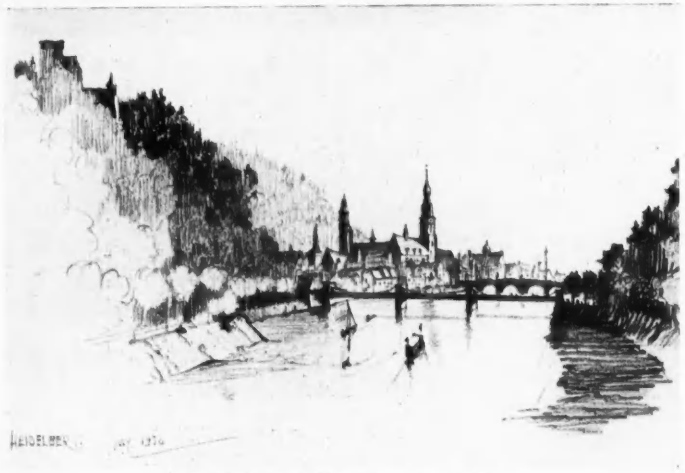
Chaddesley Corbett, Worcestershire.
By F. Palmer Cook. (Pencil : 7″ × 7″)

SECOND PRIZE (B) (FIVE GUINEAS). Waterhouse, Membury.
By Frederick W. Baldwin, Bowestoft. (Pencil : 7¼″ × 6¾″)

John Knox's House, Edinburgh.
By J. Maxwell Scott. (Pencil : buff paper : 7″ × 7″)

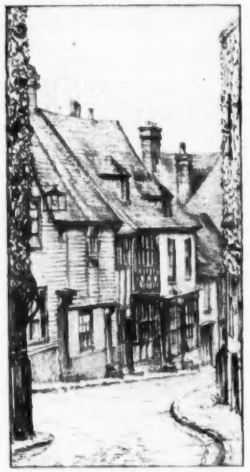
Stanton, the Cotswolds.
By F. Palmer Cook.
(Pencil : 9″ × 14″)

The Quay, Paimpol, Brittany
By E. B. Musman.
(Watercolour : 12¼″ × 6½″)



Via Raffaelo, Urbino
By Charles C. Spence.
(Pencil and wash : grey

Stanton, the Cotswolds.
By F. Palmer Cook.
(Pencil : 9″ × 14″)



The Quay,

(Pencil : 10¼″ × 14¼″)

THE SCARECROW OF INDUSTRIALISM:

A Call to Arms

BY THE VERY REV. HEWLETT JOHNSON

That the problem of cultivating beauty in modern industrial life must be radically faced was one of the main points in a paper on "The Claims of Beauty in Modern Life," read by the Dean of Manchester at the Annual Conference of Modern Churchmen. Below we print extracts from the address which claim the earnest attention of the architectural profession.

THE religious world has learned all too readily to acquiesce in an ugly civilization. It has permitted the ugly and the vulgar to invade the realms of worship. Most churches built during the last hundred years, for example, in industrial Lancashire are depressingly grim without and within. To see them recalls to my mind the question of the small boy who was dancing by his mother's side towards the seashore on an August day in a bright Welsh watering-place. Suddenly he stood stock still and, chilled and silent, whispered, "Mother, why do they need a church here?" His eye rested on a hideous chapel of Ruabon brick. It recalled the terrible churches and chapels of the industrial Lancashire town whence he came. They, and the circle of religion bound up with them, struck him as totally incongruous with the bright beauties of sand, sky and sea. The child's remark constitutes a fierce criticism of that divorce between religion and beauty which is characteristic of other places besides nineteenth-century Lancashire.

It is in our great industrial areas and amongst the sun-starved, beauty-starved populace that revolt most easily and perhaps most rightly springs. I recall vividly my own feelings as a young engineer in a large industrial town. My early youth had been spent in the country. I had seen cottage and manor, rich and poor, dwell peacefully side by side. I recall no feelings of revolt. Life was not ugly. I was as happy in the peasants' cottage as in my own home. Both had a beauty of their own. But suddenly plunged into a community where men, women and children were condemned to lifelong ugliness and gloom, whilst the wealth they helped to create departed to distant country homes and beautiful suburban villas; it was then that I awoke to a sense of outrage.

The problem of beauty must be radically faced in industrial areas and in the great cities, or its solution will never be found. Interest, as well as humanity, demands this drastic treatment of ugliness. For the industrial town is overflowing into the country in a double sense, and everywhere it is carrying with it a menace to the beauty which survives.

Times are changing rapidly. In former days the country flowed into the town and a bare trickle returned back to the country again. Industry was isolated and the country unpolluted. The old beauties were intact. Fine mansions, trim cottages, quiet lanes, and hedgerows where primroses, bluebells and honeysuckle bloomed were left inviolate. The industrial magnate could buy his country mansion and live in peace, forgetful of the waste he had left behind him.

Today all that is changed. It is easier now to return to the countryside, if only for a day. And it is increasingly difficult for the country to digest the mass of bad taste which pours daily into it. Those who live in spacious splendour in the country talk bitterly of the ugly stream which is overwhelming them—litter, charabancs, disorderly filling stations, clumsy concrete bridges and gaunt, treeless roads. Yet often it is they who are responsible for the lack of beauty. In the towns, chimneys, from the mills which they own, belch forth smoke. Their workfolk live in soulless streets, bounded by dumps and grassless fields. What sense of disciplined beauty can such a population ever hope to possess? Such desolate surroundings have killed the Englishman's innate sense of taste, colour, and form, and ruined the grave dignity of his common life. And when men issue forth from surroundings such as these—and a new mobility is enabling them to do so—they issue forth form-blind and colour-blind and reckless of a beauty they have never learned to see. The more industrious and successful hoard their savings until they too can escape to country places, and there build petrol stations and bungalows. The remainder can at least take their Sunday or holiday charabanc trip and litter the ground beside the country mansion. Thank God both alike have still the taste to prefer clean air to foul, and green fields to cinder-tips.

But there is more in it than that. Industry itself spills across the countryside. Commerce must congregate around stock exchanges, with an eye on the tape, an ear at the telephone, and a hand on the neighbour's door. Industry, on the other hand, can and does decentralize. The electric pylon and the motor-lorry are symbols of the change. Ready power and flexible transit send the factory everywhere. And unless industry itself, and all its surroundings, are rid of the dirt, disorder, ugliness and squalor which we now associate with it, there is small hope left of preserving or increasing our beautiful English heritage.

Happily the situation was never less hopeless than today. Ugliness in industry is as needless now as was ugliness in agriculture yesterday. If the rural villages of a bygone England could grow to be the simple and charming things they are, the industrial villages of the future England may also, in their turn, grow up beside them with a beauty and charm of their own; more formal and precise and geometrical perhaps, but as fit to take their place in the dignity of English life as the formal geometrical St. Paul's is fit to stand beside the freer Gothic of the Abbey. Industry has now no need to be dirty, ugly, or disorderly, and where it is so you see the hall-mark of inefficiency. Other lands are learning to produce all that we produce save the grime and disorder of the process. Nay, more; they are actually learning to produce in industry, and through industry, new and positive forms of beauty. I see glimpses of it everywhere, and notably in Scandinavian lands. These are worth a moment's fuller notice.

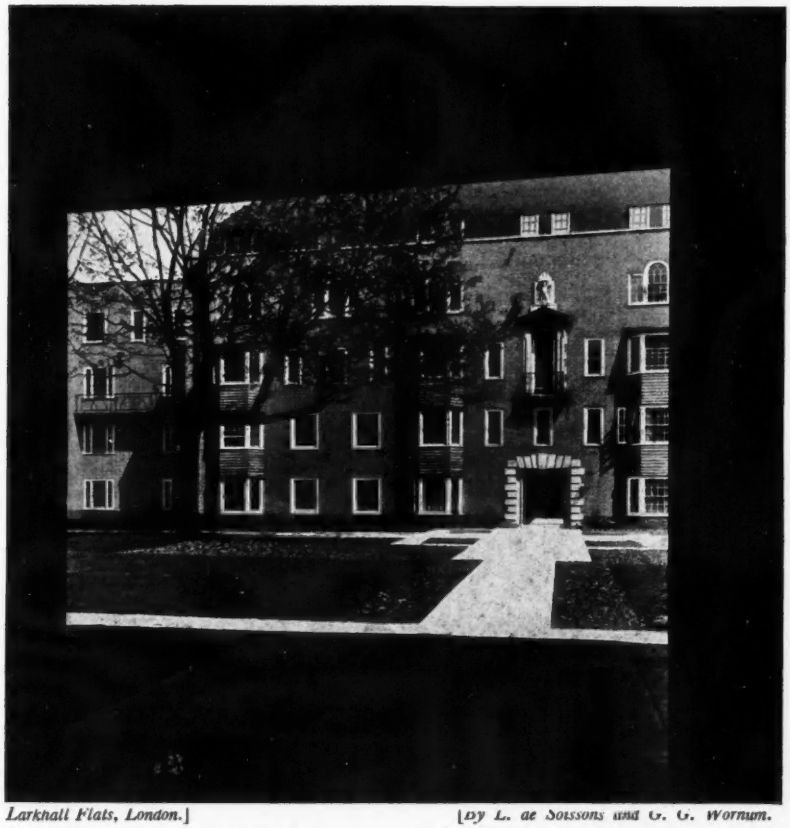
Take Sweden as a case in point. The Swedes make use of all that industrialism has to give, and as industrialists they are amazingly efficient. Incidentally there is no country in the world whose whole range of major industrial concerns can at this very moment show so phenomenally prosperous a balance sheet as Sweden can. Yet the ugly side of modern industrial life is wanting there. Order, method, cleanliness, and positive beauty are the rule. The Stockholm offices of the Swedish Match Factory are a feat of beauty. Grouping themselves about a great courtyard, which you enter through iron gates of splendid craftsmanship, their walls are open to the sun, snowy white above and pale-green marble beneath. In the centre is Carl Milles's fountain, surmounted by a charming emerald-green Diana. Poised on a lofty pedestal, she startles the graceful forest beasts in the four quarters of the court. It is an exquisite creation. Let the efficiency of the Swedish Match Factory speak for itself throughout the world: here it is seen at home, and it walks hand in hand with beauty.

And if you want to make a peculiarly odious comparison, visit the Odelberg pottery works of Sweden and compare them with the works you may see today in our own English Staffordshire.

The basis of all this Swedish beauty in industry, it is pertinent to note, is a broad one. It rests upon a studied artistry of common life. You may see this artistry in the Swedish homes. You may see it in tramcars. The conductor who takes your fare slides the coins of different sizes each into its proper slot in a tiny casket on his belt, and releases in a moment the precise sum needed for the change. No fumbling and no disorder. You may see it in restaurants. I never saw a dirty table, or a slatternly maid, in all the weeks of my stay in Swedish towns and villages.

Who can wonder that the beauty of such a land is crowned by a town hall that has been aptly described as the noblest building which our age has yet produced? Its story reads like an ancient legend: frescoes wrought by a royal prince; councillors' chambers clothed with tapestries from noble homes; while the thousand copper plates which roof the whole with an emerald canopy are the separate gifts of the less wealthy citizens, each zealous to finish a task which a big-hearted municipality had conceived too nobly for its purse. To describe the fierce beauty of Stockholm's Town Hall would lead me too far afield. But it shows what men of our own time can do; and to see it is to understand why architects and men of taste cross a continent and a world to feast upon it.

From Sweden let us return to England and its possibilities. Our fields and villages are worth preserving, and the industrial decentralization promises to bring them happily within reach of increasing multitudes.



So are our English country towns worthy of preservation. Their existence is at the moment precarious. Road traffic threatens them. Road lorries thunder through Oxford streets, disturbing old foundations and wrecking ancient calm. Innumerable beauties are sacrificed as congestion grows. Towns like these are bottlenecks on great high roads, and if we would preserve their beauties traffic must be diverted along loops; and well-planned loops serve the double purpose alike of controlling the encroachment of industrial works and preserving the town unspoilt, a delightful companion to a new and well-designed industrial area. Park-like zones should guard an ancient town from all encroachments, and give each child and adult a chance of moving among green things and simple beauties. Nuremberg preserves its classic form and features like a jewel in the centre of the modern industrial town which encircles it beyond the city ramparts and the girdle of green fields.

More important still, however, is the creation of new beauties; and they must be beauties expressive of our present age, as the Parthenon expressed the soul of Greece and Chartres that of the Middle Ages. Preservation is only half our task, and antiquarian zeal is no substitute for life. We must bring out of our treasure things new and old; we should do well to observe the point of emphasis. We must learn from the past and dare for the future. England is to be more than a museum.

The past has principles to teach us, and chiefest of these is order, proportion, reticence and emphasis. All classical cities of the past speak with the same voice. Take Siena. Its houses are standard in size; its roofs of equal height; and all are fashioned with a uniform and beautiful brick. This presents the quiet and unexciting background where the common citizen learns and practises the dignity of restraint. It presents the foil against which public buildings stand forth in splendour of planning and richness of material—the great town square, the town hall and the cathedral, splendid alike in curve and space and glowing in marble and gold. And the same is true of Venice, where uniformity marks the houses flanking the quiet canals and quiet streets and provides a fitting emphasis for the mighty piazza and the splendours of Campanile, Doge's Palace and St. Mark's Cathedral.

Would that such order, reticence and suppression marked Regent Street in London, or Market Street in Manchester, with their sky-line ragged and restless, fatiguing the eye by the babel it sees as the ear by the babel it hears.

Restraint and alignment must as surely be the notes of the classic city of tomorrow as they were the notes of the classic city of yesterday. To copy the precise form in which this principle embodied itself is futile. It is the spirit, not the letter, that counts. But the principles of order and restraint are themselves eternal, and within their beautifully restricted lines there is ample scope for individuality. And never, perhaps—to turn again to this special application, the city street—was it so easy to secure such unity of skyline in our cities as it is today, when steel and concrete offer us strong flat roofs. What splendours Regent Street might have afforded to a wiser people, with a noble sweep of cornice and balustrade from one end to the other, and accommodating a

Larkhall Flats, London. [By L. de Soissons and G. G. Wornum.

"Glimpses of the new possibilities we may get in Sir Theodore Chambers's Larkhall flats at Clapham, where, despite the threefold greater population which he houses, an effect of spacious and parklike surroundings replaces the old plainness and congestion."

Swedish Match Factory Offices, Stockholm.] *[By Ivor Tengbom.*

" The Stockholm offices of the Swedish Match Factory are a feat of beauty. Grouping themselves about a great courtyard . . . their walls are open to the sun, snowy white above and pale-green marble beneath. In the centre is Carl Milles's fountain, surmounted by a charming emerald-green Diana. Poised on a lofty pedestal, she startles the graceful forest beasts in the four quarters of the court. It is an exquisite creation."

secondary street along its summit lined with flowers and shrubs and open restaurants! But it is vain to dream of noble cities till we provide clean ones. Dirt destroys beauty and thwarts its creation.

It is our duty to create, not only to preserve or to avoid. We must create beauties which shall be really expressive of the age we live in, and embody in emotional form its achievements. The nature of these new beauties already begins to shape itself. The bodywork of our motor-cars shows it. The lines and bonnet of a Vauxhall car thrill me, and I like them none the less because they are mass-produced; indeed, it is time we ceased to deplore mass-products as necessarily inartistic. The air liner is beautiful. The bridge and promenade deck of an ocean steamer are beautiful. I would even be so bold as to say that an electric pylon has a beauty of its own as it strides across the countryside. To me at any rate it is the symbol of the cleanly power; and it is a masculine thing. M. le Corbusier shows, in a fascinating analysis, how close is the affinity between cleanness of line and directness of purpose in the modern vehicle on the one hand, and the Parthenon of Pheidias or the apses of Michelangelo at St. Peter's Cathedral in Rome on the other. Both result from a studied selection crowned by the touch of æsthetic genius.

It is in this direction that we must look if we are to create the fundamentals of a beautiful environment. For the prime essentials in this regard are beautiful houses, beautifully placed, flooded with air and light, and in intimate contact with green and growing things.

At the moment the places where we dwell and work are, in general, beautiful neither in themselves nor in their planning. Our homes are ill-thought-out. They take no adequate account of modern needs and possibilities. They are not standardized.

We want the standardized house; that is, the house which takes account of modern demands for air and light and proper heating; the house in which windows are large, walls thin and built of heat-preserving and sound-absorbing materials. Thick walls are not the warmest, and they absorb light by deep abrasures. We want the house where no space is wasted, no unnecessary angles give access to dirt or obstruct the vacuum-cleaner, and where the roof is flat and used as a solarium; houses which produce a sense of calm and require a minimum of labour to run them. Steel, concrete, and synthetic materials can give us all we need, and when such houses are mass-produced they can be provided at a fraction of the present cost and graded according to our need as cars are graded from a Baby Austin to a Rolls-Royce.

And when once this standard house appears, then, as le Corbusier points out, the real skill and genius of the architect can begin its work. The touch of genius will play around the common given elements—the windows, doors, roofs and wall spaces. Line, proportion and mouldings will undergo subtle changes. Like the apses of St. Peter's, or the cornice of the Parthenon, the mathematical and classical quality will enter into them. The perfect profile and contour will appear. A new style, expressive of our own age, will be born, and our emotions will be touched to a more exalted tone by the daily environment of life.

So much for the beauty that we anticipate in the modern house unit; a beauty gathering up and expressing of all that is finest in, and of, a mechanical, scientific and hygienic age. A wide uniformity there may be. That in itself need not militate against beauty; the bricks of Rome at its best were uniform and beautiful; it was in their grouping and composition that variety entered in. At the same time, though I conceive of a whole series of standardized houses, some large, some small, and some medium-sized, and each grade varying according to its functions, I should be the last one to rule out marked touches of genius or individuality where these can be created or afforded. It is in the interest of men of limited means, and that all may be housed, and housed in dignity, and that certain broad and grand lines in house structure may be evolved, that I plead for standard houses. We turn to the groupings themselves; to the

village, the garden suburb, and the city. Natural features must be woven into each as part and parcel of the whole. A prime element in the charm of the Parthenon consists in the use made of the distant horizon in the make-up of its theme. Art and nature blend; the two beauties hang together and each exalts the other. So the new beauties of building and grouping will tend to ally themselves on all hands with nature. In place of the present ugly rows of slum or villa houses there will be bold and rich and expressive combinations of the various standard houses, of whatever order these may be. Glimpses of the new possibilities we may get in Sir Theodore Chambers's Larkhall flats at Clapham, where, despite the threefold greater population which he houses, an effect of spacious and parklike surroundings replaces the old plainness and congestion. And the same effect of spaciousness, and the entrance of light and air, and the play of water in pool and fountain, marks equally the new Mattiottihof municipal tenements in Vienna.

The decentralization of industry gives us at this very moment just the opportunity we seek. The old congestion of industrial areas is breaking up, and with it may go the real monotony of the old ugly unit houses and their entire banishment from natural beauty. A new grouping of finely-designed unit houses surrounding such an industrial unit as Messrs. Heinemann's splendidly-designed Windmill Press at Kingswood, with its classical façade, its lawns and flower-beds and sedate collegiate character, will create in the English industrial village a beauty no whit behind the noblest beauties of the rural village of the past.

Turn to the city of the future. Rid of its smoke and industrial operations, freed too from the immense congested populations which these involved, and with its own commercial workers housed in suitable garden suburbs, the city of the future can become as nobly expressive of our age and restful to work in as today it is mean and meaningless and huddled and fatiguing. We must do with the city what we have already done with the workshops of industry. I contrast the Ford or Morris workshop of today with the shops I knew thirty years ago. Space, restraint, order, cleanliness, lightness, brightness, fitness reign, where once all was dark, dirty, huddled and cramped. Though it looks less busy, it is a thousandfold more efficient. Here is the model for our cities.

I think of my own Manchester. Its streets are narrow and congested, the winding lanes of an old market town are still made to serve the needs of traffic a hundredfold greater than the traffic for which they were designed. Consequently we possess vehicles which are capable of travelling sixty miles an hour, yet must crawl along at four. There is the tedious journey into town in the morning and the struggle out at night. Offices are approached through narrow streets and narrower corridors: most of them are dark and noisy, close to the dust and din of the street. We suffer from wear and tear. Beauty is banished; for a hurried life is not a beautiful life.

If we would really face the problem of the beautiful city, and it is there that most men spend the bulk of their conscious hours, we had better take seriously to heart the admirable recommendations of the Town Planning Congress at Strasbourg in 1923; recommendations which at first sight seem hopeless of achievement until we remember the possibilities that lie hidden away in the engineers' concrete and steel. Four principles are laid down: (1) We must de-congest the centres of our cities and facilitate our traffic; (2) we must increase the density of our cities and bring about the close contact demanded by business; (3) we must increase the means by which traffic can circulate, i.e. we must modify the conception of the street, which has become useless for modern transport needs; and (4) we must increase the area of green and open spaces.

If people would have clean cities and fine habitations and natural beauty unpolluted all around them they must work for these things in unison.

Windmill Press, Kingswood, Surrey.] [*By Lord Gerald Wellesley and Trenwith Wills.*

"Such an industrial unit as Messrs. Heinemann's splendidly-designed Windmill Press at Kingswood, with its classical façade, its lawns and flower-beds and sedate collegiate character, will create in the English industrial village a beauty no whit behind the noblest beauties of the rural village of the past."

SOCIETIES AND INSTITUTIONS

SMOKE ABATEMENT IN SHEFFIELD

Commenting on the report on research work at Sheffield, during the National Smoke Abatement Conference at Leicester, Mr. Evans said there were great possibilities for coke-oven gas for the majority of Sheffield products. Sheffield was the centre of a very big coke-oven industry, and he thought that the use of this gas as fuel, in the place of raw coal, would help to solve the city's smoke problem in respect of as much as 80 per cent. of its products.

Dr. E. W. Smith, London, pointed out that there were forty million cubic feet of gas per day generated in the coke ovens of the Sheffield district which could be converted for use for town and other purposes. If this could be used for industrial purposes, he contended that it would go a long way towards the cure of the smoke nuisance.

Mr. W. Asprey, chairman of the Sheffield Public Health Committee, said it must be remembered that the manufacturers had themselves already admitted that the emission of a great deal of black smoke was unnecessary. He was watching with great interest the researches of the Sheffield University into the manner in which use could be made of the smoke.

MEDIÆVAL ARCHITECTURE

Sir Banister Fletcher, P.R.I.B.A., F.S.A., at the Central School of Arts and Crafts, delivered on Wednesday last the introductory lecture of a course of twenty-four lectures on Mediæval Architecture, given under the auspices of the University of London.

Sir Banister dealt first with the nature of the course and explained that he would deal with the study of architectural history on broad lines from a popular point of view, tracing its evolution in the different countries in Europe.

Sir Banister illustrated his lecture with lantern slides, of which some twelve hundred will be shown during the course, thus making the study of this subject easy and enjoyable. He showed that mediæval architecture was a continuous evolution from the round-arched or Romanesque period, to the pointed arch of the Gothic period, and was the result of forces and tendencies underlying the life of mediæval times.

THE APPRECIATION OF ARCHITECTURE

"The Appreciation of Architecture" is the subject of the weekly series of Portsmouth University Extension Lectures, which commenced on Friday, September 27, in the Examination Hall of the Municipal College, Portsmouth.

Mr. A. S. Oswald, M.A., explained, in his first lecture, that he wished to consider architecture as embracing the whole realm of buildings, utilitarian included. The fact that a building was useful did not preclude it from being beautiful.

He pointed out that there were four approaches to the subject upon which depended the various viewpoints popularly adopted. The first was the literary and romantic approach, in which there was a distinct appeal to the emotions. There was also the ethical standpoint, an approach greatly favoured by Ruskin, and in a slightly different form by William Morris.

Another conception was that of the archæologist. Archæological values, he said, should not be confused with artistic values. The last approach was that of the scientist who maintained that good architecture was good construction truthfully expressed.

The lecture was illustrated by lantern slides.

R.I.B.A. EXHIBITION OF DESIGNS

The designs of students of schools of architecture recognized for exemption from the R.I.B.A. Final Examination will be exhibited in the R.I.B.A. Galleries, 9 Conduit Street, London, W.1, from October 14 to 20, 1930, inclusive, between the hours of 10 a.m. and 8 p.m. (Saturday, 10 a.m. and 5 p.m.). The R.I.B.A. Silver Medal for Recognized Schools and £5 in books is awarded for the best set of drawings submitted.

The designs of students of schools of architecture recognized for exemption from the R.I.B.A. Intermediate Examination will be exhibited in the R.I.B.A. Galleries from October 24 to 31, 1930, inclusive, between the hours of 10 a.m. and 8 p.m. (Saturday, 10 a.m. and 5 p.m.). The R.I.B.A. Bronze Medal for Recognized Schools and £5 in books is awarded for the best set of drawings submitted at this exhibition.

UNIVERSITY OF LONDON SCHOOL OF ARCHITECTURE

The new session at the Bartlett School of Architecture, University College, opened on Monday, October 6. New students were received on Monday and Tuesday from 10 a.m. to 1 p.m. Students of the evening course in architectural design will be received at an inaugural meeting today, October 8, at 5.45 p.m.

A room in which the art possessions of the College have been brought together and made available for students and members of the public was opened on September 30. It has been provided through the generosity of Sir Joseph Duveen, Bart., and has been designed by Professor A. E. Richardson, F.R.I.B.A. An outline inventory of the prints, etchings and drawings, including the Grote and Vaughan bequests, has been prepared by Mr. A. M. Hind, Assistant Director of the Department of Prints and Drawings at the British Museum.

Among the public lectures arranged for the first term is a course by Miss E. Jeffries Davis, Reader in the History of London, on "Re-plannings of London, *c.* 1520–1920."

The full programme may be obtained from the Secretary, University College, W.C.1. A stamped addressed envelope should be enclosed.

COMPETITIONS OPEN

October 20.—The Maternity and Child Welfare Committee of the City of Birmingham invites architects to submit competitive designs for two infant welfare centres, one at Warren Farm Road, Kingstanding (Perry Barr), and the other at Trittiford Road (Billesley). Competitors must have occupied offices in Birmingham as their head office for six months prior to July 19, 1930. Assessor: A. T. Butler, F.R.I.B.A. Premiums, £100 in respect of each centre. Conditions of competition and plans of the sites may be obtained on application to Herbert H. Humphries, M.INST.C.E., City Engineer and Surveyor, the Council House, Birmingham. Deposit £1 1s. for each centre. Latest date for submission of designs: October 20.

October 30.—The General Building Syndicate, Ltd., invites architects to submit competitive schemes for the development of a site at Liverpool, fronting St. John's Lane, Queen Square and Rose Street. Premiums: £250, £100 and £50, for first, second and third prizes, respectively. Particulars, etc., are obtainable on application to the Secretary, the General Building Syndicate, Ltd., 36 St. Martin's Lane, W.C.2. Latest date for submission of designs: October 30.

November 30.—The Burton-on-Trent Local Education Authority invites architects to submit competitive designs for a proposed new Council school to accommodate approximately 800 children, to be erected on a site in Clarence Street. Assessor: H. T. Buckland, F.R.I.B.A. Premiums: £150, £100 and £50 for the designs placed 1st, 2nd and 3rd, respectively. Applications for the conditions of the competition and site plan should have been made before September 8 to L. E. Burgess, Secretary and Director of Education, Education Offices, Guild Street, Burton-on-Trent. Latest date for submission of designs: November 30.

November 30.—The Guildford Cathedral Committee invites any architect, who has been engaged in the design of cathedrals or churches, to submit for examination drawings and other illustrations of his works; or a design for a cathedral. Not more than three sets of drawings may be submitted, packed in one large portfolio. The Committee, with the assistance of Mr. Walter Tapper, A.R.A., will examine the portfolios, and select a limited number of architects for the Final Competition. Each architect selected for the final competition will receive 500 guineas, whether his design is accepted or not. Portfolios should be addressed to The Venerable the Archdeacon of Surrey, The Diocesan Office, Lloyds Bank Chambers, Guildford, not later than November 30.

December 25.—A prospectus giving full particulars of the international competition for the Ukrainian State Theatre, organized by the Kharkov Town Council, Russia, has recently been issued. The theatre is to be erected in the centre of Kharkov, on the site of the present Comsomolsky Square (Young

Communist Square), and will contain a mass musical stage, and seating capacity for 4,000 persons. The competition will be assessed by a jury comprising a president, vice-president and fifty-six members. Prizes: 1st, 10,000 rub.; 2nd, 8,000 rub.; 3rd, 6,000 rub.; 4th, 5,000 rub.; 5th, 4,000 rub.; 6th, 3,000 rub.; 7th, 8th and 9th, 2,000 rub.; 10th, 11th, 12th, 1,500 rub. Drawings should be sent to the Kharkov Town Council on or before December 25. Copies of the prospectus are obtainable from the Embassy of the Union of Soviet Socialist Republics, Harrington House, 13 Kensington Palace Gardens, London, W.8.

December 31.—The Incorporated Association of Architects and Surveyors invites competitive designs for a Model Petrol Filling and Service Depot. The competition has the full support of the Automobile Association, the Scapa Society and other bodies which have at heart the preservation of the countryside, as well as the principal motor-trade journals. Assessors: Alfred Stephens Cross, M.A. (CANTAB.), V-P., I.A.A.S.; Edward H. Fryer, Deputy Secretary of the Automobile Association; and Walter Groves, Editor of *The Motor*. Prizes: 50 guineas, 20 guineas and 10 guineas for first, second and third places, respectively. Smaller awards may also be made on the advice of the assessors, and at the discretion of the Council of the Association. In addition a prize of 10 guineas and two prizes of 5 guineas each will be awarded to laymen for the best suggestions submitted with or without sketches. Full particulars, etc., are obtainable from the Secretary, the Incorporated Association of Architects and Surveyors, 1 Wilbraham Place, London, S.W.1. Latest date for submission of designs: December 31, 1930.

February 1.—The Norwich Corporation invite architects practising in Norwich and in the County of Norfolk to submit competitive designs for a proposed new fire station to be erected on a site in Bethel Street, Norwich. Conditions of the competition are obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. Deposit, £1 1s. Latest date for submission of designs: February 1, 1931.

No date.—The Committee of the Foundation Hospital and the Rectorate of the Royal Yugoslavian University of Zagreb invites competitive designs for the general rebuilding plans of the Foundation and Clinic Hospital of Zagreb. Assessors: 1. Dr. Srkulj Stjepan, Burgomaster and Chairman of the Foundation, as president of the jury. 2. Henauer, W., architect, of Zurich (or his representative, Ch. Thevenaz, architect, of Lausanne), for the Swiss Engineers' Association of Germany. 3. Dr. Ing. Kreis Wilhelm, of Dresden, for the Engineers' Association of France. 4. Arch. Expert H.R., of Paris, for the Engineers' and Architects' Association of France. 5. Dr. Culumovic Pavao, Primarius, for the Medical Association of Zagreb. 6. Ing. Gabric Franjo, for the Yugoslavian Association of Engineers and Architects, Zagreb section. 7. Dr. Rasuhin Josip, deputy for the Directors of the Institute of Hygiene Foundation Hospital of Zagreb 8. Prof. Dr. Prasek Emil, for the medical faculty of Zagreb. 9. Dr. Durst Franjo, for the medical faculty of Zagreb. 10. Arch. Heinzel Vjekoslav, Alderman of the City of Zagreb. Committee representative of the jury: Ing. Jurkovic Mato, Stadtbaurat in Zagreb. Prizes: 1st, 20,000 Swiss francs; 2nd, 15,000 Swiss francs; 3rd, 10,000 Swiss francs. 15,000 Swiss francs have been set aside for any further work which may be required. Programme and particulars of the competition will be sent on or after August 15, 1930, on application to the Stadtvorstand of Zagreb (Mr. Matica, secretary), Room No. 70, 2nd floor, on payment of 200 dinar. Latest date for submission of designs: January 15, 1931.

THE ARCHITECTS' DIARY

WEDNESDAY, OCTOBER 8

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Mediæval Architecture: A Typical Mediæval Cathedral." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Inaugural meeting of students of the evening courses in architectural design. **5.45 p.m.**

ILLUMINATING ENGINEERING SOCIETY. At the Lighting Service Bureau, 15 Savoy Street, Strand, W.C.2. Report on Progress in Illuminating Engineering, prepared by the Technical Committee. Also Exhibition illustrating developments in illuminating engineering. 7 p.m. (Light refreshments, 6.30 p.m.) **7 p.m.**

HOUSING AND HEALTH EXHIBITION, Kelvin Hall, Glasgow. Until October 18. 10 a.m. to 10 p.m. **10 a.m.**

THURSDAY, OCTOBER 9

C.P.R.E. Third Annual Conference, to be held at Welwyn Garden City. Until October 11. Among the papers to be read are the following: "The Preservation of Commons, Parks, Open Spaces and Nature Reserves, and the Provision of Playing Fields." By Sir Lawrence Chubb. "Town and Regional Planning in their Relation to the Objects of the C.P.R.E." By Sir Theodore Chambers, K.B.E., F.S.I. "Education and Citizenship in their Relation to the Safeguarding of the Countryside, etc.," and "Flora and Fauna, including the Preservation of Trees, Wild Flowers, Roadside Plants and the Protection of Birds." Each paper will be open to discussion.

UNIVERSITY OF LONDON, University College' Gower Street, W.C.1. "Recent Discoveries in Egypt." By Reginald Engelbach. Chairman: Professor Sir Flinders Petrie, F.R.S. (Lantern Illustrations.) **5.30 p.m.**

INSTITUTION OF WELDING ENGINEERS. At the Engineers' Club, Manchester. "The Training of Operatives in the Welding and Cutting Industries." By J. Ryder.

FRIDAY, OCTOBER 10

ROYAL SANITARY INSTITUTE, 90 Buckingham Palace Road, S.W.1. Sessional Meeting to be held at the Guildhall, Nottingham. Welcome by Councillor E. H. Lee, Chairman of the Health Committee, followed by tea, 4 p.m. A Discussion will take place on "River Pollution," to be opened by Alderman A. R. Atkey, J.P. 4.30 p.m. Chairman: Charles Porter, M.D., B.SC., etc. **4 p.m.**

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. Associate Members and Graduate Section. Dinner and Smoking Concert, to be held at the National Hotel, Upper Bedford Place, W.C.1. **7 p.m.**

SATURDAY, OCTOBER 11

Sunrise, 6.15 a.m. Sunset, 5.18 p.m.

ROYAL SANITARY INSTITUTE, 90 Buckingham Palace Road, S.W.1. Meet at the Guildhall, Nottingham, at 9.15 a.m. for visits to the Factory and Welfare Department of Boots Pure Drug Company, Ltd. Followed by an inspection of the New Council House at 11.30 a.m. **9.15 a.m.**

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS. North-Eastern District Meeting at the Council Offices of the Chester-le-Street U.D.C. Various Visits of Inspection to Durham County Road Works. **1.45 p.m.**

TUESDAY, OCTOBER 14

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visits to (a) The New "Atmospheric" Cinema, Richmond Hill. 12 noon. (b) The Star and Garter House, Richmond Hill. 3 p.m., and (c) Ham House, Petersham, the residence of the Earl of Dysart. p.m. **12 noon.**

WEDNESDAY, OCTOBER 15

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "The Character of Mediæval Architecture." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. First of three public lectures on "Danish Castles and Manor Houses." By J. H. Helweg. (Lantern Illustrations.) **5.30 p.m.**

THURSDAY, OCTOBER 16

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Yates Lectures. First of eight public lectures on "Greek Myths and their Representation in Art." By Professor E. A. Gardner. (Lantern Illustrations.) **5 p.m.**

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Visit to Cement Marketing Company's Laboratory, Portland House, Tothill Street, Westminster, S.W.1. (Party limited to 30.) **7 p.m.**

SATURDAY, OCTOBER 18

Sunrise, 6.27 a.m. Sunset, 5.2 p.m.

MONDAY, OCTOBER 20

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Public Lecture on "More Roman Towns in North Africa." By W. N. Neech, M.A. Chairman: Professor H. E. Butler, M.A. (Lantern Illustrations.) **5.30 p.m.**

BIRMINGHAM WELFARE CENTRES COMPETITION. Latest date for submission of designs.

TUESDAY, OCTOBER 21

MORLEY COLLEGE, Westminster Bridge Road, S.E.1. "Art." By Gui St. Bernard. **8 p.m.**

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to Cecil Sharp House, 2 Regent's Park Road, N.W.1. H. M. Fletcher, the architect, will describe the building. **8.30 p.m.**

WEDNESDAY, OCTOBER 22

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Italian Mediæval Architecture: The Romanesque Period in Italy." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Second of a course of three public lectures on "Danish Castles and Manor Houses." By J. H. Helweg. (Lantern Illustrations.) **5.30 p.m.**

INSTITUTE OF FUEL. Annual Conference to be held at the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, W.C.2, until October 23. Evening: Annual Dinner to be held at the Connaught Rooms, Great Queen Street, W.C.2, at 6.45 p.m.

THURSDAY, OCTOBER 23

UNIVERSITY OF LONDON, University College, Gower Street, W.C.2. Yates Lectures. Second of a course of eight public lectures on "Greek Myths and their Representation in Art." By Professor E. A. Gardner. (Lantern Illustrations.) **5 p.m.**

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Lecture by T. J. Clark, A.I.STRUCT.E., of the British Portland Cement Association. **7.30 p.m.**

SATURDAY, OCTOBER 25

Sunrise, 6.40 a.m. Sunset, 4.48 p.m.

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Visit to the works of Messrs. Johnson, Dartford. **2 p.m.**

TUESDAY, OCTOBER 28

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, S.W.1. "English Ironwork." By Edward Yates. **7 p.m.**

MORLEY COLLEGE, Westminster Bridge Road, S.E.1. "Architecture: the Citizen's Part." By Clough Williams-Ellis, F.R.I.B.A. **8 p.m.**

WEDNESDAY, OCTOBER 29

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Last of three public lectures on "Danish Castles and Manor Houses." By J. H. Helweg. (Lantern Illustrations.) **5.30 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Italian Mediæval Architecture The Romanesque Period in North and South Italy." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

THURSDAY, OCTOBER 30

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Yates Lectures. Third of eight public lectures on "Greek Myths and their Representation in Art." By Professor A. E. Gardner. (Lantern Illustrations.) 5 p.m. First of five public lectures on "Re-plannings of London, *c.* 1520-1920." By Miss E. Jeffries Davis. 5.30 p.m. **5 p.m.**

BURTON-ON-TRENT COUNCIL SCHOOL COMPETITION. Latest date for submission of designs.

SATURDAY, NOVEMBER 1

Sunrise, 6.52 a.m. Sunset, 4.34 p.m.

TUESDAY, NOVEMBER 4

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Public lecture on "Egyptian Statues." By Miss M. A. Murray. (Lantern Illustrations.) **5.30 p.m.**

MORLEY COLLEGE, Westminster Bridge Road, S.E.1. "Industry." By Sir Walter Layton, C.H. **8 p.m.**

WEDNESDAY, NOVEMBER 5

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Italian Mediæval Architecture: The Gothic Period in North Italy." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. At the Swedenborg Hall, 20 Hart Street, Bloomsbury, W.C.1. Sessional Meeting. "The Operation of the Heat Pump, and its Possible Applications to Heating Problems, particularly Swimming Bath Heating." By T. G. N. Haldane, M.A., A.M.I.E.E. **7 p.m.**

INSTITUTION OF SANITARY ENGINEERS. Annual Dinner to be held at the Holborn Restaurant, W.C. **7 p.m.**

THURSDAY, NOVEMBER 6

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Yates Lecture. Fourth of a course of eight public lectures on "Greek Myths and their Representation in Art." By Professor A. E. Gardner. (Lantern Illustrations.) 5 p.m. Second of a course of five public lectures on "Re-plannings of London, *c.* 1520-1920." By Miss E. Jeffries Davis. 5.30 p.m. **5 p.m.**

VICTORIA AND ALBERT MUSEUM, Cromwell Road, South Kensington, S.W.7. Lecture Theatre. "English Mediæval Building: Its Sculpture and Painting." By Professor E. S. Prior. (Lantern Illustrations.) **5.30 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Italian Mediæval Architecture: The Gothic Period in Central and South Italy." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

ROYAL ACADEMY, Burlington House, W.1. "Rembrandt and his Pupils." (Illustrated by magnified photographs from Continental Galleries.) By A. P. Laurie, D.SC. **4 p.m.**

LAW REPORT

BLOCKS OF FLATS—ASSESSMENT POINT

Towle v. *Improved Industrial Dwellings Co., Ltd. Court of Appeal. Before the Master of the Rolls and Lords Justices Romer and Slesser*

THIS was an important appeal, which was partly heard at the end of the last law term, and which will occupy the attention of the Court on its resumption next week for several days, and raised a question as to the method of assessing blocks of flats for income-tax purposes.

The appeal is by the Improved Industrial Dwellings Co., Ltd., from a judgment of Mr. Justice Rowlatt, sitting in the King's Bench Division, allowing the appeal of the Crown, through Mr. Towle, its Inspector of Taxes, from a decision of the Income Tax Commissioners, and dismissing the company's cross-appeal.

Mr. Latter, K.C., for the appellant company, said the flats in question were Nos. 1 to 54 a, b, c and d, Morrison Buildings, South Commercial Road, Whitechapel, which were used for the housing of the working classes. Hitherto the flats had been assessed as separate flats, and the company contended that they were aggrieved in being deprived of the legal right to claim allowances of income tax " in respect of voids of one or more flats " when the whole of the block in which they were grouped was not empty. The company also complained that under such grouping a reduced scale for allowances for repairs would be allowed as compared with a larger allowance made when each flat was separately assessed. Each flat had its own front door and was approached from landings from flights of stairs. There was no door at the foot of the staircase and the ground-floor passage was open to the street. Each flat was self-contained. The dwellings were within the area to which the Valuation (Metropolis) Management Act, 1869, applied, and were duly assessed in the 1925 valuation list as separate flats and not in groups by the Stepney Borough Council, there being no objection by the Inspector of Taxes. The gross values of the respective flats as several hereditaments were not liable to be reassessed for rating purposes during the quinquennial period ending in 1930, and allowances for income-tax purposes in previous years for repairs in respect of the flats had been allowed hitherto at the rates set out in the Finance Act, 1923, and allowances had been made for any period for which any flat might have been void. The contention of the appellant company was that each of the flats was in law and in fact a separate house for all purposes of the Income Tax Acts, and was to be assessed and charged separately. The Crown submitted that the amount of the assessment was the amount of the assessment on each group of flats. The Commissioners determined that the gross assessments of the several flats made under the Act were conclusive for the purposes of the Income Tax Acts during the quinquennial period, 1925–30, but if in the opinion of the Court that determination was wrong and the flats could be re-assessed during such quinquennial period, then the Commissioners determined that under the Income Tax Rules flats should be assessed together in blocks or groups consisting of those flats approached from the street by a separate entrance. The Crown appealed to Mr. Justice Rowlatt for the first determination and the company for the second. Mr. Justice Rowlatt decided that the contention of the Crown was right and allowed that appeal with costs, holding that the argument for the company was not sound, because when one had entered within the main walls and under the roof of the buildings, one had entered the house or the building which included the several tenements. He therefore dismissed the company's appeal. It was from this that the company now appealed.

The Attorney-General, Sir William Jowitt, K.C., appeared for the Crown.

Before giving judgment, the Court had before them the case of Johnstone (Inspector of Taxes) *v.* the Consolidated London Properties, Ltd., which raised, *inter alia*, a similar point in regard to flats at Kensington.

The hearing of both appeals stood over till the Court resumes its work next month.

Telephone and Letter Boxes

Mr. P. Morton Shand, writing in the current issue of *The Architectural Review* on " Recent Tendencies in Post Office and Telephone Exchange Design in Great Britain," says :

Sir Giles Gilbert Scott's very dignified steel cabinets (figure two) are by far the best street telephone boxes that any country can boast of. All that they lack is a wide shelf on which the telephone directory, still left to swing in space, can be comfortably laid open and consulted. The earlier G.P.O. telephone boxes are unsatisfactory because they were designed in concrete as though the material employed were wood. Nothing can be said in favour of their varnished timber prototypes.

Whatever strictures may be passed on the architectural shortcomings of the G.P.O., it must never be forgotten that it is the only postal administration which has ever perfected a really satisfactory type of letter-box. But that was long ago, and the design was pretty certainly no gentlemanly architect's job. The dear old Victorian pillar-boxes, as cast by those honest iron-founders, Handyside of Derby (figure three), and robed in its splendid scarlet, is as conspicuous as it is good to look upon. No industrial design ever embodied " fitness for purpose " more fitly or to better purpose. The oval, double-slotted variety is rather less prepossessing. Latterly the sovereign beauty of its proportions has been grievously impaired by reducing the girth of the sturdy column. Even the earlier (Cochrane) hexagonal model (figure one), with its acorn finial, has an undeniable classic elegance. Original specimens of both bear the interlaced " V.R." monogram.

figure one Cochrane pillar box, circa 1866.

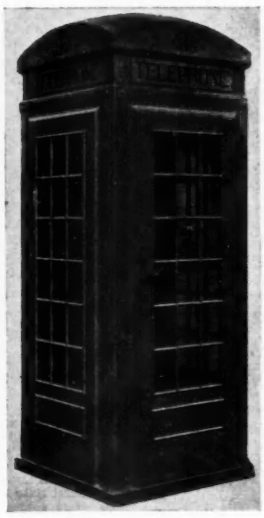

figure two Standard sheet steel telephone cabinet, designed by Sir Giles Gilbert Scott.

figure three Handyside pillar box, circa 1878.

TRADE NOTES

Pumice as a Building Material is the title of a new booklet just issued by Messrs. J. H. Sankey and Son, Ltd. This material, of volcanic origin, consists of trachytic pumice-rock fragments varying in size approximately from 0·04 to 1·5 in. with a certain percentage of "fines," and has a specific gravity of about 0·85. Among the advantages claimed for pumice concrete are the following: (*a*) Less dead weight; (*b*) entire absence of sulphur and other detrimental chemical ingredients; (*c*) high fire-resistance (official tests up to 2,000 Fahr.); (*d*) sound and heat insulator; (*e*) proof against both condensation and damp, by reason of its cellular texture; (*f*) an easy medium for fixing by cutting, nailing, or screwing; (*g*) excellent bond for mortar, perfect key for plaster. Pumice aggregate is also regarded, owing to its lightness, hygienic and other properties, as particularly suitable for making concrete either cast *in situ* or in precast blocks. The importance of trachytic pumice as an aggregate for concrete has, it is said, been recognized on the Continent for nearly eighty years. The usual proportions of pumice and cement for close concrete work are as follows:

For floors—4 parts of coarse pumice, 2 parts of fine pumice, 1 part of Portland cement.

For walls (*in situ*)—From 6 to 8 parts of pumice to 1 part of Portland cement.

The following official analysis gives the composition of an average sample of pumice ("Bims Sand"): Silica, 61·0 per cent.; alumina, 21·0 per cent.; iron oxide, 4·0 per cent.; calcium oxide, 1·5 per cent.; alkalis, 8·0 per cent.; loss on ignition, 4·5 per cent.

Pumice aggregate has recently been supplied for use in the construction of the following buildings: Masonic Peace Memorial, Great Queen Street, W.C.; Lloyds Bank, Ltd., Teddington; Hitchin Boys' Grammar School; Bon Marché, Brixton; Ladies' Carlton Club, Grosvenor Place, S.W.; Electricity Sub-station, East Ham.

*

In a new catalogue on scientific central heating, just issued by Messrs. Hope's Heating and Lighting, Ltd., are descriptions and illustrations of typical oil-fired installations carried out by the company in domestic buildings, commercial buildings, churches, hospitals, schools, office blocks and residential flats, and in engineering works and factories. The plant is automatic from the time the electric current is switched on, the burner starting and stopping by the thermostatic controls. The oil is atomized mechanically and sprayed as a fine mist into the firebox of the boiler. It is mixed with low pressure air in the correct proportion, ignited by electric spark, and completely burnt. The burner may be controlled automatically by a thermostat fixed in the heated building. This instrument is sensitive to, and operated by, a variation of 2 degrees Fahrenheit of the surrounding air. Alternatively, the apparatus may be operated by maintaining the water in the boiler at any desired temperature, and further provision may be made for varying this temperature automatically to suit outside variations. The hot water is maintained at any predetermined temperature by an aquastat fixed in the storage cylinder. The firm claim to have perfected controls for maintaining from one boiler both radiators for heating and hot water for domestic use at suitable temperatures. The oil storage tank may be sunk in the ground, fixed in the boiler house or in an adjacent space. It is filled from the oil supplier's tanker through a pipe run to a convenient position with complete freedom from dust and dirt.

*

The Cement Marketing Co., Ltd., have received an order for approximately 20,000 tons of cement for the Underground Railway extension from Finsbury Park to Cockfosters. British collieries will benefit by this order, since nearly 10,000 tons of coal will be required in the manufacture of the cement.

THE BUILDINGS ILLUSTRATED

Following is a list of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

The Cambridge Theatre, Seven Dials, W.C. (pages 539-543). General contractors, Gee, Walker and Slater, Ltd. Sub-contractors: Redpath, Brown & Co., Ltd., constructional steelwork; Caxton Floors, Ltd., floors and staircases; Luxfer, Ltd., windows and lanterns; Carrier Engineering Co., Ltd., heating and ventilating; Berkeley Electrical Co., Ltd., electrical installation; Waygood-Otis, Ltd., lifts; Pyrene, Ltd., sprinkler installation; Sturtevant Engineering Co., Ltd., vacuum cleaning plant; Gimson & Co., counterweights and stage sets; Hydraulic Engineering Co., Ltd., jigger for fire curtain; Ames and Finnis, roof tiling; Frank Burkitt, fire curtain; John Brunskill, stage floor; A. C. Gibson & Co., roller shutters; Haskins, Ltd., roller shutters to cloakrooms; Venreco, Ltd., stage lighting equipment; Newalls Insulation Co., insulation to boiler-room; J. W. Gray & Son, Ltd., lightning conductors; Synchronome & Co., Ltd., electric clocks; John Bolding, Ltd., sanitary fittings; Reliance Telephone Co., intercommunication telephones; Fred. Braby & Co., Ltd., roof ventilators; Art Pavements and Decorations, Ltd., terrazzo paving and biancola; Potter Rax Gate Co., Ltd., collapsible gates; Comyn Ching & Co., Ltd., canopy and grilles; Chubb and Sons, Ltd., safe; C. and A. Brown, Ltd., models; C. W. Courtenay, Ltd., stonework; Ragusa Asphalte Co., Ltd., asphalt; T. W. Palmer & Co., Ltd., handrails and balustrades; S. W. Farmer and Sons, Ltd., suspended ceilings steelwork; Lindsay, Savile & Co., paintings; T. and W. Farmiloe, Ltd., plumbing supplies; E. Hatley and Son, ventilators; Hollis Bros., Ltd., oak floors; J. M. Newton and Sons, Ltd., glazing; Girlings Ferro Concrete Co., Ltd., circle steppings; Willment Bros., Ltd., excavation; G. A. Geyton, sign writing; Electrolumination, Ltd., Neon illuminated signs; and J. Akers, Ltd., signs.

General contractors for the decoration of the theatre, Waring and Gillow, Ltd. Sub-contractors: G. Jackson and Sons, Ltd., plaster work; Fenning & Co., Ltd., marble work; Lap (C. I. Process), Ltd., bas-reliefs; Conrad Parlanti, Ltd., bronze work, engraved doors, and metalwork; Beardmore & Co., Ltd., door furniture, metal lighting fixtures, and metalwork; Robinson, King & Co., Ltd., and T. and W. Ide, mirrors and glass; Woodward, Grosvenor & Co., carpets; Crowly & Co., hand-made carpets; Dualite, Ltd., ornamental glass in lighting fittings; and Standard Insulator Co., Ltd., rubber flooring.

Headquarters, Auxiliary Air Force, Coplaw Street, Glasgow (page 544). General foreman, James Boyd. Sub-contractors: Thaw and Campbell, foundations, dampcourses, asphalt, bricks and stone; Trussed Concrete Steel Co., Ltd., fireproof construction; Robert Brown and Son, Ltd., tiles; James Cuthbertson and Son, slates; Redpath, Brown & Co., Ltd., structural steel; Dobbie, Forbes & Co., grates; James Goodlet, gasfitting and plumbing; H. M. Speirs & Co., electric wiring and bells; Osler and Faraday, Ltd., electric light fixtures; Shanks & Co., Ltd., sanitary fittings; George Boyd & Co., door furniture; Wm. Tonner and Sons, plaster; Thomas Henderson, joinery.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATIONS

27605. Johnson, A. L., and Johnson, Clapham and Morris, Ltd. Metal reinforcements for reinforced concrete constructions. September 16.

27848. Crowther, G. Doorways for dwellings, etc. September 18.

27849. Crowther, G. Walls of buildings, etc. September 18.

27850. Crowther, G. Wall coverings. September 18.

27929. Gernaerf, J. Buildings. September 18.

SPECIFICATION PUBLISHED

334837. Cromwell, B. Floors for building construction.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour ;* NAVVY, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour ;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0
Screened ballast or gravel, add 10 per cent. per yd.			
Clinker, breeze, etc., prices according to locality.			
Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0
Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.			
Transport hire per day :			
Cart and horse £1 3 0 *Trailer*	£0	15	0
3-ton motor lorry 3 15 0 *Steam roller*	4	5	0
Steam lorry, 5-ton 4 0 0 *Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0	1	6
SPREAD and level, including wheeling, per yd.	0	1	6
FILLING into carts and carting away to a shoot or deposit, per yd. cube	0	10	6
TRIMMING earth to slopes, per yd. sup.	0	0	6
HACKING up old grano. or similar paving, per yd. sup.	0	1	3
PLANKING to excavations, per ft. sup.	0	0	5
DO. over 10 ft. deep, add for each 5 ft. in depth, 30 per cent.			
IF left in, add to above prices, per ft. cube	0	2	0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup.	0	2	1
DO. 6 in. thick, per yd. sup.	0	2	10
PUDDLING, per yd. cube	1	10	0
CEMENT CONCRETE, 4-2-1, per yd. cube	1	17	6
DO. 6-2-1, per yd. cube	1	12	6
DO. in upper floors, add 15 per cent.			
DO. in reinforced-concrete work, add 20 per cent.			
DO. in underpinning, add 60 per cent.			
LIAS-LIME CONCRETE, per yd. cube	£1	14	0
BREEZE CONCRETE, per yd. cube	1	7	0
DO. in lintels, etc., per ft. cube	0	1	6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube	0	3	9
FINE concrete benching to bottom of manholes, per ft. cube	0	3	0
FINISHING surface of concrete spade face, per yd. sup.	0	0	9

DRAINER

LABOURER, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* BRICKLAYER, 1s. 8½d. *per hour ;* PLUMBER, 1s. 8½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. *6 in., per ft.*	0	1	3
DO. *9 in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. *6 in., per yd.*	0	8	0
Portland cement and sand, see " Excavator " above.			
Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½
STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft.	0	4	3
DO. 6 in., per ft.	0	5	0
DO. 9 in., per ft.	0	7	9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft.	0	8	3
DO. 6 in., per ft.	0	10	3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1s. 8½d. *per hour ;* LABOURER, 1s. 3½d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
Midhurst white facing bricks, per M.	5	0	0
Multi-coloured facings, per M.	7	7	9
Best red facings, per M.	7	7	9
Rubbers, 9½ in., per M.	12	0	6
Staffordshire blue, per M.	9	5	0
Firebricks, 2½ in., per M.	9	5	0
Glazed salt, white, and ivory stretchers, per M.	21	10	0
DO. *headers, per M.*	20	10	0
Colours, extra, per M.	5	10	0
Seconds, less, per M.	1	0	0
Cement and sand, see " Excavator " above.			
Lime, grey stone, per ton	£2	11	6
Mixed lime mortar, per yd.	1	6	0
Dampcourse, in rolls of 4½ in., per roll	0	2	6
DO. *9 in., per roll*	0	4	9
DO. *14 in., per roll*	0	7	6
DO. *18 in., per roll*	0	9	6
BRICKWORK in stone lime mortar, Flettons, or equal, per rod	30	0	0
DO. in cement do., per rod	32	10	0
DO. in stocks, add 25 per cent. per rod.			
DO. in blues, add 100 per cent. per rod.			
DO. circular on plan, add 12½ per cent. per rod.			
DO. in backing to masonry, add 12½ per cent. per rod.			
DO. in raising on old walls, etc., add 12½ per cent. per rod.			
DO. in underpinning, add 20 per cent. per rod.			
HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS, fair, per ft. sup. extra	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra	0	0	10
WEATHER pointing, do. do.	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup.	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities, in finishing to steps, etc., per ft. sup.	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup.	0	11	0
SLATE DAMP COURSE, per ft. sup.	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ¾ in., per yd.	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup.	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each	0	0	3

MASON

MASON, 1s. 8½d. *per hour ;* DO. *fixer,* 1s. 9½d. *per hour ;* LABOURER, 1s. 3½d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour.*

Portland Stone :			
Whitbed, per ft. cube	£0	4	6
Basebed, per ft. cube	0	4	9
Bath stone, per ft. cube	0	3	0
Usual trade extras for large blocks.			
York paving, av. 2½ in., per yd. super	0	11	0
York templates, sawn, per ft. cube	0	7	6
Slate shelves, rubbed, 1 in., per ft. sup.	0	2	6
Cement and sand, see " Excavator," etc., above.			
HOISTING and setting stone, per ft. cube	£0	2	2
DO. for every 10 ft. above 30 ft. add 15 per cent.			
PLAIN face Portland basis, per ft. sup.	£0	2	8
DO. circular, per ft. sup.	0	4	0
SUNK FACE, per ft. sup.	0	3	9
DO. circular, per ft. sup.	0	4	10
JOINTS, arch, per ft. sup.	0	2	6
DO. sunk, per ft. sup.	0	2	7
DO. DO. circular, per ft. sup.	0	4	6
CIRCULAR-CIRCULAR work, per ft. sup.	1	2	0
PLAIN MOULDING, straight, per inch of girth, per ft. run	0	1	1
DO. circular, do., per ft. run	0	1	4
HALF SAWING, per ft. sup.	0	1	0
Add to the foregoing prices, if in York stone, 35 per cent.			
DO. Mansfield, 12½ per cent.			
Deduct for Bath, 33⅓ per cent.			
DO. for Chilmark, 5 per cent.			
SETTING 1 in. slate shelving in cement, per ft. sup.	£0	0	6
RUBBED round nosing to do., per ft. lin.	£0	0	6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1	7	6
YORK SILLS, W. & T., ft. cub. fixed	1	10	0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0	1	3
DO. 2½ in. thick, per ft. sup.	0	1	6

SLATER AND TILER

SLATER 1s. 8½d. *per hour ;* TILER, 1s. 8½d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour ;* LABOURER, 1s. 3½d. *per hour.*
N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200 :			
Portmadoc Ladies	£14	0	0
Countess	23	0	0
Duchess	32	10	0

Old Delabole	*Med. Grey*	*Med. Green*
24 in. × 12 in.	£42 11 3	£45 1 0
20 in. × 10 in.	31 4 3	33 0 6
16 in. × 10 in.	20 18 0	22 4 9
14 in. × 8 in.	12 1 0	12 16 3

Green Randoms, per ton	£8	3	9
Grey-green do., per ton	7	3	9
Green peggies, 12 in. to 8 in. long, per ton	5	13	9
In 4-ton truck loads, delivered Nine Elms station.			
Clips, lead, per lb.	£0	0	6
Clips, copper, per lb.	0	2	0
Nails, compo, per cwt.	1	6	0
Nails, copper, per lb.	0	2	2
Cement and sand, see " Excavator," etc., above.			
Hand-made tiles, per M.	£5	18	0
Machine-made tiles, per M.	5	8	0
Westmorland slates, large, per ton	9	0	0
DO. *Peggies, per ton*	7	5	0

SLATING, 3 in. lap, compo nails, Portmadoc or equal :

Ladies, per square	£4	0	0
Countess, per square	4	5	0
Duchess, per square	4	10	0
WESTMORLAND, in diminishing courses, per square	6	5	0
CORNISH DO., per square	6	3	0
Add, if vertical, per square approx.	0	13	0
Add, if with copper nails, per square approx.	0	2	6
Double course at eaves, per ft. approx.	0	1	0

SLATING with Old Delabole slates to a 3 in. lap with copper nails, at per square.

	Med. Grey	*Med. Green*
24 in. × 12 in.	£5 0 0	£5 2 0
20 in. × 10 in.	5 5 0	5 10 0

DO., 3-ply, per yd.	0	1	9
CENTERING for concrete, etc., including horsing and striking, per sq.	2	0	0
TURNING pieces to flat or segmental soffits, 4½ in. wide, per ft. run	0	0	4½
DO. 9 in. wide and over, per ft. sup.	0	1	2

[*continued overleaf*

CARPENTER AND JOINER: *continued*

SHUTTERING to face of concrete, per square	£1	10	0
DO. in narrow widths to beams, etc., per ft. sup.	0	0	6
USE and waste of timbers, allow 25 per cent. of above prices.			
SLATE BATTENING, per sq.	£0	12	6
DEAL boarding to flats, 1 in. thick and firrings to falls, per square	2	10	0
STOUT feather-edged tilting fillet to eaves, per ft. run	0	0	6
FEATHER-edged springer to trimmer arches, per ft. run	0	0	4
STOUT herringbone strutting (joists measured in), per ft. run	0	0	6
SOUND boarding, ⅞ in. thick and fillets nailed to sides of joists (joists measured over), per square	2	0	0
RUBEROID or similar quality roofing, one-ply, per yd. sup.	0	2	3
DO., two-ply, per yd. sup.	0	2	6
DO., three-ply, per yd. sup.	0	3	0
TONGUED and grooved flooring, 1¼ in. thick, laid complete with splayed headings, per square	2	5	0
DEAL skirting torus, moulded, 1¼ in. thick, including grounds and backings, per ft. sup.	0	1	0
TONGUED and mitred angles to do.	0	0	6
WOOD block flooring, standard blocks laid herringbone in mastic:			
Deal 1 in. thick, per yd. sup.	0	10	0
DO. 1¼ in. thick, per yd. sup.	0	12	0
Maple 1¼ in. thick, per yd. sup.	0	15	0
DEAL moulded sashes, 1¼ in., with moulded bars in small squares, per ft. sup.	0	2	6
DO. 2 in. do., per ft. sup.	0	2	9
DEAL cased frames, oak sills and 2 in. moulded sashes, brass-faced pulleys and iron weights, per ft. sup.	0	4	6
MOULDED horns, extra, each	0	0	3
DOORS, 4-panel square both sides, 1¼ in. thick, per ft. sup.	0	2	6
DO. moulded both sides, per ft. sup.	0	2	9
DO. 2 in. thick, square both sides, per ft. sup.	0	2	9
DO. moulded both sides, per ft. sup.	0	3	0
DO. in 3 panels, moulded both sides, upper panel with diminished stiles with moulded bars for glass, per ft. sup.	0	3	6
If in oak, mahogany, or teak, multiply 3 times.			
DEAL frames, 4 in. × 3 in., rebated and beaded, per ft. cube	£0	15	0
Add for extra labour, per ft. run	0	0	1
STAIRCASE work:			
DEAL treads 1¼ in. and risers 1 in., tongued and grooved, including fir carriages, per ft. sup.	0	2	6
DEAL wall strings, 1¼ in. thick, moulded, per ft. run	0	2	0
If ramped, per ft. run	0	4	6
SHORT ramps, extra, each	0	7	6
ENDS of treads and risers housed to strings, each	0	1	0
2 in. deal mopstick handrail fixed to brackets, per ft. run	0	1	6
4½ in. × 3 in. oak fully moulded handrail, per ft. run	0	5	6
1¼ in. square deal bar balusters, framed in, per ft. run	0	0	6
FITTINGS:			
SHELVES and bearers, 1 in., cross-tongued, per ft. sup.	0	1	6
1¼ in. beaded cupboard fronts, moulded and square, per ft. sup.	0	2	9
TEAK grooved draining boards, 1¼ in. thick, and bedding, per ft. sup.	0	4	6
IRONMONGERY:			
Fixing only (including providing screws):			
TO DEAL—			
Hinges to sashes, per pair	0	1	2
Do. to doors, per pair	0	1	7
Barrel bolts, 9 in., iron, each	0	1	0
Sash fasteners, each	0	1	0
Rim locks, each	0	1	9
Mortice locks, each	0	4	0

SMITH

SMITH, *weekly rate equals* 1*s.* 8½*d. per hour*; MATE, *do.*, 1*s.* 3½*d. per hour*; ERECTOR, 1*s.* 8½*d. per hour*; FITTER, 1*s.* 8½*d. per hour*; LABOURER, 1*s.* 3½*d. per hour.*

Mild Steel in British standard sections, per ton	£12	10	0

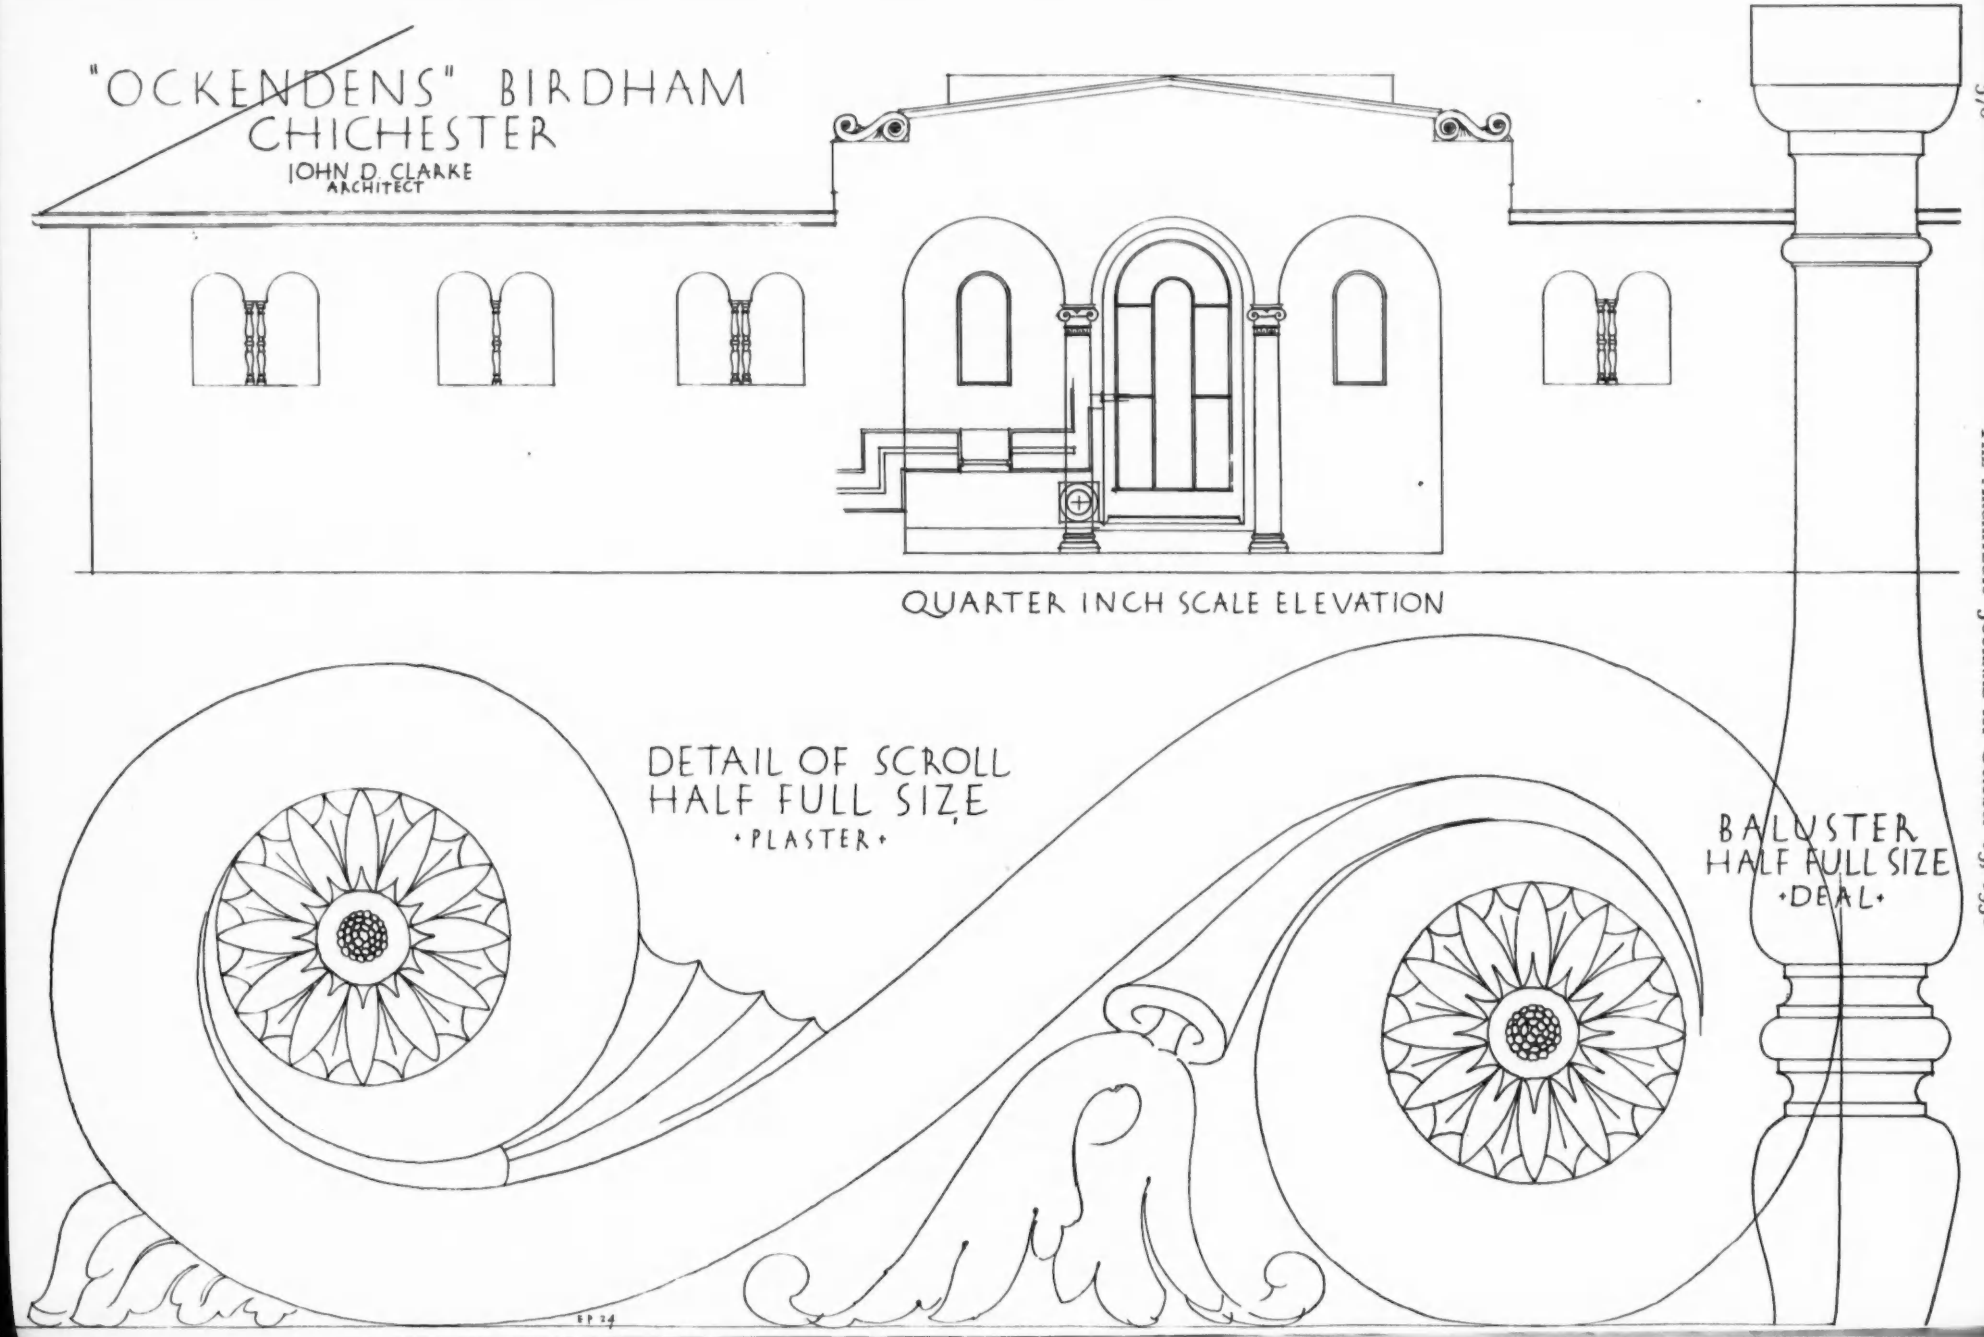
SCALE DETAILS:

A WEEKLY SERIES

OCKENDENS,
BIRDHAM, CHICHESTER,
SUSSEX

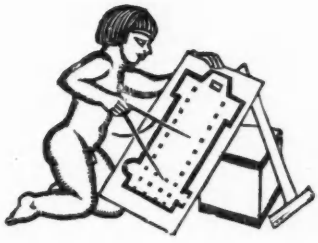
Designed by
JOHN D. CLARKE

AN unusually fresh outlook on the treatment of a one-story domestic building is shown in the photograph above, and in detail in the drawings overleaf, which illustrate a bungalow in the Selsey peninsula, Sussex.



The external walls are of 11 in. cavity brickwork, rendered in cement externally, and developed at the entrance into a three-arched motif, which is given height sufficient to break up above the eaves in the form of a conventionalized pedimented parapet.

Precast plaster scrolls, a detail of one of which, to half full size, will be found on the drawing, terminate this parapet at both ends, and small columns are used to flank the centre arched opening.



The treatment of the windows should also be noticed. These consist of sashes which are made to open by sliding down inside the cavity of the wall beneath the cill. Many experiments with full-size models were made before the final design was evolved.

Where the windows are coupled, the centre mullion is covered by a pair of delicately designed balusters of which a detail is reproduced overleaf.

The drawings may be read with architects' scales (¼ in.; and 6 ins. = 1 ft.)

THE PLIGHT OF THE CRAFTSMAN

"Craft against craft makes no living."
—OLD PROVERB

IT has recently been again pointed out that the position of the craftsman-specialist on a building job remains very far from satisfactory, because undefined. There is no consistent procedure running through the industry which governs the method of employment of craftsmen. One of the results of this state of affairs is that after a specialist has given his price, and this price has been accepted by the architect, he may find himself called upon by the contractor (to whom, be it remembered, he looks for payment) to allow a discount or to take out insurance policies for certain risks which it would certainly seem to be the contractor's duty to cover, and these amounts may vary according to the arbitrary whim of each particular contractor.

The demand for a discount would seem quite indefensible, in view of the fact that clause 28 of the Conditions of Contract lays down that the sums in payment of work performed by specialists shall be payable by the contractor without discount or deduction. Yet the specialist knows that the contractor has it within his power to make things both difficult and unpleasant for him in the execution of his work on the job, despite the fact that in his estimate the contractor is allowed to add his profit for specialists' work. The inference is that that profit is to be earned by rendering some service. And that service, of course, includes waiting upon the specialist and giving him facilities for the proper carrying out of his work.

It is in connection with the giving of facilities that the extraordinary insurance demands are made. It will sometimes happen with stone carving that work must be carried out on the stone before it is *in situ*, and the obvious place to do this is in the contractor's yard or wharf where there are proper banker facilities. Yet where this has to be done the contractor insists upon indemnification against all risks to the specialist's men. In other words, the specialist is to carry the contractor's third party risks, and such risks insurance companies—quite reasonably—often refuse to undertake.

The contractor, on his part, maintains, in defence of these demands, that the specialist working in his yard does so to suit his own convenience, whereas the specialist, with more reason, maintains that he works in the contractor's yard for the benefit of the job; that it is the obvious and reasonable place to work, and that even had he facilities of his own for handling large blocks of stone, it is obviously uneconomical to shift them about from one place to another; finally, that it is for the granting of facilities of this very kind that the contractor adds his profit to the specialist's estimate. Even in connection with these indemnification forms, which the specialist is called upon to sign, there is no uniformity.

Then, too, there are certain minor matters in regard to which the position of the specialist is far from satisfactory. If in the process of carving a piece of stone a flaw reveals itself, whose is the duty of replacement? Again, is there justification for the frequent practice of compelling the specialist to wait for payment due to him until the contractor shall have received his payment from the building-owner?

It has been suggested that the position of the specialist might be improved were he to be employed by the building-owner and to receive payment direct from him. But in the case of large works this is clearly not possible on account of the labour which would fall upon the building-owner in settling separately with every specialist.

There is today a general desire to raise the standard of craftsmanship, but as a preliminary it is surely necessary to give the craftsman an unequivocal position in the hierarchy of the trade, where he will not be subjected to petty annoyances and embarrassments.

A WATER POOL FOR AQUATIC PLANTS

The quadrangle in front of the new science workshops at Christ's Hospital, Horsham, which were opened yesterday by H.R.H. the Prince of Wales, has been designed with a central water pool to provide facilities for the study and development of aquatic plants. The water pool is planned with canals divided by rills into pools of varied depths, supplied with running water. Mr. Sydney Tatchell, of Tatchell and Wilson, is the architect. Further views appear on pages 575 to 578.

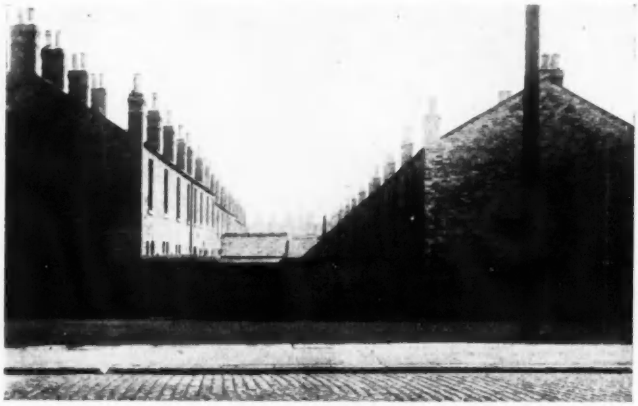
NEWS & TOPICS

The carved stone figure of Edward VI, removed, together with certain Wren brickwork, from the old premises of Christ's Hospital at Newgate when they were pulled down after the school had been removed to Horsham. The resemblance to the present Prince of Wales is too striking to pass unobserved. As part of the consolidation of the school's present Sussex home, the work of preservation of these relics was recently undertaken. Over twenty layers of paint and other coverings were found upon the statue before the original gilding was disclosed. It has now been covered with gold leaf, which brings into relief its fine modelling. The two views were taken before and after treatment.

AT CHRIST'S HOSPITAL

TO visit Horsham for the formal opening of a new block at Christ's Hospital by the Prince of Wales—who, with the guests, afterwards lunched with the boys—was, for me, to rekindle an old memory. Sauntering up the wide avenues, dusted, now, with brown leaves, crossing the open lawn-set quadrangles to Sir Aston Webb's buildings, and arriving at the additions made by Mr. Sydney Tatchell, I fell to contrasting these spacious Sussex amenities with the old buildings in the city. Not that I was ever at school at Newgate, or can recall, at this distance of time, all the impression they made. But I was taken, at a tender age, to dine in that great hall, and retrieve a picture of a dim roof vaulting above bright lights; of a gallery, of a reading-desk from which a lesson was read; of singing, and of long tables with a dais at the end. Up the aisles, after we had dined, advanced a procession of blue-coated scholars, each loaded with the impedimenta of the meal, to make his bow to Authority. It was, in its way, a monkish ritual, a tradition to be treasured.

THE C.P.R.E. CONFERENCE



More than one speaker at last week's National Conference of the C.P.R.E., at Welwyn, stressed the point that time was of the essence of the contract into which they have entered. If the remaining beauties of our countryside are not to be destroyed under our eyes, means must be sought of educating, and educating quickly, those, who—poor souls, through no fault of their own—are born with no respect for its amenities. "If the younger generation," said Dr. Vaughan Cornish, "were taught to discern the symbolic beauty of scenery they would find in the human pageant, in the glory of architecture, in the play of light on hill and dale, a fount of inspiration"; and Professor Abercrombie advocated the dissemination among teachers, through the Board of Education, of an impulse towards the protection of fauna and flora in the young who are in their care. Lord Ullswater indeed put his finger on a tender spot when he stated the strange truth that "People kill the thing they love." Legislation can do something to stay their hands, but it is upon a widespread change of heart that ultimate reliance must be placed. Much is already being done, in the way of preserving commons and open spaces (and Sir Lawrence Chubb urged the Government to do more), to help the people; it remains for the people to help themselves to full measure of the benefit.

AT BEAUVAIS

The town of Beauvais, associated with the tragic disaster to R101, is one of the most interesting architectural centres in France. It stands on the southern frontier of Picardy, the northern frontier of the Ile de France, and the western edge of Normandy. In the valley of the Therain, over which the airship flew, have been found many Neolithic remains. The Romans built a town called Cæsar Magnus, complete with temple, baths, amphitheatre, and cemetery, and the modern motor rushes along a main road built on the foundations of the highway used by the Roman legionaries. The Roman town was completely destroyed by the Germanic tribes in A.D. 275, but the lines of the new city erected in A.D. 300 can just be traced.

★

Over a thousand years later, about A.D. 1569, the cathedral, called by Viollet-le-Duc "the Parthenon of French architecture," was designed by an architect, Jean Vast. He succeeded in meeting the wishes of the Bishop and erecting a spire to set at defiance the laws of equilibrium. His wooden spire stood on three turrets, and the iron cross at the top was 153 metres above the ground. Four years later it collapsed and in its fall dragged down two pillars of the choir. Much more damage would have been done if a rope had not been attached to part of the tower which was hanging perilously over the cathedral. A criminal who was awaiting execution offered to climb up and fasten a rope to the tottering tower if he were given his freedom. He succeeded and saved his life. Today the choir is isolated and the nave is still unfinished. If the original plans were completed Beauvais would possess the largest Gothic church in Europe.

Carlisle housing—old style. From the latest D.I.A. Cautionary Guide, which is notable for being published with the specific approval of the town authorities.

RURAL COUNCILS AND OFFICIAL ARCHITECTS

The question of official architects for bodies of insufficient consequence to provide enough work to call for real talent over long periods continues to be debated by councils up and down the country. Generally speaking, they decide to buy an architect as cheaply as possible, saving where they can control expenditure, to make up for the vast moneys which the Government call upon them to disburse for schools, housing, etc. etc.

★

The real crux of the matter, so far as many smaller councils are concerned, lies in the fact that they cannot afford to pay a really good man a good salary; they have perhaps a run of architectural work to be done, but no prospect of a continued need for large building; and to do this work with a second-rate architect means the engagement of a staff to help him. It may be that in the future and as local government expenditure decreases, the small official architect will disappear, the work being done by outside architects.

FORLORN LAMBETH

One may observe at first hand the value of new public improvements upon adjoining property by studying the history of the Lambeth Embankment, for so many years the derelict shore that has seemed to point to the uselessness of all South London improvements schemes. This pathetic stretch of road has never been used as it should be for two reasons. First, it has no depth of site, since the Southern Railway embankment runs parallel with the road only a few yards distant; and second, it has no visible connection with bridge heads, which is to say that the embankment must disappear behind St. Thomas's Hospital at the one end and behind a group of works and warehouses at the other.

★

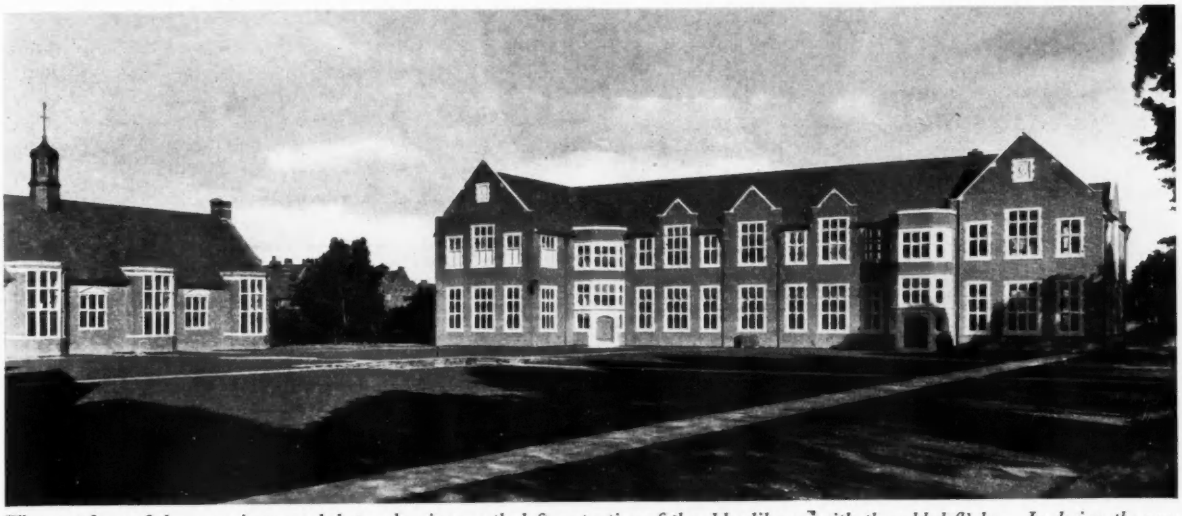
Once build Lambeth Bridge and a new end of the embankment is made to end satisfactorily and, we hope, grandly. Immediately it becomes a desirable site, since association with a fine bridge is a guarantee that values cannot fall very far. These facts, and the congestion elsewhere, explain how it comes about that a well-known firm has chosen the Lambeth Embankment as the site for a very large building. I venture to think that their wise action will not be without its effect upon other parts of the same river bank, the fate of which lies in the balance at this moment.

THE TWO-BOB LOOK

It is on record that during one week of this summer some 13,000 people paid fifty cents each to be lifted up the Chrysler, Woolworth, and other skyscrapers of New York, to seek thrills and views from the tops. In some cases there was the added pleasure of looking down into Wall Street and of seeing the speculators and money kings reduced to the proportions of gold bugs. The main enjoyment came from the sight of so many peaks of building and the brilliant light and shade effects, similar to the exciting scenery of the Rockies or the Canyons.

★

Whereas Europeans identify themselves with their native soil, Americans seem to find themslves more easily in the newest and highest of their buildings, and although I do not consider American architecture is as good as English, it is a much more popular art. Who goes up the Monument or St. Paul's except a few country cousins and the American tourists? Or is it that we have no building which is a real thriller like the Chrysler, 800 odd feet high, and rocking in the wind? Big business might be done with a scraper near the Tower of London from which the docks as well as the City and Westminster could be spied, and the face of Big Ben read through a telescope.



IS SMARTERLY IN TORONTO?

A Canadian architect has hit on the bright idea of building a model dwelling-house in a suburb of Toronto; as the work proceeds he hopes to gather the public round him, interest them in the technical processes and craftsmanship, and get the romance of concrete and timber over to them. Each week he will contribute to the local newspaper an article describing progress and those special qualifications of the house which make it a "model." I can imagine some fine captions: The Mystery of the Brass Thimble; The Secret Nail; Peggy and the Duchess. He will equip the house with all the labour-saving gadgets he can gather together, and presumably will plan it with the same idea. I hope he will explain why sham half-timber and tinelizabethan fireplaces are omitted. Given an expositor with sound knowledge and taste, what a noble work of education he might accomplish! But I have a horrid fear that this is Smarterly, and he is merely out to get a hundred repeats of a "Model" which is very stale indeed.

ASTRAGAL

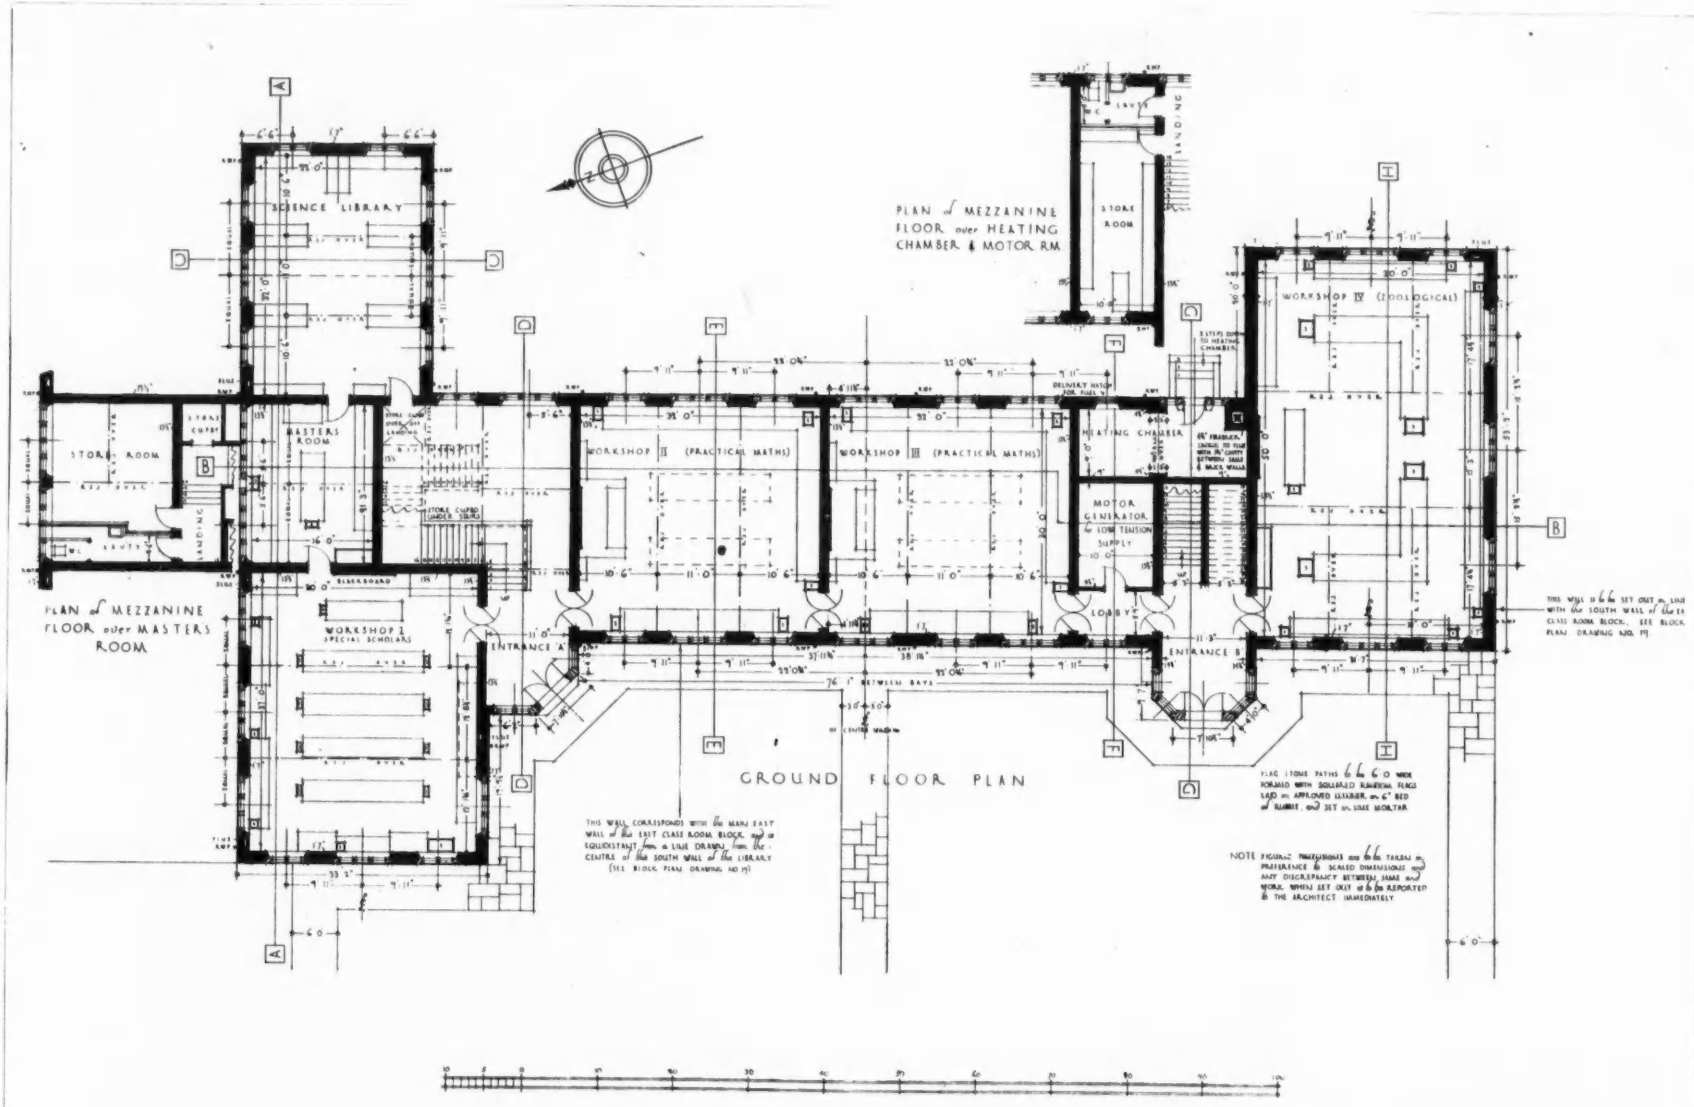
Carlisle housing—new style. Corporation-built houses on the Stanwix estate. Light, air and flowers. The D.I.A. Guide prints a message from the mayor.

The west front of the new science workshops, showing, on the left, a portion of the older library with the added flèche. In design the new building responds as far as practicable to the east and facing classroom block designed by the late Sir Aston Webb and Mr. Ingress Bell.

SCIENCE WORKSHOPS, CHRIST'S HOSPITAL

DESIGNED BY SYDNEY TATCHELL (TATCHELL AND WILSON)

YESTERDAY, October 14, H.R.H. the Prince of Wales, K.G., the President and Chairman of the Council of Almoners of Christ's Hospital, opened a new block of science workshops and a new quadrangle at Christ's Hospital, Horsham. The buildings have been erected and equipped by the Council of Almoners with the assistance of generous gifts from the Corporation of the City of London, the City Livery Companies and private benefactors, together with a grant from the William Dunn Trustees.



The object the Council of Almoners has in view is the provision of facilities for education in scientific agriculture, so that boys who display a talent for natural science may be encouraged to become research students, for whom there is an urgent need, not only in Great Britain, but especially in the Dominions overseas. In thus widening the field of scientific education and providing fresh opportunities for boys to qualify themselves to respond to the call of Empire, Christ's Hospital is again the pioneer amongst the public schools of England.

The new science workshops are erected on a piece of ground, hitherto unused, to the south of the library, and the opportunity has been taken to lay out a new quadrangle of which three sides are formed by the new block on the east, the library on the north, and the east classroom block on the west, leaving the south side open. The new buildings are designed to form a respond as far as possible to the east classroom block, part of the original scheme carried out by the late Sir Aston Webb and Mr. Ingress Bell, when the school was first built.

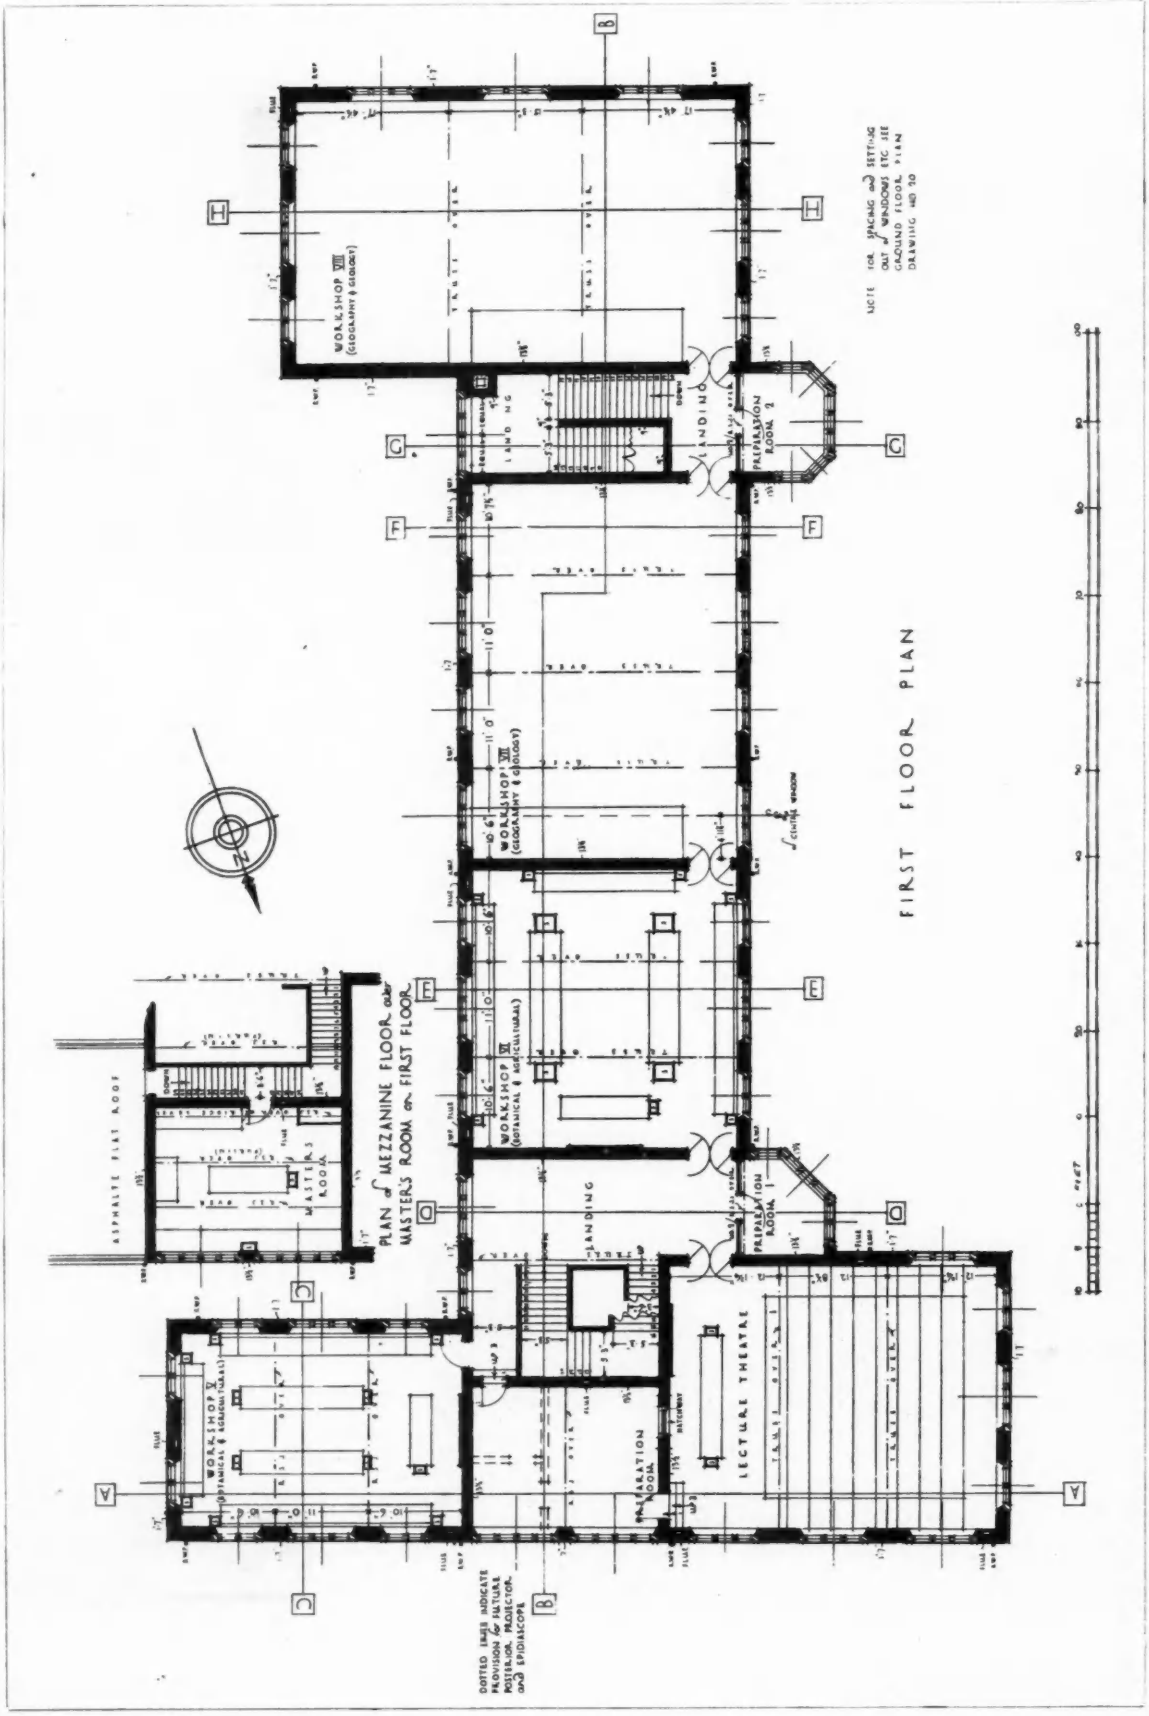
To emphasize the main axial line of the new quadrangle a flèche has been added to the roof of the library, and by the generosity of the Amicable Society of Blues (an association of old scholars founded over three centuries ago) three stone seats have been provided in the quad; and, as a centre fountain and ornament in the pool, a reproduction in cast lead of Verrochio's "Boy with a dolphin." Lead masks as water spouts at each end of the canals, and a sundial placed at the intersection of the central stone-flagged paths, have also been given by this ancient society.

The north entrance. The buildings are faced with multicoloured bricks, with reconstructed stone dressings and tiled roof. In the foreground is the end of a canal, with lion's head mask.

New Science Workshops, Christ's Hospital, Horsham.]

[*By Sydney Tatchell* (*Tatchell and Wilson*).

Plans of the ground floor and of the mezzanine floors over the heating chamber and motor room, and over the masters' room. On the ground floor are two entrances and staircases, workshops for special scholars and for practical mathematics and zoology, and preparation and store rooms. The largest workshop on the ground floor measures 50 ft. by 30 ft., and is devoted to zoology.



Two of the workshops on the first floor : geography and geology ; and botany and agriculture. In planning the workshops due provision has been made for future scientific developments. Ample light and space are provided for both masters and boys.

New Science Workshops, Christ's Hospital, Horsham.] *[By Sydney Tatchell (Tatchell and Wilson).*

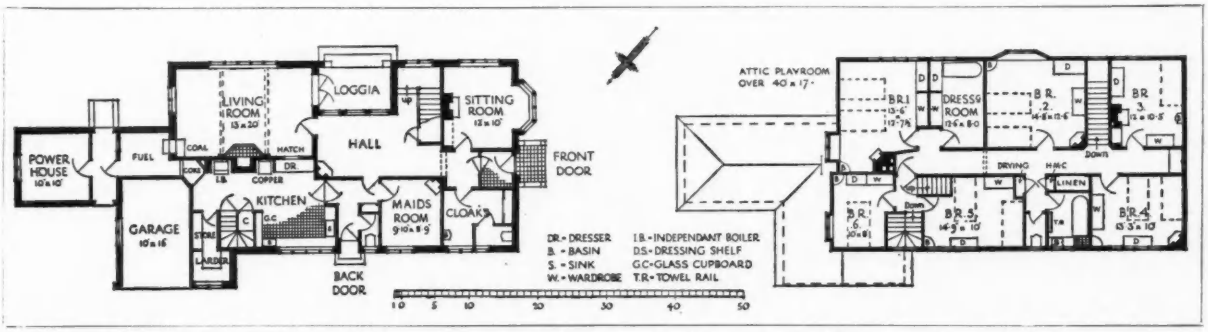
This is the larger of the two workshops devoted to geography and geology. It is about 50 ft. long by 30 ft. wide. The smaller workshop, about 40 ft. by 30 ft., is illustrated above. Both workshops are planned on the first floor.

special scholars and for practical mathematics and zoology, and preparation and store rooms. The largest workshop on the ground floor measures 50 ft. by 30 ft., and is devoted to zoology.

New Sciences Workshops, Christ's Hospital, Horsham. [By Sydney Tatchell (Tatchell and Wilson).

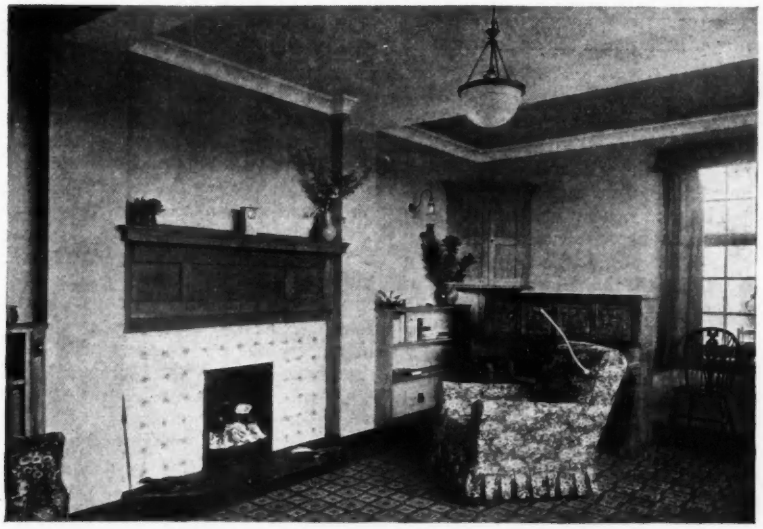
On the first floor are a lecture theatre, accommodating 120 students, workshops for botany, agriculture, geography and geology, and masters' and preparation rooms. An extensive flat roof is provided over a portion of the building for experimental work under glass.

The garden front, facing the sea.

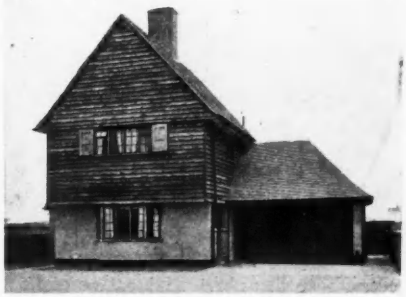


HOLIDAY HOUSE AT LITTLESTONE

DESIGNED BY A. L. N. RUSSELL
(KNAPP-FISHER, POWELL & RUSSELL)



"DYKE END," Littlestone-on-Sea, Kent, has been designed for plain living, with a minimum of furnishing and decorations. In addition to the accommodation shown on the plans, there is a large attic room, affording magnificent views over the Romney Marsh. The interior woodwork is treated in three tones of bronze-green, grey and deep blue. The latter colour has a special charm when seen in conjunction with the white tiles on enamelled walls in the bathroom.



A view from the south. The main entrance faces south-west. The walls are of roughcast, coloured with a slightly pinkish tone to avoid harsh contrast with the tiles; metal casement windows are fitted. The plinth is tarred.

Ground- and first-floor plans. It was desired to get as many bedrooms as possible on the first floor, with the most direct arrangement of passage and service. Fitted wardrobes, and dressing shelves with drawers below, make movable furniture in bedrooms entirely unnecessary. A separate stair and a baize door in the upper passage keep the part of the house used by servants entirely separate.

The fireplace in the living-room. A coal box has been planned in the corner of the room, which can be filled direct from the fuel store at the back.

The side elevation of the chauffeur's cottage, which is connected to the garage.

over a portion of the building for experimental work under glass.

LONDON'S GARAGE PROBLEM

A Ring of Car Parks Underground

DEVISED BY THOMAS SPENCER

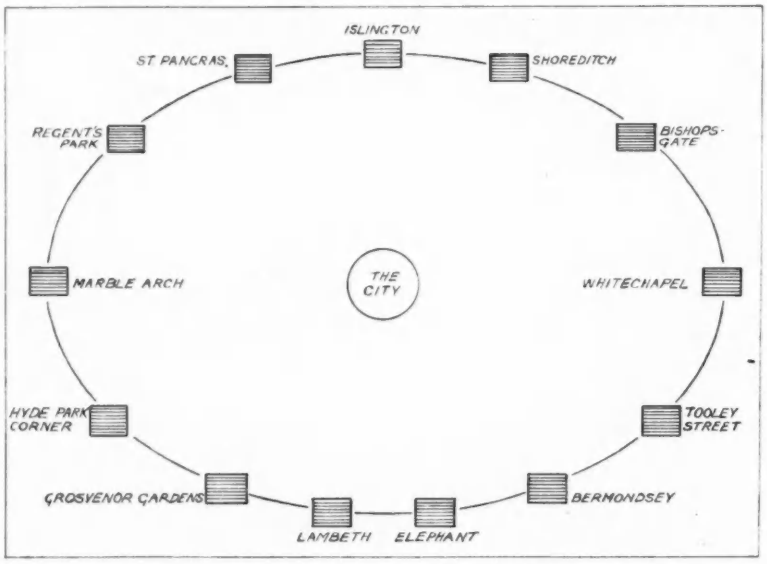
OWNERS of cars who have been accustomed to use them for driving into and out of London are finding by tedious experience that more and more time is wasted in making the innermost three or four miles. Already, traffic congestion is such that this portion of the run often takes as long as the remainder, where the total journey involved is of about twelve to fifteen miles. This condition is bound to be seriously aggravated as time goes on.

Moreover, when the car is in London, what is to be done with it? It may only be parked in certain public places, and then usually only for two hours at a time; while to leave it in a garage—of which there are not nearly enough to go round—is expensive and wastes still more time. It is small wonder that Londoners are beginning to ask themselves whether it is worth while bringing the car to town at all.

Many think that they should be definitely prohibited from doing so, at least within the central area most subject to congestion and delay. To mitigate the hardship of such a prohibition and to solve the two difficulties outlined in the first two paragraphs is the aim of a scheme to which considerable thought has been devoted by Mr. Thomas Spencer, the London architect, whose drawings, illustrative of his proposals, are here reproduced.

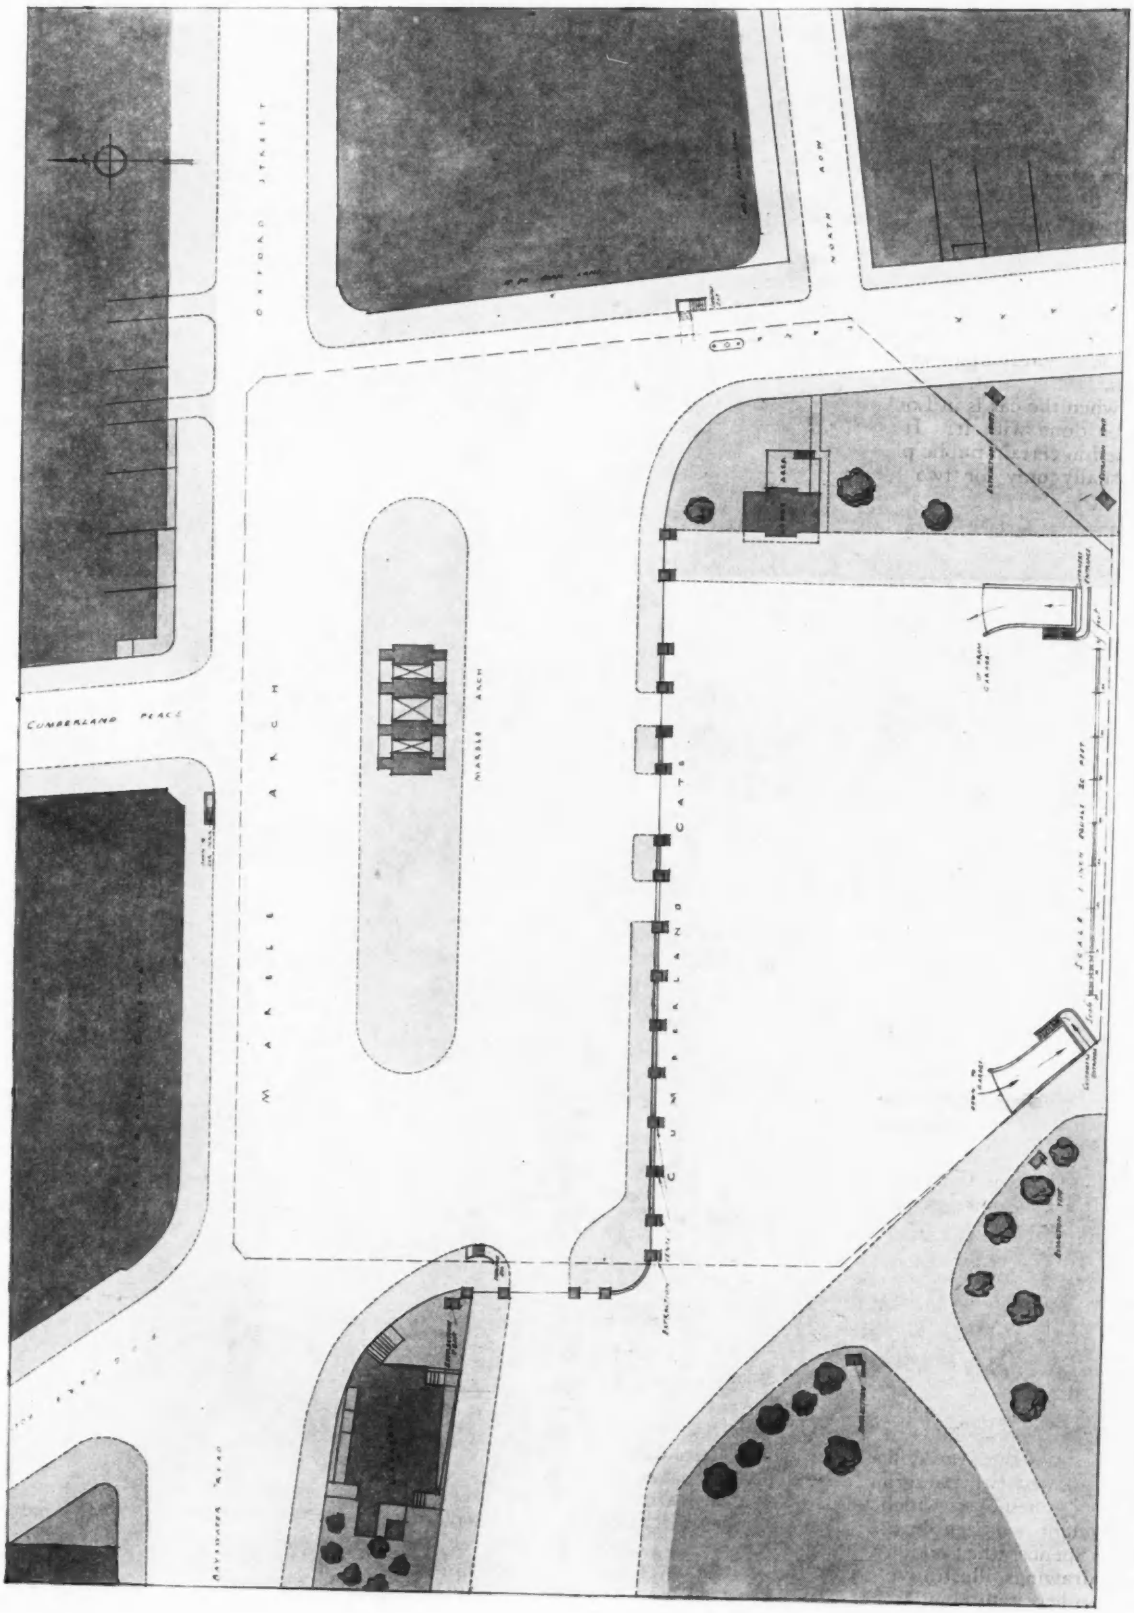
He visualizes a ring of large car parks, to the number of a dozen or more, situated on the perimeter of the congested area, where motorists would leave their vehicles, completing their journeys to the City by the public means of transport, already abundant, and susceptible of considerable acceleration were the roads made freer for them by the withdrawal of all private vehicles.

The garages would accommodate about 2,000 cars, and would be constructed underground. This is not a new suggestion: the idea of so using Leicester Square has recently been mooted. The use of any square, however, is open to the objection that the trees would almost certainly be sacrified. As for sites already occupied by buildings, the difficulties presented by their foundations would be prohibitive. There are, however, many open spaces which present neither of these drawbacks, and could be developed on similar lines to the Piccadilly Circus station of the Underground railway system.



A typical site of the kind, at Marble Arch, is the subject of the detailed plans reproduced on the facing and following pages. It will be observed that a large area is here available, clear of trees and buildings, and that two floors are indicated, the roof of the upper being only just beneath the surface of the ground. Access by means of ramps, which have obvious advantages over the system of lifts that become an unwelcome necessity where considerable depths (or considerable heights, in the case of above-ground garages) have to be negotiated, would be easily and conveniently arranged. One would drive down, when entering, by one ramp, and drive away up the other, both being actually just within the precincts of Hyde Park, and having large open spaces about them.

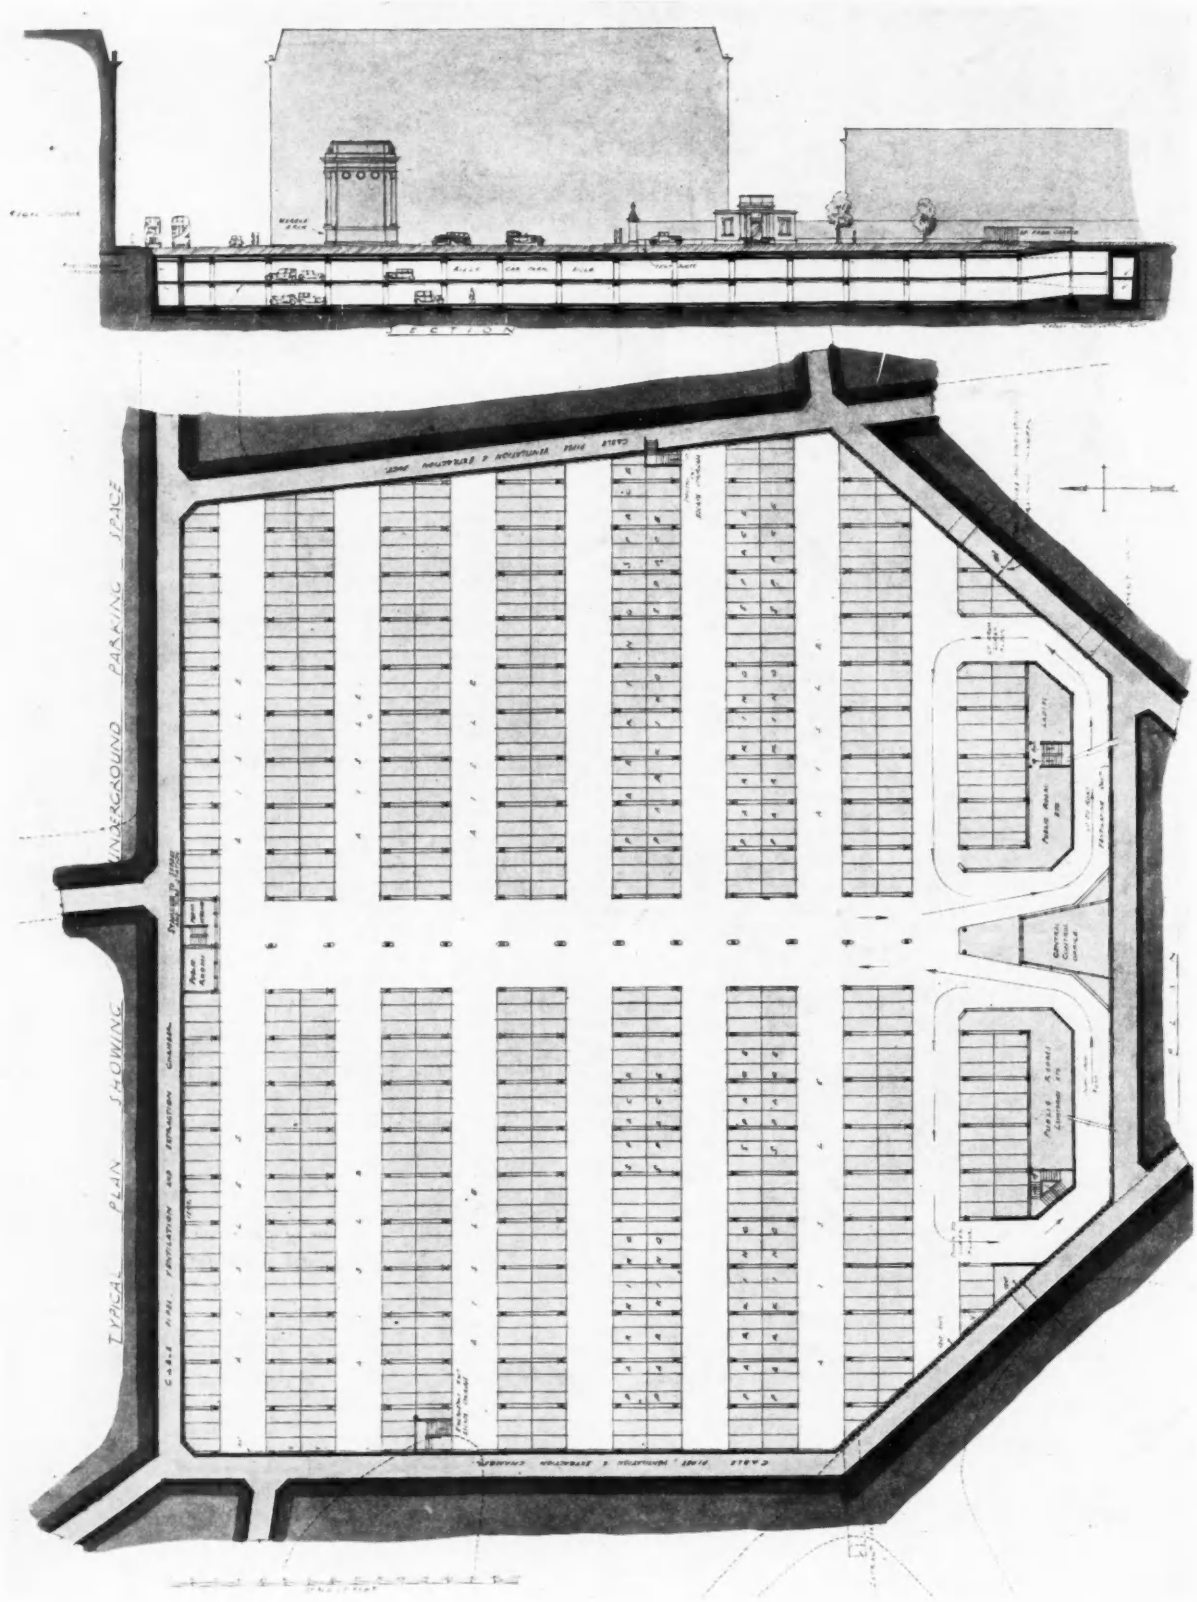
The question of ventilation, in view of the poisonous elements in the exhaust gases from motor-car engines, always of high importance, assumes particular urgency underground, but presents no difficulty that could not be solved by modern means of mechanical extraction. The building would be entirely surrounded, both as to walls and as to floors, by a complete system of ventilating ducts, with extraction pipes and vents brought to the surface at a number of points, not only around the area itself, but arranged in a line crossing its centre. The arrangement is clearly shown in the drawing facing this page. To provide against accidental failure the extraction motive-power would be duplicated.



Nor is the essential of ventilation the only benefit to be secured from such ducts. They offer ideal conduits for electric cables, water and gas pipes. By running them therein the necessity for frequently digging up the surface of the roadways above in order to effect repairs, or even to lay on fresh branch supplies, would be eliminated once and for all. Thus another contributory cause of traffic congestion would be removed.

On whom should fall the considerable cost of building such a chain of excavated parks? They are in the nature of public services. If sited as proposed, below extensive road spaces or other open ground, the question of site value should not arise, and the cost of construction should, it is suggested, be borne municipally, with possible assistance from the Ministry of Transport. If the existing garages, with buildings on expensive ground and run for private profit, can afford to park cars at fees averaging, say, 2s. 6d., there seems no reason why larger undertakings, of the kind in view, could not be made self-supporting for a very small charge per car.

The suggestion merits the serious consideration of the London County Council, and other bodies who will shortly be driven, by the march of events, to take drastic steps to deal with the traffic problem. H. F.



A diagrammatic representation of the scheme for a ring of underground car parks around central London outlined in this article.

Key-plan of the large open space at Marble Arch, to illustrate a typical underground car park, as visualized in the scheme. The area proposed to be utilized is shown by the broken lines; ramps down to and up from the garage floors are indicated to be provided just within the gates of Hyde Park.

[*By Thomas Spencer.*

[By Thomas Spencer.

The Marble Arch suggestion in greater detail. The architect's drawings of section and plan of a two-floor underground car park that would accommodate some 2,000 vehicles. It will be noticed that the question of mechanical ventilation, which is a material part of any scheme of the kind, has received special attention ; also that subways for cables and pipes are included.

ENGLISH PRECEDENT No. 137

THE DINING-ROOM, RAYNHAM HALL, NORFOLK

Raynham Hall, Norfolk, is one of those houses where William Kent is known to have carried out a number of improvements which it is not by any means easy to identify today. Externally, there is much uncertainty as to the features for which Kent may be held responsible. Within the house the uncertainty is less. Certainly the screen which divides off a portion of the dining-room is authenticated in every line.

An arched screen of this sort provides an unusual substitute for the columnar type, but it is not always an appropriate one. Here it seems to have been designed as a setting for the spectacular entrance of the noble host—"centre back," as stage folk say, and booted and spurred for choice.

LETTERS FROM READERS

Official Architecture

SIR,—Just when Mr. Owen and I have filled our fountain pens, and borrowed an anthology of English verse, so that we can indulge in a friendly quarrel, and hand it to each other in poetry, we are assailed by the jolly old "Business Man," who has, with characteristic effrontery, side-tracked the real issue of whether we were talking about architecture or architects, cathedrals or stations, unconscious insults, and intelligence of architects. I submit that you, sir, should not have allowed "Business Man" to crash the gate until Mr. Owen and I had finished with each other.

Mr. Owen's contribution to the Olympia debate resolves itself into three divisions—1 : preamble covering yet another definition of architecture; 2 : vitriolic attack on the work of an eminent architect; 3 : quotation of Rudyard Kipling. As division 2 took up the major part of his remarks, I am still of the opinion that he *was* discussing architects rather than architecture.

Regarding division 3 : let us imagine for a moment the scene in the architects' department of a large brewery :

Chief Staff Architect : "Are the Walworth Road Tavern drawings finished ready for the builder?"

Chief Staff Architect's Staff (in chorus) : "Yes, sir."

C.S.A. : "The Master has praised your efforts?"

C.S.A.S. : "He has."

C.S.A. : "You have all returned your salaries to your employers?"

C.S.A.S. : "Yes, sir."

C.S.A. : "You have had the all-sufficing joy of working for nothing, and have each drawn the thing as you saw it, I hope?"

C.S.A.S. (fervently) : "We have."

C.S.A. : "Then you are indeed happy, and doubly so, in that you have kept this work from the greedy, sneaking, avaricious, mean, sordid-minded outside practitioner."

A beautiful and ennobling thought, truly !

As for "Business Man," I consider him to be an uncouth fellow. Just why he should unerringly put his clumsy finger on the very bones of the question, I am unable to judge. Here is big business unmasked, the bag opened and the cat freed. Here, Mr. Owen, is the architect before architecture ! One feels that the prettiest definition of architecture in the world would pass over "Business Man's" head without him needing to duck to avoid it.

But there is one thing the business laddie doesn't know : I would gently draw his attention to the fact that he can get architecture and the services of staff architects gratis. He need not spend a paltry £500 a year on a tame one. All the big general stores will supply him with anything he wants in the way of plans and specifications free of all charge and obligation, so long as he guarantees that he will buy the door knobs for his new building from them.

It is indeed a difficult world for the lone professional man.

J. R. LEATHART

The Calton Jail Site

SIR,—Since Mr. Ramsay MacDonald, speaking in his less familiar capacity of what, in his already sufficiently remote day, used to be called an æsthetic, complained that an unauthorized sketch of a model of buildings which the Government proposed to erect on this site "had been accurately described [by Sir Lionel Earle] as 'a complete travesty of the original design,'" a hitherto singularly quixotic controversy may be said to have entered a new, and somewhat more actual, phase.

While awaiting the verdict of the Royal (Scottish) Fine Arts Commission on the second amendment to the original (English) design, a Scottish National Committee has taken up arms in defence of Edinburgh's threatened amenities. Unfortunately, this public-spirited body is composed of sentimental romantics and archæologically-minded reactionaries, whose comprehension of the modernist movement in architecture goes no farther than a gasp of senile horror. Paradoxically enough, the canons of taste of these gentlemen are all but identical with those of the nominal villain of the piece, that stout old Ruskinian, Mr. Lansbury, who recently described Mr. Emberton's virile extension of Olympia as "a perfect prison." Like the Corporation of Edinburgh, the National Committee can be relied upon to stand firm for the dead hand of the past, which it has admittedly every title to represent; and refuse to lend ear to the impatient voice of the present, which it dreads and loathes. Not a few modern-minded Scots have been driven to the humiliating conclusion that there is, on the whole, less to fear from the Office of Works, whose defeatism towards the spirit of the age has lately been tempered by certain uneasy stirrings of a long-forgotten structural sincerity.

A comparison of the official drawing of this uninteresting model and the offending sketch of it published by *The Scotsman*, which is now possible, shows that the difference between them is altogether too trivial to justify the sweeping expression "a complete travesty" applied to the latter. So far the honours rest with *The Scotsman*, which virtuously parades its injured innocence and at the same time accuses "the stereotyped lines" of the Office of Works design of "showing no imagination, no freshness, no boldness or originality of conception."

That is all very well as part of a topical journalistic polemic spiced with political bias ; but what exactly is the editorial "conception" of the positive side to this string of architectural negatives ? Presumably, a demand for something either decidedly less, or decidedly more, modern than the official elevations. The charge of a lack of "boldness"—an only too common euphemism for Edwardian "fruitiness"—seems to betray furtive hankerings after the turreted pomps of Scots Baronial. This style is perennially dear to the commercially romantic hearts of the Edinburgh shopkeeper baillies who have been progressively ruining Princes Street. Let them take to heart the awful warnings of Balmoral and Skibo Castles, or the future Scottish Embassy erected by a well-known firm of whisky distillers in the (London) Haymarket — through the plate-glass windows of which Raeburn's superb Macnab may be seen dourly dismissing Landseer's Monarch of all the Glenlivets as a stuffed stag unworthy the stalking.

The words "we cannot imagine any alteration in the design making it acceptable for the Calton Crag" are highly significant. The question may be asked : Has *The Scotsman* any definite views as to what sort of style *is* appropriate to this craggy site ? If so, why does it not expound them to its readers ? If not, why does it continue to harp on the subject ? Unconstructive, negative criticism—and this is all Scotland's leading daily paper has so far had to offer—only lends colour to the suspicion that it is chary of avowing any particular preference until it sees which way the cat is likely to jump.

Mr. MacDonald has hinted that he might agree to restrict the use of the Calton Hill to the new Sheriff court-house. This would leave the problem of finding a site for these Government offices—and a site has got to be found for them somewhere sooner or later—exactly where it was before the present agitation started. *The Scotsman* is of opinion that "there are other sites in Edinburgh where buildings like those figured in the official drawing would not be objectionable, and might even be considered a civic improvement." Curious as is the phraseology of this statement—which sounds as though the

writer were ready to admit that Neo-Egyptian, Neo-Grec, Neo-This or Neo-That do quite nicely for back streets, provided it is recognized that Neo-Baronial must always be *de rigueur* for commanding positions—it at least expresses the glimmerings of a belief, not apparently shared in other quarters, that the indispensable preliminary to making Edinburgh a true capital once again is the worthy town planning of some central area in which to group the Scottish Departments of State.

P. MORTON SHAND

Polytechnics and Exhibitions

SIR,—My attention has been drawn to the letter by "Polygnotus" in your issue dated October 1.

I must admit that I agree with some of the statements made in that letter. For instance, we deliberately refrained from exhibiting at the Building Trades Exhibition any of the work of our Architectural School, preferring to concentrate upon the work of the craft section for which the Exhibition is primarily intended; and in this section the high standard of the work exhibited by the technical schools generally must prove to any unbiassed observer the value of systematic training.

As to your correspondent's statements with regard to the training of architects, I can, of course, only speak in reference to the Northern Polytechnic. We have here one of the schools referred to, that has been recognized by the Board of Architectural Education as up to the standard of the Intermediate Examination of the R.I.B.A., and this recognition would not have been granted had the Board not been convinced not only that we were able to give training up to this standard but that we had actually been providing that training for a number of years.

Your correspondent implies that it is only a very few of those who have been trained in the polytechnics who become successful architects, and that many of the students issuing from the polytechnics "drift in and out of offices." I cannot say how far this may be true of other technical schools, but it is certainly not true of the Northern Polytechnic. On the contrary, we have no difficulty in placing our students in good offices, and there is every indication that they have established themselves as useful members of the profession, and many are now in responsible positions.

The architectural students who pass through our Day School of Architecture receive a training which we believe to be exceptionally practical and valuable, due to the facilities which we are able to afford them of becoming closely acquainted with the associated crafts by actual practice in the trade shops. This practical knowledge will necessarily be of great value to them afterwards, when they have to assess the quality of the work which they are supervising.

I may add that it has always been our policy very strongly to discourage unsuitable students from attempting to enter the architectural profession.

R. S. CLAY
(Principal, Northern Polytechnic)

Settling-Up Honeywood: xxi

THE CAT JUMPS ONCE MORE

BY KARSHISH
(H. B. CRESWELL)

Sir Leslie Brash, the owner, has written a preposterous letter to the architect, Spinlove, objecting to his charges; taking him to task for obstructing his claim against Grigblay, the builder, for defective painting, and for passing items for "profits" and "fees" in the builder's Statement of Account; and particularly complaining of a recently-discovered opening from the furnace flue into the hollow wall, and of neglect to discern the cause of the resulting dispersion of fumes, and stop the nuisance.

SPINLOVE TO RUSS AND CO. (SOLICITORS)

Dear Sirs, 4/12/26.

I enclose copy of letter I have received from Sir Leslie Brash, and also a copy of that to which it is a reply. As your client, by objecting to my style, appears to require me to answer him in his own, I am replying to you. It was a great shock to me to get his letter, as no doubt he intended, since it is the result of ten days' reflection; and what his immediate more "forcible rejoinder" would have been I do not know, for such studied misrepresentation and abuse must need deep thought.

You are acquainted with the facts of the Riddoppo dispute, and will be able to point out to your client that I was *right* in advising him not to use the paint, *right* in supporting Mr. Grigblay's objection to using it, and *right* in saying Mr. Grigblay could not be held responsible for the failure—as was also Counsel's opinion and is your own view; that it is a mere quibble to say I took sides with the builder; that if your client, at any point in the dispute, had acted on my advice he would have saved himself wasted trouble and expense; that everything I have done has been in his interests, which if I had acted differently, would not have been the case. The truth is that what your client resents is my being right and he wrong.

You will also be able to explain to your client that the "profits" and "fees" charged in the Statement of Account are according to custom; that every detail of the account has been audited by the Quantity Surveyor, Mr. Tinge, after authorization by me, according to the stipulations of the contract; and may remind him that I offered to explain any points upon which he was not satisfied.

I enclose copy of the official Scale of Charges issued by the Royal Institute of British Architects, so that you will be able to show your client that my charges are in accordance with it, except where they are less. I find, however, that I omitted certain services for which I am entitled to additional fees: I therefore enclose amended account in substitution for that previously sent in error.

With regard to the leakage of coke fumes, you will be able to tell your client that his ardour in abusing me for what is no one's fault but his own outruns his discretion unless he can explain: (1)—how his household has been "continuously tormented by disgusting effluviums ever since the house was occupied," when no one but Lady Brash was able to detect any smell at all, and the furnace that caused it was out of use for more than six months; and (2)—in what way I was guilty, also "continuously," of "elusive dilatory procrastination" for giving assurances that there was nothing wrong with the drains, when there was not, or in failing to recognize a smell which it required the services of a chemist to determine.

The facts are, as your client knows, that early in the year it was suspected something was wrong with the drains. The builder investigated and found unsanitary conditions due to neglect to keep traps clear. The drains were subsequently proved sound, and there were no more complaints of smells till the 10th October. An indeterminate stuffy smell was then noticed, and at my instigation a consulting chemist was called in who, four weeks ago, reported fumes from coke fires. My dilatoriness has since then consisted in determining what and where the defect was and getting the work opened up. In this I have been delayed fifteen days by your client's prohibiting the builder from entering the house, and by the refusal of the builder to make good until your client accepted responsibility for the defect, which is revealed *to be a hole knocked in the flue by a chimney-sweep employed by your client*, who eluded the foreman after being told not to touch

the flues. You will, therefore, be able to point out to your client that he has misstated many facts perfectly well-known to him, and that he alone is responsible for any annoyance he has suffered.

In this letter I have tried to confine myself to the business of settling up; but as Mr. Grigblay cannot answer for himself and my silence might imply acceptance of the aspersions on him, I wish to say that Mr. Grigblay has from first to last done his duty—and more than his duty; that he is a scrupulously honourable and self-respecting man and a conscientious and capable builder; that the whole of the trouble during the past months has been made by your client; and that Mr. Grigblay has far more cause for grievance against the building owner than the building owner has against him.

You will note that your client has had the forethought to write in his own hand so as to escape the consequences of libel—a most wise precaution. It may be, however, that his sense of his obligations is not entirely regulated by fear of legal proceedings, and therefore, although he has made it impossible for me to enforce a withdrawal and apology, I will nevertheless pay him the compliment of demanding both.

Yours faithfully,

We have noticed before that the highly temperamental Spinlove has a bit of the Old Adam in his make-up. Like other temperamental persons he becomes a different being under different circumstances, and it is this that explains the exuberant folly of some of his letters, the stiff-necked superciliousness of others and the passionate resentment he sometimes, as here, displays. He must have had the devil at his elbow when he wrote and re-wrote and polished up and altered the first typescript of the above, for it is clear he could not have produced the thing off-hand. The stored depths of bitterness it reveals are dreadful; and it is the sort of letter that may be said to be scarcely ever written, for those who are capable of writing them know better than to indulge themselves; and those who do not, lack the capacity. Gifts such as Spinlove here displays are wasted in any but a political career—and worse than wasted. The arresting thing about the letter is the deliberate uprooting of the plant Spinlove has been tending for two years with such solicitude, and the discarding of Brash's esteem and friendly offices just when they were ripe for garnering. This seems inexplicable; for if Spinlove were characteristically unable to control his temper he could not have arrived at the position he has reached. The only explanation that seems possible is that there are matters affecting the relationship of Brash and his architect which this correspondence has not revealed.

The wild folly of Spinlove's action does not, however, prevent us from admiring his courage in writing the letter; and there is a manly disregard of consequences which shows him to be of finer metal than we have hitherto had reason to suppose. That the letter is not quite fair to Brash is of no consequence: the only impediment to our perfect joy at the prospect of Brash reading it is that Spinlove is but little over thirty and Brash is advanced in middle age—for I imagine Grigblay's "old gentleman" to be no indication of senility, but provoked by a humorous perception of frontal luxuriance, tight boots and similar abnegations of youth.

We may also sympathize with Spinlove. In what way ought he to have replied to Brash's outrageous letter? It is a very difficult question. He might, of course, have flattered Brash into reason by being submissive, giving a diplomatic answer to the various complaints, appealing for a more tolerant view of the facts and a recognition of what was due to him; or he might have risked a letter of passionate protest, such as in early days Brash once provoked him to, but he could scarcely have done either except at the loss of his own self-respect and his claim on Brash's—but why should he make any surrender whatever?

When a letter is written under a genuine misapprehension and without any intention of offensiveness, a diplomatic answer removes the misapprehension and prostrates the offender with the realization of his transgression; but when, as in Brash's case, there is a deliberate intention to affront, and facts are wilfully distorted to bolster abusive aspersions, the problem is how best to hit back, and hit back with effect, for it is easy for the hitter to do more damage to himself than to his adversary—as Spinlove seems to have done. Spinlove must have been tormented with the difficulties of the position before he struck the happy idea of addressing his reply to Russ; and if he had written coldly, instead of with feeling, made no attempt at retort, and suggested the expedience of an apology without appearing to care whether it were conceded or not, he would probably have hit Brash the harder and disarmed him of deeper grievances. The things that will hurt Brash are Spinlove's disdaining to reply to him; Russ's seeing his letter; and the humiliation of being told that his various grievances are without foundation and that he is wrong and Spinlove right. Spinlove's carefully polished sarcasms were not necessary, and may be expected to do him more harm than they will Brash.

MISS PHYLLIS BRASH TO SPINLOVE

Dear Jazz, 7/12/26.

What have you been doing to Dad? He is utterly furious with you and I am afraid he is going to see Mr. Russ today. Why do you make all this trouble? It was never like this when the house was being built, and afterwards he was so blown out and pleased with everything — but now everything is horrid. He *shouted* today —he hardly ever does that. Do please have a reconcilly, or I don't know what will happen. Why is not the flue put right?

Yours,

P.

PS.—Mum comes home tomorrow, in spite of all cold and comfortless. She took the leap at Brighton—not into the sea but into a psycho-merchant's bosom, and Aunt G. says it's done her good already.

SPINLOVE TO MISS PHYLLIS BRASH

Solemnly, it is not my fault. I would do anything to have a reconcilly, but he wrote me a most terrible letter; abusive and misrepresenting all the facts—not troubling to understand them, and actually insulting. I could not possibly take it lying down and did not know how to answer without making matters worse, so, as he proposed to refer matters to Russ, I replied to Russ. I suppose this has upset him, but Russ will put things right I am sure. The flue can be patched up directly the word is given. I can do no more.

Excuse typed letter as I am in a rush.

RUSS TO SPINLOVE

Dear Sir, 9/12/26.

On receipt of your letter and enclosures we communicated with our client, who has since called to see us and has instructed us to say that his letter to you of November 2nd was written under a misapprehension as to certain facts. He now realizes that his aspersions on yourself were not justified, and he withdraws them and expresses his regret that he made them.

We shall be glad if you will make an appointment with Mr. Russ at this office on an early day for the purpose of explaining one or two matters arising out of the Statement of Account, and your own charges.

We have also to direct you to instruct the builder to make the necessary alterations to the flue at the earliest moment, and to inform us directly you know definitely the date when the work will be completed.

Yours faithfully,

It will be noticed that, by ignoring Spinlove's vituperations, Russ's formal letter conveys a more effective rebuke than any retort or comment on them would be likely to do. Russ has evidently persuaded Brash to a more reasonable state of mind.

SPINLOVE TO MISS PHYLLIS BRASH

Dear P., 10/12/26.

Since you rang up this morning a letter has come from Russ which puts everything right so far as business is concerned—apology and everything. Will you keep a lookout tomorrow morning and let me know how thingys are at your end, as I am writing him

a really nice letter that I hope will put everything right. Excuse typewriter.

Yours,

For "him" I read "your Father."

SPINLOVE TO RUSS AND CO.

Dear Sirs, 10/12/26.

I am much obliged for your letter and gladly accept without reserve Sir Leslie Brash's withdrawal and apology. Of course, I was bound to ask for it.

I will call and see Mr. Russ at 11 on Thursday if that will be convenient to him.

I have arranged by telephone with the builder to put the repairs to flue in hand at once. They will be finished next week, and there is no reason why the furnace should not be lighted on Friday.

Yours faithfully,

SPINLOVE TO BRASH

Dear Sir Leslie Brash, 10/12/26.

I have today received a most satisfactory letter from Mr. Russ which I have, of course, suitably acknowledged; but I am impelled to thank you and to express to you the great pleasure I received from the message he sends from you. I do hope that everything is now all right between us. I was in great difficulties when I received your letter, as it was really altogether "too rather," as Phyllis says, and misrepresented the facts in such an extraordinary way that I could not trust myself to reply direct; and as you had threatened to call me to account with Mr. Russ I thought the best thing would be to take the bull by the horns (I am not referring to you, of course) and see if *that* would do any good—as it has, I am thankful to say.

I have arranged with Grigblay to get on with the work to the flue, and you will be glad to know that he will definitely get to work next week and that you will be able to light the furnace next Friday, certain. I understand you agree that the damage was caused by the sweep Lady Brash employed, and that no question will be raised on that point after the work is restored. As you know, he refused to touch the flue except on the understanding that you accepted responsibility for the damage.

With kind regards and best wishes,

Yours very sincerely,

So this is Spinlove's idea of a "really nice letter"! He would have been entirely right in telling Brash he received his message with very great pleasure and accepted it fully and without reserve; and in adding a light comment on some remote subject to show that he regarded the quarrel as over and out of mind; but he appears—as usual—to have written out of the feelings of the moment without any regard for the effect, which will be to open every wound that Brash's vanity has suffered in his interview with Russ.

MISS PHYLLIS BRASH TO SPINLOVE

Dear Jazz, 11/12/26.

I spotted your screed at breakfast this morning, but I do not think Dad is going to wear it next his heart *immediately*. He put it back in the envelope after he had read it, and said nothing, but he lobstered—he does that sometimes; not anger—sort of bashful, don'tcher? What was it you said to make him? Mum is wonderful, but, odds architects and builders, when are we going to have the heat on? The whole household is suffering terribly from a chilblain on Mum's little finger. She is writing to you. *It's all right.*

Yours,

P.

Mem: *Go and get psychoed.*

SPINLOVE TO GRIGBLAY

Dear Sir, 17/12/26.

I kept an appointment with Mr. Russ, Sir Leslie Brash's agent, yesterday and am glad to tell you that there is no intention of proceeding against you for the Riddoppo failure. The matter has been dropped and all suggestions that you were in any way responsible withdrawn.

I enclose certificate for £1,802 11s. 9d. being final balance due under the contract as shown in the Statement of Account. The account for restoring the flue, including analyst's fee, should be rendered separately.

Yours faithfully,

The doorway at No. 38 Johnson Street, Westminster, of which a measured drawing, by R. A. F. Riding, is reproduced on the facing page, is typical of many in this somewhat neglected district of Westminster that may soon be lost. Its simple charm may be summed up in two words—"good design."

BRASH TO SPINLOVE

Dear Sir, 13/12/26.

I am gratified by your intimation that you have received and fittingly acknowledged a communication from Mr. Russ, and that that communication meets with your approval.

The matter you refer to as in dispute between us is, I apprehend, anent the furnace flue, in which eventuality it appears we are in agreement, and I accordingly observe with satisfaction that you have succeeded in obtaining Mr. Grigblay's consent to undertake the work, as the result of his protracted decision in this matter has been of interest to us for a considerable time.

I suffer, I apprehend, from a certain unavoidable confusion of mind anent the various building operations which Mr. Grigblay objects to perform and those others anent which he refuses to take responsibility; but any compliances on his part which offer expectations that we will shortly see the last of him are most welcome.

Yours faithfully,

Brash is sulky. Spinlove has won!

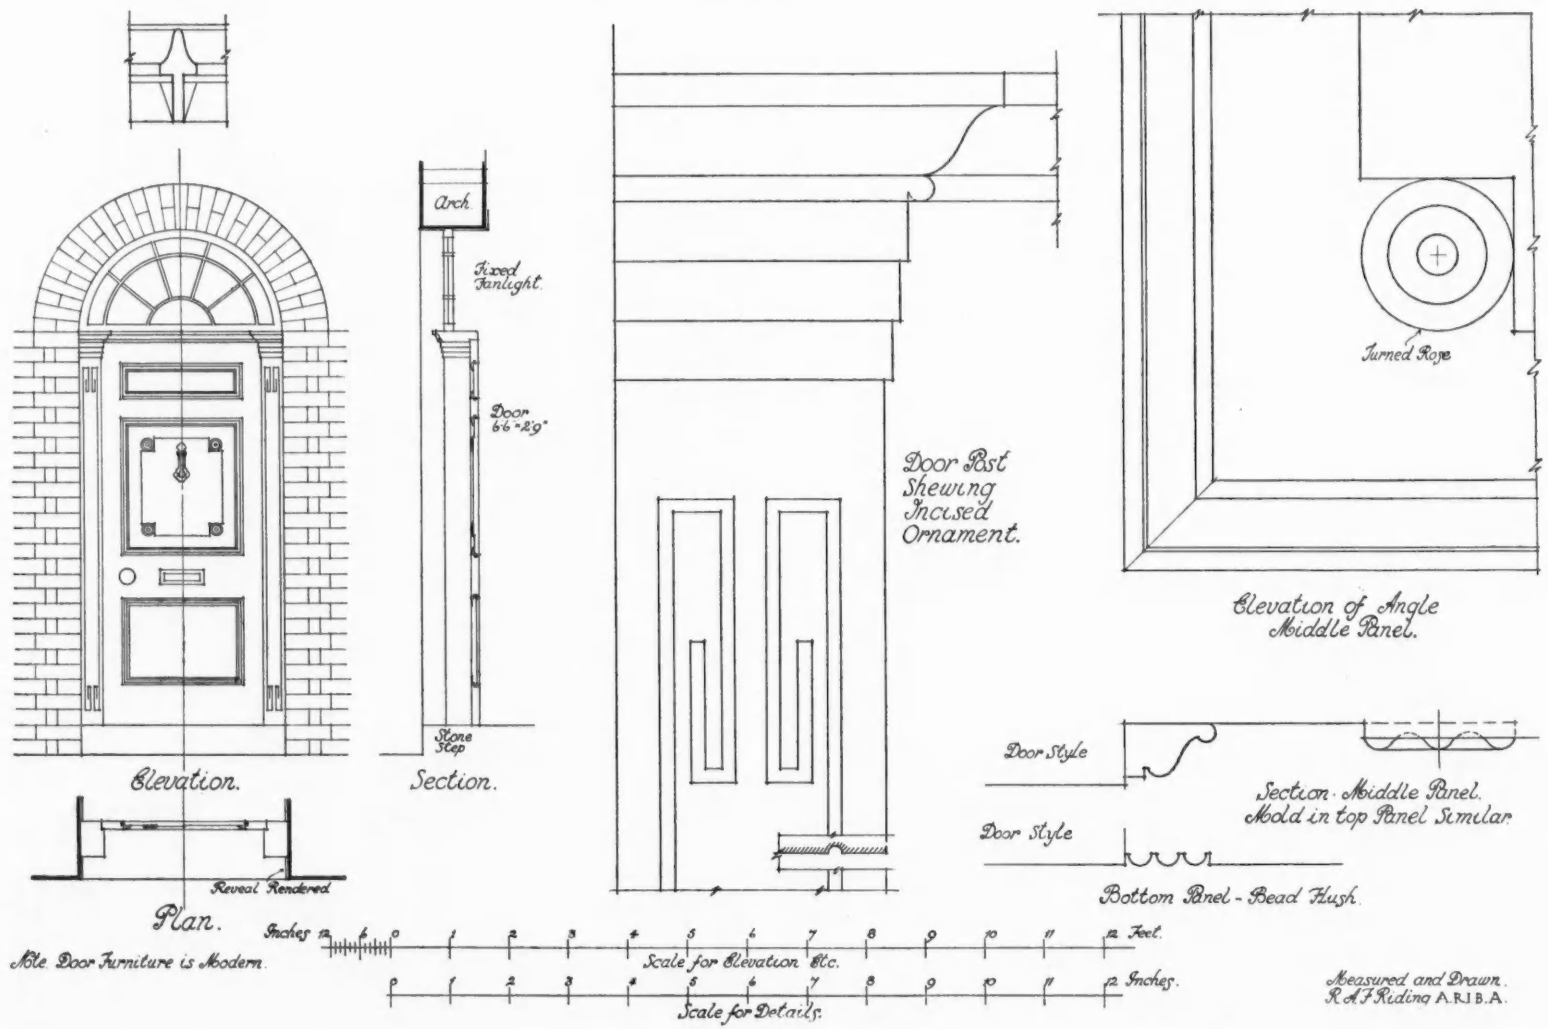
LADY BRASH TO SPINLOVE

My dear Mr. Spinlove, 13/12/26.

Here I am again you will see, after a most enjoyable stay at Brighton with my sister, but all the time I was there I wished I was at home which rather spoilt my visit in spite of not having a *dreadful* chilblain when I was there.

First about the *heat*. Leslie says it will never be finished but the men are at work now so will you tell them to be a little *quicker*. There, I knew I had forgotten something. I nearly wrote to you from Brighton but it is so much easier when one is closer. Mrs. Cooper tells me they are *all the rage* just now but of course only young people do it in public and I should never *dream* though Phyllis always does. Now what would it all cost? I should like it on the roof so as to be as near the sun as possible, with steps up and down and all closed in so as to be invisible, so will you tell me and then I will ask Leslie.

Phyllis is having some friends on Saturday to celebrate the hot water she says and we hope you will stay the night. Please excuse writing, I have such a *dreadful* chilblain on my finger.



Yours very sincerely,

And Sunday night. P.

Apparently the lady has in view a sun-bath. The benefits of psycho-analysis are not as pronounced as might have been hoped.

[NEXT WEEK: XXII—A LAST SURPRISE]

DOORWAY, NO 38 JOHNSON STREET. WESTMINSTER.

In the above Regency example, of which a photograph appears on the facing page, the opening and the door itself are well proportioned, and the mouldings very good. The inside line of the sturdy doorpost is effectively carried round the arch by the glazing bar of the fanlight, and the face of the post itself is happily relieved by the fluting, the latter being very carefully spaced on the post.

LITERATURE

THIS ENGLAND

IT is for the younger generation that Mr. F. J. Gould has written *This England*, in the hope that it may inspire them with a desire to maintain and develop many beautiful elements in English scenery—buildings, crafts and popular tradition.

Each chapter of the book takes some fresh realm of beauty, scenes of nature, such as mountains, rivers, forests: or alternatively, music, painting, learning, etc., and Mr. Gould strives in the small space of the few pages devoted to each subject to show their myriad aspects and to present to us as many historical and other facts about them as possible.

In an attempt to use every available weapon in order to bring home to his readers how packed with tradition and teeming with interest is almost every square inch of England, the author piles fact upon fact and date upon date, until at the end of a chapter one seems to have been round the world and down the centuries in the compass of half a dozen pages.

The ground covered by the author in so small a book is so great that I seriously wonder if he does not somewhat defeat his own end. Nevertheless, it is an honest attempt to bring to the notice of those about to leave school or college something of the grace and splendour of the simple things of beauty to be found in all ages and times, not only in England, but throughout the world.

In this mechanical age, when speed is the predominant factor, when so often "full of care, we have no time to stand and stare," it is well to turn the minds of the younger generation towards the restfulness of rural scenes, cottages, windmills, and further afield to the wonder of temples, sculpture, primitive handwork, etc., and to remind them of days when there was time for all things.

A CHINESE COMPENDIUM

THE sixth issue of the *China Architects' and Builders' Compendium, 1930*, has recently been published. It has been edited by Messrs. J. T. W. Brooke, A.R.I.B.A., and R. W. Davis. In the preface it is stated that the feature of the latter part of 1929 and early 1930 has been the continued development in building schemes in China in spite of the phenomenal drop in exchange.

The twelve months since the last issue of the Compendium, the authors point out, have shown further large increases in the prices paid for land throughout the whole of the International and French Settlements, and in the area adjacent to those extra-Settlement roads where the Shanghai Municipal Council still retains control. This continued rise in land values seems to be due to a variety of very different causes, some connected with the natural growth of Shanghai and others with political and financial considerations of a world-wide character.

Among the subjects the authors have incorporated in the Compendium, chapters are devoted to land valuation and registration, professional charges and building regulations.

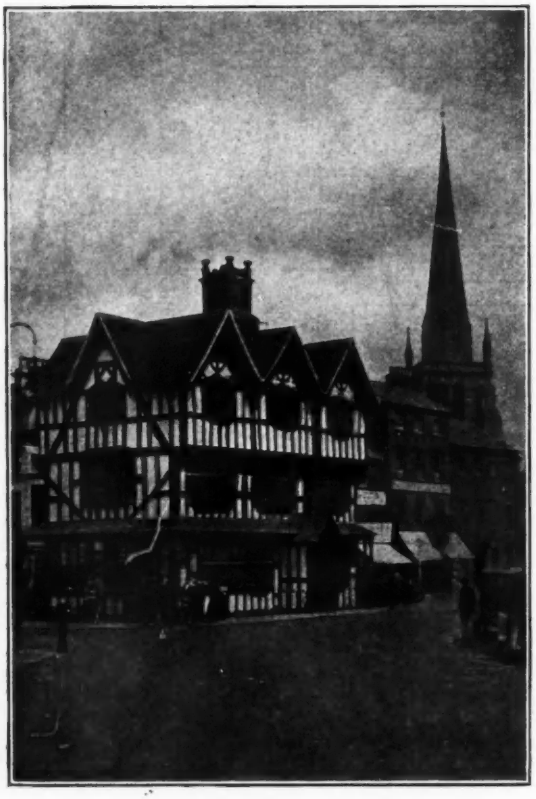
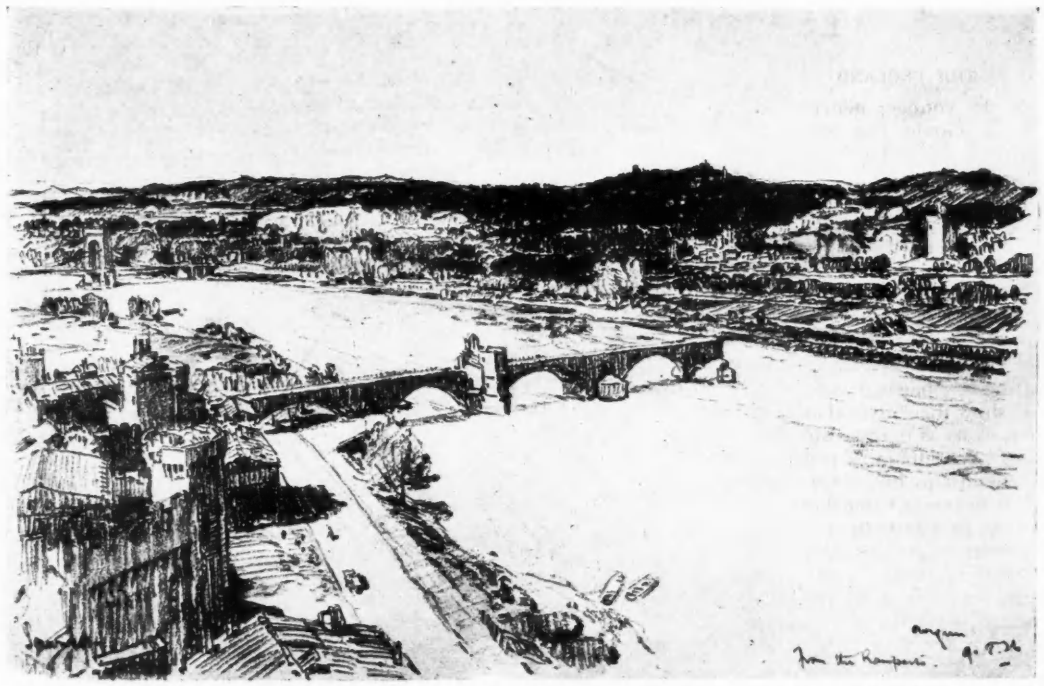
The China Architects' and Builders' Compendium, 1930. Edited by J. T. W. Brooke and R. W. Davis. Shanghai: North China Daily News and Herald, Ltd.



THE ART OF SKETCHING

MR. SALWEY'S latest book, *The Art and Practice of Sketching*, goes to prove, if this were necessary, that the author is conversant with every medium of sketching. Before, we knew him as a connoisseur in the art of sketching with the lead pencil; now he is revealed to us as the versatile exponent of all the media of this most fascinating of arts.

Sketching, as we see it through the author's eyes, is a pathway leading to greater things. It is the medium by which great artists have recorded their contacts with Nature, and which has led them on to the finished work.



The student reading this book will not find it the usual dull, technical work which makes him throw down his pencil in despair, but rather an interesting manual tracing the history of sketching from early days to recent times, and dealing first with the principles of this important branch of art, followed by the actual practice of sketching, so masterfully dealt with that it urges the sketcher to be "up and doing" and to attack his work with a fresh vigour, more seriously and assiduously than ever.

In his chapter on architecture, Mr. Salwey points out that there is little else from which the student will learn more, little from which he will derive greater satisfaction than the drawing or painting of architecture. It is also seldom that an architectural subject, worthy of a sketch, is not to be found within easy reach. It would also be a rare case in which a group of buildings does not present, at some time of day, or under certain weather conditions, attraction as a subject. There is, he tells us, a certain aspect of the matter which is not so obvious, and that is that a sketch of a building may all too easily be merely prosaic. The charm of a cast shadow from nearby objects which puts half the building in shade and leaves

The Old House, Hereford.

the rest in strong light, the introduction of a neighbouring tree, an unusual angle of view, these interests may all be left unrealized in the eager desire just to obtain a sketch of the subject.

The illustrations play a particularly important part, as they exactly typify each point in the thesis of the book. They are chosen from the works of great masters from Rembrandt to Orpen, and include a long and varied list of world-famous artists.

Mr. Salwey has added a useful section on materials which should prove invaluable to the amateur. M. G.

THE SPECIFICATION WRITER

Daylight Illumination: Data Available

By JOHN W. T. WALSH, M.A., D.SC.

IT was, until recently, a frequent lament of the illuminating engineer that the architect did not pay sufficient attention to the problems of artificial lighting and that it was only in the final stages of construction, when no material modification of design could be made, that the lighting expert was called in to do his best with a practically completed building.

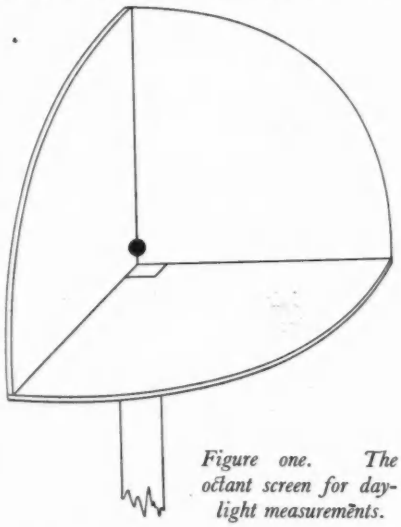
It might not have been an altogether irrelevant retort of the architect that, while it was true that the artificial lighting of a building was important, the admission of daylight in adequate amount and suitably distributed was even more important and that this was a subject which 99 per cent. of illuminating engineers completely ignored.

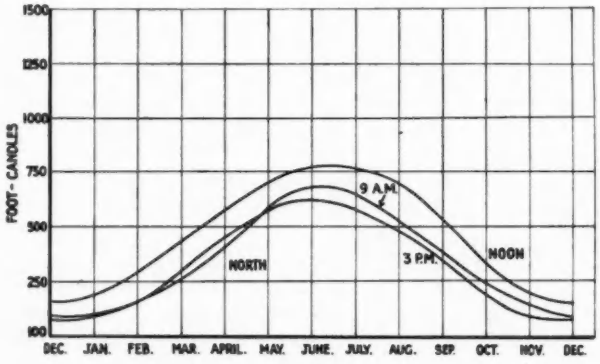
It is, however, significant that both complaints have far less justification today than they had some ten or even five years ago. Many architects are now paying a great deal of attention to lighting problems, and frequently consult the illuminating engineer at an early stage in the design of an important building. On the other side, illuminating engineers are gradually coming to a general realization of the importance of studying the problems of natural lighting.

The National Illumination Committee of Great Britain has a sub-committee for studying the problems of natural lighting and, similarly, the Illumination Research Committee of the Department of Scientific and Industrial Research, through one of its sub-committees, has initiated several researches on matters of great interest to architects. These researches are, for the most part, being conducted at the National Physical Laboratory at Teddington and the results obtained are published from time to time either as "Technical Papers" of the Committee, in the pages of the technical press, or in the Annual Report of the National Physical Laboratory. It is intended here to describe some of the work that has already been completed and to summarize briefly the results.

DIURNAL AND SEASONAL VARIATIONS

It is clearly a first necessity in any study of the natural lighting of buildings that there should be adequate data as to the amount of daylight available, on the average, at any given time of day in any particular period of the year. With the object of providing data of this kind, daily measurements of daylight illumination have been made at Teddington during the past five years. These measurements have been made thrice daily, viz., at 9 a.m., 12 noon and 3 p.m. (G.M.T.), and curves showing the averages for each month have been published. In order to take the element of aspect into account, the readings have not been taken on an open surface exposed to the whole of the celestial hemisphere, but the surface receiving the daylight has been placed in the corner of an octant, as shown in figure one. This octant is capable of rotation about a vertical axis and measurements have been made with the octant facing in turn each of the cardinal points (true, not magnetic). Thus the measurements made in each year have provided twelve curves. From the published results, the twelve curves of figures two to five have been drawn to show the mean variation throughout the year of the illumination due to each of the four octants of sky at each of the three times of day mentioned above. These curves show only the light received from the sky, as the card was always shielded from direct sunlight.





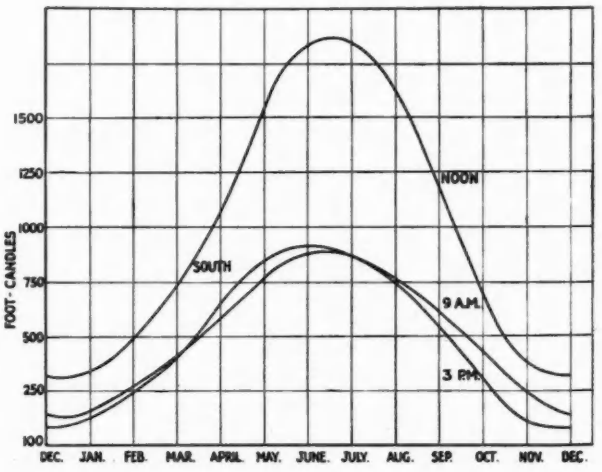


Figure one. The octant screen for daylight measurements.

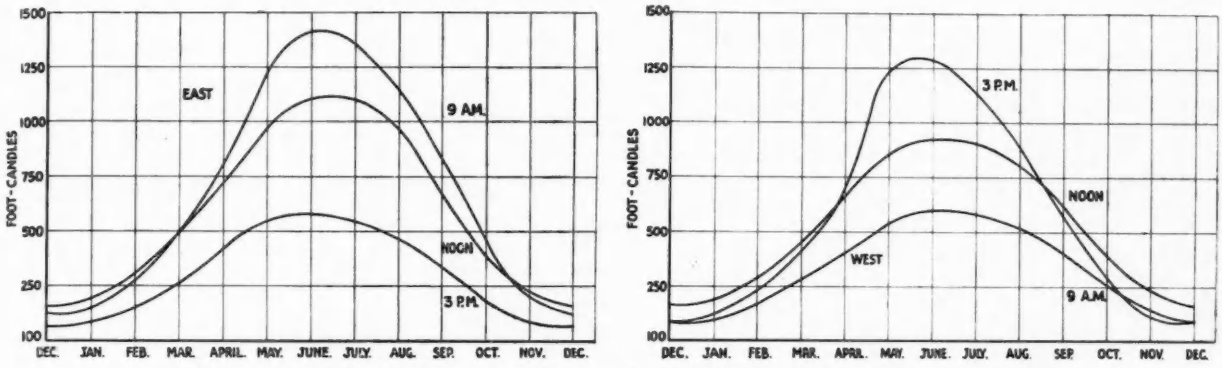
The illumination of a surface exposed to a quarter-sphere of sky facing, say, N.W., can be obtained at once by adding the ordinates of the curves (i.e. the lengths of the perpendiculars from the curves to the base-lines) for north and for west. For a quarter-sphere facing west it is probably sufficiently accurate to add to the ordinates of the curve for the west octant half the sum of the ordinates of the curves for the north and south octants. Alternatively, the ordinates of the curve for the west octant may be doubled. It will be found that the results obtained by the two methods do not, in general, differ very greatly.



The illumination of a surface exposed to the complete hemisphere of sky is, of course, obtained by adding the ordinates of all four curves, for the appropriate time of day.

Although a good deal of information can be obtained from the curves of figures two to five, it is sometimes

Figures two and three. Annual curves of average daylight, at three times of day, obtained by exposing a surface in an octant screen with aspects to the north and south skies respectively.

Figures four and five. Annual curves of average daylight, for east and west aspects respectively.

desirable to have more complete knowledge of the variation of daylight throughout the period from before sunrise until after sunset. Measurements at three times in the day are scarcely sufficient, and it is for this reason that attempts are being made to develop apparatus which will automatically record the daylight illumination and so give a complete chart of the variation throughout each day. Such apparatus must depend on the use of a light-sensitive device such as a photo-electric cell. These cells have been used for the purpose of obtaining daylight records in America for some years and a recorder based on their use is now being developed at Teddington. A typical record for an average day is shown in figure six. On a dull day the record is, naturally, much more steady, while on a bright day, with white clouds on a clear sky, it is much more irregular than that shown.

WINDOW-GLASS TRANSMISSION

It is generally assumed that the loss of light by absorption in ordinary window glass of good quality is negligible if the glass be kept in a reasonable state of cleanliness. This, however, is scarcely true when, as in many practical cases, the window is much obstructed, so that the greater part of the light reaches the window obliquely. For light incident normally, it is true, about 90 per cent. of the incident light is transmitted, but careful measurements have shown[1] that when all the light is incident at angles of 45° or more, the transmission factor drops to about 77 per cent. for ¼-inch plate. Measurements made at the same time on other types of glass showed transmission factors ranging from about 83 per cent. to 34 per cent. Rough rolled glass transmitted 82 per cent. of normally incident light and 67·5 per cent. of light incident at 45° and over. Corresponding figures for Hartley's rolled were 70 and 53 per cent. or 81 and 40 per cent., depending upon whether the light was incident on the smooth or the fluted surfaces of the glass. Wired rolled glass gave transmission factors of 67 and 53 per cent. under the same conditions as to incidence of the light, while prismatic glasses of various types gave values ranging between 82 and 46 per cent. It should, perhaps, be remarked here that these percentages refer to the total amount of light transmitted through the sample of glass, without reference to its distribution. The principal object of prismatic glasses is, of course, to increase the amount of light reaching parts of the interior of a building.

It is not unnatural to suppose that glasses differ in their capacity for holding dirt and that therefore their transmission factors will fall at different rates if they are allowed to go uncleaned for lengthy periods in a city atmosphere. Some tests are now in progress on this matter, a number of samples of glasses being exposed at Westminster and measured periodically. The measurements have not yet been continued for sufficiently long to allow of publication of the results.

(To be continued)

[1] *The Transmission of Commercial Window Glass*, by C. J. W. Grieveson. Technical Paper No. 2 of the Illumination Research Committee, D.S.I.R.

A BRITISH Standard Specification (No. 398–1930) has been issued, classifying the characteristics of internal light fittings. It first defines the polar curve of light distribution, the solid of light distribution, and symmetrical and asymmetrical light distributions. Symmetrical light distributions, whose axes are regarded as vertical, are then classified (specific definitions being given). The "frame ratio" is used to define various classes of light distribution. (28 Victoria Street, London, S.W.1. Price, 2s. 2d., post free.)

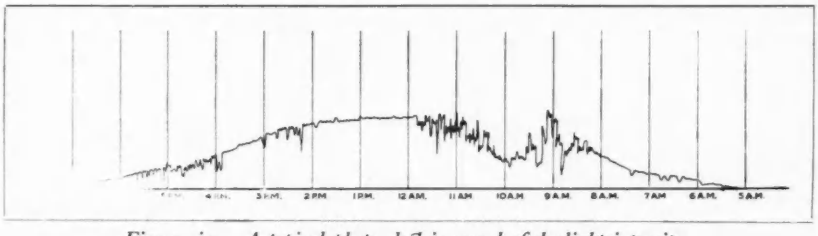


Figure six. A typical photo-electric record of daylight intensity.

IN view of the considerable interest shown of late in the effect of the ultra-violet rays of sunlight upon the human body and in the consequent introduction of window glasses that transmit them, investigations have been undertaken into the whole subject. The physical factors which bear on the physiologically active radiation of sunlight are briefly considered and the development and properties of ultra-violet transmitting window glasses are discussed in Bulletin No. 8 of the Building Research Station (H.M. Stationery Office, price 4d.). After a theoretical examination of the intensity distribution of ultra-violet radiation in a room glazed with special glass, the conditions under which this glass may be used with greatest effect are indicated. The final conclusion at which the report arrives is that, leaving out of account buildings designed specifically for sun treatment, although ultra-violet glass in large unobstructed windows can admit therapeutic radiation in appreciable quantities, to receive this radiation it is essential to sit near a window or in the direct rays of the sun. Glass seems to be available commercially which may be expected to transmit fully half the therapeutic rays falling on it.

QUESTIONS THAT ARISE

Gable Ends

H. O. S. writes: "*What is your expert's opinion on the following two questions: (a) What is the best method of finishing the gable ends of a pantile roof? One end shows the upward end of the pantile and the other the downward one. Can they be made to match? (b) Quite a number of old cottages have a little gable at the ends of hipped roofs, which is sometimes filled in with wood louvres. I am interested to know whether this is done for ornament, or as a means of ventilating the roof timbers.*"

With regard to question (*a*) I consider that the best finish to gable ends is with a parapet in the Flemish manner, either in the form of a stepped gable, or following the pitch of the roof and rounded at the apex.

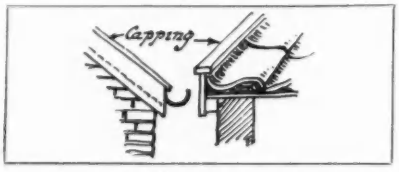

Figure one.

A much cheaper method, often used, is where the gable is finished with a barge board on an external rafter, nailed to the face of the wall; a capping is placed at the top to cover the tile, as shown in the accompanying figure one. For many interesting points on pantiling, I should advise your correspondent to consult *Little Things That Matter*, by Edwin Gunn, published by the Architectural Press.

(*b*) In the older work the gable noticed by your correspondent is a constructional device whereby the builders avoided a complicated joint at the head of the hip rafters as shown in figure two. A large number of these

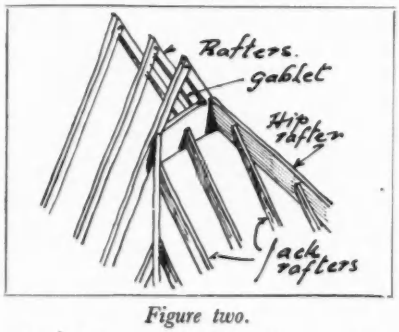

Figure two.

old roofs were built without ridge pieces, the rafters being halved and pegged together, and the gablet provided a workmanlike job. Mr. Gunn, in his book, *Little Things That Matter*, suggests the gablet should be used in modern work.

It was at times left open as a means of ventilation, but this was not the origin of the feature. W. H. C.

Heather Thatching

E. R. writes: "*I have received the order to re-thatch a small summer-house with heather, and shall be glad if you will let me know where heather is obtainable for this purpose.*"

Heather for thatching can be obtained from Messrs. Inman & Co., Rustic Works, Stretford, Manchester.

Except in the north of England and Scotland, where it is still occasionally used for ordinary purposes, heather thatching is almost restricted to summer-houses, pavilions, bird-tables, and so forth. It is not a difficult craft, bundles of heather, lapped somewhat similarly to slates or tiles, being bound with stout tarred twine to battens or rafters in such fashion that each succeeding bundle covers the tying of those beneath. The eaves courses should be well tilted and packed hard and solid, the soffit being well trimmed off to a slightly undercut line with stout shears after the roof is finished.

E. G.

Errors in Bills of Quantities

"Snod" writes: "*The reply given by 'H. S.' to the query regarding errors in bills of quantities* (September 17 issue) *appears to me to be an absolute reversal of the true position. By the statement in the query, 'based on bills of quantities,' I presume it is intended that the contract is a 'lump sum contract where bills of quantities form part of the contract.'*

"*Just as the builder contracts to 'carry out certain building works for a stated lump sum,' so does he, in the instance given, contract to carry out 100 feet lineal of some work for £7 10s. Any variation made in quantity when the work is executed must be paid for at £7 10s. + 100 per foot lineal = 1s. 6d.*

"*If the 15s. per lineal foot is a reasonable price for the work, it is a very unfortunate position for the builder, but he must bear the loss incurred by his own errors, unless the building-owner agrees to pay the extra when the circumstances are explained to him.*

"*If the rate per unit (i.e. 15s.) formed the contract it would be a different type of contract, viz., 'a schedule contract' in which the rates per unit would be scrutinized by the quantity surveyor and extensions carefully checked, and if the error was not then brought to light the builder would have a claim against the building-owner owing to neglect on the part of his agent.*

"*It is quite possible that the builder would not have secured the contract, in the instance mentioned, if he had extended the item correctly, and if the claim were allowable we should find the error 'made on purpose' and lump sum tenders would then be useless, as there would be no guarantee of the lump sums indicating the comparative prices of the builders tendering.*"

If "M. G.," in his query on errors in bills of quantities (September 17 issue) means that quantities form part of the contract, then I agree with "Snod," that strictly under this agreement any variation made in quantity must be paid for as he suggests.

There is now a growing tendency for the quantity surveyor to check the extensions of the lowest tender and report any errors to the architect for adjustment before the contract is signed, even when quantities form part of the contract. If this is done, no errors will have to be dealt with in the final settlement. H. S.

Party Walls

P. L. T. writes: "*I own the middle of three adjacent plots. Am I correct in claiming the right to allow the footings of the party walls I am about to erect to project on to the plots to either side?*"

With regard to buildings in the London area, the reply is covered by a digest of the procedure under the London Building Act, 1894. A building owner desirous of erecting a party wall must give notice to the adjoining owner, describing the proposed wall. With the consent of the adjoining owner, a party wall may be built half on the land of each, or as agreed; the expense to be shared in proportion to the use which may be made of the wall by the respective owners.

Where the owner proceeds to build an external wall on his own land, as in the case of the querist, he shall have the right, at his own expense, at any time after the expiration of one month from the service of a notice (under section 87 of the London Building Act, 1894) on the adjoining owner, to place on the land of the adjoining owner, below the level of the lowest floor, the projecting footings of the external wall, with concrete or other solid substructure thereunder, making compensation to the adjoining owner or occupier for any damage occasioned thereby.

Where any difference arises between a building-owner and an adjoining owner in respect of any matter arising with reference to any work to which any notice given under this Act relates, unless both parties concur in the appointment of one surveyor, they shall each appoint a surveyor, and the two surveyors so appointed shall select a third surveyor, and such one surveyor or three surveyors, or any two of them, shall settle any matter from time to time during the continuance of any work to which the notice relates.

A. T. A.

FURNITURE DESIGN

THE Autumn Exhibition of Furniture and other household articles designed by Frank Brangwyn, R.A., and organized by Messrs. E. Pollard and Co., Ltd., supplies a long-felt need.

Here we are provided with ample proof that furniture can be designed by an artist without the sacrifice of comfort and convenience and that additional expense usually entailed by the provision of something unique or æsthetic. As a matter of fact, "æsthetic" is a term Mr. Brangwyn somewhat eschews. He is eminently practical-minded, and his approach to his work is rather that of a workman tackling the various technicalities of his job from a common-sense standpoint.

His furniture is made for use, and its beauty of contour and proportion and embellishment is particularly derived from its inherent fitness of purpose and a regard for the nature of the material itself. The chairs have an amplitude implying comfort; likewise, with close attention to technical efficiency, the drawers of the cabinets open with swift and flowing motion.

Ornamentation is chiefly of contrasting inlay as exemplified by cabinet (No. 5977), a typical example in which the grain of the wood is utilized in a colourful manner; an otherwise unbroken space is relieved by a simple rectilinear design with an ornamented hinge to form a pleasing adjunct, e.g. china cabinet (No. 220). This is a unique specimen, displaying Brangwyn's ingenuity and attention to minutest detail even to the design of the cup hangers themselves. Nowhere are we confronted with ornate carving to harbour dust, nor applied to meaningless accessories merely to demonstrate the artist's fancy.

The keynote of Brangwyn's designs is his directness of association between the materials employed and the object to be served. It is this contact with concrete facts which enables him to tackle the problem of the machine and leave the beaten tracks of the "arti-handi-crafts" which, however estimable the intention, have done much to distort the mind of the average person as to the value of art in conjunction with things of practical service.

Sir John Lavery, R.A., LL.D., in a speech before opening the exhibition, said he was told that in nearly all industries where design and colour were required they, in Great Britain, were heavily handicapped in competing with foreign production because of the want of encouragement given to science and art students when they left the schools, and also because the student himself believed that the designing of things in everyday use required a lower order of intelligence than the painting of a picture, and to be associated, however indirectly, with commerce was disastrous to art. It was high time that the myth should disappear.

G. R.

LAW REPORT

QUESTION OF RESERVATION OF MINERALS

Dunn v. *Purdon. Chancery Division. Before Mr. Justice Luxmoore*

THIS action concerned a dispute as to the purchase of land and a bungalow in Yorkshire, and one of the points raised was as to the minerals under the land. Plaintiffs, Mr. and Mrs. Dunn, sued for specific performance of a contract to purchase for £1,900 a bungalow and thirty acres of land, and set up a contract, contained, it was alleged, in certain letters.

Defendant denied that the letters set up any contract, and said if they did disclose a contract it was to be construed as the sale of an unencumbered fee simple in possession and that the plaintiffs could not convey the whole of the fee unencumbered, because they did not own the minerals as the property was subject to a colliery lease.

Plaintiffs, in their reply, said that was quite true. They admitted that there were defects in the title regarding the mineral rights, but they pleaded that the defendant had full prior notice of it.

Mr. Morton, K.C., for the plaintiffs, called Mr. Dunn, who said the defendant had full knowledge of the restrictions concerning the minerals. When the defendant broke off negotiations the reason he gave was that the mineral restrictions were too onerous.

Mr. Spens, K.C., appeared for the defendant, who gave evidence and denied plaintiffs' allegations, saying he did not know of the existence of the mining lease until he took the draft contract to his solicitor.

His lordship dismissed the action with costs, saying it was clear from the correspondence that there was an open contract for the sale of the bungalow and the land. The question that arose upon that was whether the land was sold subject to the reservation as to the minerals and the colliery lease. Plaintiffs' letter to the defendant made it clear that there were some mineral reservations, but there was no reference to a lease. Defendant had stated that he read the letter, but he did not examine the contract, sending it back with the intimation that the sale could not go through. If the defendant had read the contract he would have seen that the land would be sold subject to the reservation of the minerals. To succeed the plaintiffs must show that the defendant knew what was in the contract. To his lordship's mind it had not been established that the defendant knew of the lease to the colliery company of about nineteen acres of the land, and with regard to the remaining eleven acres he knew neither of the reservation of the minerals nor of the lease. Under these circumstances he could not enforce specific performance on an unwilling purchaser.

Dresser in ash, with cupboards and three drawers below. The cupboard front is of marquetry, introducing Circassian ash. An exhibit in the Brangwyn–Pollard Exhibition.

R.I.B.A. FINAL EXAMINATIONS

Alternative Problems in Design

FOLLOWING is a list of R.I.B.A. problems in design for the year ending December 31, 1931. Additional copies of the list may be obtained on application at the R.I.B.A. :

1. The drawings, which should preferably be on uniform sheets of paper of not less than Imperial size, must be sent to the Secretary of the Board of Architectural Education, R.I.B.A., 9 Conduit Street, W.1, on or before the dates specified below.

2. Each set of drawings must be signed by the author, and his full name and address, and the name of the school, if any, in which the drawings have been prepared, must be attached thereto.

3. All designs, whether done in a school or not, must be accompanied by a declaration from the student that the design is his own work, and that the drawings have been wholly executed by him. In the preparation of the design the student may profit by advice.

4. Drawings for subjects *a* are to have the shadows projected at an angle of 45° in line, monochrome, or colour. Drawings in subjects *b* are to be finished as working drawings. Lettering on all drawings must be of a clear, scholarly, and unaffected character.

5. After a design has been approved it may be re-submitted together with the specified working drawings on *any* of the dates for submission of drawings given below.

6. All candidates taking the Final Examination in 1932 and subsequent years will be required to include in the four Testimonies of Study for which they must secure approval before being admitted to the Examination, one out of the two subjects set annually as R.I.B.A. Problems in Design involving a simple acoustic treatment with calculations to give the appropriate time of reverberation. The two subjects set for 1931 which may be treated acoustically are Problems Nos. CXVIII and CXXI. A list of articles and books on the subject to guide candidates in obtaining the necessary information may be obtained free on application to the Secretary, R.I.B.A.

CXV.—*b :* Working drawings for Subject No. CXIII *a. A Housing Scheme in the North-West London Area.*—The design for a first pair or group of cottages along the Estate Road on the south-east side of that road may, after it has been approved, be re-submitted with complete working drawings to the scale of 8 ft. to 1 in., with detail elevations facing the two roads to the scale of half-inch to 1 ft.

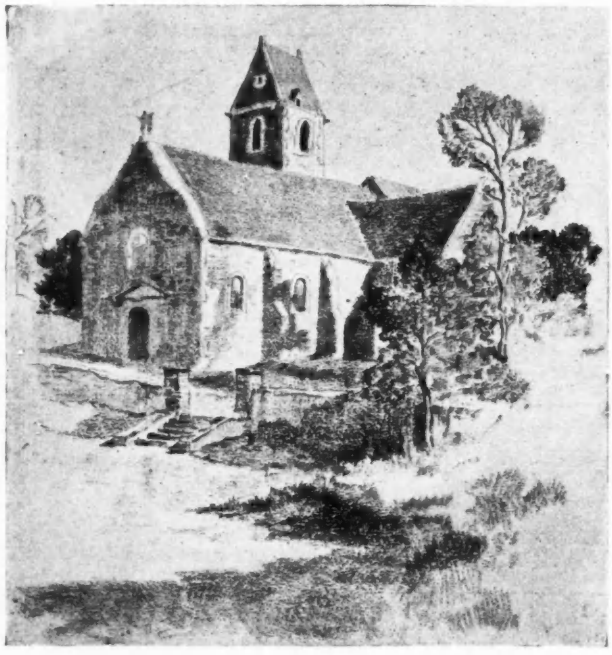
CXVI.—*b :* Working drawings for Subject No. CXIV *a. A Secondary School for about 200 Boys.*—The design may, after it has been approved, be re-submitted with half-inch details of a portion of the front, including the main entrance, and full-size details.

CXVII.—*a : A design for a Shopping Arcade.*—To be erected on an island site, measuring 250 ft. by 150 ft., with streets on all sides, in the shopping district of a large town which is to be developed as a shopping arcade. A pavement will surround the entire site, towards which shops may face, as well as on to an arcade or arcades, which latter may suitably be top-lighted. It may be assumed that the demand will be mainly for small shops, although it should be possible for one shop to occupy several bays or sections if desired. Ample show space should be provided, with storage either in basements or on first floors or galleries. Small office accommodation for use with the shops should be provided, but independent office accommodation over the shops is not required. The arcades will be open at night and artificially lighted. Facility of police supervision should, therefore, be considered. The scheme should also provide the following : Lavatories and rest room for both sexes for shop assistants; small office for superintendent and letting agent; heating chamber; provision for collection and disposal of refuse.

Drawings required : Plan of all floors to one-sixteenth-inch scale. Two street elevations to one-sixteenth-inch scale. Sufficient sections to show the design generally, and particularly the arcades, to one-sixteenth-inch scale. Detail of one bay of street elevation and one bay of arcade to half-inch scale.

The design for the shopping arcade may, after it has been approved, be re-submitted with the addition of working drawings showing the ground-floor plan and longitudinal and cross-sections through arcade to one-eighth-inch scale.

CXVIII. — In accordance with instruction to candidates number 6 (above), section *a* of Problem in Design No. CXVIII may be treated acoustically. *a : A design for a Pump Room.* At a Spa such as Bath or Leamington it is proposed to erect a pump room in which the medicinal waters can be taken. The road frontage is 200 ft.; the site is of considerable depth and gives access to public gardens. The buildings are to be placed in close proximity to the road, with a layout of terraces, etc., towards the public gardens. The ground has a slope of 1 ft. in 5 ft. down from the roadway. A large hall must be provided, about 4,000 sq. ft. —this to include space for the medicinal spring or fountain, a band platform, recesses, colonnades, or other architectural features. Particular attention should be paid to the provision of good natural lighting and a view over the terraces and gardens, to which latter there should be easy access. The following additional accommodation will be required : Reading room, writing room, small service room, staff rooms and bandroom, and cloakrooms and lavatories.



Drawings required : One-sixteenth-inch scale layout plan showing buildings and immediate surroundings. Plan, cross-section and elevations of entrance and garden frontages, all to one-eighth-inch scale. Half-inch detail of the fountain. *b :* The design for a pump room may, after it has been approved, be re-submitted with the addition of a half-inch cross-section through the building showing the roof construction, together with one-eighth-inch scale working drawings.

CXIX.—*a : A design for a Branch Bank on a corner site,* to be built on a level corner site at a junction of a main and a side road. The site has a fifty feet frontage to the main road, and a ninety feet frontage to the side road, part of which may be left open as a garden. The accommodation required is : Banking hall (approximately fifteen clerks); shop to main road, and so arranged that it can be taken into banking hall at a later date; manager's room and waiting room; stairs and lift to strong room in basement; male and female lavatories, two or three average size flats above Bank with entrance from side street.

Drawings required : Plans, sections and elevations to scale of one-eighth-inch to a foot. Section through the banking hall, showing fittings, to scale of half-inch to a foot. *b :* The design for a branch bank on a corner site may, after it has been approved, be re-submitted with the addition of working drawings of the main front with plans and sections of front to a scale of half-inch to a foot, with a sheet of full-size details.

CXX.—*a : A design for a Housing Scheme.* On the north bank of a tidal river in Essex lies a level site having a river frontage of 100 yards; depth from the river, 242 yards. The western boundary is formed by an existing road at right angles to the river, with a few shops on its west side. The eastern boundary is the dock wall, which is diagonal to the river. The length of the north boundary of the site is 300 yards. There is an embankment road on the south side of the site, terminating in the dock gates at the south-east corner of the site. It is desired to build on this piece of land twenty two-bedroom flats, with a floor area of about 600 feet super each; ten three-bedroom parlour-type houses, with a floor area of 920 feet super each; twenty three-bedroom non-parlour houses, floor area 820 super feet each.

Drawings required : Complete layout with roads, paths, gardens, etc., showing all buildings to a scale of one upon five hundred; elevation of south and west sides of complete scheme to a scale of sixteen feet to the inch. Plan of one

Sketch in coloured chalks. By Jasper Salwey. (*See book review on pages 590–1*).

[*From* The Art and Practice of Sketching.]

floor of the flats. Plans and two elevations of one cottage to a scale of eight feet to the inch. The design may, after it has been approved, be re-submitted with the addition of a working drawing to half-inch scale, showing one complete section and two elevations of a block of the flats.

CXXI.—In accordance with Instruction to Candidates number 6 (above), Section *a* of Problem in Design No. CXXI may be treated acoustically. *a: A design for Offices for an Association of Manufacturers.* A group of important foreign industrial concerns have secured a corner site in London for their use as a common meeting place, and also to provide accommodation for their Chairman when in town. The site is level and rectangular, having a frontage of sixty feet to a main street and eighty feet to a side street. Accommodation required: Top-lighted conference room, to accommodate fifty people, with raised dais at one end; area about 800 square feet; retiring room to accommodate six people, with private external entrance; committee room; waiting room; entrance hall; staircase and lifts; lavatories and cloakrooms; chairman's sitting-room, with servery adjoining, bedroom, etc.; bathroom; general and two private offices; caretaker's living room, two bedrooms, and bathroom, with kitchen in touch with the servery, but not necessarily on the same floor.

Drawings required: Plans of each floor, two elevations and one section, to eighth-inch scale, and a detail of a small portion of the building to half-inch scale. The design for Offices for an Association of Manufacturers may, after it has been approved, be re-submitted with the addition of working drawings of the front and of the roof over the conference room to half-inch scale, with a sheet of full-size details.

CXXII.—*a: A design for an Entrance to a Botanical Gardens.* A new main entrance to a Botanical Gardens is to be formed on a by-pass road. The gates should be well set back from the roadway. Turnstile entrances for pedestrians, and also entrances and exits for carriages must be provided; due regard must be paid to persons and carriages entering and leaving the grounds. An office for attendants, small shop for the sale of postcards and guides, and cloakrooms are to be incorporated in the entrance design.

Drawings required: Plans, elevations and sections, scale eighth-inch to one foot. A portion of this scheme to be detailed to half-inch. The design may, after it has been approved, be re-submitted with the addition of complete eighth-inch scale working drawings and such half-inch details as would be required by the builder.

Dates for the Submission of Designs in 1931: Subject CXVII, February 27; Subject CXVIII, April 30; Subject CXIX, June 30; Subject CXX, August 31; Subject CXXI, October 30; Subject CXXII, December 31.

SOCIETIES AND INSTITUTIONS

R.I.B.A. EXAMINATIONS

The forthcoming final and special examinations will be held on the following dates:

Final Examination: December 3, 4, 5, 6, 8, 9, 10 and 11, 1930 (last day for receiving applications: November 3, 1930).

Special Examination: December 3, 4, 5, 6, 8 and 9, 1930 (last day for receiving applications: November 3, 1930).

SUFFOLK ARCHITECTS

On Saturday afternoon, October 4, about thirty members and friends of the Suffolk Society of Architects visited Orford Castle, and were conducted over the castle by Mr. H. Munro Cautley, A.R.I.B.A., who was the architect for the recent restorations carried out there. Before proceeding inside, Mr. Cautley gave a brief outline of the history of the castle, which was built in 1173-78.

The outstanding features about this castle are the remarkable state of preservation of the keep, which is all that remains, and the fact that here is found the first attempt, in a building of this kind, to provide sanitary conveniences. Latrines exist in several apartments, and there are sinks installed in the kitchens. It is probable that the whole castle was at one time surrounded by a wall, a portion of which has been revealed by excavation, and a moat.

The walls of the keep are built of a stone which has now definitely been proved to have been taken from a quarry near Ancaster, and Septuria, which was obtained locally, and is found in many churches throughout Suffolk. This is rather badly weathered. Caen stone has also been used inside.

The visitors spent two hours looking over the castle.

CHELMSFORD ARCHITECTS VISIT BURNHAM

About forty members of the Chelmsford Chapter of the Essex, Cambs. and Herts. Society of Architects, accompanied by lady friends, recently visited the Mildmay Ironworks of Messrs. Booth and Brookes, Ltd., and were shown over the works, being much interested in the various processes in connection with the manufacture of piano frames. Special interest was taken in a new window sill which the company have patented. The visitors lunched at the Royal Burnham Yacht Club. The party afterwards went to Creeksea Place, travelling up the river to Creeksea by motor boat.

THE MEDIÆVAL CATHEDRAL

Sir Banister Fletcher, P.R.I.B.A., F.S.A., at the Central School of Arts and Crafts on Wednesday last, lectured on the origin and design of the mediæval cathedral.

The cathedral church, he explained, was gradually evolved from earlier building types through successive periods, and was enlarged and enriched as the ritual needs and devotional spirit grew. The plan may have been derived from several sources in remote pagan days. He described the chief features of the cathedrals of Western Europe, more especially of France and England, and concluded by giving some vivid glimpses, by means of lantern slides, of typical home and Continental cathedrals.

TOWN PLANNING

The annual country meeting of the Town Planning Institute was held recently at Leicester. Mr. Pritchard, the town clerk of Leicester, in a paper read at the opening session, traced the history of Leicester from pre-Roman days down the ages to the present time, and dwelt especially on the centuries when the history of England centred very much in this part of the country. Mr. A. T. Gooseman, the city engineer and surveyor, also gave an interesting address on the various developments and town-planning improvements taking place at present in Leicester and the environs.

From This England.] [*By F. J. Gould.*

A Sussex mill and shepherd. (*See Book Review on page 590.*)

His paper dealt with the difficulty of coming to a mutually satisfactory financial arrangement with the adjoining authorities, concerned in a joint town-planning scheme. Secondly, it gave the experience gained in the carrying out of a scheme under the powers conferred by the Interim Development Order, which he thought would illustrate that, even with these limited powers, town planning had justified itself, and finally, that the Leicester new street and widening scheme in the centre of the city would clearly show the economic advantages of town planning as compared with the great expense involved in widening streets in built-up areas.

SOUTHEND SCHOOL OF ARTS AND CRAFTS

The School of Arts and Crafts, Southend-on-Sea, has now entered upon its fifth year as a recognized school of the R.I.B.A. up to the Intermediate stage, and although in close proximity to the metropolis still continues to form an efficient training centre for the future architect and allied craftsman.

In addition to the three-year certificate course in architecture, instruction is given in all sections of building craftsmanship, the syllabus being so arranged that there is a mutual interchange of students in all branches of the school activities. The need for a close acquaintance with the practical side of their craft for students taking the three-year course is fully recognized and provided for, instruction being given in brickwork, masonry, carpentry, joinery, plumbing, plasterwork and modelling—the practical work being closely linked up with exercises in the studio. The facilities for a grasp of essential æsthetic considerations are available for students taking special craft instruction, the syllabus being so drafted as to afford a comprehensive balance. Under an arrangement with the Board of Architectural Education it is now possible, in special cases, for a student of the Junior Art Department to proceed to the senior school.

Facilities for a comprehensive training and choice of courses in these and other subjects have been provided by the local authority, and the total number of students taking advantage of this programme, both day and evening, is on the increase, the total enrolled last session being 1,451.

A certain number of entrance and other scholarships are available for promising students, and close contact is preserved with employers.

Particulars of courses and fees can be obtained either from the Education Offices, Warrior Square, Southend, or from the School.

OBITUARY

ALFRED E. PAINTER : 1875-1930

We regret to record the death of Mr. Alfred Eaton Painter, L.R.I.B.A., of Wolverhampton, after a long illness.

He was articled to John Weller, of Wolverhampton, and commenced private practice in that town in 1899. He was responsible for the design of many buildings in the district, including the Women's Hospital, the Scala Cinema, Prestwood Sanatorium, Kinver; The Limes Sanatorium, Himley; and St. Paul's Sunday schools, now in course of erection.

For over twenty-three years he was a member of the Wolverhampton Town Council, and at one time senior councillor. Mr. Painter was fifty-five years of age.

P. F. CRINKS : 1879-1930

We regret to record the sudden death of Mr. P. F. Crinks, a well-known member of the electrical profession. Mr. Crinks was a pupil of Mr. H. Faraday Proctor, and later held several appointments on the engineering staff of the Bristol Corporation Electricity Department. He joined the British Westinghouse Electric and Manufacturing Company in 1910, and for several years represented them in the Western Circuit. After being transferred to the London office of this company, he was appointed London sales manager for Metropolitan-Vickers Electrical Company and later managing director of Metro-Vick Supplies, Ltd. He was a prominent member of the E.L.M.A. and E.D.A. Councils. Mr. Crinks was fifty-one years of age.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

New Science Workshops, Christ's Hospital, Horsham (pages 572, 575-578). General contractors, Henry Norris and Son, Ltd. Quantity surveyors, Young and Brown. Stone carving, George Alexander. Electrical installation, W. J. Strand. Clerk of Works, F. H. Pendrey. Foreman of Works, J. Lemmon. Sub-contractors : Acme Flooring and Paving (1904) Co., Ltd., wood block flooring; Bromsgrove Guild, cast lead fountain and stone seats; A. Gallenkamp & Co., Ltd., laboratory gas and water taps; Durbin and Sons, plumbing and drainage; Empire Stone Co., Ltd., reconstructed stone; J. W. Gray and Son, Ltd., lightning conductors; G. N. Haden and Sons, Ltd., central heating; McDowell Steven, cast rainwater heads and downpipes; Roberts Adlard & Co., roof tiling; Sussex Brick Co., Southwater facing bricks; Smith Walker, Ltd., constructional steelwork; Siegwart Fireproof Floor Co., fireproof floors; Stuarts Granolithic Co., Ltd., granolithic stairs; Martin Van Straaten, wall tiling; C. E. Welstead, Ltd., casements and lead lights; William White, White's Hygeian rock composition; W. Bainbridge Reynolds, Ltd., vane, lanterns and wrought ironwork. The whole of the workshop benches and equipment have been made by the general contractors from designs by the architect in consultation with the Senior Science Master, Mr. D. H. Burleigh.

House at Littlestone-on-Sea, Kent (page 579). General contractors, Ellis Bros. Sub-contractors : Bratt Colbran & Co., grates; Crittall Manufacturing Co., Ltd., casements.

COMPETITIONS OPEN

October 20.—The Maternity and Child Welfare Committee of the City of Birmingham invites architects to submit competitive designs for two infant welfare centres, one at Warren Farm Road, Kingstanding (Perry Barr), and the other at Trittiford Road (Billesley). Competitors must have occupied offices in Birmingham as their head office for six months prior to July 19, 1930. Assessor : A. T. Butler, F.R.I.B.A. Premiums, £100 in respect of each centre. Conditions of competition and plans of the sites may be obtained on application to Herbert H. Humphries, M.INST.C.E., City Engineer and Surveyor, the Council House, Birmingham. Deposit £1 1s. for each centre. Latest date for submission of designs : October 20.

October 30.—The General Building Syndicate, Ltd., invites architects to submit competitive schemes for the development of a site at Liverpool, fronting St. John's Lane, Queen Square and Rose Street. Premiums : £250, £100 and £50, for first, second and third prizes, respectively. Particulars, etc., are obtainable on application to the Secretary, the General Building Syndicate, Ltd., 36 St. Martin's Lane, W.C.2. Latest date for submission of designs : October 30.

November 30.—The Burton-on-Trent Local Education Authority invites architects to submit competitive designs for a proposed new Council school to accommodate approximately 800 children, to be erected on a site in Clarence Street. Assessor : H. T. Buckland, F.R.I.B.A. Premiums : £150, £100 and £50 for the designs placed 1st, 2nd and 3rd, respectively. Applications for the conditions of the competition and site plan should have been made before September 8 to L. E. Burgess, Secretary and Director of Education, Education Offices, Guild Street, Burton-on-Trent. Latest date for submission of designs : November 30.

November 30.—The Guildford Cathedral Committee invites any architect, who has been engaged in the design of cathedrals or churches, to submit for examination drawings and other illustrations of his works; or a design for a cathedral. Not more than three sets of drawings may be submitted, packed in one large portfolio. The Committee, with the assistance of Mr. Walter Tapper, A.R.A., will examine the portfolios, and select a limited number of architects for the Final Competition. Each architect selected for the final competition will receive 500 guineas, whether his design is accepted or not. Portfolios should be addressed to The Venerable the Archdeacon of Surrey, The Diocesan Office, Lloyds Bank Chambers, Guildford, not later than November 30.

December 25.—A prospectus giving full particulars of the international competition for the Ukrainian State Theatre, organized by the Kharkov Town Council, Russia, has recently been issued. The theatre is to be erected in the centre of Kharkov, on the site of the present Comsomolsky Square (Young

Communist Square), and will contain a mass musical stage, and seating capacity for 4,000 persons. The competition will be assessed by a jury comprising a president, vice-president and fifty-six members. Prizes: 1st, 10,000 rub.; 2nd, 8,000 rub.; 3rd, 6,000 rub.; 4th, 5,000 rub.; 5th, 4,000 rub.; 6th, 3,000 rub.; 7th, 8th and 9th, 2,000 rub.; 10th, 11th, 12th, 1,500 rub. Drawings should be sent to the Kharkov Town Council on or before December 25. Copies of the prospectus are obtainable from the Embassy of the Union of Soviet Socialist Republics, Harrington House, 13 Kensington Palace Gardens, London, W.8.

December 31.—The Incorporated Association of Architects and Surveyors invites competitive designs for a Model Petrol Filling and Service Depot. The competition has the full support of the Automobile Association, the Scapa Society and other bodies which have at heart the preservation of the countryside, as well as the principal motor-trade journals. Assessors: Alfred Stephens Cross, M.A. (CANTAB.), V-P., I.A.A.S.; Edward H. Fryer, Deputy Secretary of the Automobile Association; and Walter Groves, Editor of *The Motor*. Prizes: 50 guineas, 20 guineas and 10 guineas for first, second and third places, respectively. Smaller awards may also be made on the advice of the assessors, and at the discretion of the Council of the Association. In addition a prize of 10 guineas and two prizes of 5 guineas each will be awarded to laymen for the best suggestions submitted with or without sketches. Full particulars, etc., are obtainable from the Secretary, the Incorporated Association of Architects and Surveyors, 1 Wilbraham Place, London, S.W.1. Latest date for submission of designs: December 31, 1930.

February 1.—The Norwich Corporation invites architects practising in Norwich and in the County of Norfolk to submit competitive designs for a proposed new fire station to be erected on a site in Bethel Street, Norwich. Conditions of the competition are obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. Deposit, £1 1s. Latest date for submission of designs: February 1, 1931.

No date.—The Committee of the Foundation Hospital and the Rectorate of the Royal Yugoslavian University of Zagreb invites competitive designs for the general rebuilding plans of the Foundation and Clinic Hospital of Zagreb. Assessors: 1. Dr. Srkulj Stjepan, Burgomaster and Chairman of the Foundation, as president of the jury. 2. Henauer, W., architect, of Zurich (or his representative, Ch. Thevenaz, architect, of Lausanne), for the Swiss Engineers' Association of Germany. 3. Dr. Ing. Kreis Wilhelm, of Dresden, for the Engineers' Association of France. 4. Arch. Expert H.R., of Paris, for the Engineers' and Architects' Association of France. 5. Dr. Culumovic Pavao, Primarius, for the Medical Association of Zagreb. 6. Ing. Gabric Franjo, for the Yugoslavian Association of Engineers and Architects, Zagreb section. 7. Dr. Rasuhin Josip, deputy for the Directors of the Institute of Hygiene Foundation Hospital of Zagreb 8. Prof. Dr. Prasek Emil, for the medical faculty of Zagreb. 9. Dr. Durst Franjo, for the medical faculty of Zagreb. 10. Arch. Heinzel Vjekoslav, Alderman of the City of Zagreb. Committee representative of the jury: Ing. Jurkovic Mato, Stadtbaurat in Zagreb. Prizes: 1st, 20,000 Swiss francs; 2nd, 15,000 Swiss francs; 3rd, 10,000 Swiss francs. 15,000 Swiss francs have been set aside for any further work which may be required. Programme and particulars of the competition will be sent on or after August 15, 1930, on application to the Stadtvorstand of Zagreb (Mr. Matica, secretary), Room No. 70, 2nd floor, on payment of 200 dinar. Latest date for submission of designs: January 15, 1931.

THE ARCHITECTS' DIARY

WEDNESDAY, OCTOBER 15

R.I.B.A., 9 Conduit Street, W.1. Exhibition of drawings by students exempted from the R.I.B.A. Final Examination. Until October 20. 10 a.m. to 8 p.m. (Saturdays, 10 a.m. to 5 p.m.). Also Statutory Examinations for certificates of competency to act as district surveyor under the London Building Acts and building surveyor under local authorities. Until October 17. **10 a.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "The Character of Mediæval Architecture." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. First of three public lectures on "Danish Castles and Manor Houses." By J. H. Helweg. (Lantern Illustrations.) **5.30 p.m.**

HOUSING AND HEALTH EXHIBITION, Kelvin Hall, Glasgow. Until October 18. 10 a.m. to 10 p.m. **10 a.m.**

AUSTRALIAN TIMBER EXHIBITION. At Australia House, Strand, W.C.2. Exhibition will remain open until November 7.

THURSDAY, OCTOBER 16

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Yates Lectures. First of eight public lectures on "Greek Myths and their Representation in Art." By Professor E. A. Gardner. (Lantern Illustrations.) **5 p.m.**

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Visit to Cement Marketing Company's Laboratory, Portland House, Tothill Street, Westminster, S.W.1. (Party limited to 30.) **7 p.m.**

SATURDAY, OCTOBER 18

Sunrise, 6.27 a.m. Sunset, 5.2 p.m.

MONDAY, OCTOBER 20

R.I.B.A., 9 Conduit Street, W.1. Council Meeting. **4.30 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Public Lecture on "More Roman Towns in North Africa." By W. N. Neech, M.A. Chairman: Professor H. E. Butler, M.A. (Lantern Illustrations.) **5.30 p.m.**

BIRMINGHAM WELFARE CENTRES COMPETITION. Latest date for submission of designs.

TUESDAY, OCTOBER 21

SOUTH-EASTERN SOCIETY OF ARCHITECTS. Croydon Chapter. At the Free Library, Croydon. "Modern Conditions and their Influence on Architectural Design." By Hugh Macintosh, F.R.I.B.A.

MORLEY COLLEGE, Westminster Bridge Road, S.E.1. "Art." By Gui St. Bernard. **8 p.m.**

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to Cecil Sharp House, 2 Regent's Park Road, N.W.1. H. M. Fletcher, the architect, will describe the building. **8.30 p.m.**

WEDNESDAY, OCTOBER 22

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Italian Mediæval Architecture: The Romanesque Period in Italy." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Second of a course of three public lectures on "Danish Castles and Manor Houses." By J. H. Helweg. (Lantern Illustrations.) **5.30 p.m.**

INSTITUTE OF FUEL. Annual Conference to be held at the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, W.C.2, until October 23. Evening: Annual Dinner to be held at the Connaught Rooms, Great Queen Street, W.C.2, at 6.45 p.m.

THURSDAY, OCTOBER 23

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Literature Standing Committee.

SOUTH-EASTERN SOCIETY OF ARCHITECTS. Croydon Chapter. Dinner and Dance to be held at the Greyhound Hotel, Croydon. Tickets: 12s. 6d. single, 20s. double.

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Inaugural address by the President, C. C. Paterson, O.B.E. (Light Refreshments 5.30 p.m.). **6 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.2. Yates Lectures. Second of a course of eight public lectures on "Greek Myths and their Representation in Art." By Professor E. A. Gardner. (Lantern Illustrations.) **5 p.m.**

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Lecture by T. J. Clark, A.I.STRUCT.E., of the British Portland Cement Association. **7.30 p.m.**

FRIDAY, OCTOBER 24

R.I.B.A., 9 Conduit Street, W.1. Exhibition of drawings by students exempted from the R.I.B.A. Intermediate Examination. Until October 31. 10 a.m. to 8 p.m. (Saturdays, 10 a.m. to 5 p.m.).

SATURDAY, OCTOBER 25

Sunrise, 6.40 a.m. Sunset, 4.48 p.m.

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Visit to the works of Messrs. Johnson, Dartford. **2 p.m.**

TUESDAY, OCTOBER 28

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, S.W.1. "English Ironwork." By Edward Yates. **7 p.m.**

MORLEY COLLEGE, Westminster Bridge Road, S.E.1. "Architecture: the Citizen's Part." By Clough Williams-Ellis, F.R.I.B.A. **8 p.m.**

WEDNESDAY, OCTOBER 29

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Last of three public lectures on "Danish Castles and Manor Houses." By J. H. Helweg. (Lantern Illustrations.) **5.30 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Italian Mediæval Architecture: The Romanesque Period in North and South Italy." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

THURSDAY, OCTOBER 30

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Yates Lectures. Third of eight public lectures on "Greek Myths and their Representation in Art." By Professor A. E. Gardner. (Lantern Illustrations.) 5 p.m. First of five public lectures on "Re-plannings of London, *c.* 1520-1920." By Miss E. Jeffries Davis. 5.30 p.m. **5 p.m.**

BURTON-ON-TRENT COUNCIL SCHOOL COMPETITION. Latest date for submission of designs.

SATURDAY, NOVEMBER 1

Sunrise, 6.52 a.m. Sunset, 4.34 p.m.

HORNIMAN MUSEUM, Forest Hill, S.E.23. "London in the Stuart Age." By D. Martin Roberts, M.A. (Lantern Illustrations.) **3.30 p.m.**

MONDAY, NOVEMBER 3

R.I.B.A., 9 Conduit Street, W.1. Allied Societies Conference, 2 p.m. Meeting of the Board of Architectural Education, 2.30 p.m. Council Meeting, 4.30 p.m. Opening General Meeting; address by the President, Sir Banister Fletcher, P.R.I.B.A., F.S.A. 8.30 p.m. **2 p.m.**

TUESDAY, NOVEMBER 4

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Practice Standing Committee.

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Public lecture on "Egyptian Statues." By Miss M. A. Murray. (Lantern Illustrations.) **5.30 p.m.**

MORLEY COLLEGE, Westminster Bridge Road, S.E.1. "Industry." By Sir Walter Layton, C.H. **8 p.m.**

WEDNESDAY, NOVEMBER 5

R.I.B.A., 9 Conduit Street, W.1. Meetings of the Art Standing Committee and the Board of Architectural Education Examinations Committee.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Italian Mediæval Architecture: The Gothic Period in North Italy." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. At the Swedenborg Hall, 20 Hart Street, Bloomsbury, W.C.1. Sessional Meeting. "The Operation of the Heat Pump, and its Possible Applications to Heating Problems, particularly Swimming Bath Heating." By T. G. N. Haldane, M.A., A.M.I.E.E. **7 p.m.**

INSTITUTION OF SANITARY ENGINEERS. Annual Dinner to be held at the Holborn Restaurant, W.C. **7 p.m.**

THURSDAY, NOVEMBER 6

SOUTH-EASTERN SOCIETY OF ARCHITECTS. Brighton Chapter. At the Municipal School of Art, Brighton. "Modern Buildings." By Francis R. Yerbury. (Lantern Illustrations.)

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Yates Lecture. Fourth of a course of eight public lectures on "Greek Myths and their Representation in Art." By Professor A. E. Gardner. (Lantern Illustrations.) 5 p.m. Second of a course of five public lectures on "Re-plannings of London, *c.* 1520-1920." By Miss E. Jeffries Davis. 5.30 p.m. **5 p.m.**

VICTORIA AND ALBERT MUSEUM, Cromwell Road, South Kensington, S.W.7. Lecture Theatre. "English Mediæval Building: Its Sculpture and Painting." By Professor E. S. Prior (Lantern Illustrations.) **5.30 p.m.**

SATURDAY, NOVEMBER 8

Sunrise, 7.4 a.m. Sunset, 4.23 p.m.

MONDAY, NOVEMBER 10

SOCIETY OF MOTION PICTURE ENGINEERS. At the Royal Photographic Society, 35 Russell Square, W.C.1. "Sound Film Studio." By C. W. Glover, A.M.INST.C.E., M.I.STRUCT.E. **7.45 p.m.**

TUESDAY, NOVEMBER 11

MORLEY COLLEGE, Westminster Bridge Road, S.E.1. "Life and the Countryside." By J. W. Robertson Scott. **8 p.m.**

WEDNESDAY, NOVEMBER 12

SOUTH-EASTERN SOCIETY OF ARCHITECTS. Brighton Chapter. Smoking Concert, to be held at Booth's Restaurant, East Street, Brighton. Chairman: John L. Denman, F.R.I.B.A.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Italian Mediæval Architecture: The Gothic Period in Central and South Italy." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

ROYAL ACADEMY, Burlington House, W.1. "Rembrandt and his Pupils." (Illustrated by magnified photographs from Continental Galleries.) By A. P. Laurie, D.SC. **4 p.m.**

THURSDAY, NOVEMBER 13

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Science Standing Committee.

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Yates Lectures. Fifth of a course of eight public lectures on "Greek Myths and their Representation in Art." By Professor A. E. Gardner. (Lantern Illustrations.) 5 p.m. Third of five public lectures on "Re-planning of London, *c.* 1520–1920." By Miss E. Jeffries Davis. 5.30 p.m. **5 p.m.**

ROYAL ACADEMY, Burlington House, W.1. "Modern Pigments: Their Proper Selection and Use." By A. P. Laurie, D.SC. **4 p.m.**

TRADE NOTE

Among the new catalogues issued by Messrs. A. Gallenkamp & Co., Ltd., are two dealing respectively with electrically heated laboratory apparatus and laboratory fittings, including Technico standard unit type benches. The firm have conducted a large number of experiments and tests during the last few years, in order to determine the most suitable method of heating, and to enable them to offer their clients, with confidence, electrically heated apparatus for the laboratory which will be efficient, economical, durable, and satisfactorily perform the work it is designed for. It is claimed that Gallenkamp electrically heated apparatus embodies the latest and best heating elements, and that the method of applying the elements is on the lines of the most approved modern electric heating practice. The design is such as to facilitate ease of inspection and replacement of the heating elements, and renewal elements can be fitted in a few minutes. Owing to the great success of the firm's Technico standard unit benches, they have designed further units, from which fittings for a complete laboratory can now be selected. The units are designed so that benches can be made up with bench tops to suit the size of room. Units are supplied with table plates which are slot-screwed into the top, in any position. In the event of leakages the units can be easily moved out to repair pipes, by placing a temporary support under the bench top or by fixing the bench top on supports. Copies of the new catalogue may be obtained from Messrs. A. Gallenkamp & Co., Ltd., Technico House, 17-29 Sun Street, and 1-3 Clifton Street, Finsbury Square, London, E.C.2.

A New Light Non-Corrosive Alloy

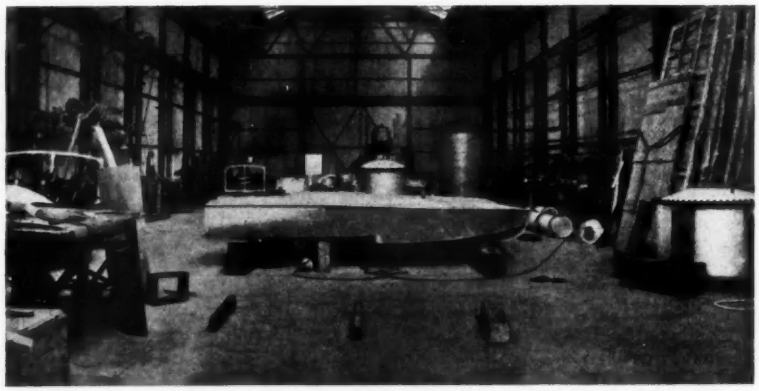
A day or two ago the writer visited Smethwick, where the new alloy, Birma Bright, is being produced, and Wolverhampton, where Messrs. Gibbons, Ltd., are fabricating it into metal windows, façades and architects' fittings. At Smethwick one learned something of the general theory of atmospheric corrosion. The objectives in the production of an anti-corrosive alloy are, first, to retard corrosion as nearly as possible to the vanishing point, and secondly to ensure that the colour of its "rust" is not far removed from that of the virgin material.

In Birma Bright, the metals making up the alloy are chosen for their close potential relationship, so that it has inherent stability and permanence within the molecule, and the forces tending towards its disruption are reduced to a minimum.

In practice this new alloy has been applied for the last six years to chemical plant—vats connections, taps, etc., used in acetic acid factories, jam factories and other trades. In these applications its anti-corrosive qualities were the principal attraction. More recently, however, the combined characteristics of lightness, strength and permanence have caused its introduction into maritime construction, and small motor-cruiser hulls are being built wholly of Birma Bright, for use in tropical waters. The success of the alloy in this application is certainly a striking one, since warm salt-water and marine growths are powerful enemies, and light hulls have hitherto succumbed very quickly to their onslaughts.

Tests carried out on Birma Bright surfaces show that after two years only very slight white spots appear on the surface, which are easily rubbed off with a soft rag. Other tests—in hard water, in acids and in ultra-violet light exposures, all seem to place the new alloy very high on the anti-corrosive scale. The colour of the polished surface and its texture is between that of aluminium and steel.

At Wolverhampton the writer was principally interested in reviewing the adaptability of the alloy. Raw materials take the form of sheets, pressings, castings, die-castings and extruded sections for metal windows. In the foundry he saw intricate castings, such as radiator grilles, being produced by standard practice and apparently without special difficulties. The surface seemed smooth and comparatively regular. Small parts such as hollow door knobs were cast from metal moulds and had an almost polished surface.



Pressings for finger plates, roses and lock parts were being pressed from standard tools. Inquiries in the production shops indicated that the new alloy is tractable in turning, milling and filing operations, and calls for no special methods or precautions in manufacture.

In the casement shops, windows of normal design were being made principally for hospitals and showrooms. The material takes the form of bright extruded sections, and joints are made by acetylene welding. Welded joints were shown to be strong and reliable.

Another interesting characteristic of Birma Bright was demonstrated by examples of the anodium surface treatment. This appears to be a process of skin-hardening, comparable in a way to the well-known "blueing" process used on steel parts. Anodium Birma Bright has a wide range of colour. The normal one is grey-white. It is harder and less subject to scratching than the untreated surface; in fact, rubbing for half an hour with metal polish made no impression on the skin, and it is claimed to close the pores of the surface and so prevent the adhesion of dust and dirt to the surface. The material could be cleaned by washing with a hose-pipe after long exposure to the dust-laden atmosphere of cities. Certainly, the treated surface shows an appearance of hardness and imperviousness; dirt seems to rub off it, rather than into it.

This anodium film can be given chemical colouring, so that bronze, copper, old gold, and even blues, greens, purples and reds and greens can be reproduced upon it. Owing to the hardness of the film, the underlying surface can be made reflecting by such processes as engine turning, sanding or rippling. These delicate effects are protected by the impervious skin, and yet shine through by reason of its transparency. A curious range of colours and surface effects are thus obtained.

Probably these surface treatments will find a field in decoration, now that architecture is in closer harmony with colour schemes and metal work. At the moment, however, the readier outlet would seem to be for the standard anodium finish in hospitals and restaurants, where the need for cleanliness and permanence is paramount.

A 16-ft. outboard hull, cast, in two halves, in Birma Bright, ⅛-inch thick, and some chemical vats, in the workshops at Smethwick.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The extensions to the Holy Ghost Church, BALHAM, will cost £3,000.

Sanction is to be obtained by the BERMONDSEY Borough Council to borrow £9,050 for the purchase of premises near Grange Road.

Plans passed by the BECKENHAM Council: Three houses, Scotts Lane; fifteen houses, Winchester Road; house, Foxgrove Avenue; house, Downs Hill; fifty-three houses, Birchwood Avenue; two houses, Hayes Way; nine houses, St. Mary's Avenue; sixty houses, Eden Way; 140 houses, Merlin Grove; house, Kelsey Way; house, Wickham Way; house, Foxgrove Road; three houses, Celtic Avenue; twenty-nine houses, Stanhope Grove; alterations, Manor House Club (Eden Park Hall), Croydon Road; additions, Wesleyan Chapel, Clock House Road; wireless factory, Kent House Lane; three residential shops and two lock-up shops, Upper Elmers End Road, by Eden Park station; six residential shops, Upper Elmers End Road; two houses, Mays Hill Road; four residential shops, High Street; four houses, Shortlands Road.

Plans passed by the BROMLEY R.D.C.: Garage, Pickhurst Rise; six pairs houses and one detached house, The Avenue, Park Langley Estate; house, Woodland Way; house and garage, Copse Avenue; forty-six semi-detached houses and garages, Hawkhurst and Sherwood Ways; pair of houses, Copse Avenue; pair semi-detached houses and garages, corner of Croydon Road and Hawes Lane; new road between Hawes Lane and Kent C.C. by-pass road and new cul-de-sac off Hawes Lane; garage, Hawes Lane; garage, Wickham Chase; house and garage, Croydon Road; shops and flats, High Street; garage, Langley Way; pair of semi-detached houses, Ravenswood Avenue; eight semi-detached houses, Boleyn Gardens.

The foundation stone of the new church of Our Lady of Grace and St. Teresa, The Green, CHINGFORD, Essex, was laid by the Bishop of Brentwood on Saturday, October 4.

Messrs. F. T. Wooding and Son are to erect houses in Holmside Road, Thurleigh Avenue and Nightingale Lane, CLAPHAM.

Plans for the Essex County Nursing Association's Training Home to be erected in Frizlands Lane, Dagenham, and for the Conservative Social Centre to be erected in Glebe Road, Dagenham, has been approved by the DAGENHAM Urban Council.

Plans passed by the EPSOM U.D.C.: Detached house, Beaconsfield Road, for Mr. Turner; bungalow, Grosvenor Road, for Mr. Harris; house, Woodcote Close, for Mr. R. G. Francis; house and garage, Christchurch Mount, for Mr. G. Pinto; house, Birches Close, for Mr. O'Shea; house and garage, Birches Close for Mr. P. Gibbons; flats at the rear of "The Shrubbery," South Street, for Mr. E. Uden.

Work is now in progress on the first part of the Underground Company's scheme for extending the Piccadilly Tube from HAMMERSMITH to NORTHFIELDS. The whole scheme is estimated to cost £3,000,000, and the Hammersmith to Ravenscourt section, on which work has now been started, will cost approximately £180,000.

Plans passed by the HENDON U.D.C.: New road and sewers off Selvage Lane, Mill Hill, for Messrs. E. Owers, Ltd.; seventeen shops with flats, Pennine Drive, Golders Green, for Messrs. J. Laing and Son; four pairs houses, Barnet By-pass Road, Mill Hill, for Mr. H. S. Bostock; twenty-four houses in road to be known as Cloister Gardens, off Hale Lane, Mill Hill, for Mr. W. F. Thorpe; forty semi-detached houses and one detached house in road to be known as Meadow Gardens, Mill Hill, for Mr. W. F. Thorpe; 290 houses, Colindeep Lane, Hendon, for Mr. H. V. Rowlands (subject to the surveyor's report); six pairs semi-detached houses, Walmington Fold, Woodside Park Estate, for Mr. F. J. C. Ingram.

It is expected that the east wing of the new County Hall, LAMBETH, S.E., will be completed within eighteen months.

It is estimated that the scheme for the restoration of Alexander Palace, MUSWELL HILL, will entail an outlay of £190,000, towards which the First Commissioner of Works has promised a Government contribution of £80,000.

Plans passed by the ORPINGTON Parish Council: House and garage, Mada Road, for Mr. W. J. Purton; house and garage, Woodride, Petts Wood, for Mr. R. Foster; two semi-detached houses, Manor Way, Knoll Rise, for the Silwood Construction Co., Ltd.; additions, Westfield School, High Street, for Mr. E. M. Lawford; house and garage, Woodride, Petts Wood, for Mr. E. H. Pyne; house, Woodride, Petts Wood, for Mr. E. V. Willis; three houses and garages, Woodride, Petts Wood, for Mr. W. Noel Rees; two houses, Park Avenue, Goddington Estate, for Mr. A. G. Conway; house and garage, Sutherland Avenue, for Mr. E. G. Burr; house and garage, Woodride, Petts Wood, for Mr. B. J. Vann; four houses, Charterhouse Road, for Mr. J. Edmonds; two houses, Grosvenor Road, for Mr. E. G. Burr; two houses, Prince's Avenue, Petts Wood, for Mr. Martin Lee Hull (garages attached); house, Mayfield Avenue, for Wheathill Estates, Ltd.

The Rugby Union propose to erect a new stand at the TWICKENHAM Ground. It will provide accommodation for approximately 12,250 people.

Plans passed by the UXBRIDGE Council: New distribution depot for United Dairies, Ltd.; three houses, Vine Lane; four houses, Honey Hill; ten bungalows and two houses, Hercies Road; seven shops with flats over, Uxbridge Road, Hillingdon, for Messrs. Barretts-Perkins, Ltd.; five shops, Swakeleys Road, Ickenham, for West Middlesex Investment Co.; forty-four bungalows, with road and sewer sections, Cherry Grove Estate, Hillingdon, for Home Roofs, Ltd.

SOUTHERN COUNTIES

Schemes costing over £74,000 have been approved by the BOURNEMOUTH Council to provide work for the winter.

The Education Committee of the EASTBOURNE T.C. recommend approval of preliminary plans for making the best use of the existing site for a new Girls' High School buildings.

Plans for the erection of forty cottages in Ham Lane, Lewes, have been submitted to the LEWES T.C.

At a recent meeting of the Uckfield R.D.C. it was decided to erect eight houses at MAYFIELD.

Plans passed by the WINCHESTER T.C.: Additional classrooms, Peter Symonds' School; garage, "Stanton," St. Cross Road; garage at St. Michael's Rectory, Culver Road; alterations to shop front, 2 Southgate Street; alterations to domestic offices, 12 Kingsgate Street; additions to "Halfway," Sleepers Hill; dwelling-house in Chilbolton Avenue; alterations to premises, 10 Jewry Street; alterations and additions, 11 Parchment Street; alterations to No. 4 Ranelagh Road; garages, Edgar Road, "Camden," St. Cross Road, and Fordington Road.

SOUTH-WESTERN COUNTIES

Eighteen houses are in course of erection at BISHOPSNYMPTON, NORTH MOLTON, and RACKENFORD.

When the appeal for funds for the restoration of BRISTOL Cathedral is issued by the Chapter, a sum of at least £30,000 will be asked for.

At a recent meeting of the DEVIZES R.D.C. tenders were accepted for the erection of five pairs of new houses in the parishes of Beechingstoke, Bromham, and Patney.

The LYMPSTONE Parish Council is to carry out a water scheme at a cost of £10,000.

MIDLAND COUNTIES

The BEDWORTH U.D.C. has decided to defer the question of erecting new council offices.

Messrs. Lewis, store proprietors, are to erect a new store in Bull Street, BIRMINGHAM, facing their existing premises, at a cost of £350,000.

NORTHERN COUNTIES

A layout plan providing for the erection of 130 non-parlour-type houses has been approved by the Housing and Town Planning Committee of the BLYTH Council.

Work has started on the construction of a new cinema for Sidney Bacon's Pictures, Ltd., on a site adjoining the General Post Office, Warwick Road, CARLISLE. The architects are Messrs. Percy L. Browne and Son.

The CARLISLE City Council has accepted a tender of £52,854 for the widening of the River Eden bridge.

The Building, Highway and Sanitary Committee of the Clayton-le-Moors District Council recommended, and the Council approved, the plan submitted on behalf of Messrs. Jas. Broadley, Ltd., for the proposed extension of their works in William Street, CLAYTON-LE-MOORS.

Plans for the erection of 123 new houses and bungalows have been approved by the FYLDE R.D.C.

At a meeting of the GOOLE U.D.C. a resolution recommending the Council to erect a further fifty houses in Goole and twenty-five in Old Goole was carried.

Messrs. Lewis, store proprietors, are to erect a new store in the Headrow, LEEDS, at a cost of £750,000.

The NEWCASTLE Corporation has received the sanction of the Ministry of Health for the construction of swimming baths at Byker, Scotswood, Fenham, and Jesmond, at a total estimated cost of £60,000.

A start is to be made as soon as possible by the NEWCASTLE Corporation with the erection of 177 three- and four-room houses on the St. Anthony's estate, being part of the city's housing programme of 3,000 houses, costing nearly £3,500,000.

A scheme is afoot for the rebuilding of the premises of the Poor Children's Holiday Association in Percy Street, NEWCASTLE, at an estimated cost of £20,000.

The construction of a tunnel at an estimated cost of £1,300,000, is recommended by expert engineers for the linking up of NORTH and SOUTH SHIELDS. It has been suggested that a proposal for the erection of a bridge which would cost £1,000,000 more, should be abandoned.

At a meeting of the General Committee of the SCARBOROUGH Town Council the extension of the Town Hall was approved, subject to a grant being obtained from the Unemployment Grants Committee to proceed with a section of the scheme, estimated to cost £19,000.

The SOUTHPORT Works Committee has prepared a scheme, costing approximately £40,000, for improvements to its promenade. The first part of the scheme comprises the erection of a floral hall to seat 1,700 people and the remodelling of the gardens; the other part of the scheme is to erect an ornamental footbridge across the marine lake, with improvements to footpaths, and the erection of a colonnade, shelter, and bandstand.

The question of extending the public library and museum has again arisen in SUNDERLAND. A scheme now being considered provides for the removal of the Winter Gardens from the museum site to the other side of the Mowbray Park lake and for the use of the present site for extensions to the main building.

The WEST HARTLEPOOL T.C. has decided to put in operation a scheme for improving a portion of the front at Seaton Carew, at a cost of £22,280.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given

The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1*s.* 3½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour ;* NAVVY, 1*s.* 3½*d. per hour ;* TIMBERMAN, 1*s.* 5*d. per hour ;* SCAFFOLDER, 1*s.* 4½*d. per hour ;* WATCHMAN, 7*s.* 6*d. per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.
Transport hire per day :

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0	1	6
SPREAD and level, including wheeling, per yd.	0	1	6
FILLING into carts and carting away to a shoot or deposit, per yd. cube	0	10	6
TRIMMING earth to slopes, per yd. sup.	0	0	6
HACKING up old grano. or similar paving, per yd. sup.	0	1	3
PLANKING to excavations, per ft. sup.	0	0	5
DO. over 10 ft. deep, add, for each 5 ft. in depth, 30 per cent.			
IF left in, add to above prices, per ft. cube	0	2	0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup.	0	2	1
DO. 6 in. thick, per yd. sup.	0	2	10
PUDDLING, per yd. cube	1	10	0
CEMENT CONCRETE, 4-2-1, per yd. cube	1	17	6
DO. 6-2-1, per yd. cube	1	12	6
DO. in upper floors, add 15 per cent.			
DO. in reinforced-concrete work, add 20 per cent.			
DO. in underpinning, add 60 per cent.			
LIAS-LIME CONCRETE, per yd. cube	£1	14	0
BREEZE CONCRETE, per yd. cube	1	7	0
DO. in lintels, etc., per ft. cube	0	1	6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube	0	3	9
FINE concrete benching to bottom of manholes, per ft. cube	0	3	0
FINISHING surface of concrete spade face, per yd. sup.	0	0	9

DRAINER

LABOURER, 1*s.* 3½*d. per hour ;* TIMBERMAN, 1*s.* 5*d. per hour ;* BRICKLAYER, 1*s.* 8½*d. per hour ;* PLUMBER, 1*s.* 8½*d. per hour;* WATCHMAN, 7*s.* 6*d. per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. *6 in., per ft.*	0	1	3
DO. *9 in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. *6 in., per yd.*	0	8	0
Portland cement and sand, see " Excavator " above.			
Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft. 0 4 3
DO. 6 in., per ft. 0 5 0
DO. 9 in., per ft. 0 7 9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft. 0 8 3
DO. 6 in., per ft. 0 10 3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1*s.* 8½*d. per hour ;* LABOURER, 1*s.* 3½*d. per hour ;* SCAFFOLDER, 1*s.* 4½*d. per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
Midhurst white facing bricks, per M.	5	0	0
Multi-coloured facings, per M.	7	7	9
Best red facings, per M.	7	7	9
Rubbers, 9½ in., per M.	12	0	6
Staffordshire blue, per M.	9	5	0
Firebricks, 2½ in., per M.	9	5	0
Glazed salt, white, and ivory stretchers, per M.	21	10	0
DO. *headers, per M.*	20	10	0
Colours, extra, per M.	5	10	0
Seconds, less, per M.	1	0	0
Cement and sand, see " Excavator " above.			
Lime, grey stone, per ton	£2	11	6
Mixed lime mortar, per yd.	1	6	0
Dampcourse, in rolls of 4½ in., per roll	0	2	6
DO. *9 in., per roll*	0	4	9
DO. *14 in., per roll*	0	7	6
DO. *18 in., per roll*	0	9	6
BRICKWORK in stone lime mortar, Flettons, or equal, per rod	30	0	0
DO. in cement do., per rod	32	10	0

DO. in stocks, add 25 per cent. per rod.
DO. in blues, add 100 per cent. per rod.
DO. circular on plan, add 12½ per cent. per rod.
DO. in backing to masonry, add 12½ per cent. per rod.
DO. in raising on old walls, etc., add 12½ per cent. per rod.
DO. in underpinning, add 20 per cent. per rod.

HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS, fair, per ft. sup. extra	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra	0	0	10
WEATHER pointing, do. do.	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup.	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities, in finishing to steps, etc., per ft. sup.	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup.	0	11	0
SLATE DAMP COURSE, per ft. sup.	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ¾ in., per yd.	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup.	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each	0	0	3

MASON

MASON, 1*s.* 8½*d. per hour ;* DO. *fixer,* 1*s.* 9½*d. per hour ;* LABOURER, 1*s.* 3½*d. per hour ;* SCAFFOLDER, 1*s.* 4½*d. per hour.*

Portland Stone :			
Whitbed, per ft. cube	£0	4	6
Basebed, per ft. cube	0	4	9
Bath stone, per ft. cube	0	3	0
Usual trade extras for large blocks.			
York paving, av. 2½ in., per yd. super	0	11	0
York templates, sawn, per ft. cube	0	7	6
Slate shelves, rubbed, 1 in., per ft. sup.	0	2	6
Cement and sand, see " Excavator," etc., above.			
HOISTING and setting stone, per ft. cube	£0	2	2
DO. for every 10 ft. above 30 ft. add 15 per cent.			
PLAIN face Portland basis, per ft. sup.	£0	2	8
DO. circular, per ft. sup.	0	4	0
SUNK FACE, per ft. sup.	0	3	9
DO. circular, per ft. sup.	0	4	10
JOINTS, arch, per ft. sup.	0	2	6
DO. sunk, per ft. sup.	0	2	7
DO. DO. circular, per ft. sup.	0	4	6
CIRCULAR-CIRCULAR work, per ft. sup.	1	2	0
PLAIN MOULDING, straight, per inch of girth, per ft. run	0	1	1
DO. circular, do., per ft. run	0	1	4
HALF SAWING, per ft. sup.	0	1	0

Add to the foregoing prices, if in York stone 35 per cent.
DO. Mansfield, 12½ per cent.
Deduct for Bath, 33⅓ per cent.
DO. for Chilmark, 5 per cent.

SETTING 1 in. slate shelving in cement per ft. sup.	£0	0	6
RUBBED round nosing to do., per ft. lin.	£0	0	6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1	7	6
YORK SILLS, W. & T., ft. cub. fixed	1	10	0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0	1	3
DO. 2½ in. thick, per ft. sup.	0	1	6

SLATER AND TILER

SLATER 1*s.* 8½*d. per hour ;* TILER, 1*s.* 8½*d. per hour ;* SCAFFOLDER, 1*s.* 4½*d. per hour ;* LABOURER, 1*s.* 3½*d. per hour.*
N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200 :						
Portmadoc Ladies				£14	0	0
Countess				23	0	0
Duchess				32	10	0
Old Delabole	*Med.*	*Grey*		*Med.*	*Green*	
24 in. × 12 in.	£42	11	3	£45	1	0
20 in. × 10 in.	31	4	3	33	0	6
16 in. × 10 in.	20	18	0	22	4	9
14 in. × 8 in.	12	1	0	12	16	3
Green Randoms, per ton				8	3	9
Grey-green do., per ton				7	3	9
Green peggies, 12 in. to 8 in. long, per ton				5	13	9
In 4-ton truck loads, delivered Nine Elms station.						
Clips, lead, per lb.				£0	0	6
Clips, copper, per lb.				0	2	0
Nails, compo, per cwt.				1	6	0
Nails, copper, per lb.				0	2	2
Cement and sand, see " Excavator," etc., above.						
Hand-made tiles, per M.				£5	18	0
Machine-made tiles, per M.				5	8	0
Westmorland slates, large, per ton				9	0	0
DO. *Peggies, per ton*				7	5	0

SLATING, 3 in. lap, compo nails, Portmadoc or equal :

Ladies, per square	£4	0	0
Countess, per square	4	5	0
Duchess, per square	4	10	0
WESTMORLAND, in diminishing courses, per square	6	5	0
CORNISH DO., per square	6	3	0
Add, if vertical, per square approx.	0	13	0
Add, if with copper nails, per square approx.	0	2	6
Double course at eaves, per ft. approx.	0	1	0

SLATING with Old Delabole slates to a 3 in. lap with copper nails, at per square.

	Med.	Grey		Med.	Green	
24 in. × 12 in.	£5	0	0	£5	2	0
20 in. × 10 in.	5	5	0	5	10	0
16 in. × 10 in.	4	15	0	5	1	0
14 in. × 8 in.	4	10	0	4	15	0
Green randoms				6	7	0
Grey-green do.				5	9	0
Green peggies, 12 in. to 8 in. long				4	13	6

TILING, 4 in. gauge, every 4th course nailed, in hand-made tiles, average per square 3 17 6
DO., machine-made do., per square 3 7 6
Vertical Tiling, including pointing, add 18*s.* 0*d.* per square.

FIXING lead soakers, per dozen	£0	0	10
STRIPPING old slates and stacking for re-use, and clearing away surplus and rubbish, per square	0	10	0
LABOUR only in laying slates, but including nails, per square	1	0	0

See " Sundries " for Asbestos Tiling.

CARPENTER AND JOINER

CARPENTER, 1*s.* 8½*d. per hour ;* JOINER, 1*s.* 8½*d. per hour ;* LABOURER, 1*s.* 3½*d. per hour.*

Timber, average prices at Docks, London Standard, Scandinavian, etc. (equal to 2nds) :			
7 × 3, per std.	£22	0	0
11 × 4, per std.	30	0	0
Memel or Equal. Slightly less than foregoing.			
Flooring, P.E., 1 in., per sq.	£1	4	6
DO., *T. and G., 1 in., per sq.*	1	4	6
Planed boards, 1 in. × 11 in., per std.	30	0	0
Wainscot oak, per ft. sup. of 1 in.	0	1	6

FIR fixed in wall plates, lintels, sleepers, etc., per ft. cube	0	4	6
DO. framed in floors, roofs, etc., per ft. cube	0	4	6
DO. framed in trusses, etc., including ironwork, per ft. cube	0	8	6
PITCH PINE, add 33⅓ per cent.			
FIXING only boarding in floors, roofs, etc., per sq.	0	13	6
SARKING FELT laid, 1-ply, per yd.	0	1	6
DO., 3-ply, per yd.	0	1	9
CENTERING for concrete, etc., including horsing and striking, per sq.	2	0	0
TURNING pieces to flat or segmental soffits, 4½ in. wide, per ft. run	0	0	4½
DO. 9 in. wide and over, per ft. sup.	0	1	2

[*continued overleaf*

CARPENTER AND JOINER: *continued*

SHUTTERING to face of concrete, per square	£1	10	0
DO. in narrow widths to beams, etc., per ft. sup.	0	0	6
USE and waste of timbers, allow 25 per cent. of above prices.			
SLATE BATTENING, per sq.	£0	12	6
DEAL boarding to flats, 1 in. thick and firrings to falls, per square	2	10	0
STOUT feather-edged tilting fillet to eaves, per ft. run	0	0	6
FEATHER-EDGED springer to trimmer arches, per ft. run	0	0	4
STOUT herringbone strutting (joists measured in), per ft. run	0	0	6
SOUND boarding, ¾ in. thick and fillets nailed to sides of joists (joists measured over), per square	2	0	0
RUBEROID or similar quality roofing, one-ply, per yd. sup.	0	2	3
DO., two-ply, per yd. sup.	0	2	6
DO., three-ply, per yd. sup.	0	3	0
TONGUED and grooved flooring, 1¼ in. thick, laid complete with splayed headings, per square	2	5	0
DEAL skirting torus, moulded, 1¼ in. thick, including grounds and backings, per ft. sup.	0	1	0
TONGUED and mitred angles to do.	0	0	6
WOOD block flooring, standard blocks laid herringbone in mastic :			
Deal 1 in. thick, per yd. sup.	0	10	0
DO. 1¼ in. thick, per yd. sup.	0	12	0
Maple 1¼ in. thick, per yd. sup.	0	15	0
DEAL moulded sashes, 1¾ in., with moulded bars in small squares, per ft. sup.	0	2	6
DO. 2 in. do., per ft. sup.	0	2	9
DEAL cased frames, oak sills and 2 in. moulded sashes, brass-faced pulleys and iron weights, per ft. sup.	0	4	6
MOULDED horns, extra, each	0	0	3
DOORS, 4-panel square both sides, 1¼ in. thick, per ft. sup.	0	2	6
DO. moulded both sides, per ft. sup.	0	2	9
DO. 2 in. thick, square both sides, per ft. sup.	0	2	9
DO. moulded both sides, per ft. sup.	0	3	0
DO. in 3 panels, moulded both sides, upper panel with diminished stiles with moulded bars for glass, per ft. sup.	0	3	6
If in oak, mahogany, or teak, multiply 3 times.			
DEAL frames, 4 in. × 3 in., rebated and beaded, per ft. cube	£0	15	0
Add for extra labour, per ft. run	0	0	1
STAIRCASE work :			
DEAL treads 1¼ in. and risers 1 in., tongued and grooved, including fir carriages, per ft. sup.	0	2	6
DEAL wall strings, 1¼ in. thick, moulded, per ft. run	0	2	0
If ramped, per ft. run	0	4	6
SHORT ramps, extra, each	0	7	6
ENDS of treads and risers housed to strings, each	0	1	0
2 in. deal mopstick handrail fixed to brackets, per ft. run	0	1	6
4½ in. × 3 in. oak fully moulded handrail, per ft. run	0	5	6
1¼ in. square deal bar balusters, framed in, per ft. run	0	0	6
FITTINGS :			
SHELVES and bearers, 1 in., cross-tongued, per ft. sup.	0	1	6
1¼ in. beaded cupboard fronts, moulded and square, per ft. sup.	0	2	9
TEAK grooved draining boards, 1¼ in. thick, and bedding, per ft. sup.	0	4	6
IRONMONGERY :			
Fixing only (including providing screws) :			
TO DEAL—			
Hinges to sashes, per pair	0	1	2
Do. to doors, per pair	0	1	7
Barrel bolts, 9 in., iron, each	0	1	0
Sash fasteners, each	0	1	0
Rim locks, each	0	1	9
Mortice locks, each	0	4	0

SMITH

SMITH, *weekly rate equals* 1*s.* 8½*d. per hour ;* MATE, *do.*, 1*s.* 3½*d. per hour ;* ERECTOR, 1*s.* 8½*d. per hour ;* FITTER, 1*s.* 8½*d. per hour ;* LABOURER, 1*s.* 3½*d. per hour.*

Mild Steel in British standard sections, per ton	£12	10	0
Sheet Steel :			
Flat sheets, black, per ton	17	0	0
DO., *galvd., per ton*	18	0	0
Corrugated sheets, galvd., per ton	17	10	0
Driving screws, galvd., per grs.	0	1	10
Washers, galvd., per grs.	0	1	1
Bolts and nuts per cwt. and up	1	18	0
MILD STEEL in trusses, etc., erected, per ton	25	0	0
DO., in small sections as reinforcement, per ton	16	0	0
DO., in compounds, per ton	17	0	0
DO., in bar or rod reinforcement, per ton	22	10	0
WROT-IRON in chimney bars, etc., including building in, per cwt.	2	0	0
DO., in light railings and balusters, per cwt.	2	5	0
FIXING only corrugated sheeting, including washers and driving screws, per yd.	0	2	0

PLUMBER

PLUMBER, 1*s.* 9*d. per hour ;* MATE OR LABOURER, 1*s.* 4*d. per hour.*

Lead, milled sheet, per cwt.	£1	13	0
DO. *drawn pipes, per cwt.*	1	13	6
DO. *soil pipe, per cwt.*	1	16	6
DO. *scrap, per cwt.*	1	1	6
Copper, sheet, per lb.	0	1	0
Solder, plumber's, per lb.	0	1	0
DO *fine, per lb*	0	1	6
Cast-iron pipes, etc. :			
L.C.C. soil, 3 in. per yd.	0	3	0
DO. *4 in., per yd.*	0	3	8
R.W.P., 2½ in., per yd.	0	1	5
DO. *3 in., per yd.*	0	1	8
DO. *4 in., per yd.*	0	2	5
Gutter, 4 in. H.R., per yd.	0	0	11
DO. *4 in. O.G., per yd.*	0	1	2½
MILLED LEAD and labour in gutters, flashings, etc., per cwt.	3	2	6
LEAD PIPE, fixed, including running joints, bends, and tacks, ½ in., per ft.	0	2	2
DO. ¾ in., per ft.	0	2	5
DO. 1 in., per ft.	0	3	4
DO. 1¼ in., per ft.	0	4	5
LEAD WASTE or soil, fixed as above, complete, 2½ in., per ft.	0	6	6
DO. 3 in., per ft.	0	7	9
DO. 4 in., per ft.	0	10	6
WIPED soldered joint, ½ in., each	0	2	6
DO. ¾ in., each	0	3	2
DO. 1 in., each	0	3	8

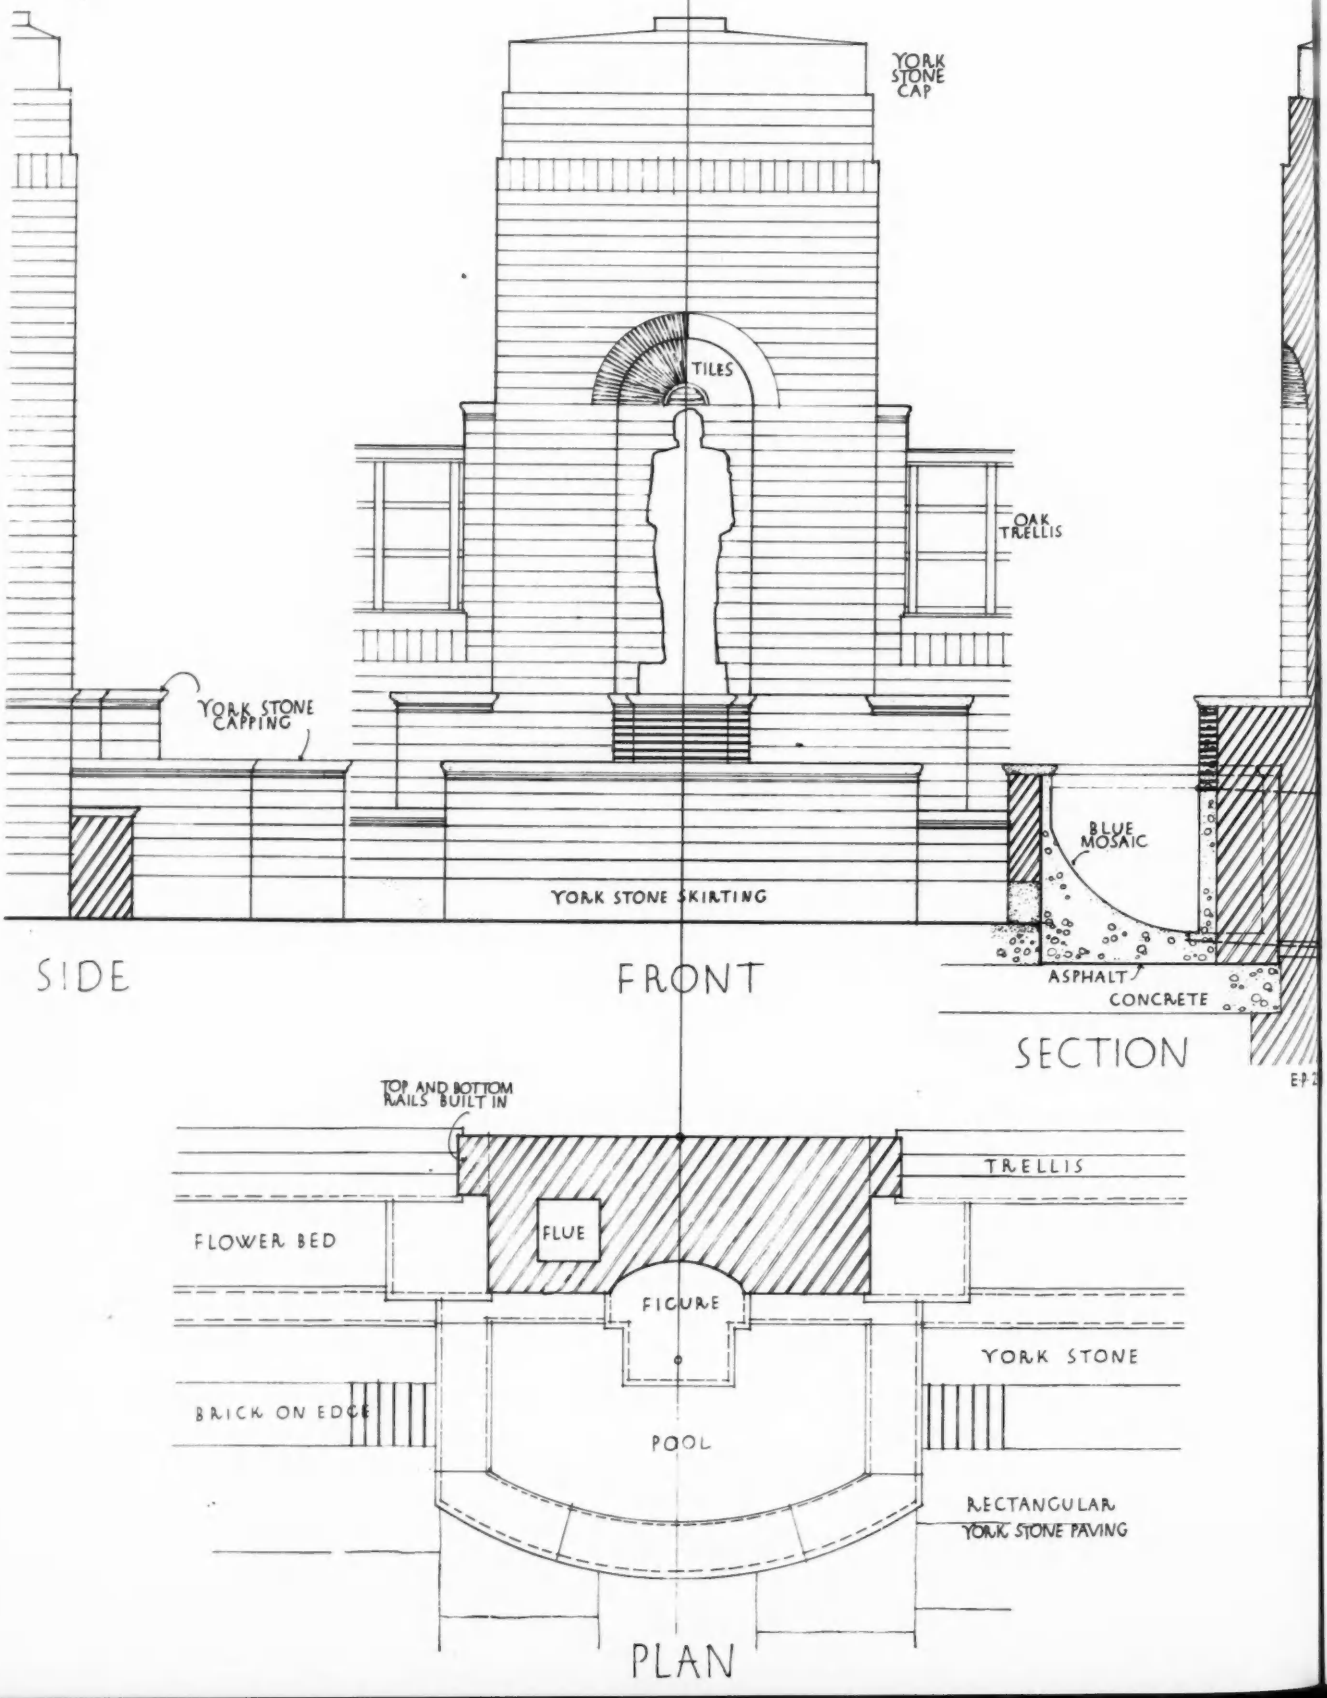
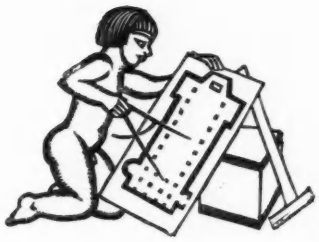
NICHE AND POOL ON ROOF GARDEN, KINGSLEY HALL, BOW, E.



Designed by C. COWLES-VOYSEY



WHEN the flat of a building is intended for use as a roof garden, the treatment of chimney-stacks demands particular attention. In the photograph above is shown one of the chimneys at Kingsley Hall, which has been successfully used as the foundation for an interesting composition of niche with terra-cotta figure, and pool below.

The pool itself is formed of concrete, lined with blue mosaic and encased in brickwork, with a complete tank of asphalt between the concrete and the brick, to ensure water-tightness. It is flanked by flower-beds, contained behind dwarf walls coped with York stone, which divide them from the irregular random York stone paving of the remainder of the roof.

The drawings overleaf may be read with a scale of ½ in. = 1 ft.

A FORM OF SLOW DEATH

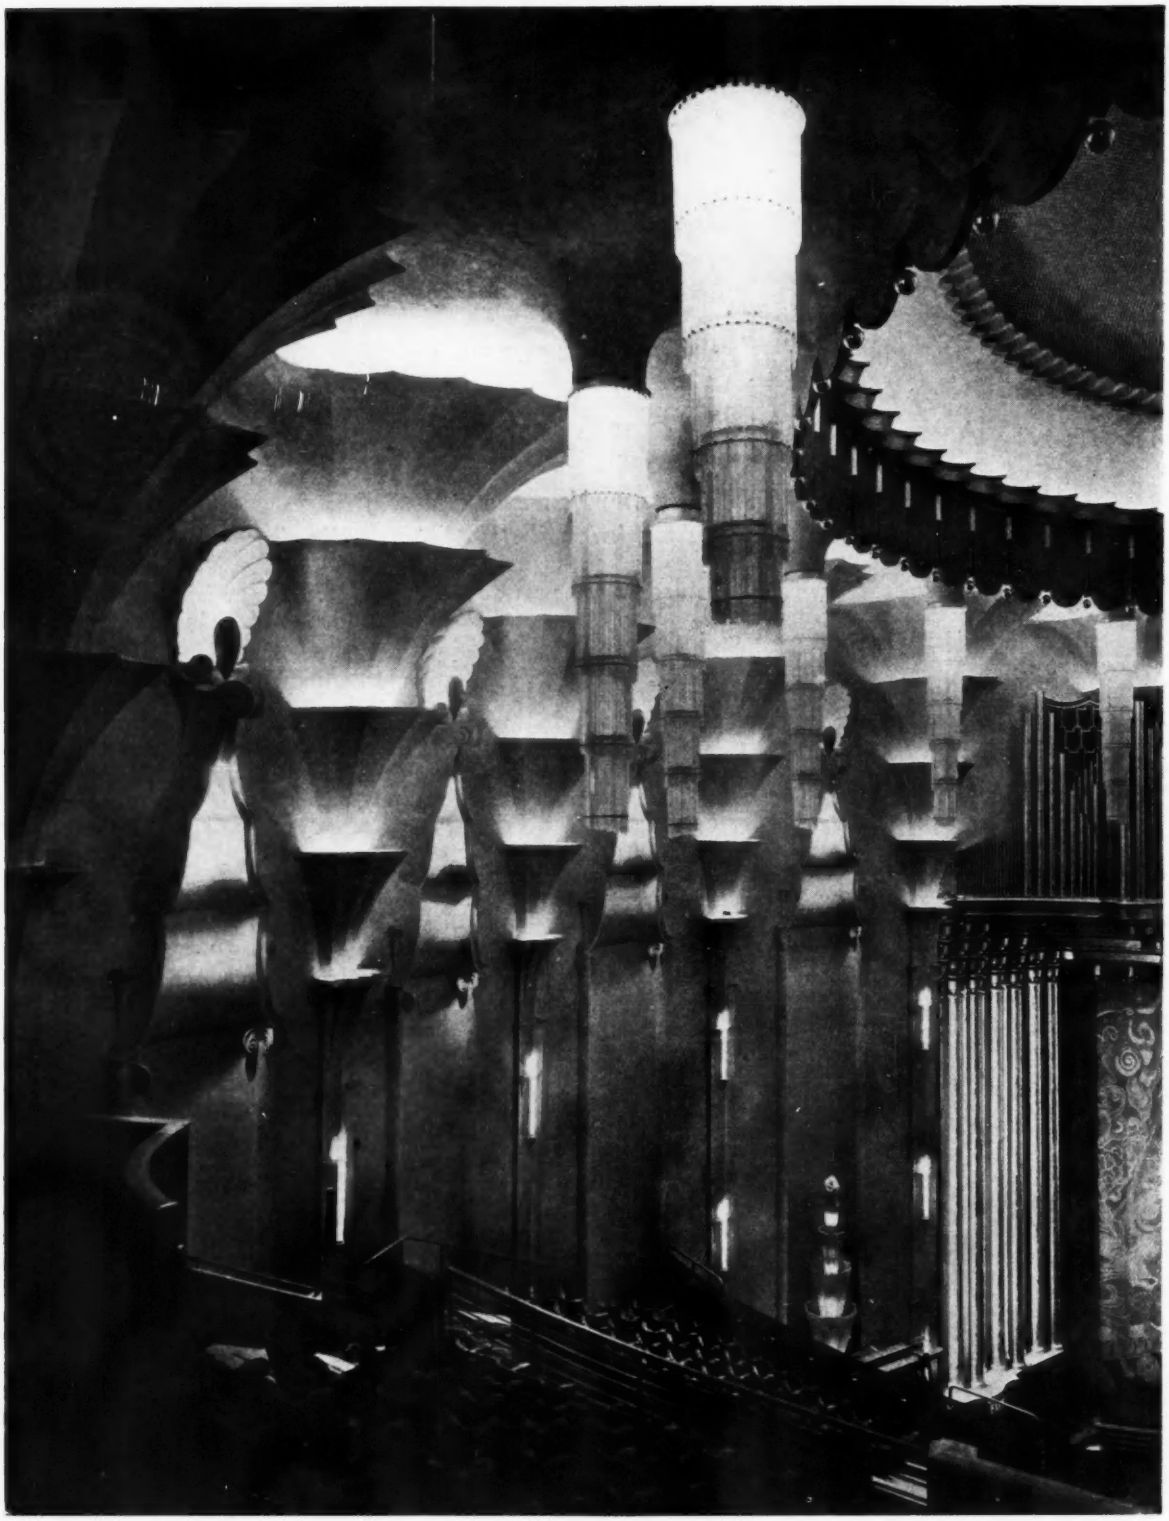
" Think of some workless man stepping from the street down dark, evil stairs into . . ."

THERE are many things which it is necessary to our way of living that we should remember only at intervals. One of these things is the fact of poverty, the very thought of which, prolonged beyond a moment's contemplation, cancels out the seeming good of all the possessions of body and mind by which we are given to set great store.

We know that poverty exists. Around us over square miles of this London we know that millions are living a life of perpetually hard struggle, and that many thousands barely survive the extremity of their misfortune; yet we are so made that we can only live one life, into which flows so much the greater balance of our emotions that little is left for objects which are not our immediate concern.

It is a law of existence and not a new callousness that makes men go about their business as though, if they stopped for an instant or looked about them at the plight of their fellow-creatures, they would be snatched away from the paths which industry has worn smooth for them.

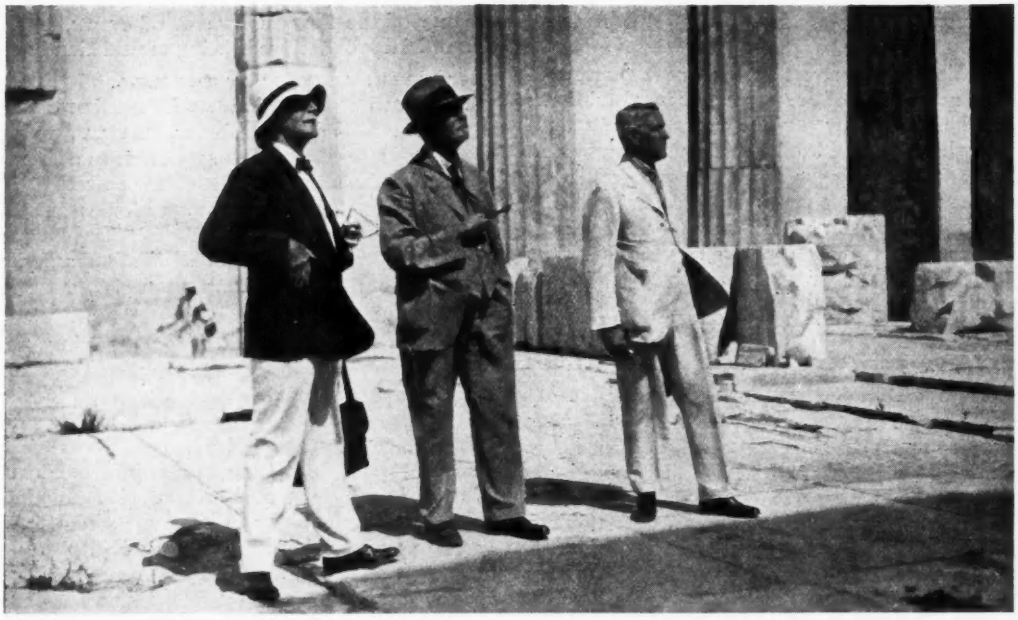
Yet there come moments when some ugly fact stands in the way, and makes chaos of nice order; as now, when we might have thought with pleasure of the bettering conditions of the housing of London's poor, comes the report of the Medical Officer of Health for the L.C.C. with a statement of conditions too appalling to think of with equanimity.



There are about 30,000 basement dwellings in London, all of which are considered unfit for human occupation. These are not all separately occupied, for more than 100,000 people live in them under varying degrees of congestion. " The most insanitary areas do not, and have never," according to the report, " provided such intense degrees of insanitariness as are to be found in the case of these underground rooms. On a moderate computation not more than a fourth of the living-rooms in an insanitary area are so grossly insanitary as the worst type of basement dwelling . . . and if this worst type is selected for clearance, 100 per cent. of utterly insanitary rooms, quite unfit for human habitation, will, in consequence, pass out of use. . . . Never is this so in improvement schemes under which insanitary areas are cleared."

It is obvious to architects if not to anyone else that a basement presents the worst conditions for human occupation. The direct contact with earth on the floors, if not the walls, ensures a perpetual state of dampness which no amount of fresh moving air would entirely remove, if it were indeed possible to bring to the areas and dank pits, through which these rooms receive their light, sufficient quantities of air for even ordinary uses. The normal conditions of basements are therefore heavily loaded against health and sanitation; they are the very atmosphere of rheumatism, tuberculosis and rickets.

If it would be difficult under normal conditions to live there healthily, how much less possible is it, when to these are added poverty, overcrowding, and dirt; misery and no hope of anything better. Imagine for a moment what is represented by these things. Think of some workless man stepping from the street down dark, evil stairs into . . . One cries for a Dickens to put it before the world. For there is no law against basement habitation. All over London people live in basements: decent people, people who have money to enable them to be orderly and clean. It is only when acute poverty drives the lowest into the worst holes and corners, forsaken by everyone with the smallest chances of escape, that the basement becomes a form of slow death.



Here then is a new aspect of slum clearance hitherto unsuspected. We know from the medical officer's report that most slum clearances leave the worst form of slum nearly untouched. What is its incidence in slum property? Where may it be attacked at its worst? And how may it be made possible for the new Act to be applied to the removal of this worst remaining blot?

These are questions to which, once they have arisen, we must find answers—as substantial as those by means of which London has removed the stigma of owning the worst slums in Christendom.

STALACTITIC LIGHTING AT A LONDON CINEMA

A photographic study of the interior decoration of the New Victoria Theatre, opened on Wednesday last by Mr. George Arliss, the film star. The decoration belongs to no "period" or "style." It creates the atmosphere of a fairy palace under the sea, illuminated by mysterious lights: a fantastic home for "make believe" and play. The theatre has been designed by Messrs. W. E. Trent and E. Wamsley Lewis. *See also pages 611–615.*

Distinguished visitors inspect the Acropolis, Athens, during a recent R.M.S.P. Mediterranean cruise : Sir William Llewellyn, K.C.V.O., P.R.A. ; Sir Reginald Blomfield, R.A., PP.R.I.B.A., and the Rt. Hon. Sir Leslie Scott, P.C., K.C.

NEWS & TOPICS

THE STEEL QUESTION

ELSEWHERE in this issue a more detailed account is given than I could hope to give here of a momentous conference, held in London last week, with stresses in steel as its main subject. It seems to deserve the adjective because it marks a definite step forward in the direction of bringing our antiquated building regulations into step with some of mankind's recent ingenuities. Readers of THE ARCHITECTS' JOURNAL will not need to be reminded that the old yoke, fashioned centuries ago, during the undisputed reign of stone, brick and wood, has been found to chafe severely of late. Steel has arrived; we all use it; yet we are hindered from full exploitation of its economical possibilities.

★

Steel really *is* a recent ingenuity of mankind, but it has been in manufacture long enough to have undergone various processes of perfection : the metal we can obtain today is very different from that of fifteen or twenty years ago. It was one of the materials upon which a state of war focussed the activities of many able brains. But, perhaps for the very reason that its characteristics have been changing comparatively rapidly, research into such of its properties as are of interest to all engaged in building —chiefly resistance to stresses and strains—has hitherto been of a somewhat fragmentary order. Meanwhile, what we have been working to, as was said at the conference, might be termed not so truly factors of safety as factors of ignorance.

★

This freely admitted, it was an obvious recommendation that research should be undertaken to fill in the gaps that exist in our scientific knowledge, and to co-ordinate the results with what is already known. But research is so much overdue that it was decided to push forward with the publication of an interim report on which some reasonable code of building regulations could be based at an early date. It was suggested that this should be framed in such a way as to admit of interpolation and amendment as and when the results of expert investigation become available. There will, of course, be other voices to be heard when revision of the building laws comes to be tackled in earnest, but it is something to know that their anatomy, in a very literal sense, is now under expert scrutiny.

BUILDING TRADE OPERATIVES DISCUSS AMALGAMATION

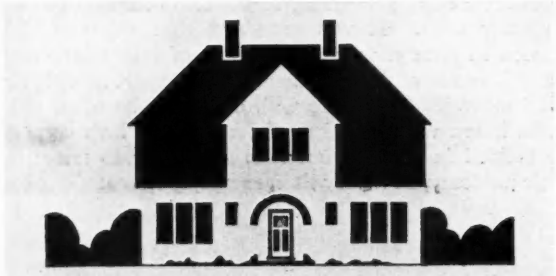
This is an age of amalgamation of interests. Last week the building trade unions met in special conference at Chester and discussed a merger between some fifteen unions affiliated to the National Federation of Building Trades Operatives. Twelve of them decided to ballot their members on the question of amalgamation, and the voting is expected to take place early next summer. Thus may come into being a great " Operative Builders' Union " or " Building Workers' Union," with a membership of a quarter of a million. One effect would be a reduction in the executive from 140 members to 20—a centralization of power indeed. Seeing that things are as they are, this may be no bad thing for the men themselves, and may simplify the complications that many have found a bar in the past in establishing those good relations upon which we all alike depend.

THE ACHIEVEMENT OF KINGSWAY

We celebrated last week the twenty-fifth anniversary of the opening of Kingsway, the most ambitious of London improvements since the construction of the embankments. Everyone knows what an unsavoury and crowded district was swept away to make this fine street. I have even met those who regretted the passing of a London which, even

if it was a cesspool in fact, looked rather interestingly crooked to the romantically-minded.

★



The construction of the street cost about a quarter of a million : the acquisition of the property cost 4½ millions; and now at the end of twenty-five years I understand that everything has been paid off. Taking the war period into account, and allowing for the effects of a policy of loading the heavy interest charges on to the purchasers from the very beginning, this is a remarkably short period, and goes to prove that finely conceived works of public improvement, carried out over poor property, are not only self-balancing but can be made to show a profit.

THE SCOTTISH CHALLENGE TO OFFICIAL ARCHITECTURE

The Office of Works make poor progress with their plans for Government buildings on the Calton Jail site at Edinburgh. The Edinburgh Town Council did, indeed, accept one plan submitted to them, but since they required alterations to be made the new plan had to be again submitted to the Scottish Fine Art Commission, who have now, it appears, rejected them in greater part. Thus a second deadlock is reached, and it may happen that the Government may withdraw from the site altogether.

★

Without the necessity of taking sides in the matter, it seems obvious that local and Scottish national feelings have been offended in the first case by an act of bureaucratic high-handedness, which later stubbornness on the part of the Government has only served to stiffen into absolute opposition.

OUR 1931 SELECTION OF

FIFTY DIFFERENT HOUSE DESIGNS

Selection No.		
22.	50 plans on blue print paper -	17s. 6d.
23.	50 plans on white paper - -	27s. 6d.
24.	50 plans on white paper and coloured	50s. 0d.

This selection contains 50 designs of 2-bedroom to 6-bedroom houses and bungalows. All plans on separate sheets. Scale: Eight feet to an inch. The above selection can also be obtained in two loose-leaf books at 15s. per selection extra.

OUR SELECTION OF

TWENTY-FIVE DIFFERENT SHOP DESIGNS

Selection No.		
19.	25 plans on blue print paper -	15s. 6d.
20.	25 plans on white paper - -	25s. 0d.
21.	25 plans on white paper and coloured	50s. 0d.

This selection contains 25 designs of shops suitable for town and country.

THE [redacted] TRACING AND PLANNING CO.

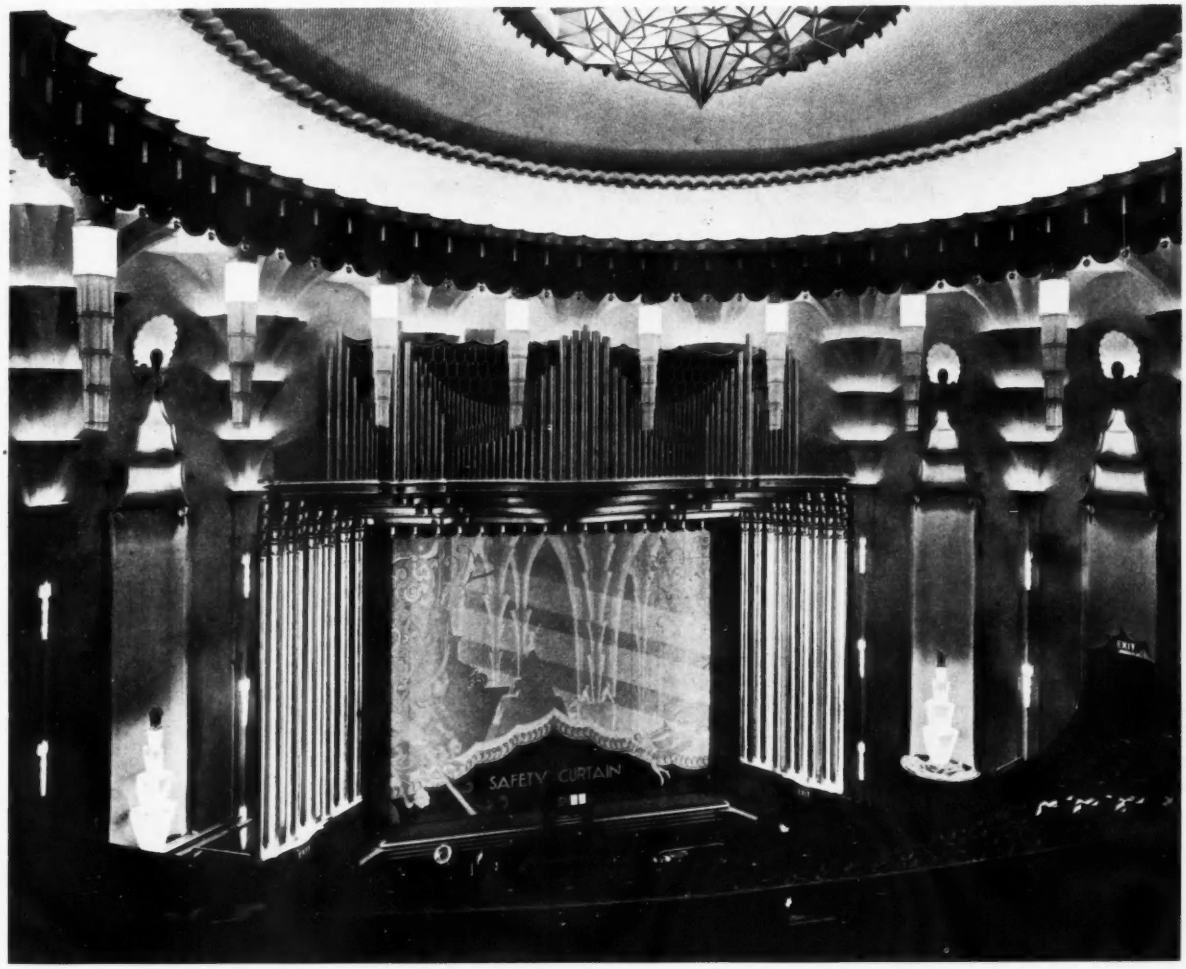
Flat burglary, or Penny Plain and Twopence Coloured. A reproduction of a leaflet that some of our readers may recognize as having reached them through the post : we hope none of their designs have been "traced" for this "1931 selection."

This warfare has drifted a little out of the public eye because of the slow movement of events, but it is here that official architecture is being most defiantly challenged.

FIRST WOMAN ASSISTANT AT THE R.C.A.

The Board of Education has for the first time appointed a woman, Miss M. S. Taylor, A.R.C.A., to the School of Architecture, Royal College of Art, as assistant. About a tenth of the number of students at recognized schools are women, so that their recognition is at least timely; and, my recollection of the College of Art being an absolute dream of wonderful and remarkable femininity, one might even presume the appointment tardy.

SURSUM CORDA



Even the Church is tacitly recognizing the modern appreciation of colour. In my comings and goings I recently entered one of London's lesser-known cathedrals —Southwark—and was spell-bound by the effect of the carved stone screen behind the altar, now entirely covered with dull gold, from floor to a height of about ten feet, with a few spots picked out in rich colours. This is splendid, without being in the least garish. And, a day or two ago, knowing the lantern of St. Paul's Cathedral was to be the subject of English Precedent in this issue, I glanced at it with new interest. It was a sunny morning and the eye was gladdened with the gilding of this lantern and the terminals of the two towers, glistening against the blue October sky.

DONKEY-TRICKS IN AUSTRIA

In Vienna there practises an architect who probably interpolates an unprintable adjective when reciting to himself, "the Law is a hass," and who must have realized by this time that the Press is another species of animal that it is ill to clap in blinkers. In the riots of three years ago the roof and top-story of the Viennese Palace of Justice were burnt; Heinrich Reid has rebuilt them; and the papers did not view the result kindly. One of them, musing upon the yellow colour of the new additions, used a freezing simile about ice-cream; nor could it understand why the floor should have "nymphs and dolphins" by way of ornamentation. (Evidently, Heinrich has always had his opinion of the Law; but a Palace of Justice is not, after all, the most auspicious place in the world to air it.) But the Law thought no harm—at first. Under the new Press law it inflicted a fine of 500 schillings (£15) upon the paper, at the instance of the disgruntled architect.

★

Even in Austria, however, despite the hassinine Law, there is what looks curiously like "the freedom of the Press" with which we are blessed in England. The paper made no bones about publishing the sentence against itself, but added the manifesto : "The Palace of Justice from today is the finest building in the world. Whoever differs from that opinion is fined 500 schillings"; and proceeded to appeal. (Well it knew that the Law is a hass.) And won, with costs against the plaintiff. What I want to know now is : Does the reversed decision mean that the Law resents having been baited in its own Palace of Justice; or deems Heinrich no better than a hass himself; or holds the paper, though wrong by law, to have been really right; or acknowledges and bewails its own hassininity; or—but this is all hay and hee-haws. . . . The serious thing for Heinrich is that what was merely an opinion in ink on paper has, by legal operation, been more or less carved in stone for all to see for all time. ASTRAGAL

The auditorium is made to resemble "a fairy palace under the sea." The dome above the circle is in the form of a gigantic shell; the walls give the impression of being cut away from coral and rock. Decorative features include undersea growths, stalactites, two alabaster fountains, one on either side of the proscenium, and chairs and carpets giving in design and in colour the effect of waves.

THE NEW VICTORIA THEATRE

"A Fairy Palace under the Sea"

W. E. TRENT AND E. WAMSLEY LEWIS, ASSOCIATED ARCHITECTS

PERHAPS no building in London has provoked so much criticism, favourable and otherwise, as the New Victoria Cinema Theatre which opened its doors to the public on Wednesday last. The building stands in a popular shopping district in the immediate vicinity to Victoria Station, with long frontages to two streets, crowded daily with shoppers and with travellers to and from the suburbs, the South Coast and the Continent. It is not surprising, therefore, that since the building first began to take shape much comment has taken place concerning its unorthodox appearance and its unusual constructional features.

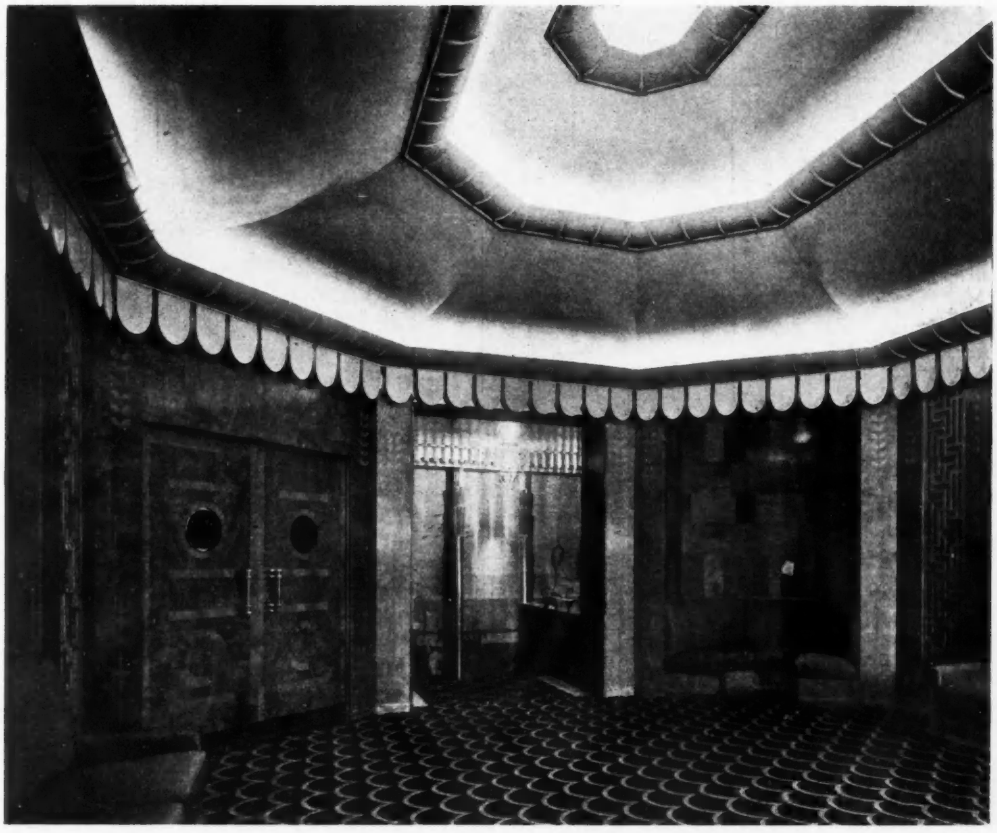
In planning the theatre the architects encountered considerable difficulties owing to the perfect rectangular shape of the site. It was essential to provide the theatre with as many seats as possible and at the same time to leave ample space for entrances, exits, stairs, rest-rooms, etc. To attain this object the whole of the stalls floor has been placed below street level, and the entrance hall arranged in the depth of the balcony. At the stage end the floor of the stalls is 22 ft. below street level, and the side gangways are actually under the pavement in Wilton Road and Vauxhall Bridge Road. Above the stalls there is a large single balcony. It extends the full width of the theatre, and is about 90 ft. deep from back to front. This balcony seats 1,100 persons, and with the stalls provides a total seating accommodation of three thousand.

Having sunk the stalls beneath the street level it was necessary to provide heavy concrete retaining walls varying from three to seven feet in thickness on both sides of them. At the stage end the adjoining building, a big drapery store, erected on four great stanchions loaded up to about three hundred tons, had to be underpinned as the cinema excavations went down 10 ft. lower. The entrance floor hall is suspended from the girders carrying the balcony. There are two main balcony girders, one weighing 93 tons, the other 70 tons, and each 101 ft. long. The smaller of these was brought by rail to London from the North of

The Vauxhall Bridge Road front. On both façades the architects have adopted a treatment of horizontal bands, with deep shadows, as a means to express life and movement, the attributes of the film.

Over the entrance from Wilton Road, as over that from Vauxhall Bridge Road, the vertical lines are designed to stop the passer-by in the street and bid him enter. Entertainment is suggested by gaily coloured canopies.

New Victoria Theatre, London.]

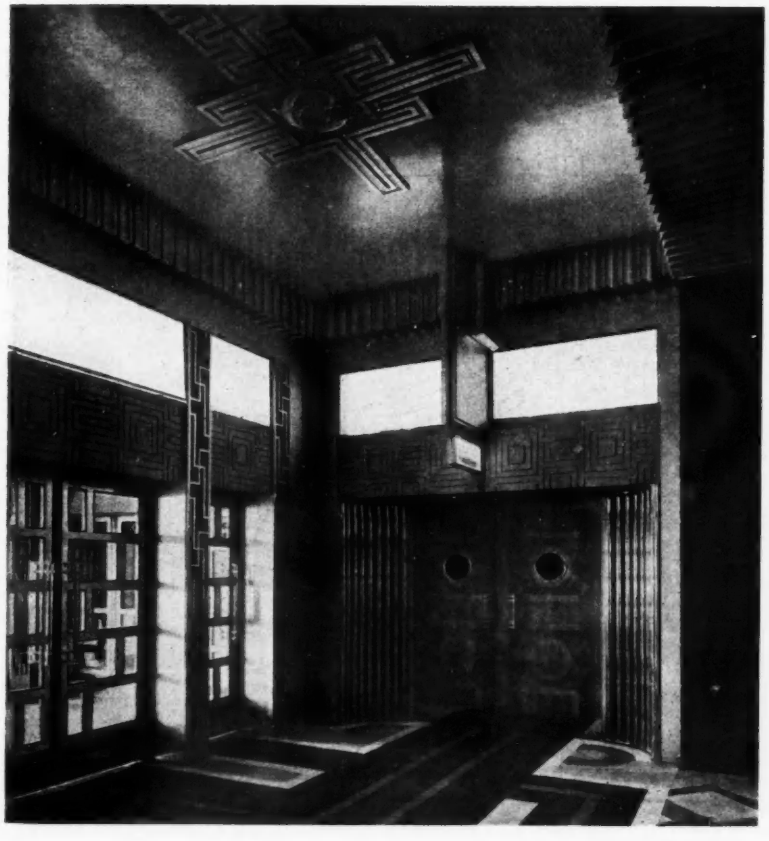


England in one piece, taken through the streets in one piece to the site, and lifted straight into position. It is said that this is the biggest girder ever handled in this way. The whole building is a steel-framed structure, and the total weight of the steel involved is upwards of 1,600 tons. All the stanchions rest on large steel grillages, filled in solid with concrete.

As in two cases the point loads reach nearly nine hundred tons, very heavy foundations have been rendered necessary.

Owing to the restricted nature of the site the whole of the drainage is within the building and in many cases the suspended floors and drains have been constructed together. All the sewage is lifted by a pump to the level of the sewer in the street. For the same reason, that of a restricted site, the boiler house and the heating and ventilating plant are placed in the roof, where are also the projection rooms, electrical workshops, etc. Air is drawn in and, after being filtered, washed and warmed, is forced into the auditorium from the ceiling downwards and extracted under the seats.

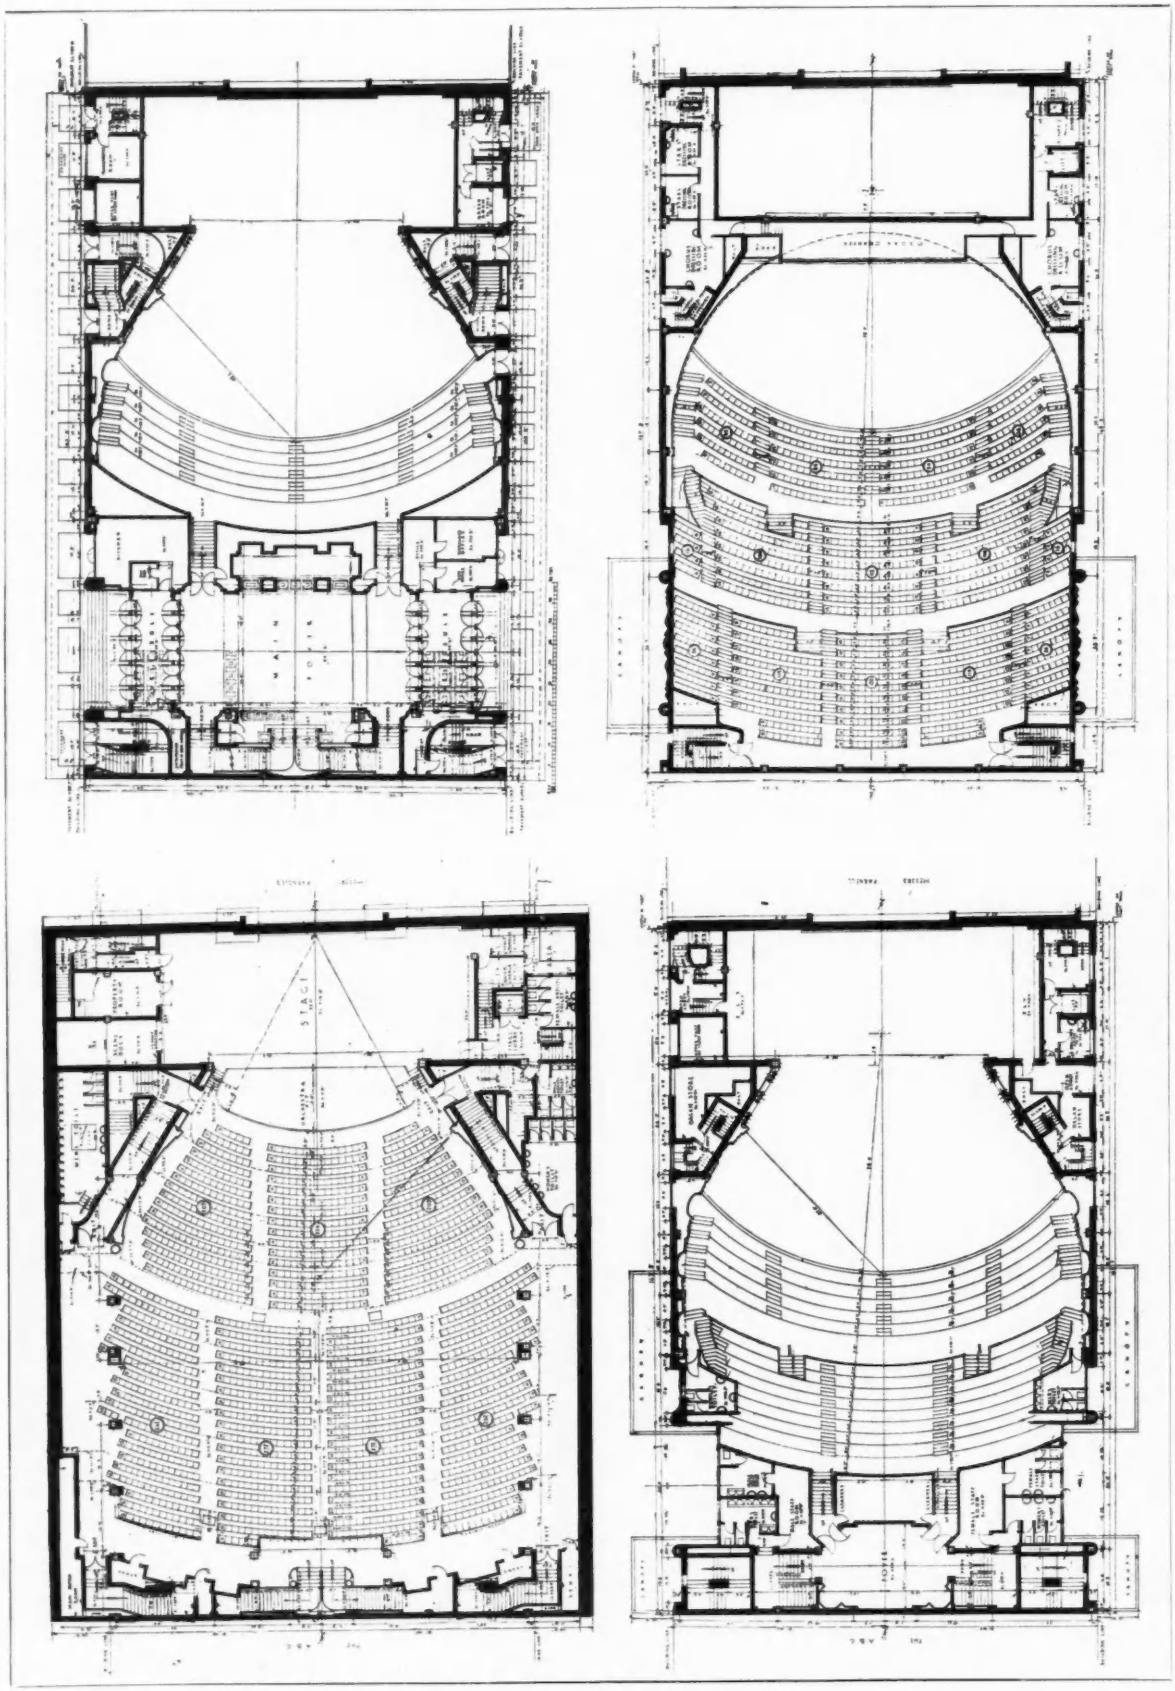
The height from the floor under the stage to the roof of the stage is 94 ft. Over the centre of the auditorium is a dome 65 ft. in diameter, the steel ribs



A corner of the foyer on the first floor. The other end is similar in architectural treatment. The doors shown give access to the circle, and the staircase leads to the main foyer on the floor below.

The main foyer showing, on the left, the entrance doors from Vauxhall Bridge Road and, to the right, the doors leading to the circle. A photograph of the staircase on the opposite side of the foyer appears on page 615.

[*W. E. Trent and E. Wamsley Lewis, associated architects.*



being filled in with concrete. The eye of this dome, 20 ft. in diameter, is glazed to admit such daylight and sunlight as is required by the London County Council during the day. At other times a steel rolling shutter excludes daylight.

The striking and mysterious lighting effects of Mr. E. G. Nichols, chief engineer of the cinema company, and his assistants, Mr. Humphrey and Mr. Cucksey, contribute enormously to the success of the architects' conception. Among the effects obtainable are those of clouds, fire and snow.

The latest type of mercury-vapour rectifier is installed to give "short-circuit proof" d.c. supply for the projectors and the organ.

In carrying out the deep excavations an interesting piece of Old London was discovered. At a depth of about 14 ft. and running diagonally from end to end of the site a line of old mooring posts and the camp-sheeting of an old wharf were uncovered. On one side of the posts was a layer of black river mud, showing that in earlier days a water-way (probably an arm of the Thames) extended to this point, and that barges came up to discharge their cargoes here. To present-day Londoners the idea of a wharf at Victoria may sound incongruous, but here was obvious proof that it once existed.

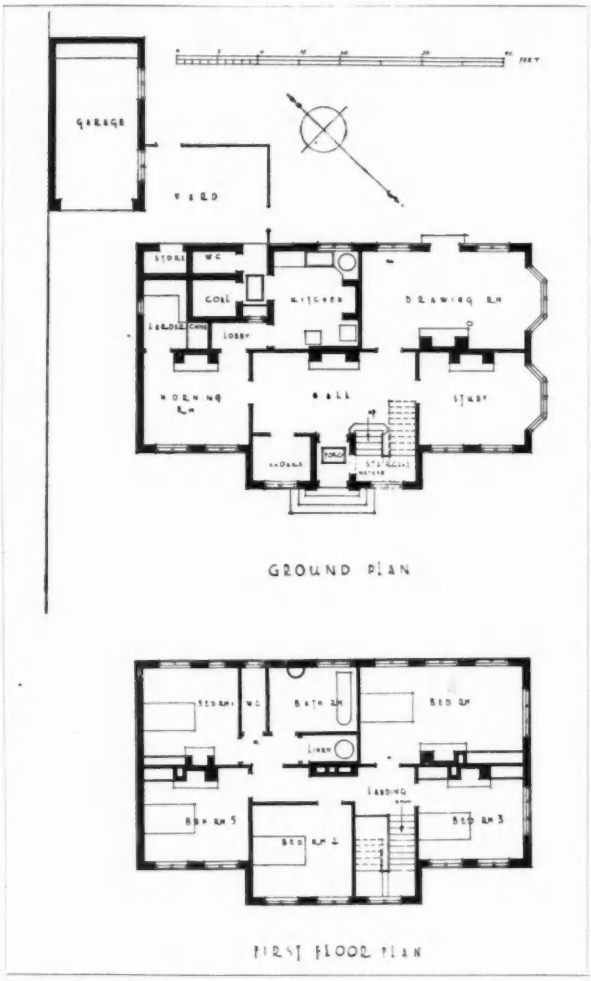
Plans of the stalls, ground floor, upper foyer and balcony floor. The frontage line to Vauxhall Bridge Road is at the top of each plan, and that to Wilton Road is at the bottom. Seating accommodation is provided for 1,710 persons in the stalls and 1,076 in the balcony. The whole of the stalls floor is below street level. The site is 168 ft. long by 104 ft. wide.

Vauxhall Bridge Road is at the top of each plan, and that to Wilton Road is at the bottom.

New Victoria Theatre, London. [*W. E. Trent and E. Wamsley Lewis, associated architects.*

The main foyer, showing staircase leading to upper foyer. On the left are the entrance doors from Wilton Road. On either side of the staircase are flights leading down to the stalls.

TWO HOUSES IN LEICESTERSHIRE

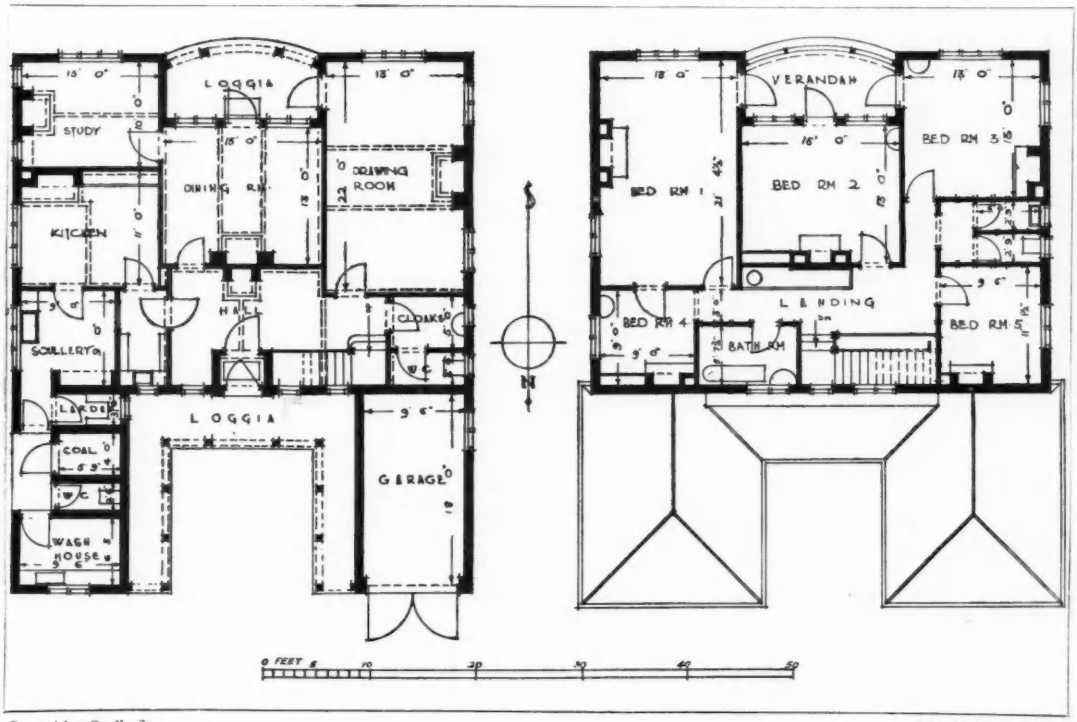


DESIGNED BY E. J. WILLIAMS

Bardon House: the entrance front, showing the long eight-light window overlooking the staircase.

ON this and the following two pages are illustrated two houses which have been erected on the outskirts of Leicester—Bardon House on the Lutterworth Road, and Stepaside in the Fairway, Oadby.

Bardon House occupies a site on the main road from Leicester to Lutterworth and overlooks the valley of the River Soar. The external walls are of hollow brick with brick piers and have rough cast panels between the first-floor windows. At the base of the walls is a blue brick plinth. The roof is covered with rough blue slates. The main entrance has an artificial stone surround, and leads through a small porch into the central hall, from which direct access is obtained to the principal rooms on the ground floor. To the left is the morning-room, and to the right are the drawing-room and the study. Behind the morning-room and approached by a lobby are the kitchen quarters. The staircase, leading to the first floor, is punctuated on the entrance front by a long window, reaching from about 7 feet above ground-floor level to the roof. This staircase leads on the upper floor to a central landing, around which five bedrooms, bathroom, w.c. and linen cupboard are planned. On the left side and at the rear of the house a garage has been provided within easy access of the main road.



Bardon House, Leicester.
Ground- and first-floor plans.

The other house, Stepaside, has two loggias, one on the entrance front and the other on the garden side. In addition there is a veranda overlooking the garden from the first floor. Entrance to the house is obtained through a loggia, which is flanked on one side by the washhouse and coals and on the other by the garage. In this house also a central hall has been planned. Leading off from this to the right is the drawing-room, and to the left the dining-room and the kitchen. On the south or garden side is a study approached from the dining-room. The loggia on this front, together with the balcony over it, has been planned and designed as the central feature of the elevation to the garden. On the first floor are five bedrooms, three of which have access to the veranda, and a bathroom, etc. The main walls are of brick and are 9 ins. thick. The elevations are treated with cement stucco, washed, and have a blue brick base. The roof is covered with pantiles.

It will be observed from a study of the accompanying plans that both houses have been designed to give the principal rooms a southerly aspect.

Stepaside, Oadby: the garden side. This house has been erected on the recently-developed Stoughton Manor estate, Oadby, some three or four miles from the city of Leicester. The main feature of this southern front is the loggia, with veranda above, to which three bedrooms have direct access.

Stepaside, Oadby.] [*By E. J. Williams.*

Ground- and first-floor plans. There are two loggias, one of which shelters the main entrance, which is thus approached across a small forecourt.

The drawing-room is the largest apartment on the ground floor of Stepaside. The window on the left-hand side overlooks the garden. Facing the right-hand window is a door to the loggia.

Stepaside, Oadby.] [*By E. J. Williams.*

The brick fireplace in the dining-room; on the right of it is the entrance from the central hall. The dining- and drawing-rooms have direct access to the loggia on the garden side.

ENGLISH PRECEDENT No. 138

THE LANTERN, ST. PAUL'S CATHEDRAL

The tall spire-like cupola which crowns its dome is one of the most characteristic things about a distant view of St. Paul's. It would have been still more conspicuous if Wren had followed his earlier plans. The schemes he got out before the fire show a spire considerably taller than the one that was built. The history of the ensuing designs is a pretty puzzle indeed.

In the so-called Model Design the cupola shrinks to a close imitation of that of St. Peter's, while in the Warrant Design it is magnified to challenge the dome itself. The final drawings prepared during the building of the cathedral differ from the executed design only in that the upper half is less by comparison with the lower. Both in the St. Paul's drawings and in those at All Souls the attic story is shallower and the domed roof flatter.

Here is another proof of the extent to which Wren designed his buildings "on the job," where the perspective of the parts could be tested with certainty.

LETTERS FROM READERS

Official Architecture

SIR,—The incursion of a business man into the correspondence upon official architecture is welcome because it reveals the mind of the commercial element of the patrons of our profession, focussed in the idea that £500 a year is an adequate salary for an architect who carries out £100,000 worth of work annually.

If we may assume that this is typical of the business mentality and morality and that it is based upon fact, it is to be devoutly hoped that the day is not far distant when the R.I.B.A. will take such steps as may be necessary to ensure through the medium of its Members who function in official capacities, that the profession is adequately remunerated, and, having done so, will see to it that none of its members ever lend themselves to this species of exploitation of our profession on penalty of the forfeiture of their Membership.

Any commercial concern which cannot, upon economic grounds, remunerate an official architect in a more equitable manner should be deliberately deprived of this source of professional service and thus be compelled to resort to the service of the private practitioner.

Our business man comes to the gist of the entire matter when he clearly states that business concerns employ official architects for economic reasons and not for the sole purpose of advancing the art of architecture. Though viewing the subject from an entirely different standpoint, I find myself in complete agreement with the business man upon this fundamental truth.

The assurance with which he essays to satisfy what he terms "Mr. Leathart's simple bewilderment," however, merely exemplifies how the uninitiated rush in where angels fear to tread. Here he is completely out of his element, for his conception of architecture as "titivating up a trifle with columns and what not" is merely an amusing exposition of an utter misconception.

A concentrated perusal of the opening speech in the debate at Olympia might possibly help him in this connection. Nevertheless, your architect readers should be indebted to the business man for his blunt, if naive, exposure of the economic aspect of official architecture.

R. WYNN OWEN

The above letter was unavoidably held over from our issue for Wednesday last. On Thursday we received the following :

SIR,—This afternoon I read Mr. Leathart's amusing letter, and by way of proving that the reply is spontaneous I enclose it herewith, couched in the form of expression which that gentleman flippantly suggested might be the manner in which we might hand our observations to each other.

I thoroughly enjoyed his letter, but I challenge him to write a reply in *verse* and have it in your hands through the post by the morning after the issue of THE ARCHITECTS' JOURNAL in which the enclosed appears, provided always you publish it, without showing it to him in advance.

OFFICIAL ARCHITECTURE

Dedicated to one J. R. Leathart, Esq., F.R.I.B.A., Architect and private practitioner

Verse hast thou chosen as the medium of a tilt?
Verse thou shalt have, then, though it cleave thee to the hilt.
As thou hast suggested, the Muse shall be our blade,
Until from sheer exhaustion our parrying be stayed.
That which thou beholdest, thou clearly canst not see;
Not e'en when 'tis plainly pointed out to thee.
Would that to Olympia thou hadst in person come,
And added there thy quota to the common sum.
There, chance, that clearer vision thou possibly hadst gained,
Which from subsequent vain babbling might have thee restrained.
For, know thee now, and be it e'er within thy ken,
There spoke I but of *works* and spoke not I of men.
Prating of men, Sir, is but old women's vogue;
And savours of the busybody, gossip, or the rogue.
Who wrought a work, I care not, provided 'tis not coarse.
Rotten work is rotten work regardless of its source,
While good work is the hall-mark of genius and of skill,
E'en though its author's hidden by accident or will.
Thinkst thou this hero-worship of the latest vogue bodes well
For the prestige of our calling?—It merely bodes its knell.
E'en now within the gutter our fair profession lies,
An object of contempt to the saner public's eyes.
Of unity or fellowship we verily have none,
Since no man's job is really his until that job is done.
For Architects, like vultures, lurk, morally defiant,
Waiting for the faintest chance to pinch a brother's client,
While the public note the posture and appraise it at its worth;
So in its eyes our profession merely grovels on the earth,
Self-degraded, belittled, and devoid of brotherhood.
A lesson from the Doctors or the Law would do us good.
When thou'st grasped, what to an Architect should be manifestly plain—
A Cathedral's not comparable with the place they start a train—
Thy vision will be clearer, and, emerging from the mists,
Thou mayst yet one day, efficient, ride gaily to the lists.
Judging from thy scribbling, insooth, a mummer thou shouldst be,
That thou'st ne'er yet found thy calling is obvious to see.
And now, Sir, if in verse, forsooth, thou canst not come again,
Then, for ever hold thy peace, and sheathe thy fountain pen.

R. WYNN OWEN

Fees—Fixed and Sliding

SIR,—Your leading article, "Fees—Fixed and Sliding," in the Oct. 8 issue of THE ARCHITECTS' JOURNAL, by offering only one adverse criticism against the R.I.B.A. revised Scale of Professional Charges, pays a great compliment to the Committee which has brought a long, tedious and arduous task to a successful issue. In such a lengthy and diverse document as the "Scale" one would not be surprised if your writer had discovered many contentious points, but the one which appears to perturb him is concerned with what is probably the least important item in the Scale, viz., the graduated fees for works costing £2,000 and under.

Whilst it is true that this graduated scale, as framed by the Committee, is not perfect, the proposals offered as an alternative do not carry us far along the road of "Arithmetic Made Easy." It is suggested that the 10 per cent. should commence "from the point where the cost of the job was zero." I have known architects' clients who might view this with suspicion—a potential attempt to charge 10 per cent. on something for doing nothing. In the examples cited with such inviting simplicity it is presumed that building costs work out conveniently in round figures—£100, £500 and so forth. Now, whilst I agree that architects might be tempted to adopt this method in order not to overtax their mental energy when calculating fees, it is customary to work on the actual costs as revealed by accounts. Thus, to calculate fees on a job costing, say, £373 19s. 11d. at 9·2 per cent., is not a great relief from the R.I.B.A. scale, and would not justify the Committee's suggestions being altered by the Council.

The graduated scale should, in my opinion, be taken as a guide, and I believe is generally used in that way. For those who desire an easy method of adapting the scale, a graph can be made, but even this is not strictly accurate. It might be possible to calculate by slide rule, but I have not heard of this having been attempted. If fees of precision *must* be adhered to, I can only suggest a gauge of the micrometer type, one of which, suitably inscribed, might also be presented, as a memento, to the client, thus enabling him to check his architect's account, and by reminding him of that gentleman's honest intentions, pave the way for future commissions above the £2,000 limit.

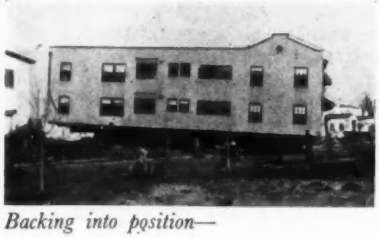
WILLIAM H. HAMLYN

Removing a house : preparing—

The Architects' Golden Opportunity

SIR,—In your leading article on "The Architects' Golden Opportunity," in your issue for October 1, you state that anywhere in England the growth of urbanism and large villages can be found, but only one town. To this one town you give the credit of being the first attempt to build to a definite plan, and state that Letchworth itself has no definite or cohesive plan.

Letchworth is the first attempt to build a town on a "definite cohesive plan." The late Sir Ebenezer Howard in 1903 formed First Garden City, Ltd., and Barry Parker and Raymond Unwin were the architects responsible for the layout and design. No material alteration has been made in that plan. Letchworth is a residential and industrial town, and the great work of building a new and complete town was recognized by H.R.H. the Duke of York, who became president of the twenty-first anniversary celebrations in 1926.



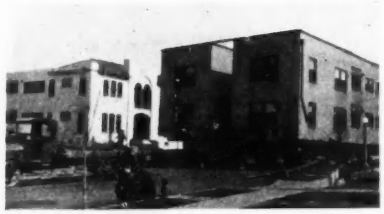
The fundamental principle of Letchworth is its completeness as a town and its distinction from a London suburb. On the industrial side there are over a hundred factories, with an industrial population of more than 4,000, the total population being about 16,000.

Its standard of open spaces is double the standard laid down as being necessary by the National Playing Fields Association, and the value of a healthy residential and industrial town is reflected in the infant mortality rate of 22·6 per 1,000, as against 65 per 1,000 for England and Wales last year.

A. T. PIKE
(FIRST GARDEN CITY, LTD.)

The Scarecrow of Industrialism

SIR, — The Dean of Manchester's demand for beauty in modern life (October 8 issue) is its own answer—in the sense that it expresses the realization today of existing ugliness and the remedy.



Backing into position—

A wave of indignation is spreading through England, which, within a few decades, may not only remove the pollutions of the past century, but create a wealth of new beautiful things. The arts of man will be used to enhance the best that Nature gives us. One has only to pause and consider the powerful and beneficial influences which are at work today, to be assured that within a generation a great change will certainly take place in the appearance of England. Even while bad taste and carelessness are still producing ugly things, the tendency is changing, and tendencies are everything. Public opinion is rapidly strengthening in the right direction.

In a few years many things which are tolerated, or even unnoticed today, will be deemed such bad form as to be impossible.

No one who attended the recent conference at Welwyn Garden City of the delegates of the constituent component bodies who form the C.P.R.E.

On the road—

can have failed to appreciate the powerful forces which have come into being since the war to make England beautiful. These forces will be irresistible. But the movement is not confined to any country or to any race. It is almost world-wide, in spite of many apparent contradictions. It is a movement as real and as vital as the Renaissance. It is noteworthy that the keynote of the C.P.R.E. Conference was not that of conservatism in the sense of indiscriminate preservation of the things of the past. It was essentially constructive and creative. Town planning, good design in new buildings, tree planting, landscape gardening, the encouragement of the sense of beauty in the coming generation, the discouragement of acts which offend the eye or destroy pleasure in landscape, the building of new and beautiful towns, the gradual amelioration of existing industrial towns, replanning them on broader and more beautiful lines. Practically every speaker who contributed to the debates showed a vision of what England might be made by positive action rather than by a policy of negation. There was no note of despondency in the face of the ugly things which were deprecated.

Preparing to move : side view—

The Dean's paper is full of a sense of certainty regarding the future. All that he says of the industrial towns of the future breathes the feeling of possible achievement rather than an unattainable utopia. It is this attitude of determination which will bring us the final victory over ugliness and squalor.

(SIR) THEODORE G. CHAMBERS

Bodily Removal of Houses

SIR,—I had often heard of houses in America being moved bodily from one site to another, but when I arrived in Los Angeles a little while ago I found that the friend whom I was visiting was having a house (consisting of four flats or "apartments" as they are called there), made of steel and concrete, moved about five miles. It gave me the opportunity of taking some photographs of the work, and I have pleasure in sending copies to you; your readers may find them of interest.

H. A. DART

Polytechnics and Exhibitions

SIR,—My attention has been called to correspondence on this subject in your pages, and in particular to a letter in your issue of October 8, from Mr. T. P. Bennett.

I have no desire to enter into the controversy regarding the standard of instruction at the Polytechnics. I note, however, that Mr. T. P. Bennett makes certain statements with regard to the Architectural Association School of Architecture.

Mr. Bennett states that the Northern Polytechnic has one great advantage

—Arrived !

over many of the University Schools and the Architectural Association; "and that is that the whole of the students are forced to take their profession extremely seriously. . . ." The inference from this statement is that students at the Architectural Association are not obliged to take their profession seriously. I would like to state that in my opinion Mr. Bennett is not entitled to draw any such inferences, and wish to point out that the students at the Architectural Association are not only obliged to take their profession seriously, but that the long record of successes by students of this school and its high standing are a proof that the standard of the work is excellent; and this can only be produced by serious work. In addition, many of the students at the A.A. are by no means financially independent, many being maintained either through the grant of scholarships or by their own efforts in such work as they are able to obtain during spare time and vacations.

I note also that Mr. Bennett mentions that the course of training in the Northern Polytechnic is as complete as that of any other architectural school in the country. I do not think it is unfair to claim that the efficiency of this course of training is largely due to the fact that past students of the Architectural Association have been largely drawn upon to provide the teaching staff at the Northern Polytechnic. Of this fact Mr. Bennett cannot but be aware.

Comparisons, such as Mr. Bennett sets up, cannot be other than invidious, and I am surprised that Mr. Bennett, who at the end of his letter advises your correspondent "Polygnotus" not to write letters to the press without obtaining first-hand information, should himself have fallen into the same error.

HOWARD ROBERTSON
(PRINCIPAL, ARCHITECTURAL ASSOC.)

SETTLING-UP HONEYWOOD

BY KARSHISH
(H. B. CRESWELL)

xxii: A Last Surprise

Spinlove, the architect, has resented a preposterous letter in which his client, Sir Leslie Brash, called him to account for imaginary grievances, by making a passionate reply to Brash's solicitors, who have sent him the withdrawal he demanded. The episode pointed to the existence of a much more intimate relationship than that of architect and employer, as was confirmed by Brash's growing sulky, by the friendly offices of his daughter, and by the complaisance of his wife, who has just invited Spinlove to the house on a week-end visit.

SPINLOVE TO GRIGBLAY (PRIVATE AND CONFIDENTIAL)

Dear Mr. Grigblay, 19/12/26.

I had a long talk with Sir Leslie during the week-end. He is sending you a cheque in final settlement today and with it a letter which I hope will end all memory of the upset over the painting. He now admits that he ought to have taken our advice in the first instance, and realizes that the failure of Riddoppo is in no way your fault. There has been no complaint of fumes since the furnace was relighted, and I slept for two nights in the house with windows shut and noticed nothing, so the matter is disposed of, at last.

What I am particularly writing to you about is the restoration of the paint. It is, as you know, in a dreadful state, and what is left of it will have to be thoroughly rubbed down and the whole painted anew. The family is going abroad for two months after Christmas, Sir Leslie will not be much at home, and it would be a great satisfaction to him to feel the work was in your charge. I know also that for personal reasons it would be a pleasure to him if you would undertake the work. It would also relieve me of great anxiety. I trust, therefore, that you will reconsider your decision to have nothing more to do with it.

Believe me,
Yours sincerely,

PS.—Sir Leslie has decided not to have the bedrooms painted out each in a different colour, as now; but uniformly in duck's-egg white as I originally designed.

Spinlove seems to have made good use of his week-end visit.

GRIGBLAY TO SPINLOVE (PRIVATE)

Sir, 20/12/26.

I am not going to say I was not glad to read your letter or that I do not know I have to thank you for the very considerate one I received yesterday from Sir Leslie Brash with his cheque for final balance. The old gentleman expresses himself in a remarkably handsome manner to one so far below him in station, and I have written him that nothing remains to be said.

The job of building Honeywood Grange has, one way and another, perhaps been a bit more of a trouble than it had any call to be; but that is what we have to expect sometimes in the building trade, and so long as the owner is satisfied and the architect, that is all I ask, for the house is a good one and if it wasn't it wouldn't be for want of everyone concerned having had a try at making it so.

About the painting, of course I will take on the work as asked; but I shall not be able to give an estimate and I shall want a free hand to do what I think well and I cannot guarantee perfect results although I will do my best to secure them. If you care to have it like that, I think, sir, it would be a good thing to have a talk over. I shall be in town tomorrow and can arrange to call at any time convenient after two o'clock.

Yours faithfully,

Grigblay evidently found Brash's "handsome expressions" more gracious and condescending than he had stomach for; and his sly reminder of obstruction due to the architect's solicitudes and the owner's interferences tells its own tale.

SPINLOVE TO BRASH

My dear Sir Leslie, 22/12/26.

Grigblay called to see me about the painting yesterday. He is glad to oblige us by doing the work, but as he does not know what is involved in it he cannot give an estimate. The work will be done as Day work—i.e. at net cost plus 15 per cent. to cover establishment charges and profit. This is an offer that ought certainly to be accepted.

He says he cannot actually *guarantee* perfect results, but he will spare no pains to secure them, and as he proposes to clean off the existing paint entirely and sand-paper all vestiges of it from the wood, there is no doubt all will be well. He will arrange with you about dismantling the rooms which he would rather not undertake.

I spoke to him about the threatened extension of villa-building up Honeywood Hill and the proposed development of the back land. He ridicules the whole idea and says it is merely a trick to induce you to buy the land at a high price. He says that some of the villas already built are standing empty and the work has been stopped, and that the land Barthold offers you *does not belong to him*. He only has a twelve months' option on it from Mr. Rallingbourne, who parts with no land without particular restrictions as to the buildings to be put on it. Were there no restrictions as to the number and kind of buildings that might be put on your land when you bought it? I recall that you asked me for a set of plans to send to Mr.

Rallingbourne's solicitors. Besides this, Grigblay says that there is no chance for a "Bungalow Town" anywhere near Marlford, and, if there were, nothing could be done unless the Building Bylaws were revised, and the District Council would never agree to that.

I saw my friend today, and he says the appliance I spoke of is Wealdstone's Non-inflammatory Spleen and Liver Pad, made in two strengths, "strong" and "extra." He recommends the latter. They can be re-charged from any electric light plug, and are stocked by Spedding, 92 Fountain Street, St. James's. My friend swears by it.

Every yours dutifully,

BRASH TO SPINLOVE

23/12/26.

My dear James—(to indite the new nomenclature),

I am considerably gratified and also relieved in mind at the intimation that the building propositions of Mr. Barthold are a fraudulent pretension; and as I have today received a peremptory reminder from Mr. Snitch, asking a reply to his previous communication, he will be sufficiently answered by my continued silence.

I had quite forgotten, as in my case it was a mere formality, that Mr. Rallingbourne makes it a prohibitive condition in his conveyances that only private houses of due importance and refinement of design shall be erected on the land.

Will you, since no alternative course seems expedient, be so obliging as to proceed to complete the necessary arrangements for Mr. Grigblay to undertake the renovation of the painting. We shall be unboundedly thankful—as you may imagine—to see a termination put to the disgraceful state of affairs which deforms the domicile and is no better than an unsightly eyesore.

I am obliged by the information you give anent the Radio Pad. I shall certainly test the efficacy of the device.

I have the pleasure to enclose cheque in final settlement of your fees. You will observe that I have augmented the amount to a round figure, but you will not, I hope, resent my indulging this friendly impulse as I apprehend that in giving me the right to do so you surrender the right to object!

The gong! I must hence to array me for the feast!

Ever, my dear boy,
Yours affectionately,

PS.—I am requested to remind you that the performance tomorrow is timed to commence at 8.15 and *not* at 8.30 as originally intimated.

We have long suspected that something of this sort was going to happen. Apparently, in the stress of a "reconcilly" staged by Pud barriers went down and consciences were unloaded all round; and appearances are that Brash, fitted out with a son-in-law and a (soi-disant) radio-active liver pad, will take on a new lease of that benevolence which lies beneath his weaknesses and follies: for Brash, despite his irascibility and pomposity, is a simple soul at heart. His simplicity is well borne out if we accept the hilarious implication of the liver pad; namely, that during the unbosomings of that eventful week-end Brash was led to confess to a discontented liver, whereupon his architect promptly recommended a cure for it.

This letter, the last in the folder, by explaining itself explains also those not infrequent signs of a relationship which the correspondence did not reveal, and of which Spinlove's bitter and reckless retort to Brash's outrageous strictures is the outstanding example. We cannot decide that no man would act as Spinlove did towards his prospective father-in-law, while we have no means of knowing under what circumstances he so acted. The matter, however, seems clear enough if we remember the months of badgering to which Spinlove has submitted, and suppose that when Spinlove's early friendship with the daughter ripened to deeper feelings, Brash found himself in hopeless opposition to an only child and a neurotic wife, and vented his irritation on the architect; and that Spinlove, secure in his position and unable to support the humiliation thrust upon him or go hat in hand to a man who considered himself at liberty to affront him, yielded to an impulse to have the thing out. In this elemental matter of pursuing a wife, a man who follows his impulses at least keeps faith with his manhood; and in no other affair of life does his manhood better recommend a man.

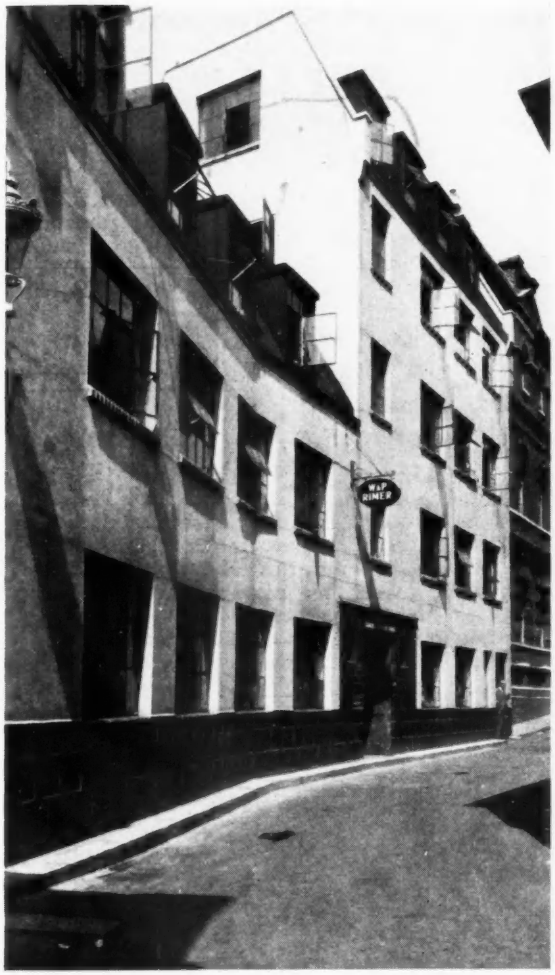
In wishing Spinlove the best of luck it must not be forgotten that this affair of his holds out new terrors to some who may be toying with the idea of employing an architect; and it is therefore desirable to make clear that Spinlove's behaviour in this matter is entirely "unprofessional."

Conclusion

AT the conclusion of this last Act of the Honeywood comedy the principal character — the editor of the compilation—following an honoured custom, pulls off the wig which has disguised him and steps in front of the curtain, as author, to thank the audience, in his natural voice, for their kind attention to the performance. There has been considerable applause and some laughter, while cat-calls from the gallery have in most cases been due to the actors being imperfectly heard or to lacunæ in their parts. The famous Brash figure has aroused disgust as well as hilarity; but if the poor man had been run over by a motor bus opposite the Bank, as nearly happened to him, the audience would have been put in mind of that essential generosity of nature which his weaknesses veiled but never entirely obscured. Of his good wife I will not speak; but I am curious to know why the ladies in the audience have not resented her, and why, particularly, they have generally objected to her daughter as a swanking young person intent on self-display. Is it that they are flattered by the remoteness of the characteristics of the elder woman from anything belonging to themselves, and jealous of the killing powers of the younger—or what? My own intimate behind-scenes familiarity with the character of Pud has given me the impression of a girl with intellect and exceptional depths of feeling, whose exuberances and slang—which is individual and not of any coterie—is partly due to abounding vitality and partly to a shyness which prompts her to disguise her real self.

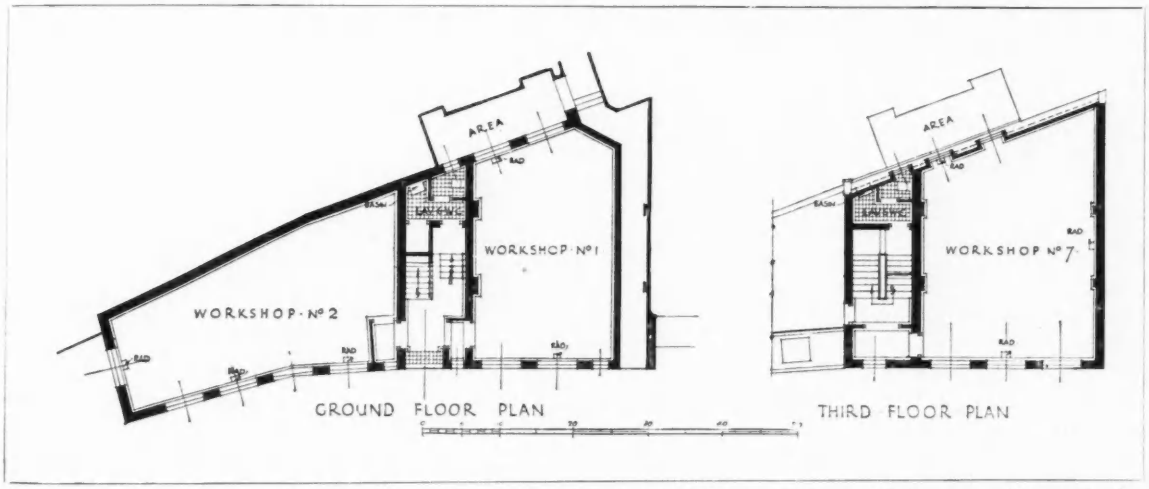
Her faithful swain, the juvenile lead, Spinlove, thinks and behaves so much as I should myself if I had not (in some degree) learned better than to do so that though I have no hesitation in naming him "ass," I am hurt when I hear anyone else do it: in fact, it is my sensitiveness to derision of Spinlove that has reminded me how much of myself belongs to him; and I can say, with the heat that would lead Spinlove to similar tactlessness, that he is much less of an ass than some are who have given him that name in my hearing.

The part of Marston Grigblay has been generally regarded as the biggest in the little show, and the representation of his character as its star turn. With that judgment I certainly have no quarrel; for Grigblay—who walked onto these pages, like the rest, from nowhere—has won my almost affectionate regard. He has become as real to me as anyone I ever knew—in fact, more real; for although he never opens his mouth without giving me surprises, I seem to know him as he is under his skin in a way the ordained loneliness of life makes impossible with actual persons. Grigblay has been widely recognized as true to type; and Bloggs, in his humble way, also; and I feel that those who so recognize them could pay no higher compliment to the building trade of this country, nor a much higher one—I will even venture—to the characteristic genius of the race of Englishmen.



> Come the three corners of the world in arms
> And Bloggs will shock them. Naught can make us rue
> If Grigblay to himself do rest but true.

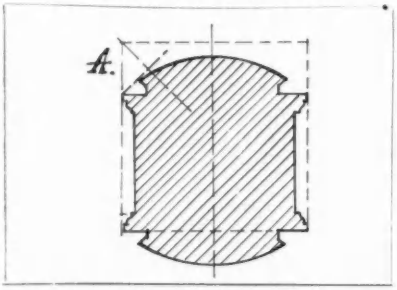
—as Shakespeare might have written had he known our friends, to whom, together with the other characters of the comedy, we have now to say "Good-bye."



[THE END]

SMALL FACTORY OFF SAVILE ROW, W.

DESIGNED BY C. H. JAMES



Two views of Nos. 1 and 2 Coach-and-Horses Yard; and plans of typical floors. Eight workshops are provided on the five floors, the first three of which cover the whole of the site. The main entrance leads straight to the staircases, at the back of which, in all but the top story, are centralized identical lavatories. The contract price was £5,620, or 1s. 8d. per foot cube.

QUESTIONS THAT ARISE

Base to a Statue

P. P. writes : "*I am preparing a scheme for erecting in a small town a statue in memory of a citizen who has recently died. The statue is to be life-size and mounted on a pedestal where it can be equally well seen from all sides. I have tried several models without success, the difficulty being that when the square base is in right proportion to the figure seen on any one side, it is too large when seen diagonally, and if correct on the diagonal it is far too narrow when seen squarely. What is your expert's opinion on this matter ?*"

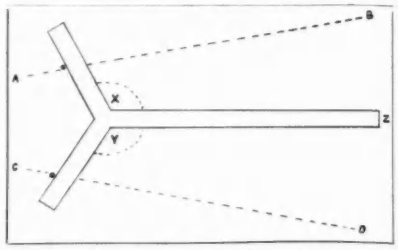
The solution to this problem is to

vary the outline of the pedestal, as a study of old examples will show. I remember discussing this with the late Mr. A. E. Rickards, and have among my notes a solution suggested by him which is shown on the accompanying sketch.

The general square line is shown dotted, but by combining this with the oblong oval, the reduction on the width of the diagonal is as much as that shown at "A."

Aluminium Paint

P. E. writes : "*I intend using aluminium paint on some steam pipes I am fitting in an old building. What is the method of applying the paint, and will it give satisfactory adherence to the heated surface ?*"



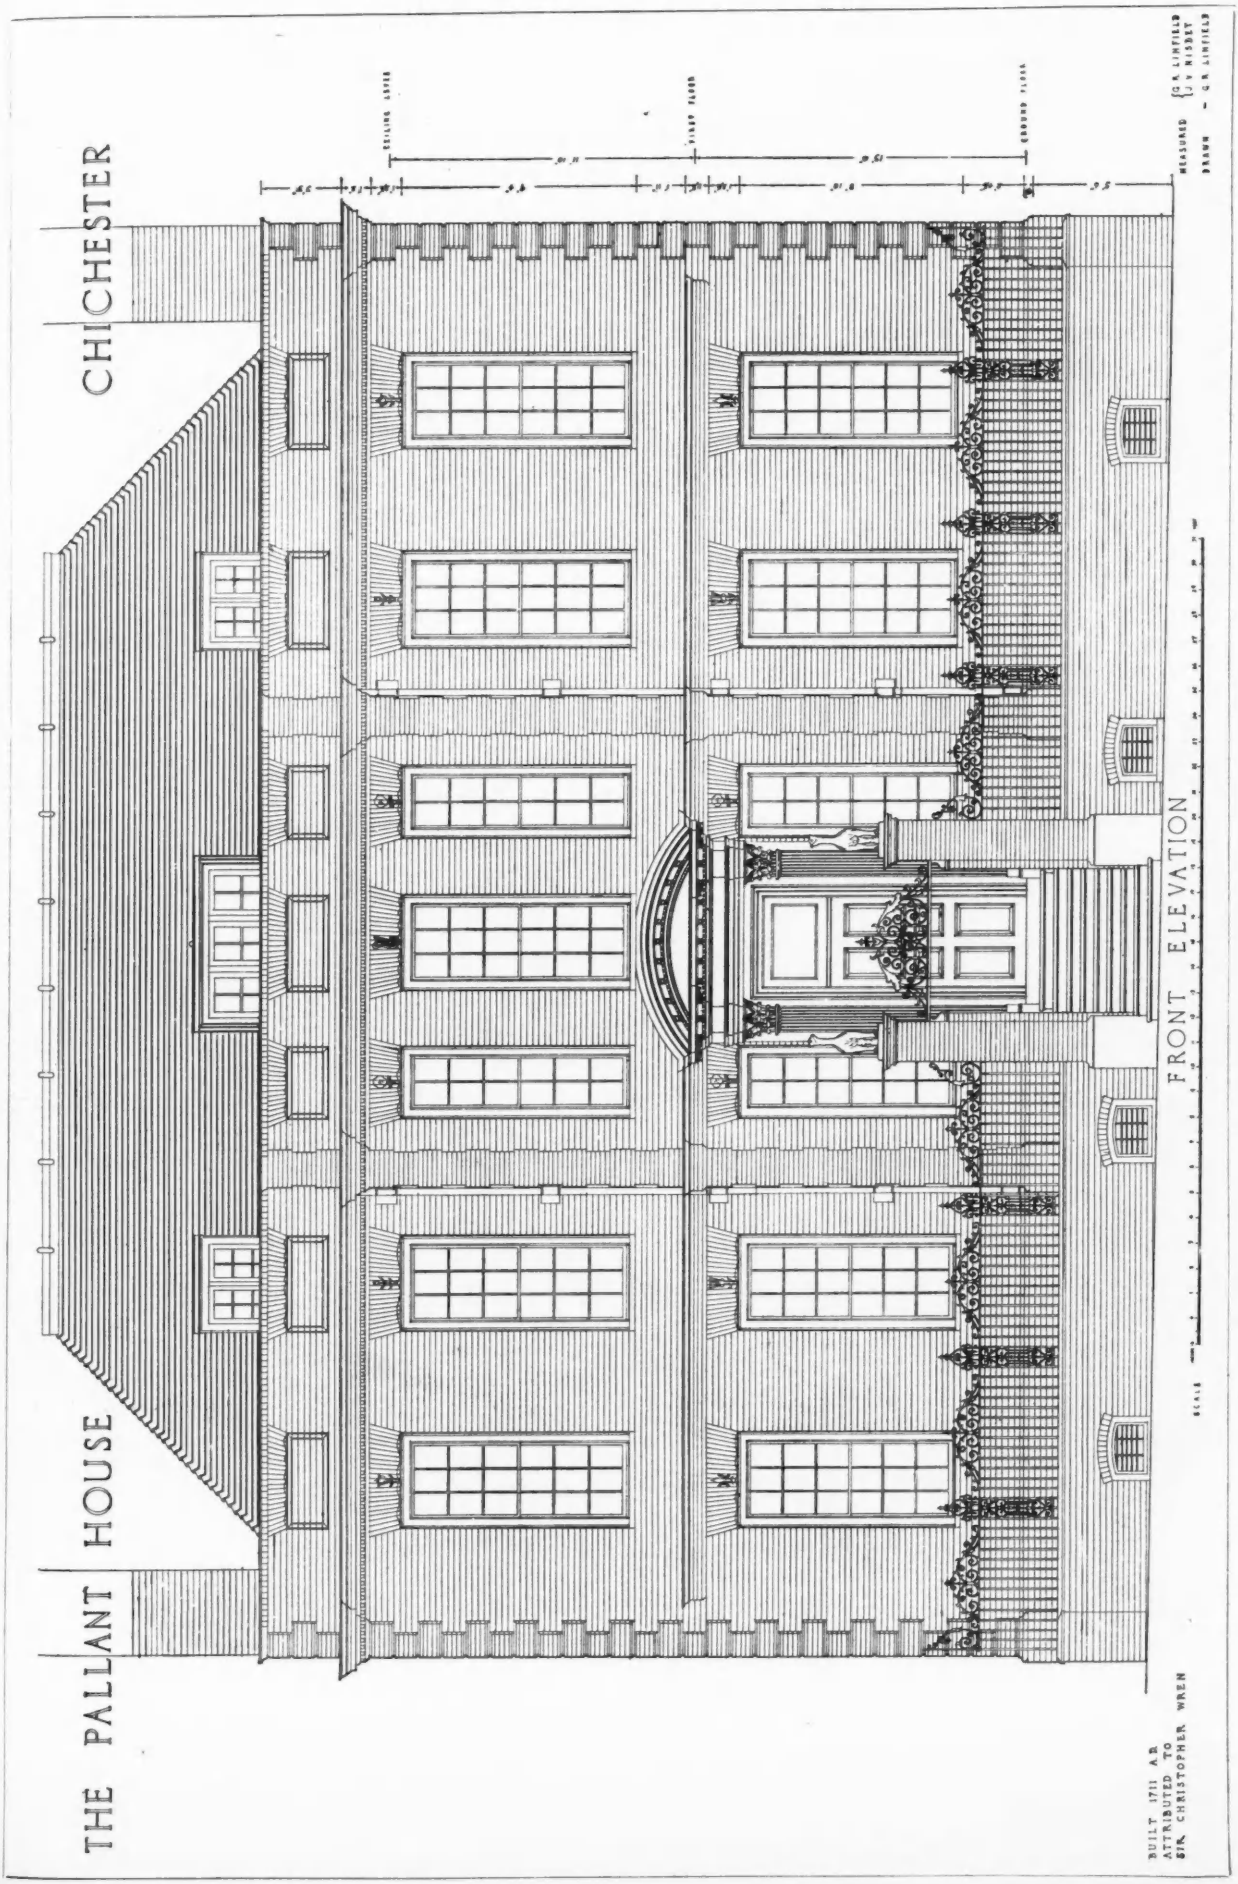
Aluminium paint can be used upon heated surfaces, such as steam pipes, hot-water pipes, flue pipes, furnaces and domestic boilers, where it is desired to reduce the heat dissipation to a minimum, more especially as the paint shows satisfactory adherence to the heated surface, even at temperatures as high as 700° F. The paint must, however, be applied to a clean, rustless surface (which should not be too smooth), and should be allowed to become quite dry before being subjected to the heat.

Under these conditions, if the surface is hot enough to destroy the vehicle, the aluminium bronze powder will still adhere to the surface of the iron, provided it is not exposed to the weather. Resin varnish will be found the most satisfactory vehicle for use in this connection. C. H. B.

Perspective Work

S. R. writes : "*Can you inform me how to set up the special form of T square, with moveable arms, used in drawing perspectives where the vanishing point is a long way beyond the drawing board ?*"

The vanishing point must first be correctly found and two lines, A B and C D, one above and one below the horizon line, drawn from this point on to the paper.



Then take any two points A, C, and in them fix the special pins on which the arms slide. Join A and C.

Set movable arms of T-square so that angle ZXA = DCA and angle ZYC = BAC.

All lines drawn on ZX as it slides over the points A and B will then converge to the true vanishing point. L. W. H.

The Pallant House, Chichester—or Swan House, as it is also called, from the somewhat indeterminate fowl sculptured at the tops of the gate piers—was built in 1711 and is attributed to Wren. Latterly in use as offices of the Westhampnett R.D.C., it is mainly of red brick; cornice, string-course, window-heads and quoins being cut. On the facing page is reproduced a drawing of the front elevation, measured by J. V. Nisbet and G. R. Linfield and drawn by the latter ; others, of external and internal details, will appear in forthcoming issues.

STEEL STRUCTURES RESEARCH

Conference Recommends New Scientific Code

SIR CLEMENT HINDLEY, chairman of the Steel Structures Research Committee, presided on October 16 over a representative conference held at the Institution of Civil Engineers. A resolution was unanimously carried approving the value of a standard practice for the employment of structural steel in building, and expressing the hope that the results of the work of the committee would be applied as they accrued.

Four influential bodies had prepared statements that were laid before the conference, and their points are briefly summarized below :

STEEL STRUCTURES RESEARCH COMMITTEE

It is becoming generally realized that full advantage is not being taken of the excellent qualities which steel possesses as a material for building construction. This neglect is attributable partly to the lack of precise knowledge of the strength characteristics under load, and partly to the prevalence in building codes of restrictions, which, whatever their merits in the early stages of development, have remained too long unrevised.

The factor of safety originally adopted was really a factor of ignorance to allow, amongst other things, for the incomplete stress analysis. The same factor is still used in the design of a good deal of steel construction, notwithstanding the advances made in both the quality of the material and general knowledge of structural design. So far as theory of structures is concerned, the important developments associated with aircraft design and with the design of railway bridges have not been so marked in general steel construction.

The time seems opportune for an organized attempt in England to introduce more exact methods of calculation. By refining the methods of stress calculation it will be possible to obtain a much closer idea of the stresses in a given structure and to adopt a more precise factor of safety.

An authoritative research committee has been appointed, consisting of representatives of the Institution of Civil Engineers, of the British Steelwork Association, and eminent engineers nominated by the Department of Scientific and Industrial Research, to supervise and direct the work. Its terms of reference are :

1 : To review present methods and regulations for the design of steel structures, including bridges.

2 : To investigate the application of modern theory of structures to the design of steel structures, including bridges, and to make recommendations for the translation to practice of such of the results as would appear to lead to more efficient and economical design.

MINISTRY OF HEALTH

The lengthy memorandum on the law and practice of public control of building in England and Wales (with appendix on the Scottish law of building), prepared by the Ministry of Health, had as its aim the logical arrangement in relation to building practice, and specially to steel structures, of the main features of a very complex branch of law. The scheme of arrangement was :

1 : The authorities exercising control.
2 : The legal forms of control.
- (i) General Acts.
- (ii) Local Acts.
- (iii) Subordinate legislation.
  - A. Bylaws.
  - B. Regulations.
  - C. Town planning.
- (iv) Discretionary powers.

3 : The law as it is, and what happens in practice.
- A. Bylaws.
  - Model bylaws; the policy pursued.
  - Local bylaws; the policy becomes effective.
- B. Local Acts.
- C. Notices and plans.

4 : Interpretation and application.

BRITISH ENGINEERING STANDARDS ASSOCIATION

After recapitulating the objects of the British Engineering Standards Association, their statement went on to remark : The members of the conference are probably quite aware that the work carried out by the Association under the general term of standardization includes the preparation of British Standard Specifications defining quality of material, standards of performance, and also factors of safety and methods to be adopted for assessing them. In fact, the preparation of any agreed technical basis or conditions deserving of national adoption as a British standard for the assistance of industry, may be said to come properly within the scope of this Association.

It is generally recognized that the work of research necessitates a somewhat different outlook from the work of preparing industrial standards, and the fact that the practical recommendations based on research are so often prepared and issued by the British Standards Association has quite definite advantages.

Research committees are generally seeking for perfection in their work and are consequently apt to feel it difficult to issue any recommendations to industry until their work is completed, whereas the committees of the Association, by their very constitution, necessarily take the purely industrial point of view and are prepared to adopt more or less provisional recommendations for immediate industrial purposes. They leave experience on the practical application of the specification and the completion of the research work to bring about the improvements desired.

BRITISH STEELWORK ASSOCIATION

The British Steelwork Association was formed :

To promote and develop the production and use of structural steelwork throughout the Empire;

To encourage experimental and research work for the purpose of improving methods of manufacture and design of steelwork and evolving new uses for steel;

To collect and spread information on structural steelwork, to offer service to architects, engineers and local authorities; and to be prepared to supply information to universities and technical colleges on the latest practice in the design and fabrication of steelwork, and, in fact, to operate as an information bureau on steel in modern bridge building and building construction.

It is generally recognized that if the building industry is to keep pace with modern requirements, more rational methods of building are essential. But a rationalization of the building industry presupposes a rationalization of the legal control exercised by which alone uniformity of design and standardization can be effected. The beginnings of this are well exemplified in the model bylaws of the Ministry of Health, and in seeking the aid of the Department of Scientific and Industrial Research and the British Engineering Standards Association in the problems which confront it, the steel industry is making its contribution towards a more rational basis of construction.

THE PROCEEDINGS

The chairman, in the course of his presidential speech, said the committee had decided on the early issue of an interim report, formulating a code of practice in steel structure design; but they were aiming at no hard and fast standardization which in a few years might become out of date.

In the subsequent discussion, Mr. David Anderson, representing the Institution of Civil Engineers, and Mr. W. T. MacLellan, president of the British Steelwork Association, were at one in advocating advance by standardization; Mr. A. N. C. Shelley said the Minister of Health was considering how far the results of the conference could be applied, while retaining local freedom in bylaws ; and Mr. G.

Topham Forrest said the L.C.C. were in sympathy with any and every endeavour to secure greater simplicity and economy in steel construction. Dr. H. M. Tory (Canada), Mr. J. Davies (Australia), Dr. Marsden (New Zealand), and Mr. W. A. J. Day (South African State Railways) expressed approval of and keen interest in the aims in view.

LITERATURE

THE NINETEENTH CENTURY

SOME years ago it was the fashion to decry everything Victorian. A more balanced criticism today appraises the nineteenth century and discovers much of permanent value among the rubbish. Perhaps Freudians will discover that the time spirit also has an inferiority complex, which forces it to ridicule the immediate past. Whatever may be the cause it is certain that the present finds the follies of the Edwardians more amusing than those of the Early Victorians. The latter are becoming interesting, and this book is an attempt to understand an age, as well as an excuse to poke fun at some of the Olympians.

It was the Great Exhibition of 1851 that divided the nineteenth century both in time and in mind. Throughout its first fifty years the tradition of the eighteenth century persisted side by side with the romantic urge of the Gothic Revival. The really great names were not Wyatt and Essex, but Cockrell, Decimus Burton, Soane and Barry, architects who founded their designs on classic tradition, the last even going so far as to prepare a classic plan for his Tudor Houses of Parliament. It is only after 1851 that chaos reigns, and in spite of such Gothic architects as Scott and Street one finds a style of "Modern-Venetian-Grecian-Gothic-Baroque-Georgian all put into the pot and stirred well."

Parts of this book should be read as a cautionary guide by critics, and the quotations from the Victorian *Builder*, *Punch*, and *The Times* should make their modern descendants becomingly wary. When Edwin Chadwick suggested, among other things, that the drainage of towns should be conveyed in sewers, *The Times* wrote: "We prefer to take our chance of cholera and the rest, than to be bullied into health"; and it was not until the smells from the Thames became intolerable under the windows of the House of Commons that anything was done to co-ordinate the drainage of London.

To some of the later architects of the century the author does not seem to do justice. The influence of Norman Shaw was profound on his many famous pupils. Pearson is not lifted into the "realm of architectural myth" solely on the merit of his work at Truro and Malta. His London churches are scholarly, and St. John's, Red Lion Square, a masterpiece of planning. Something has surely happened to Mr. Harbron towards the end, when on page 156 he says that "Sir Horace Jones clothed the skeleton of the Tower Bridge in a suitable garment," and dismisses Belcher as an architect who used classic motifs "in a personal fashion, with lumps and knobs on." The Tower Bridge is the most meretricious building in London, and Belcher, in his Mappin Building and in other places, was trying to evolve a design for the modern shop-front that would be architectural as well as commercial—no easy task at a time when the London shopkeepers had been badly scared by Norman Shaw's Regent Street façade.

There is an alluring gaiety about the book which conceals the scholarship. Like the Jester of the "Yeomen of the Guard," Mr. Harbron wears motley,

> For he who'd make his fellow-creatures wise,
> Should always gild the philosophic pill.
>
> LL. E. W.

Amphion, or The Nineteenth Century. By Dudley Harbron, F.R.I.B.A. London: J. M. Dent and Son. Price 6s. net.

LITTLE-KNOWN ENGLAND

THERE must be few people in England today to whom Mr. Harold Eberlein's latest book, *Little-Known England*, will not convey a certain feeling of ignorance and regret. How few of us really know this country in which we live! Here, however, is our opportunity of exploring it with the author as our able guide. We can wander with him through parts of East Anglia, the Chilterns, the Cotswolds, and other places of historical interest as well as of extraordinary beauty.

The book is well written, and the reader's interest is not allowed to wane in any part. It is obviously the work of a man who writes from experience, not merely from a knowledge gleaned by delving in tourists' guides, as are so many of the inferior books in this category.

During his survey of the Welsh Borderland the author makes some interesting remarks concerning the entrance into Ludlow Town. He says: ". . . of all the roads into Ludlow town, none is so beautiful, none has such truly dramatic quality, as the road from Hereford. It drops down a sharp rise at the end of Bringewood Chase and, just as it rounds a bend, there is Ludford Bridge, a splendid mediæval stone-arched structure over the Teme. Opposite is the town, piled up on an eminence, its west and south sides washed by the Teme, whose waters murmur over the weirs. The bridge continues the downward slope of the road to the farther bank; thence a broad street sweeps straight uphill to the ancient south gate. Within the gate (see illustration on this page) this goodly street goes right up to the brow of the hill in the centre of the town. The sudden view of this broad, steep roadway bursting upon you unexpectedly, after the narrowness of the gateway, makes you catch your breath. "Many of the houses on both sides show stately Georgian fronts; others, of earlier date, proclaim the local half-timber tradition. It is as noble an entrance as any town in England can boast." Those of us who have seen this entrance to Ludlow cannot but applaud Mr. Eberlein's vision.

The author incorporates in his book five invaluable scale maps, namely, the

The Narrow Gateway, Broad Street, Ludlow, Salop.

[*From* Little-Known England.]

Welsh Border south of Shrewsbury, the Cotswolds, the Berkshire Downs, North Buckinghamshire and the Chilterns, and East Anglia and Essex.

The book is as competently illustrated as it is written; and, in conclusion, I can only hope that the author's exposure to the public eye, in such an enthralling manner, of the favourite haunts of many lovers of beauty, will not lead to the necessity for rubbish boxes and anti-litter campaigns in the woods and on the downs of Little-Known England. SOCIETIES AND INSTITUTIONS

ROYAL INCORPORATION OF ARCHITECTS IN SCOTLAND

THE first meeting of the session of the Council of the Royal Incorporation of Architects in Scotland was held at 15 Rutland Square, Edinburgh—Mr. John Watson, A.R.S.A., F.R.I.B.A., Glasgow (president), in the chair. Prior to the meeting the members of Council were entertained to luncheon by the president, the prize-winners for the past session and Mr. J. N. Summerson, B.A., editor of *The Quarterly*, being the guests of the Incorporation. At the luncheon Mr. J. B. Moffat, of the College of Art, Edinburgh, who gained the Rowand Anderson Scholarship of £100, was presented with the silver medal, which is awarded with it.

The secretary reported on the donations received to date for the Lorimer Memorial Fund; and intimated that representatives of the architects, surveyors, and contractors would at an early date resume consideration of the provision of the general conditions of contract affecting building works in Scotland. Mr. Watson stressed the great importance of all accredited architects in Scotland being members of the Incorporation through one or other of its five Chapters and of the R.I.B.A. conjointly.

Mr. J. T. Thomson, Glasgow, was elected a Fellow of the Incorporation, while Messrs. Andrew Douglas and H. S. M'Nair, both of Ayr, were elected Associates.

THE STOCKHOLM EXHIBITION

A lecture, illustrated by lantern slides, on "The Stockholm Exhibition of 1930" was delivered by Mr. Charles Marriott to a meeting of the Anglo-Swedish Society on Wednesday last. Sir Harold Wernher occupied the chair.

Mr. Marriott said what he did not think was sufficiently recognized was that the Stockholm Exhibition was a belated recognition of a great change in the conditions of life and industry—the substitution of machine for hand labour. It was the most consistent attempt he had seen to show what could be done with characteristic methods of production. The movement represented was not peculiarly Swedish; it was an international movement, but the architect, Mr. Asplund, had given to it a Swedish flavour.

Roughly, he stated, there were three ways of treating contemporary civilization; one was to run away from it; another was to become enthusiastic about it; and the third, and he thought the best way, was to take it for granted. The Stockholm Exhibition was a frank and calm acceptance of things as they are, and an attempt to make the best of them artistically on their own lines; and as reflecting the Swedish combination of idealism and common sense it cleared the way for the future.

THE WORK OF THE CIVIL ENGINEER

The opening meeting of the Institution of Civil Engineers (Manchester and District Branch) was held in Manchester on Thursday last.

Mr. W. F. H. Creber, the new chairman of the branch, in his address suggested that the engineer needed more courage, that he should be pleased to discover, if he could, a flaw in a Lutyens building, or a redundant member in a Dean bridge. Engineers today were inclined to float along on the inherited experience of the engineering profession; they were spoonfed in this age of every kind of machine. In the days of Middleton, Vermuyden, Smeaton and Brindley, every engineer was "his own scientific man," and it would be well if all engineers were to recall first principles now and again, to look at their objective and ask what were its essentials. Engineers should remain students after they had left the student class, for their work was not concerned merely with technical problems, but with economic, legal, and commercial problems, too.

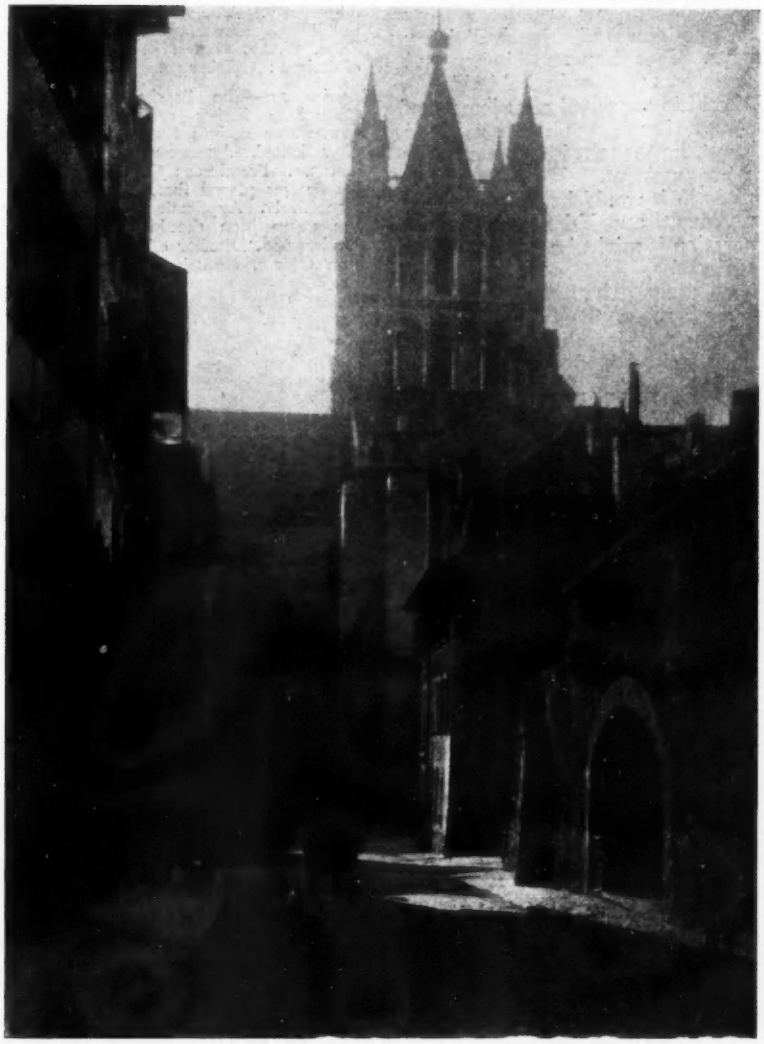
STRUCTURAL SCIENCE IN MEDIÆVAL TIMES

Sir Banister Fletcher, P.R.I.B.A., lecturing at the Central School of Arts and Crafts, on Wednesday last, gave a graphic description, illustrated by lantern slides and models, of the structural principles of Gothic cathedrals, in their "vaulting" or arched stone ceilings; their buttresses, to resist the thrust of such vaults; and their flying buttresses to bring the pressures of the high vaults down across intervening roofs to the outer edge of the buildings.

He explained the evolution of vaulting types, from the continuous barrel vault like that of a Tube railway tunnel, through the cross-vault, to the type characteristic of mediæval work.

IN THAT CONTINGENCY

The following inquiries and answers on corrosion of metal by magnesium chloride, and damp roofs, are two recently submitted by contractors to the Building Research Station. The information given in the replies quoted is based on available knowledge.



CONTRACTORS reported : That, when mixing chemicals for jointless flooring, sub-contractors allowed a tub to leak on to a reinforced concrete landing, 6 ins. thick, in which a heating panel had been installed.

They stated that the chemical contained in the tub was understood to be a chloride and feared that some corrosion would take place: they desired advice as to the course which should be pursued in order to minimize the damage caused by the liquid.

It was ascertained that the floor was of dense, well-compacted concrete, and that the bulk of the solution had been absorbed by adjacent brick walls.

Reply : Magnesium chloride solution, used in laying magnesium oxychloride jointless flooring, has an aggressively corrosive action on metals such as iron or steel. Cases have been investigated where serious corrosion of heating installations has occurred on account of failure to insulate piping from the corrosive action of flooring of this type.

In this particular case the landing, being made of good dense concrete, is unlikely to have absorbed any appreciable quantity of the chloride solution. The few areas on the underside, where a superficial layer is affected by solution which had passed through a hole in the floor and spread along the lower surface, could be treated by chipping off the surface concrete to a depth of about $\frac{1}{4}$ in.

[*Reproduced by courtesy of The Royal Photographic Society.*

A photographic study of the Cathedral, Lausanne. By the late Charles Job.

The condition of the adjacent brick walls is a more serious matter as it is evident that a large amount of the chloride solution has been absorbed. The effect of the presence of the solution in the areas affected will be to have a strongly corrosive action on embedded electrical conduits, and it will tend to cause disfiguration of internal decoration by damp stains owing to the hygroscopic nature of the salt.

So far as can be seen, there are only two possible treatments to remedy the trouble in this case. Complete removal of all saturated brickwork would obviously be the most effective method, but considering the advanced state of the building work this would hardly be practicable.

The alternative would be to insulate all metal, such as electrical conduit and pipe runs passing through the wall, from the corrosive effect of the chloride solution by means of a thorough coating with bitumastic paint or similar preparation. Disfigurement of decoration could be avoided by treating the affected area of brickwork with a waterproof membrane on the inner face over which plaster and decorations could subsequently be applied. An attempt should be made to remove the salts at the exterior face of the wall by periodic washing with copious amounts of water.

Damp Roofs

Slating and tiling contractors reported : That trouble had been experienced due to penetration of moisture through a roof covered with hand-made, sand-faced tiles. It was found on inquiry that the roof had a steep pitch of 50°. The tiles were laid on battens nailed to the rafters, and were torched on the underside. The penetration of moisture was confined to south and west aspects of the roof, and took the form of dampness of the rafters which conducted the moisture to the ceilings below. It appeared that the tiles were quite normal in respect of porosity.

Reply : It was concluded that this case was similar to a number of others which had previously been considered and that the penetration of moisture was due to the torching which had been applied.

When tiles are hanging on battens or boarding, *without torching*, there are a number of points of contact between tiles and timber, but no continuous capillary path between them, and the worst condition likely to be experienced would be the presence of a slight amount of moisture on the timber at the points of contact.

With a torched roof a different condition arises as the mortar may, and usually does, provide a continuous capillary path through which water can gain access to a large area of timber. It was suggested that the torching should be removed over the affected area of the roof.

LAW REPORTS

LESSEE'S CLAIM FOR RELIEF

Berliner v. *T. M. Fairclough and Sons, Ltd. T. M. Fairclough and Sons, Ltd.*, v. *Berliner. Chancery Division. Before Mr. Justice Maugham*

THESE two actions centred around the premises known as Premierland, Whitechapel, and judgment was given for Messrs. Fairclough, the lessors, for possession, his lordship holding that where a lessee claimed relief, the word lessee included all those who enjoyed the term of the lease as joint tenants, and that relief could not be given where only one lessee applied for it. It appeared that there were two lessees, Mr. Berliner and a Mr. Lyttlestone, and the former did not join in the application for relief against forfeiture nor for a new lease or compensation. There were two leases, and they contained full repairing covenants. The premises were in a rough state, and there had been trouble in regard to the repairs.

The defendant Lyttlestone, through his counsel, sought relief. Mr. Berliner appeared in person and said he wished to be free of all liability as soon as possible, and did not seek relief.

Evidence was given that the premises were in a dilapidated state.

His lordship gave judgment for possession as stated.

CLOSING ORDER

Parry v. *Rochester Corporation. Parry* v. *St. Catherine's Hospital. Chancery Division. Before Mr. Justice Maugham*

THE first action was brought by Mrs. Emily Parry, carrying on a tobacconist's business at 228 High Street, Rochester, against the Rochester Corporation for a declaration that a certain closing order made in March, 1929, in respect of a dwelling-house known as 228 High Street, Rochester, purporting to be made by the Corporation, was illegal, *ultra vires* and improper, and for an injunction restraining the Corporation from acting upon any such order.

There was a second action by the same plaintiff against the trustees of St. Catherine's Hospital for damages resulting from the Corporation's action in regard to the premises.

It was decided to hear the cases separately.

Mr. Kelly appeared for the plaintiff, Mr. Johnston and Mr. Gordon Alchin for the Corporation, and the trustees were represented by Mr. Johnston.

The action resulted from a closing order made under the Housing Act in relation to the plaintiff's premises. The Corporation were part owners of the premises. The plaintiff had been in possession of the premises since 1898. The site was an island site. The plaintiff was a weekly tenant at 12s. 10d. a week. The Corporation decided to make alterations in the street and set it back, and they gave the plaintiff notice to quit. There was an action for possession in the County Court in January, 1929, which was dismissed by the judge, who held that the Corporation had not proved that there was alternative accommodation for Mrs. Parry. Adjoining property was demolished and damage was then done to the plaintiff's premises. Proceedings were taken for a closing order, and the Corporation, in 1929, made such an order. For the plaintiff it was submitted that the order was *ultra vires*, as the Corporation had not used its discretion.

Mr. Kelly argued that it must be shown in order to make a closing order that the whole house was unfit for habitation and not part of it only, as in this case. Here the plaintiff had resided in part of the house all along.

Plaintiff gave evidence as to the damage done to her premises during the demolition of the adjoining property. Her shop and kitchen and two bedrooms were quite habitable.

His lordship suggested a settlement of the case, saying though he was ready to try it out, he thought it was a case for some arrangement. If he found for the plaintiff it would hold up a public improvement, and if he found for the Corporation it might be a hardship on the plaintiff.

After consulting with his lordship in his private room, the two cases were adjourned in order that a settlement might be arrived at if possible.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9, Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

St. Dunstan's Report

The fifteenth annual report of St. Dunstan's states that the financial position, which is and always has been based solely upon voluntary contributions, has been well maintained. The endowment of St. Dunstan's, begun three years ago, and estimated to be concluded twelve years hence, proceeds satisfactorily. The blinded soldiers and sailors under the care of St. Dunstan's throughout the Empire have been provided through the agency of St. Dunstan's organization with more employment than in any previous year. St. Dunstan's responsibility necessarily extends to the blind men's wives and children, and the family thus numbers 1,911 officers and men, and 5,101 wives and children.

COMPETITIONS OPEN

October 30.—Development of a site at Liverpool, fronting St. John's Lane, Queen Square and Rose Street. Premiums: £250, £100 and £50, for first, second and third prizes, respectively. The Secretary, the General Building Syndicate, Ltd., 36 St. Martin's Lane, W.C.2. Latest date for submission of designs: October 30.

November 17.—The Scarborough Education Committee invites architects to submit competitive designs for the Seamer Road New School. Assessor: Morris Thompson, F.R.I.B.A. Premiums: £100, £60, and £40, for designs placed first, second and third, respectively. Applications for conditions of the competition should be made to R. Underwood, Director of Education, Education Offices, Huntriss Road, Scarborough, not later than November 17. Deposit £1 1s. Latest date for submission of designs: January 17.

November 30.—The Burton-on-Trent Local Education Authority invites architects to submit competitive designs for a proposed new Council school to accommodate approximately 800 children, to be erected on a site in Clarence Street. Assessor: H. T. Buckland, F.R.I.B.A. Premiums: £150, £100 and £50 for the designs placed 1st, 2nd and 3rd, respectively. Applications for the conditions of the competition and site plan should have been made before September 8 to L. E. Burgess, Secretary and Director of Education, Education Offices, Guild Street, Burton-on-Trent. Latest date for submission of designs: November 30.

November 30.—The Guildford Cathedral Committee invites any architect, who has been engaged in the design of cathedrals or churches, to submit for examination drawings and other illustrations of his works; or a design for a cathedral. Not more than three sets of drawings may be submitted, packed in one large portfolio. The Committee, with the assistance of Mr. Walter Tapper, A.R.A., will examine the portfolios, and select a limited number of architects for the Final Competition. Each architect selected for the final competition will receive 500 guineas, whether his design is accepted or not. Portfolios should be addressed to The Venerable the Archdeacon of Surrey, The Diocesan Office, Lloyds Bank Chambers, Guildford, not later than November 30.

December 25.—A prospectus giving full particulars of the international competition for the Ukrainian State Theatre, organized by the Kharkov Town Council, Russia, has recently been issued. The theatre is to be erected in the centre of Kharkov, on the site of the present Comsomolsky Square (Young

Communist Square), and will contain a mass musical stage, and seating capacity for 4,000 persons. The competition will be assessed by a jury comprising a president, vice-president and fifty-six members. Prizes: 1st, 10,000 rub.; 2nd, 8,000 rub.; 3rd, 6,000 rub.; 4th, 5,000 rub.; 5th, 4,000 rub.; 6th, 3,000 rub.; 7th, 8th and 9th, 2,000 rub.; 10th, 11th, 12th, 1,500 rub. Drawings should be sent to the Kharkov Town Council on or before December 25. Copies of the prospectus are obtainable from the Embassy of the Union of Soviet Socialist Republics, Harrington House, 13 Kensington Palace Gardens, London, W.8.

December 31.—The Incorporated Association of Architects and Surveyors invites competitive designs for a Model Petrol Filling and Service Depot. The competition has the full support of the Automobile Association, the Scapa Society and other bodies which have at heart the preservation of the countryside, as well as the principal motor-trade journals. Assessors: Alfred Stephens Cross, M.A. (CANTAB.), V-P., I.A.A.S.; Edward H. Fryer, Deputy Secretary of the Automobile Association; and Walter Groves, Editor of *The Motor*. Prizes: 50 guineas, 20 guineas and 10 guineas for first, second and third places, respectively. Smaller awards may also be made on the advice of the assessors, and at the discretion of the Council of the Association. In addition a prize of 10 guineas and two prizes of 5 guineas each will be awarded to laymen for the best suggestions submitted with or without sketches. Full particulars, etc., are obtainable from the Secretary, the Incorporated Association of Architects and Surveyors, 1 Wilbraham Place, London, S.W.1. Latest date for submission of designs: December 31, 1930.

February 1.—The Norwich Corporation invites architects practising in Norwich and in the County of Norfolk to submit competitive designs for a proposed new fire station to be erected on a site in Bethel Street, Norwich. Conditions of the competition are obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. Deposit, £1 1s. Latest date for submission of designs: February 1, 1931.

No date.—The Committee of the Foundation Hospital and the Rectorate of the Royal Yugoslavian University of Zagreb invites competitive designs for the general rebuilding plans of the Foundation and Clinic Hospital of Zagreb. Assessors: 1. Dr. Srkulj Stjepan, Burgomaster and Chairman of the Foundation, as president of the jury. 2. Henauer, W., architect, of Zurich (or his representative, Ch. Thevenaz, architect, of Lausanne), for the Swiss Engineers' Association of Germany. 3. Dr. Ing. Kreis Wilhelm, of Dresden, for the Engineers' Association of France. 4. Arch. Expert H.R., of Paris, for the Engineers' and Architects' Association of France. 5. Dr. Culumovic Pavao, Primarius, for the Medical Association of Zagreb. 6. Ing. Gabric Franjo, for the Yugoslavian Association of Engineers and Architects, Zagreb section. 7. Dr. Rasuhin Josip, deputy for the Directors of the Institute of Hygiene Foundation Hospital of Zagreb. 8. Prof. Dr. Prasek Emil, for the medical faculty of Zagreb. 9. Dr. Durst Franjo, for the medical faculty of Zagreb. 10. Arch. Heinzel Vjekoslav, Alderman of the City of Zagreb. Committee representative of the jury: Ing. Jurkovic Mato, Stadtbaurat in Zagreb. Prizes: 1st, 20,000 Swiss francs; 2nd, 15,000 Swiss francs; 3rd, 10,000 Swiss francs. 15,000 Swiss francs have been set aside for any further work which may be required. Programme and particulars of the competition will be sent on or after August 15, 1930, on application to the Stadtvorstand of Zagreb (Mr. Matica, secretary), Room No. 70, 2nd floor, on payment of 200 dinar. Latest date for submission of designs: January 15, 1931.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

The New Victoria Theatre (pages 608, 611-615). General contractors, McLaughlin and Harvey, Ltd. Sub-contractors : H. Young & Co., Ltd., constructional steelwork; J. Jeffreys & Co., Ltd., heating and ventilating; C. Isler & Co., Ltd., artesian well and pumps; F. Bradford & Co., Ltd., ferro-concrete balcony and staircases; Concrete, Ltd., ferro-concrete floors; Burn Bros. (London), Ltd., plumbing and sanitary work; Stuart's Granolithic Co., Ltd., artificial stone facings and pavings; F. Braby & Co., Ltd., water tanks; Frank Burkitt, fire-proof curtain and counterweight system; Dennison, Kett & Co., Ltd., roller shutters; J. Gardner & Co., Ltd., ventilating louvres; Conrad Parlanti, Ltd., outside canopy and wrought metalwork; Garton and Thorne, Ltd., wrought metalwork; Henry Hope and Sons, Ltd., steel sashes and stage lantern light; J. A. King & Co., Ltd., pavement lights; Self-Sentering Expanded Metal Co., Ltd., steel centering for plaster works; J. W. Gray and Son, Ltd., lightning conductor; Brunswick Engineering Co., sliding roof shutter; Fenning & Co., Ltd., granite; Clarke and Vigilant Sprinklers, Ltd., sprinklers and fire hydrants; Shanks & Co., sanitary apparatus; The Chiswick Guild, wood panelling; John Bennie, Ltd., passenger lift; Morant and Miller, Ltd., glass ceiling lights; Clark and Fenn, Ltd., fibrous plaster and decorative works; Lap (C.I. Process), Ltd., modelled exterior panels; Venesta, Ltd., plymax doors and wall linings; Art Marbles Stone and Mosaic Co., Ltd., marble floors; Marble Mosaic Co., Ltd., terrazzo floors and wall linings; W. W. Turner, Ltd., seats and carpets; Lawford & Co., asphalt; Cement Marketing Co., Ltd., cement; London Brick Co. and Forders, Ltd., bricks; The Standard Insulator Co., Ltd., rubber flooring; F. H. Pride & Co., electrical fittings; John Compton Organ Co., Ltd., organ; Siemens-Schuckert (Great Britain), Ltd., stage lighting ; Plastex Manufacturing Co., plastic paint. The Strand Electric and Engineering Co. were responsible for much of the stage lighting equipment. In addition, the whole of the stage scheme of colour lighting was obtained by the use of Strand Electric's colour media.

Factory, Coach and Horses Yard, Savile Row, W.1 (page 625). General contractors, Bywaters and Sons, Ltd. Sub-contractors : Salter Edwards & Co., Ltd., asphalt; Aston Construction Co., Ltd., structural steel; J. A. King & Co., Ltd., fireproof construction; Watkins and Stone, electric wiring; John Bolding and Sons, Ltd., sanitary fittings; Stuart's Granolithic Co., Ltd., stair treads; A. E. Davis, door furniture; Crittall Manufacturing Co., Ltd., casements; Bostwick Gate and Shutter Co., Ltd., folding gates.

TRADE NOTES

Mr. L. V. Kenward, who has during the past twenty years occupied various positions with the Dunlop Rubber Company and latterly that of general sales director, has now been appointed general manager of subsidiary companies. Mr. Kenward will therefore no longer be intimately associated with the sale of tyres, but he will retain his seat on the Fort Dunlop local board which deals with tyre questions. The subsidiary companies include the Macintosh group of companies engaged in the rubber footwear, water and rainproof garment and general rubber goods businesses. Since the companies were acquired in 1926 these lines have been assuming an increasingly important place in the Dunlop output and the Board has come to the conclusion that the time has arrived when special arrangements should be made for their intensive development. It will be remembered that Mr. L. V. Kenward was recently re-elected chairman of the India Rubber Manufacturers' Association for the second year in succession.

*

Perforated metals for any screening, grading, cleaning, sorting and filtering requirement are the subject of catalogue No. 464, just issued by Messrs. G. A. Harvey & Co. (London), Ltd. Illustrations and details are given of numerous patterns of perforations, including round, square, diamond square, slots of various types and placings, stabbed, embossed and ornamental patterns. It is the boast of the firm that they are able to supply any perforated metal requirement for any purpose. In addition to iron and steel, the firm perforate nickel, stainless steel, copper, brass, bronze, monel metal, aluminium, lead, delta metal, duralumin, zinc, tinplates, as well as paper, boards, and cloth. The perforated metals meet every requirement, from the screening of coal, coke, gravel and ore to the sifting and separating of food products and fine chemicals.

*

The Interoven Stove Co., Ltd., sole manufacturers of Pascall's patent Interoven and Super Interoven convertible stoves, and of the Bewty fire adjustable barless front (Pascall's Patent), have just issued a new catalogue to the trade. In it are shown several reductions in prices, which the firm are able to make owing to the large and increasing demand for their manufactures. Leaflets have also been published to illustrate and describe two of the firm's new specialities : the Cheerio boiler and the Super Bewty fire. The latter not only converts the old register grate into a modern barless fire, but it also replaces the burnt-out bottom bars. The Cheer-ee-o is an open fire, continuous burning, heating stove, which can, it is said, be kept alight day and night at minimum cost. It is claimed that the combustion in the stove is so perfect that only a very small amount of ash accumulates in the ashes pan. The stove can be connected to any fire grate or in any position where it is possible to instal a flue pipe of 5 ins. diameter, and is easily fitted without employing expert labour. The Cheerio domestic boiler is a wrought steel independent boiler suitable for connecting to a 35-gallon tank, and with an output of 35,000 B.T.U.'s. The main advantages claimed for the boiler are an excellent open fire and a good hotplate for cooking. It is also claimed that the boiler will not crack either when coated with fur or in frosty weather.

*

Mr. John Ames, secretary and general manager of the Portland Cement Selling and Distributing Co., Ltd., the selling organization of the Red Triangle Cement group, has been elected chairman of the Incorporated Sales Managers' Association for the ensuing year. Sir Francis Goodenough was elected president.

*

Some striking reductions in the prices of Unity Tubular skirting heaters are shown in the revised list prices. The new prices affect sixteen different types of heater and show reductions in prices in most cases of over fifty per cent.

*

The factories of The Brilliant Sign Co., Ltd., are daily turning out a record number of signs suitable for every conceivable purpose. Those of our readers who can take the opportunity to visit the company's new reception room and showroom at 131 Uxbridge Road, five minutes from Shepherd's Bush Tube Station, will find an extensive display of signcraft of every description, and a number of new effects to blend with modern frontages and fittings, which should appeal particularly to those contemplating reconstruction work. In congenial surroundings, visitors may examine and test the efficiency of the Brilliant Sign Co.'s products. They may also visit the company's adjoining factories which embrace three acres of floor space, and provide employment for five hundred workmen. The various processes of manufacture and the great array of costly machinery cannot fail to interest. The firm, it will be recalled, invented the original Brilliant letter forty years ago. They have now issued a new catalogue, a voluminous production with many illustrations in full colours, a copy of which may be obtained on application to The Brilliant Sign Co., Ltd., Paragon Works, Shepherd's Bush, London, W.12.

ANNOUNCEMENTS

Mr. John T. Burt, F.S.I., chartered quantity surveyor, has removed his offices from 6a St. Martins, to 5 Grey Friars, Leicester.

Mr. Arthur A. Bowes, P.A.S.I., chartered surveyor, has removed his offices from 14 Cook Street to 62 Dale Street, Liverpool. Telephone No. : Bank 4879.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Messrs. Herbert O. Ellis and Clarke, FF.R.I.B.A., in conjunction with Mr. F. C. Bayliss, F.R.I.B.A., superintending architect to W. H. Smith and Son, are preparing plans for a stationery and bookbinding factory and showrooms, which W. H. Smith and Son propose erecting on the ALBERT EMBANKMENT, near Lambeth Bridge.

The L.C.C. has invited the municipal authorities of BERMONDSEY to undertake the clearance of two congested areas of the Borough known as Leroy Street and Bethel Place.

Plans are nearing completion of the new cinema to be erected in CAMBERWELL, for the Loughborough Playhouses, Ltd. The building will have seating accommodation for about 3,000 persons. Mr. Clifford Aish is the architect.

The Woolwich Council is negotiating for the purchase of a further 280 acres of land for housing purposes at ELTHAM.

Messrs. Hoare and Company are to rebuild the "Pied Bull," Liverpool Road, FINSBURY, at an estimated cost of £12,000.

Mr. Septimus Warwick has prepared plans for the reconstruction of the Devonshire Club, Arlington Street, PICCADILLY, W.1. The estimated total cost is £47,500.

The STOKE NEWINGTON Borough Council has decided to adopt the scheme for the erection of a new municipal building, at an estimated capital cost of £77,500. The architects are Messrs. Hobden and Porri.

EASTERN COUNTIES

The GREAT YARMOUTH Education Committee recommends the Town Council to borrow £27,000 for the erection of the new Hospital School; also £13,254 for a new school at Gorleston.

On the recommendation of the Education Committee, the LINCOLN City Council has decided to apply to the Ministry of Health for sanction to borrow £8,641 for the acquisition of a site for the completion of the reorganization scheme for senior girls in the central part of the city; also for the extension of Spring Hill Council school.

SOUTHERN COUNTIES

The FARNHAM U.D.C. has received sanction from the Ministry of Health to borrow £4,180, for the erection of twelve cottages at Trape.

Plans passed by the FARNHAM U.D.C.: Rebuilding Lloyds Bank, Castle Street; house, Alfred Road, for A. J. Stedman; house, Bridgefield, for G. W. Baigent; house and garage, Shortheath, for A. H. Parratt; house, Wings Road, for H. S. Burningham; alterations, 47, The Borough, for Cullens, Ltd.; alterations, the "Black Prince"; additions, Brookley Cottage, Runfold, for T. A. Allen; alterations and additions, Shortheath Place, for C. H. Biddulph-Pinchard.

Plans passed by the GODSTONE R.D.C.: Two cottages, Limpsfield Chart, for Mr. A. W. Clemes; alterations and additions, East Hill Road, Oxted, for Mr. G. Leach; sixty houses, Green Road, Oxted, for Mr. W. H. Spark; new roads and sewers, Shawfields, Barrow.

At a recent meeting of the HASTINGS Town Council, a scheme was approved for the erection of 110 houses at Hollington, at an estimated cost of £43,453.

At a recent meeting of the PETERSFIELD U.D.C. plans were approved for the erection of a new mortuary in the Council yard, near the fire-station.

Plans passed by the WYCOMBE Rural Council: Pair of cottages, Longwick; stable and garage at Loosley Row; dwelling house, Stokenchurch; two houses at Wooburn; cottage and garage, Flackwell Heath; house at Downley.

SOUTH-WESTERN COUNTIES

Plans have been prepared by Mr. H. J. Hammick, on behalf of the Regent Cinema Co. (Plymouth), for the proposed erection of a super-cinema in Cambridge Street, PLYMOUTH.

The POOLE Borough Council has approved the erection, by private enterprise, of over sixty houses.

The TORQUAY Corporation hope to proceed with the widening of the sea-front promenade during the present winter.

The WEYMOUTH Corporation has obtained a Government grant for a scheme for the improvement of the harbour, at a cost of £124,000.

MIDLAND COUNTIES

Plans passed by the CANNOCK U.D.C.: House, Old Penkridge Road, Cannock, for Mr. R. Bates; bungalow, Watling Street, Wedges Mills, for Mr. W. G. Smith; conversion of existing building into two bungalows, North Street, Bridgton, for Messrs. A. Wootton and Sons; house and shop, Princess Street, West Chadsmoor, for Mr. F. Robinson; two houses, Dartmouth Road, Cannock, for Mr. Cyril Wootton; house, Pye Green Road, Cannock, for Mr. R. Holford; shop, Florence Street, Hednesford, for Mr. T. Beardmore; shop, Wolverhampton Road, Cannock, for Mr. L. G. H. Swift.

The Gloucestershire E.C. has approved plans for additional accommodation at the Double View Council school, EAST DEAN, at an estimated cost of £9,800.

It is proposed to erect a new infants' school, with nursery school, on a site taken from the vicarage grounds at LEIGH. It is also proposed to remodel the present premises in Church Street to make a junior school.

The LOUGHBOROUGH Town Council propose to erect thirty-two flats for aged couples who occupy houses which the Council are to demolish.

The layout plans for fifty houses, proposed to be erected in Willowbridge Lane, SUTTON, have been approved by the Sutton U.D.C., subject to sanction being received from the Ministry of Health.

The clerk to the TIPTON (STAFFS.) U.D.C. has been instructed to negotiate for the purchase of land adjoining the Blue Pig Row property at Horseley Heath, for the provision of new municipal buildings, estimated to cost £45,000.

Plans passed by the WELLINGBOROUGH U.D.C.: Five garages, Leighton Estate, for C. J. Mather; pair of semi-detached houses, Eastfield Road, for H. A. Garrod.

The WORCESTER Infirmary Committee is to proceed with the carrying out of the first portion of its extension scheme, which will cost £90,000.

NORTHERN COUNTIES

The ACCRINGTON T.C. has under consideration the erection of new police and fire stations in Manchester Road, from plans prepared by Mr. P. Thomas, F.R.I.B.A.

It was announced at a recent meeting of the Bredbury and Romiley U.D.C. that the Cheshire C.C. propose to build a new primary school in BREDBURY to accommodate 150 infants.

A cinema is to be erected in Crackenedge Lane, DEWSBURY, Yorkshire, with accommodation for 1,700 persons. Plans have been prepared by Mr. Robert Cromie, F.R.I.B.A.

At a meeting of the HULL Corporation, consideration was given to a scheme—estimated to cost, with equipment, £48,500—for the erection of new swimming baths on land adjacent to the Newington open-air baths in Albert Avenue. The scheme was referred to a sub-committee for detailed consideration.

A cinema is to be erected in HULL, situated between Paragon Square and Beverley Road corner. A corner site has been chosen, with frontages to the new street and West Street. The seating capacity will, it is expected, be over 3,000, and the cost approximately £100,000.

Application is to be made next month, by the LIVERPOOL county magistrates, for permission to erect a cinema to seat 2,000 persons, in Crosby Road North, Waterloo. Plans have been prepared by Mr. Lionel A. G. Pritchard, A.R.I.B.A.

Plans passed at ST. HELENS: Two dwelling-houses, Prescot Road, for William Lyon; alterations to buildings, Grove Street, for Pilkington Bros.; twenty-four and fourteen houses, Chamberlain Street, for J. M. Wilson and Son; additions to Catholic Grammar School, West Park Road, for Rev. Bro. Francis; three cottages, Charnwood Street, for J. B. Williams; dwelling-house, Rivington Road, for J. Gleave and Son; two dwelling-houses, Whitefield Road, for Joseph Vose.

The Lancashire county architect has prepared plans for a new grammar school for 400 girls in Higher Lane, STAND, estimated to cost £48,585. The cost includes equipment of the building and layout of tennis court.

Plans passed by the STOCKTON Town Council: Two semi-detached bungalows, Fife Road, Norton, for Messrs. R. Blackett & Co.: alterations to the Commercial Hotel, Norton, for Messrs. J. W. Cameron & Co.: fourteen semi-detached houses, Oxbridge Lane, for Messrs. R. W. Russell and Son: temporary church, Durham Road, for Rev. A. J. Bott; house, Ragworth Road, Norton, for Mr. A. Thorpe.

The WHITBY U.D.C. has decided to sell 1,400 square yards of land, on the new Royal Crescent, at present used as a parkage, for the erection of a private hotel, subject to terms being agreed upon.

Plans passed by the WHITEHAVEN Town Council: Pavilion, Miners' Welfare Grounds, Kells; alterations to the premises of the Whitehaven News, Ltd.; garage, 23 Earls Road.

SCOTLAND

The Hamilton Dean of Guild Court has passed plans for the erection of new workshop premises in Greenfield Road, BURNBANK, by the Lanarkshire Bolt and Rivet Co., Ltd.

The EDINBURGH Council has agreed to the erection of eighteen houses, consisting of three blocks of six three-apartment houses, on the open space at the extreme south-west of the Wardie Housing Area.

Messrs. Thompson and Inglis are to erect twenty houses in Granton Road, EDINBURGH.

The Commercial Bank of Scotland, Ltd., EDINBURGH, has been granted permission by the Glasgow Dean of Guild Court to erect a building at the north-west corner of West George Street and West Nile Street.

Messrs. Lewis, store proprietors, are to reconstruct the Royal Polytechnic Stores, GLASGOW, at a cost of £40,000.

The GLASGOW Corporation Sub-Committee on Insanitary Areas is to ask the Sub-Committee on Sites and Buildings to arrange for the erection of 1,000 houses for the purpose of re-housing the tenants of houses to be dealt with by closing or demolition orders in the central and northern districts of Glasgow.

The GLASGOW Corporation has agreed to the granting of a subsidy for the erection of 1,364 houses at King's Park by the Western Heritable Investment Co., Ltd.

Plans have been passed for the erection of new works opposite their present premises, for the Lanarkshire Bolt and Rivet Co., Ltd., HAMILTON.

The Good Templar Hall, PAISLEY, where the Glen Cinema disaster took place last year, has been purchased by Paisley Corporation for road improvement purposes.

IRELAND

Tenders are shortly to be invited for the erection of the new Cottage Hospital, BALLYMONEY.

At a meeting of the DUBLIN City Commissioners it was announced that the Cabra area, containing forty-two acres of land, had been acquired. Plans were passed for the erection of 641 four-roomed houses on the site. It was also stated that a contract had been placed for sewers and roads at a cost of £25,331.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* NAVVY, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.

Transport hire per day:

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0	1	6
SPREAD and level, including wheeling, per yd.	0	1	6
FILLING into carts and carting away to a shoot or deposit, per yd. cube	0	10	6
TRIMMING earth to slopes, per yd. sup.	0	0	6
HACKING up old grano. or similar paving, per yd. sup.	0	1	3
PLANKING to excavations, per ft. sup.	0	0	5
DO. over 10 ft. deep, add, for each 5 ft. in depth, 30 per cent.			
IF left in, add to above prices, per ft. cube	0	2	0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup.	0	2	1
DO. 6 in. thick, per yd. sup.	0	2	10
PUDDLING, per yd. cube	1	10	0
CEMENT CONCRETE, 4-2-1, per yd. cube	1	17	6
DO. 6-2-1, per yd. cube	1	12	6
DO. in upper floors, add 15 per cent.			
DO. in reinforced-concrete work, add 20 per cent.			
DO. in underpinning, add 60 per cent.			
LIAS-LIME CONCRETE, per yd. cube	£1	14	0
BREEZE CONCRETE, per yd. cube	1	7	0
DO. in lintels, etc., per ft. cube	0	1	6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube	0	3	9
FINE concrete benching to bottom of manholes, per ft. cube	0	3	0
FINISHING surface of concrete spade face, per yd. sup.	0	0	9

DRAINER

LABOURER, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* BRICKLAYER, 1s. 8½d. *per hour;* PLUMBER, 1s. 8½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. *6 in., per ft.*	0	1	3
DO. *9 in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. *6 in., per yd.*	0	8	0
Portland cement and sand, see "Excavator" above.			
Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft. 0 4 3
DO. 6 in., per ft. 0 5 0
DO. 9 in., per ft. 0 7 9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft. 0 8 3
DO. 6 in., per ft. 0 10 3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
Midhurst white facing bricks, per M.	5	0	0
Multi-coloured facings, per M.	7	7	9
Best red facings, per M.	7	7	9
Rubbers, 9½ in., per M.	12	0	6
Staffordshire blue, per M.	9	5	0
Firebricks, 2½ in., per M.	9	5	0
Glazed salt, white, and ivory stretchers, per M.	21	10	0
DO. *headers, per M.*	20	10	0
Colours, extra, per M.	5	10	0
Seconds, less, per M.	1	0	0
Cement and sand, see "Excavator" above.			
Lime, grey stone, per ton	£2	11	6
Mixed lime mortar, per yd.	1	6	0
Dampcourse, in rolls of 4½ in., per roll	0	2	6
DO. *9 in., per roll*	0	4	9
DO. *14 in., per roll*	0	7	6
DO. *18 in., per roll*	0	9	6
BRICKWORK in stone lime mortar, Flettons, or equal, per rod	30	0	0
DO. in cement do., per rod	32	10	0

DO. in stocks, add 25 per cent. per rod.
DO. in blues, add 100 per cent. per rod.
DO. circular on plan, add 12½ per cent. per rod.
DO. in backing to masonry, add 12½ per cent. per rod.
DO. in raising on old walls, etc., add 12½ per cent. per rod.
DO. in underpinning, add 20 per cent. per rod.

HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS, fair, per ft. sup. extra	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra	0	0	10
WEATHER pointing, do. do.	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup.	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities, in finishing to steps, etc., per ft. sup.	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7

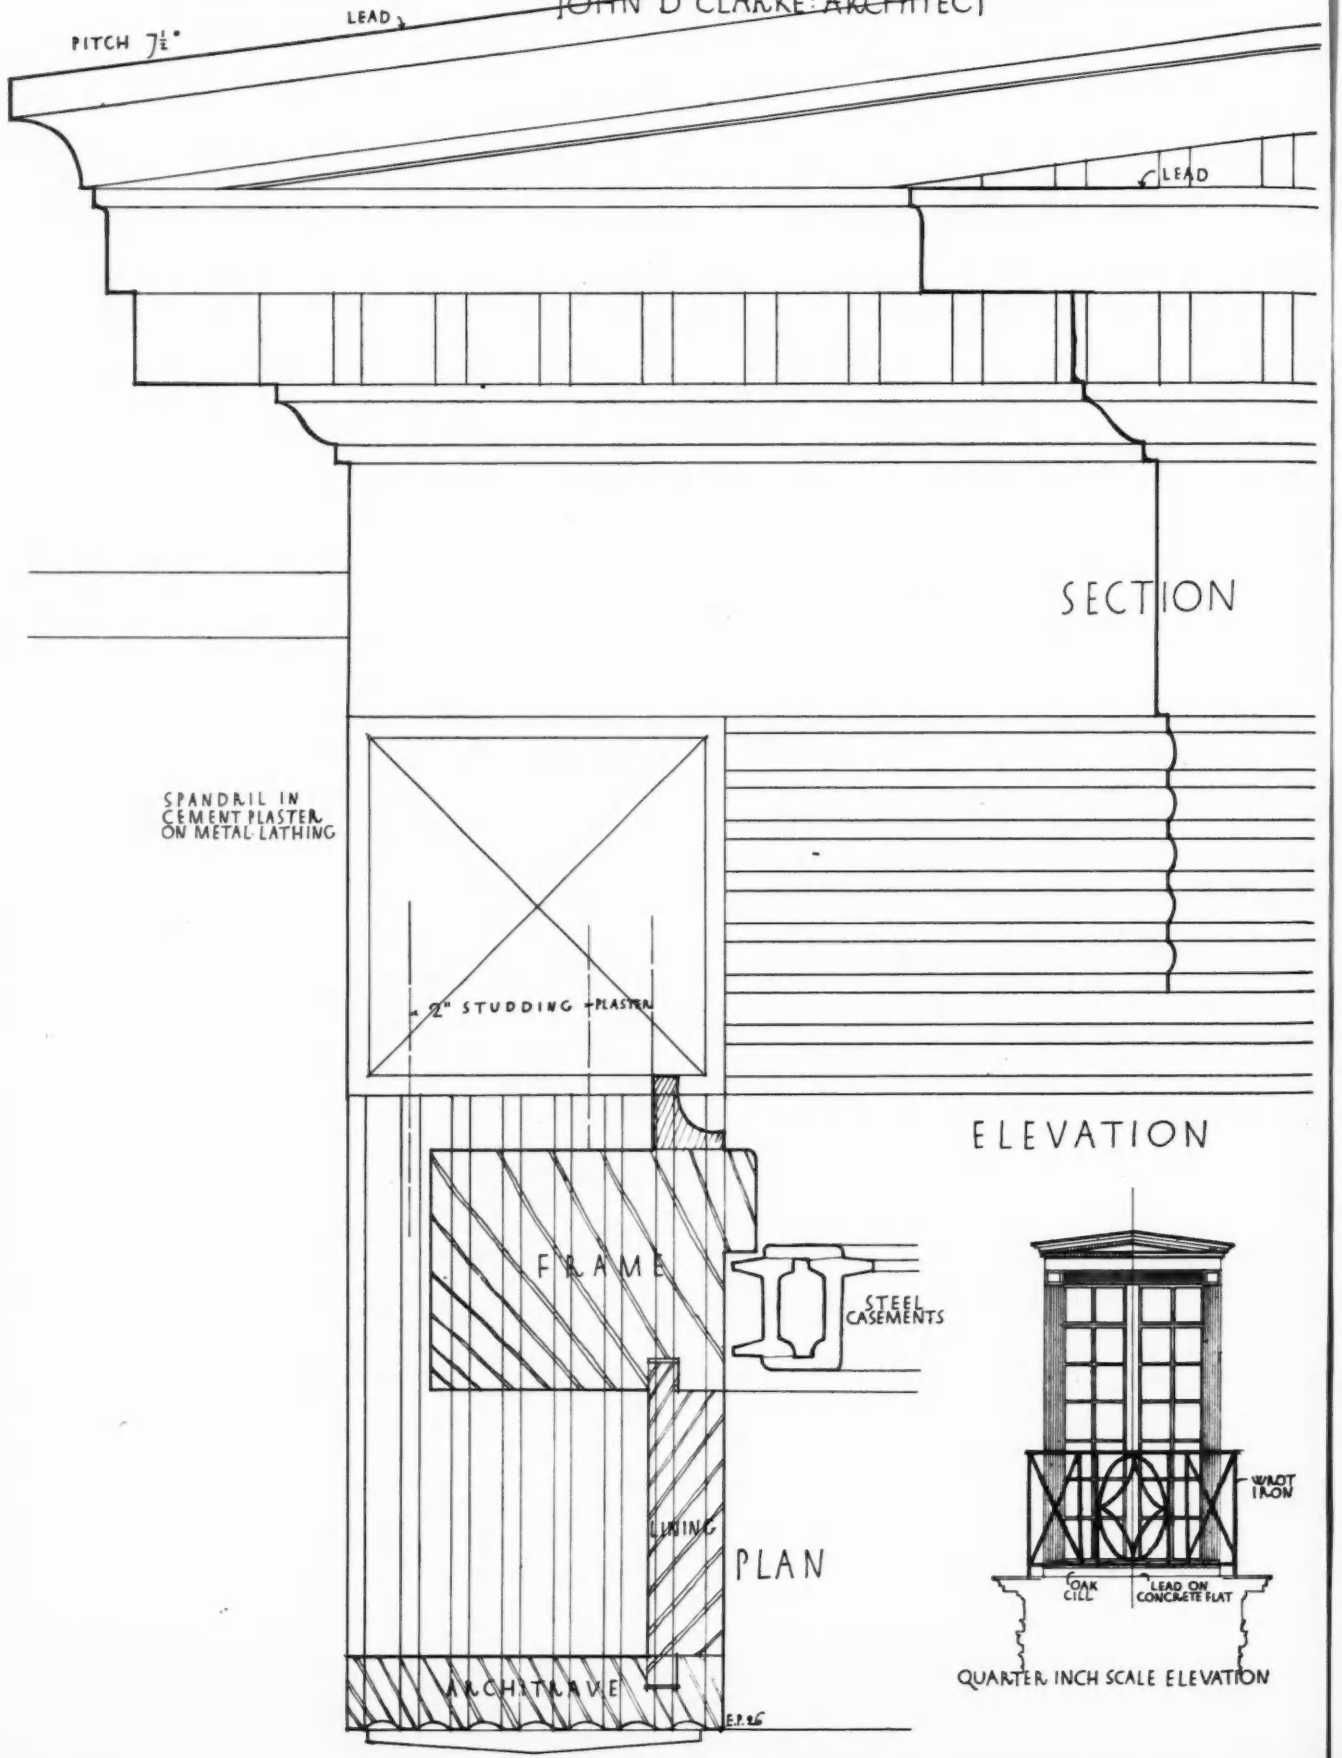
A WEEKLY SERIES

PORCH, WITH DORMER WINDOW ABOVE, AT MESSACK HOUSE, CORNWALL.

Designed by JOHN D. CLARKE

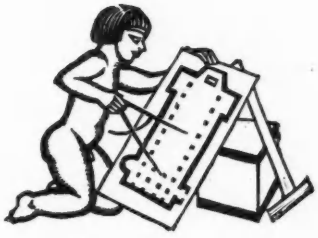
A *DORMER window opening on to the flat roof of an entrance porch, together with which it forms a unit in the design of the façade, is shown in the photograph reproduced above of part of a house at Messack Point, Cornwall.*

The lights of the dormer are of steel, built into a wood frame with a wood mullion and cill, and fitted with a transome, hung at the bottom to open in, to allow of easy ventilation when the doors are closed. The fluted architrave, with traditional frieze, dentil cornice and pediment, is of deal, painted. The top of the pediment is covered in lead, but the cheeks of the dormer are finished in cement mortar on expanded metal lathing.



The drawings overleaf give a general elevation of the dormer, together with its wrought iron balcony, to a scale of a quarter of an inch to a foot ; and also details of the architrave, frieze and cornice, half full size.

The drawings reproduced overleaf may be read with architects' ordinary scales.



MESSACK HOUSE, CORNWALL.

JOHN D CLARKE: ~~ARCHITECT~~

THE ARCHITECTS' JOURNAL

WEDNESDAY, OCTOBER 29, 1930

THE PROOF OF THE PUDDING

"*Know Thyself.*"

—SAYING ATTRIBUTED TO SOLON OF ATHENS, ONE OF THE SEVEN WISE MEN OF GREECE.

THE building of Honeywood Grange has occupied a conspicuous place in this JOURNAL for a great part of nearly two years, and we are here moved to inspect the "completed edifice"—as Brash would call it. *Settling-Up Honeywood*, which was brought to conclusion in our last issue, was concerned with the eating of the pudding, mixed and cooked with such particularity of detail in *The Honeywood File*; and as the matters dealt with in this second book—which, under the title of *The Honeywood Settlement*, is to be published shortly—either completed episodes or arose from circumstances recounted in the first, the two volumes constitute one book.

The work stands alone, we believe, in purpose, in plan and in craftsmanship. That purpose—as stated by the author in the first paragraph of the serial introduction to *The Honeywood File*—of presenting to those advanced students of architecture who are versed in the rules of a game they have never played, an intimate view of the field of their future activities, and of reducing to terms of common business intercourse the law, customs, science and art of building, is new.

The plan, to display the detailed circumstances of the building of a house by letters exchanged between the various persons concerned in the undertaking, is new—as is also the critical commentary explanatory of technical points and hidden implications arising in the letters. And the use of literary devices by which the personalities of a large variety of characters is vividly presented solely by their diction and by their way of thinking—and not thinking—this is new, too. For though the telling of stories by interchange of imaginary letters has engaged many writers from Fanny Burney to E. V. Lucas, none has, we believe, ever before exactly faced the task which the author of the Honeywood books set himself.

The educational value of the work which, although it particularly avoids being didactic, is its special aim, is attested by the opinion of the principals of some of the leading architectural schools and by their recommendation of it to their pupils, some of whom have cited Brash and Spinlove in their professional practice papers at the Institute final examination; and also by letters we have received from senior architects appreciative of the usefulness of the book. It is to such critics alone that it is possible to look for endorsement of the author's claim of verisimilitude.

The colours of his picture, as he has been careful to point out, are necessarily brighter than life; no portentous client was ever quite so pompous as Brash; no builder—unfortunately—perhaps ever so wise, so ironically humorous or so helpful as Grigblay; no foreman, possibly, ever at once so limited and so resourceful and estimable as Bloggs.

And it is expedient to admit that perhaps the building of no house ever afforded such sappy episodes as did the building of Honeywood Grange. Yet the characters and the events have been widely commended as typical by those qualified to recognize them, and more youthful readers who have from time to time questioned the truth of the picture, have, in doing so, perhaps proved the need which it is the purpose of the book to satisfy.

Of Spinlove, the architect—who is the central figure and who, throughout the two volumes, rides gales that are largely of his own raising, and whom everyone must have been relieved to see at last safely harboured—the author, in his concluding comment, says a disarming thing when he humorously admits that in Spinlove he recognizes much that belongs to himself. Perhaps other architects who have the self-knowledge that only experience can bring have made the same discovery.

The difficulties that met Spinlove from without and which, in kind, are the lot of all architects, were not so great as those that Spinlove encountered from within and which, in degree, are the heritage of all men. Here perhaps, rightly read, is the chief lesson of the book.

MODERNISMS IN CLOSE COMMUNION

In High Holborn, W.C. : The building for the Times Furnishing Company, by Cecil J. Eprile (1929) and that for Crawford's by Frederick Etchells and Herbert A. Welch (1930). Both buildings are strikingly, indeed perpendicularly, different in architectural treatment, yet each displays a precision of purpose which enables them to live together in harmony. They have practically the same lines in windows and parapet ; and the ground-floor stories are executed in the same black marble. Further illustrations of Crawford's appear on pages 652-655

NEWS & TOPICS

The late E. R. Kennedy, F.R.I.B.A., councillor and immediate past president of the Ulster Society of Architects, and a member of the firm of Munce and Kennedy of Belfast, whose death occurred recently.

NO SKYSCRAPERS IN LONDON

IT is unlikely, after all, that buildings will be permitted to scrape the London sky, at least for some time to come. The ban, however, has its origin not at all in æsthetics but, ironically enough, in common prudence. So long as the City possesses pumps and appliances capable of fighting fire effectively only up to a height of 80 ft., with modified protection up to 100 ft., no metropolitan authority in its senses—certainly not the L.C.C.—could countenance the fire risks attaching to higher buildings. The Council's Building Acts Committee have accordingly given it as their opinion that " the height of 100 ft. is the maximum which should be permitted in respect of any building in London." Of course, if this is the only reason at the back of this resolution, the mechanical engineer may be counted upon to undermine it; but that will take time—and money.

UNPOPULAR FLAT ROOFS

Four blocks of L.C.C. dwellings have flat roofs and in no one case are they popular as playgrounds for children or as drying-grounds. The objections to their use for children or clothes-drying are mainly threefold : *a:* Noise causing annoyance to the occupants in the top story; *b:* The dirt from soot and smoke; *c:* The high cost of maintaining flat roofs, which often prove porous and unsatisfactory. I am not saying that these objections are not enough to prohibit the use of existing flat roofs, or even the building of new ones in the immediate future, but I do think that we are going to make use of flat roofs for these very purposes to a growing extent, and that, while their present deficiencies are recognized to be a drawback, we would be better advised to perfect the flat roof than go back to wasteful roofs and gables. Of the objections, (*a*) and (*c*) are things that can be remedied by manufacturers as soon as they feel the pressing demand.

★

The soot and smoke problem is more difficult. It is equally present at ground and roof level, and it should be as easy to clean a roof as a yard, but, apart from this, we must surely look to a steady diminishing of atmospheric pollution. I wonder if there are any reliable figures available showing its decline during the last twenty years, for we should be able to know what we can reasonably count on before launching upon a style of architecture dependent upon clean city air. I feel we should know a good deal more about this interesting subject.

THE LESSON OF WASHINGTON

For Washington Mr. Frank Baldwin, secretary of the American Institute of Architects, in his absorbing lecture at the R.I.B.A. last week, claimed the uncommon distinction, shared only by Alexandria and St. Petersburg among cities of this size, of having been built on a preconceived plan. When, at the close of the Revolutionary War, President Washington decided to remove the capital to the point of intersection of the Potomac and Anacosta Rivers, he entrusted the layout to a French engineer, Major L'Enfant, the kernel of whose scheme was disposition about one main axis. And a brave start was made. The subsequent history is a sad commentary on the fallibility of human nature. After the lapse of some twenty years the image of an ideal began to pale before the urge to expand, and today, when it is again shining forth, the tragic errors of the intervening century are being retrieved at heavy cost—cost which makes a considerable hole in the £40,000,000 appropriated to make a fresh start. The remarkable thing is that the plan conceived 150 years ago should still be of any validity in conditions that could not then have been foreseen.

DILAPIDATION OF COUNCIL HOUSES

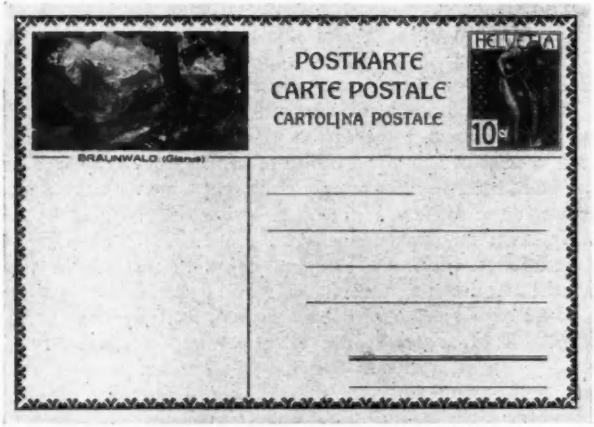
Up Birmingham way they have been having trouble with the somewhat rapid dilapidation of Council houses. For one thing, people have been falling through the rotted floors. On one occasion, so they say, a woman and her children slipped through, and the chairman of the R.D.C. concerned was informed, in reply to a question, that occurrences of the sort were not uncommon; also that some of the windows and doors had no fastenings. The causes assigned were the rotting of war-time timber, the moisture in which had been retained, as regards the floors, by the laying down of linoleum, and, in some cases, the fatal gardening activities of tenants, resulting in bringing the level of the soil above the dampcourses. Nine years is, of course, a scandalously short life for a floor, and to renew will cost the Council £10 per house. Such a state of affairs is, unfortunately, by no means peculiar to this district. It comes to this, that not only has the country paid dearly for many Council housing schemes, but that already it must spend more to maintain them in barely habitable condition.

CALTON JAIL : THE LAST PHASE

The Office of Works have now abandoned their plans for the Calton Jail site, and, subject to the reservation of a portion of it for the Sheriff Court, they offer it to the Corporation of Edinburgh. Though the objections to the official plans have been directed to their suitability and quality, and not to the fact of their occupying a site that should remain open, the Office of Works have never really countenanced the policy of employing a private architect through the agency of an open competition. They have withdrawn in order to claim whate.er tactical victory a rearguard action is likely to bring them, leaving the Sheriff Court as a skeleton force. In other words, Official architecture has been routed, and by the Royal Commission. Also, it has been routed on questions of taste, being provedly inadequate in face of a problem the best solution of which demanded, in a peculiar degree, both imagination and fine planning. In the upshot, Edinburgh is thus left with a wonderful site on its hands, which no possible reaction should suffer to be filled by

a building even less worthy than that the Office of Works were about to erect.

STEEL IN THE MAKING



When writing last week about steel structure research I had no space to record impressions recently received in a works where steel, the thing itself, is actually made. On one of my infrequent journeys to the Black North I found myself in a ship lying weatherbound at that very wharf in the Tees from which the steelwork for Sydney Harbour Bridge was shipped. One thing led to another, and a day or two later I had the privilege of being taken on a tour through Messrs. Dorman Long's Redcar works, devoted to the manufacture of pig iron and steel, and the rolling of steel plates.

★

We began with a blast furnace, an enormous cylinder more than 20 ft. in diameter and some 75 ft. high. One can walk round below the base containing the hearth or crucible, which is of an inverted conical shape, and upon which streams of running water are kept playing. There are a number of tuyères for the introduction of the blasts—air and heated compressed gas—necessary to the process, and there are also, at the height of a man, a number of eye-pieces—a 1-in. circle of blue glass mounted in the end of what is very like a prodigious telescope. Through these the initiated can gain some idea of what is passing in the inferno within, but the lay eye receives merely an impression of blinding light.

★

The tapping of a blast furnace is a spectacle sufficiently impressive to prepare one for the vivid pyrotechnics to come. Two holes are tapped, one for the slag at a higher and another for the molten iron at a lower level. The slag comes out rather like white-hot treacle, the iron looks as fluid as, or perhaps more fluid than, water. A few scintillations dance momentarily above it, like suddenly incandescent butterflies. It enters a channel prepared in a vast area of sand, and the bulk of the tapping is run into a ladle capable of holding many tons. When the ladle is full the stream of molten iron is diverted into the rectangular system of shallow channels in the sand to which the well-known terms "sows" and "pigs" are given, and is allowed to cool and solidify there. From constant association the men in charge can, I was told, forecast very exactly the composition of the iron merely from its appearance when run out of the blast furnace.

Art and the common postcard in Switzerland. In England money will not buy this, or anything remotely as good.

★

The rest of the processes take place under cover in some of the largest sheds I have ever seen. We followed the ladle which, in the course of its journey, cools down considerably, so that its contents have to be reheated in what is known as a mixing furnace. By the time it arrived there, there was only a sullen red glow with blue flames playing round the top to tell of its state, but when it was hoisted and poured by means of a duct into the mixer, a complete Brock's benefit would not suffice to indicate the cascade of scintillating particles that played round and about the operation. I was not lucky enough to see the tapping of a steel furnace, but was told that what I had seen was nothing to it. I am quite ready to believe it, as, skipping that particular phase, I was shortly led along an avenue of ten-ton steel ingots in process of cooling, and, although many of them had ceased altogether to glow, others were just purple, while some remained at a bright-red heat, I began to wonder whether I should arrive at its end with clothes and skin unscorched.

★

The ingots are cast in slightly tapering obelisks with a couple of ears at the top for the engagement of the hooks of the hoisting cranes by which they are moved about. Preparatory to rolling, the ingots are again brought up to white heat in gas-fired furnaces. When ready, they are picked up by a travelling crane and run the length of the shed to the first rolling mill. On being dropped into the cradle the ingot is caused to travel forward over a series of rotating rollers and shortly arrives at a kind of gigantic mangle, again cooled with running water. Some twenty passes between the rollers, groaning with the pressure and occasionally stopping dead with the friction, suffice to reduce the steel to a flat slab. I guessed its dimensions to be something like 4 ins. thick, 3 ft. wide and 20 ft. long. The steel is still white hot. It then passes beneath the jaws of a guillotine which cuts it into shorter slabs, the length of which is the desired width of the finished sheet. More rollers, nicely calculated to give it the exact impetus required, send it travelling along to a waiting truck.

★

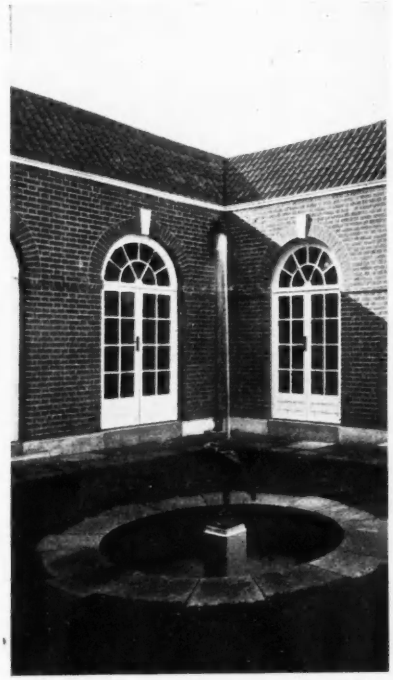
Quickly this carriage travels across the shed to the second rolling mill, where much the same process is repeated, save that after a couple of passes an ingenious arrangement of rollers swings the flat plate round through an angle of 90°, so that the latter rollings cross the grain of the previous ones. For an instant, too, a hose of water is directed on to it, and this removes scale, etc., leaving it to all appearance as hot as ever. The final dimensions of the plates I saw in manufacture were something like 6 ft. wide by 60 ft. long by $\frac{5}{8}$ in. thick, but in most cases these were to be cut to shorter lengths, and this is done cold.

★

There is much depression in the Black North. There were 11,000 unemployed in Middlesbrough alone, and though in normal times it is a wonderful sight to come in from the sea at night, the whole landscape being lit up with the glow from the blast furnaces, only a few are at present working; and it is a costly business letting out a blast furnace, since the whole of the refractory brick lining has to be reconstructed.

ASTRAGAL

A general view of the new offices, with the older fire station in the foreground. The buildings are set back from the west side of the Brighton Road ; the forecourt has a concrete carriage drive embracing a grass plot.



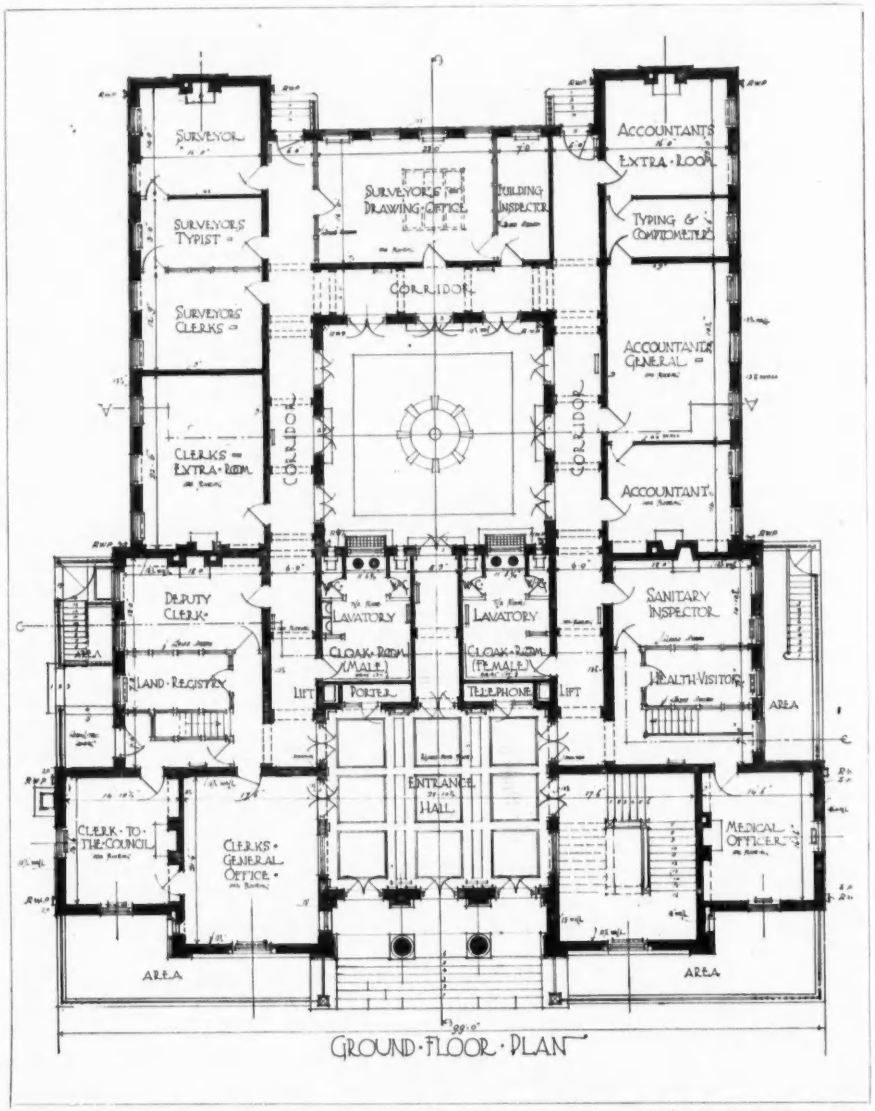
COULSDON AND PURLEY U.D.C. OFFICES

DESIGNED BY NICHOLLS AND HUGHES

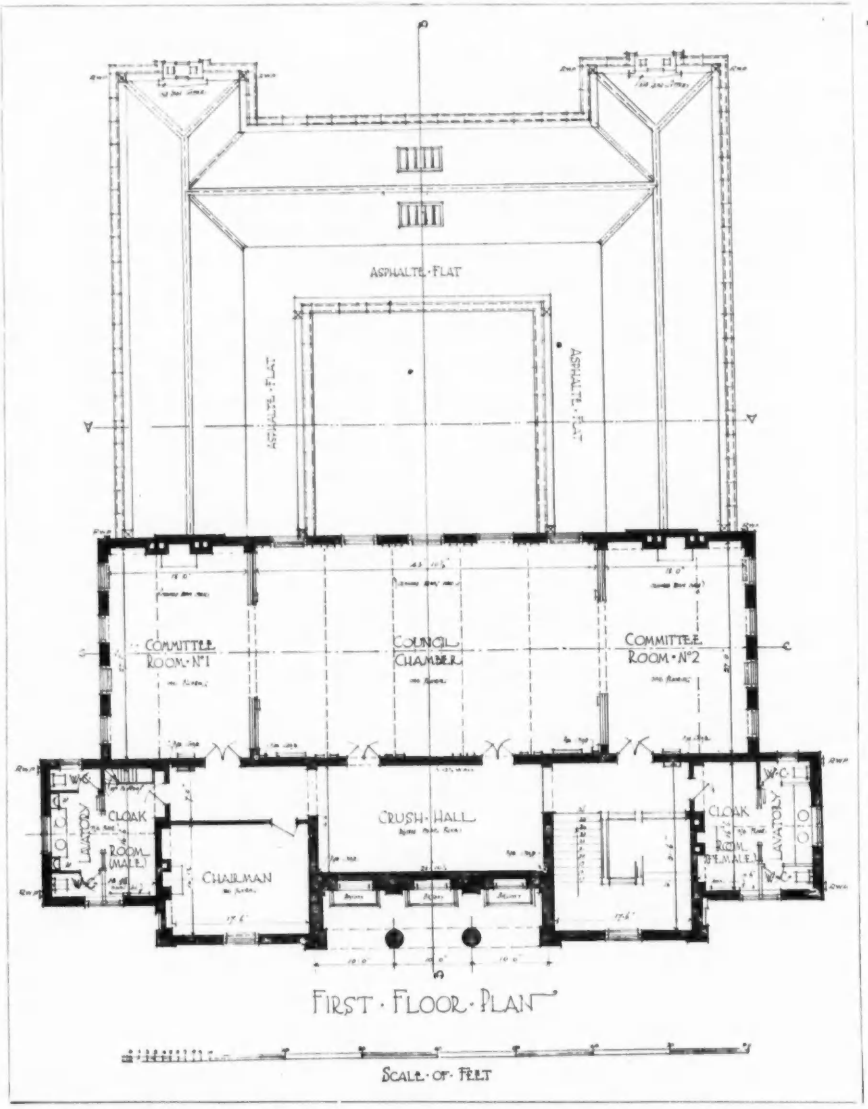
ON Tuesday of next week, November 4, the Lord Mayor of London will formally open the new offices for the Coulsdon and Purley Urban District Council. The buildings, designed in free Georgian style, have been erected in red brick and stone on the gravel pit site, opposite Old Lodge Lane, and adjoining the new fire station. The main entrances are placed on the front to the Brighton road, from which they are approached by a concrete roadway in which is set a grass lawn.

The principal feature is the portico, which is carried up to the full height of the building, and embraces Ionic columns supporting an entablature and pediment. At the top of a broad, shallow flight of steps, three pairs of arched doors admit to the entrance hall, 29 ft. by 23 ft., which is paved with San Stefano marble tiles and has the walls divided by pilasters into bays with semicircular arches on all four sides. Both walls and woodwork are finished pale buff. The main staircase on the right of the entrance hall is constructed in three easy square flights and leads to the crush hall on the first floor, whence three small balconies, with iron railings, overlook the forecourt.

The council chamber, the principal room in the building, approached from the crush hall, is 44 ft. by 27 ft. Its walls are panelled to a height of 12 ft. in wainscot oak. The wagon ceiling has panels of richly-moulded plaster work and is whitewashed. Two committee rooms are placed at either end of the council chamber and communicate with it by means of large double sliding doors, which form part of the panelling and, when slid back, form a spacious apartment.



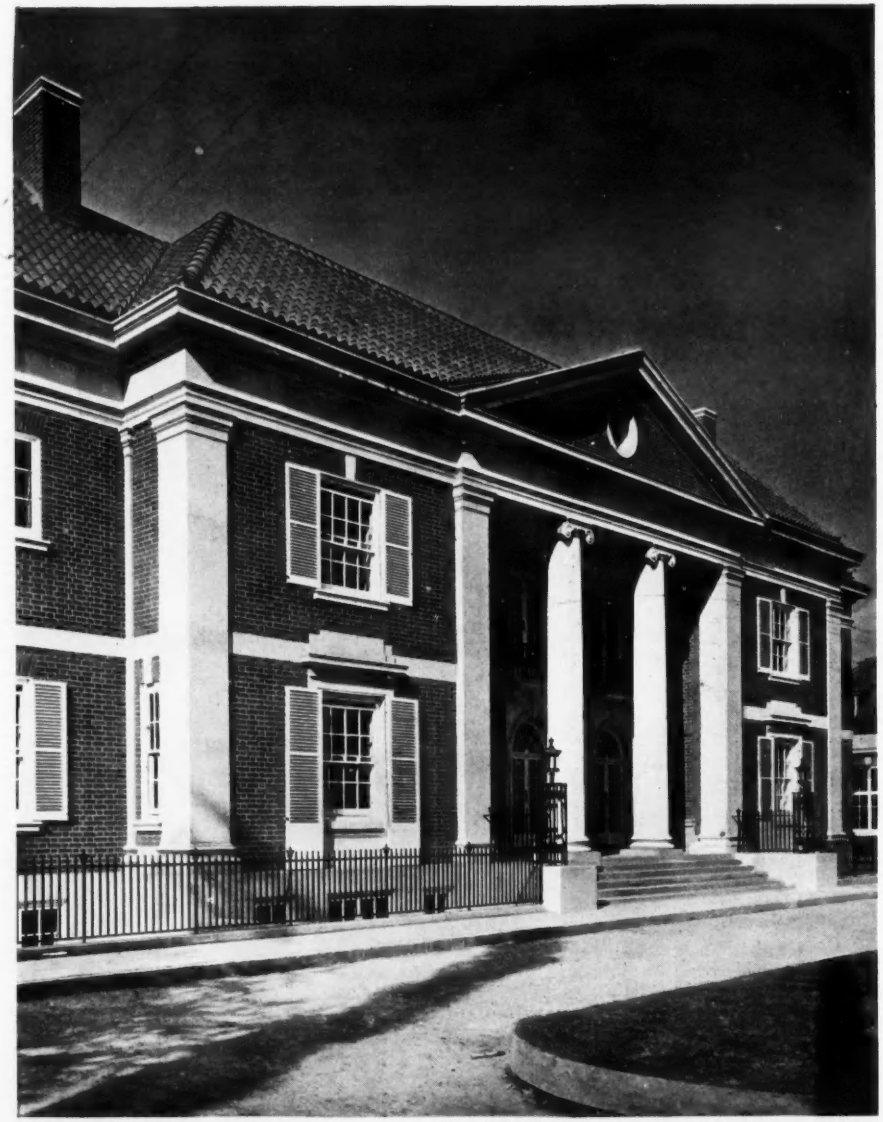
The fountain in the garden court, which is seen at the end of a corridor with vaulted ceiling when looking across the entrance hall from the central entrance door, was presented by the past and present women councillors.



The principal departmental offices are on the ground floor. They are arranged on three sides of a rectangular garden court and are all approached by one continuous corridor around the garden court, both ends of which are connected to the entrance hall. This arrangement provides for easy intercommunication between all departments. Connecting corridors are provided to allow for future extensions to be carried out at the back of the site, where there is ample room for them, without disturbing the present building. A vista of the garden court with its central fountain is obtained from the entrance hall, from which a corridor with vaulted ceiling leads to the court, where a circular pool is surrounded by grass and stone paving.

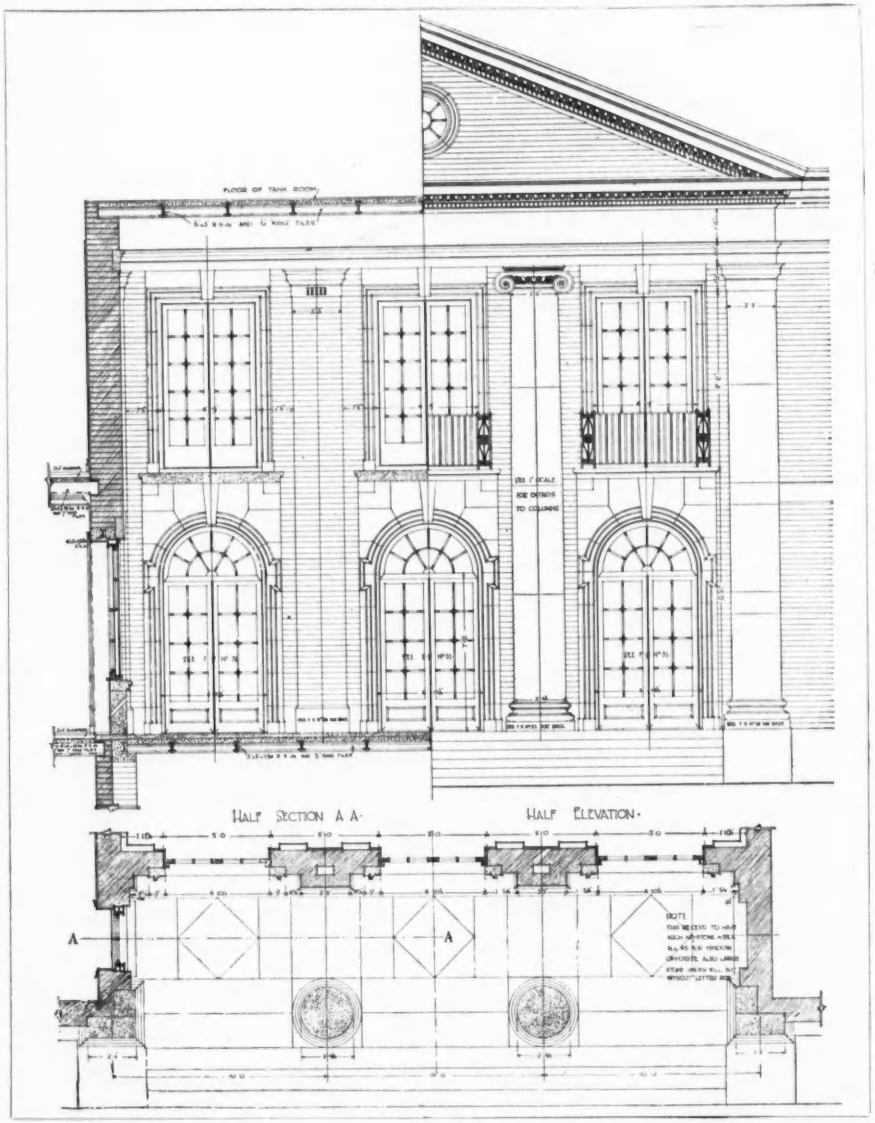
Additional offices, stores, strong rooms, heating chamber and canteen are on the lower ground floor, a lift connecting the last-named direct to one of the committee rooms.

Two impressions remain after inspection of these buildings : the abundant light enjoyed by every room in them; and the harmony of the scheme of decoration. The tones of the walls run through various shades of buff to pale cinnamon, and so lead to the warm brown of the council chamber panelling.



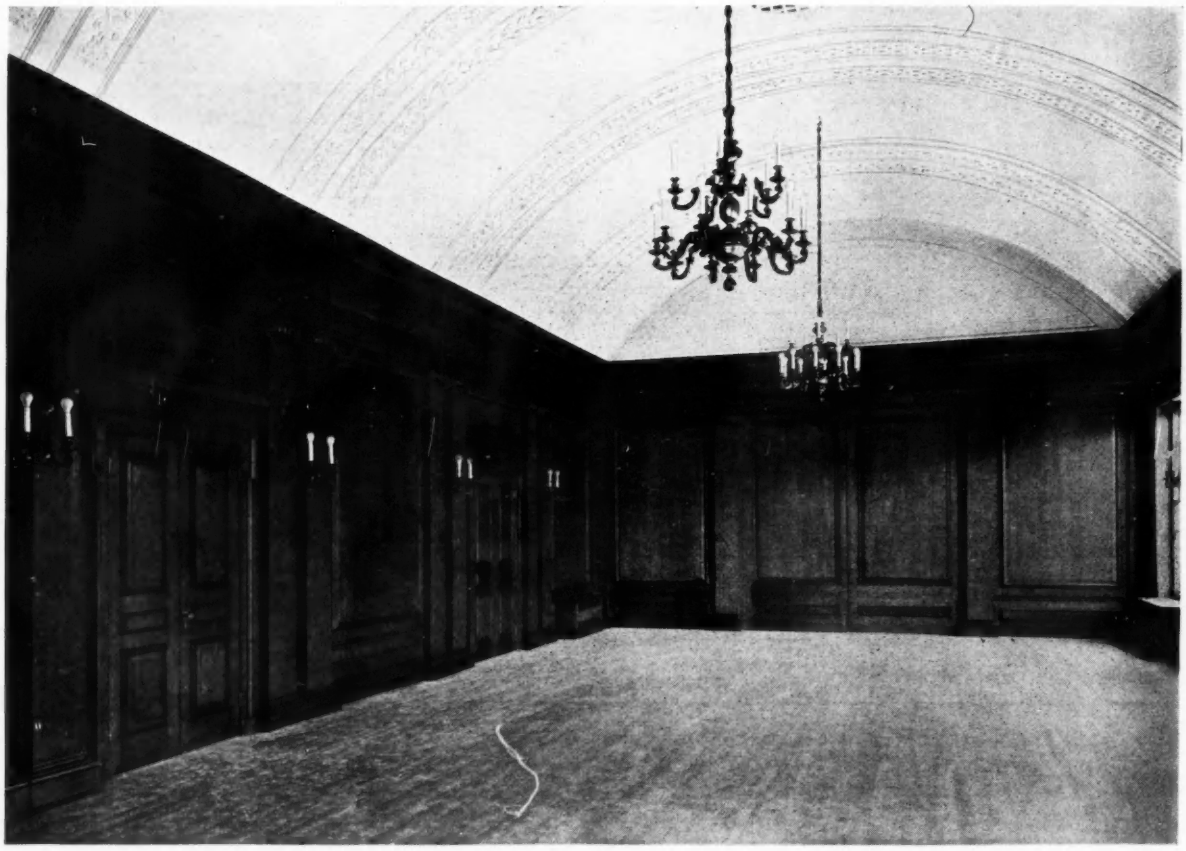
The ground-floor plan. The layout centres about the garden court, the principal offices being served by corridors running on either side of and behind it. Subsidiary offices and store-rooms are placed in the basement.

The first-floor plan. Here the feature is the council chamber, with a committee-room at either end; the three rooms can be thrown into one by sliding back the pairs of dividing doors. The crush hall has three small balconies.



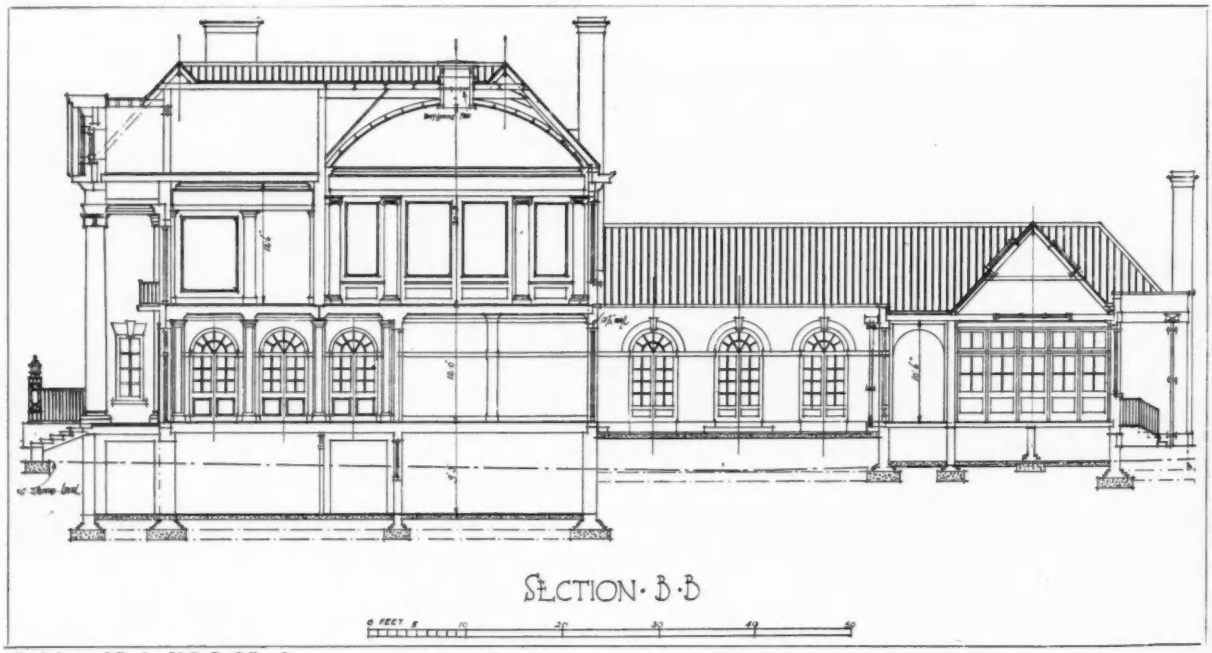
are placed in the basement.

crush hall has three small balconies.



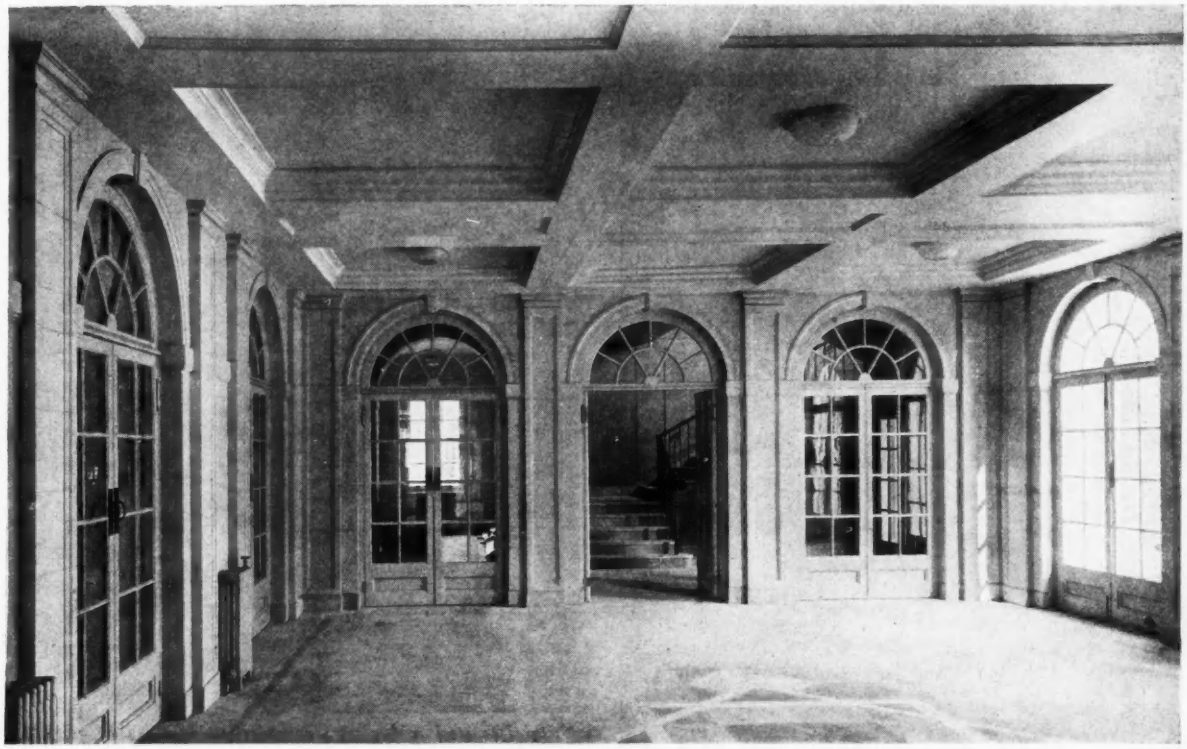
Coulsdon and Purley U.D.C. Offices.]

A broad flight of steps leads up within the stone portico, and three pairs of arched glazed doors give access to the main entrance hall. The main walls of the building are of bright-red brick, and the railings and ironwork of the three first-floor balconies are painted black.



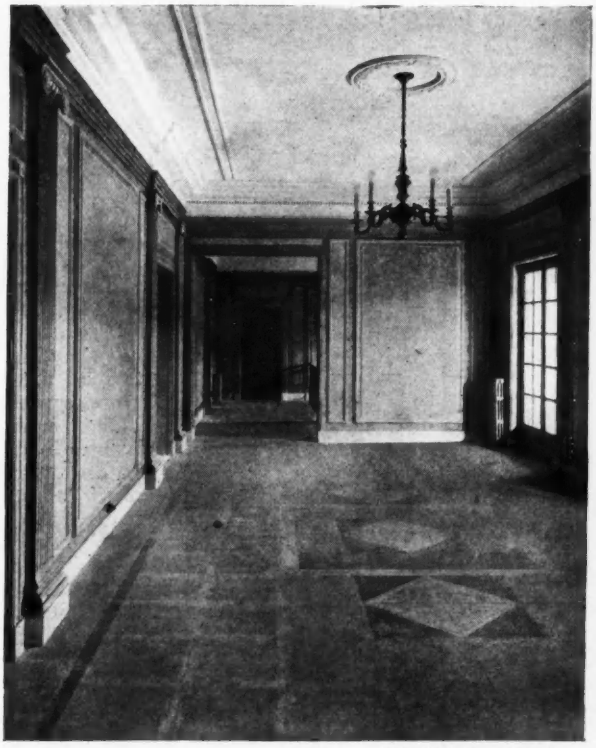
[*By Nicholls and Hughes.*

A reproduction of the architects' half-inch detail drawing of half-section and half-elevation, with plans of the columned main entrance, which extends the height of the building. The Ionic columns support an entablature and pediment with small eye-window.



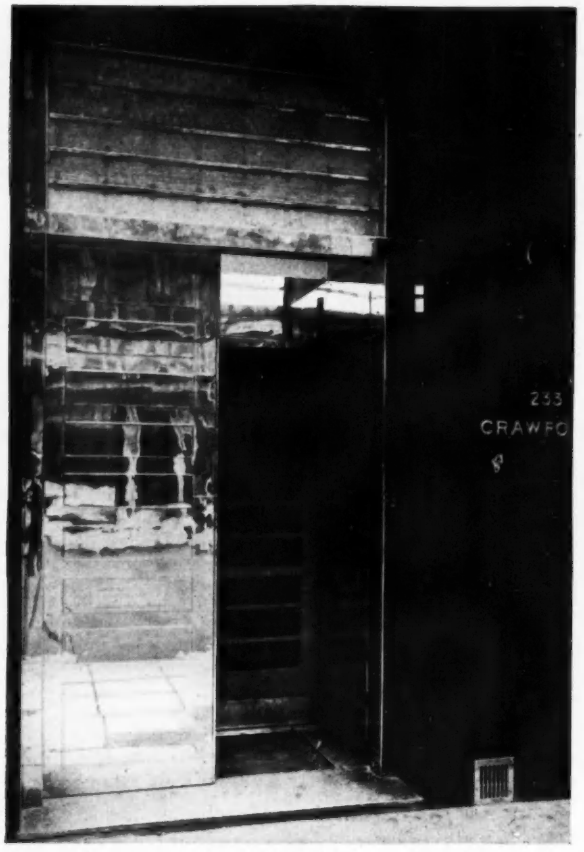
A general view of the council chamber, looking towards one of the committee-rooms; the two central panels of the dividing partition can be slid back. The oak wainscot, 12 ft. high, is of a warm brown colour, and the whitewashed wagon ceiling has moulded panels. The electroliers are in smoky copper, highly polished.

Coulsdon and Purley U.D.C. Offices.]

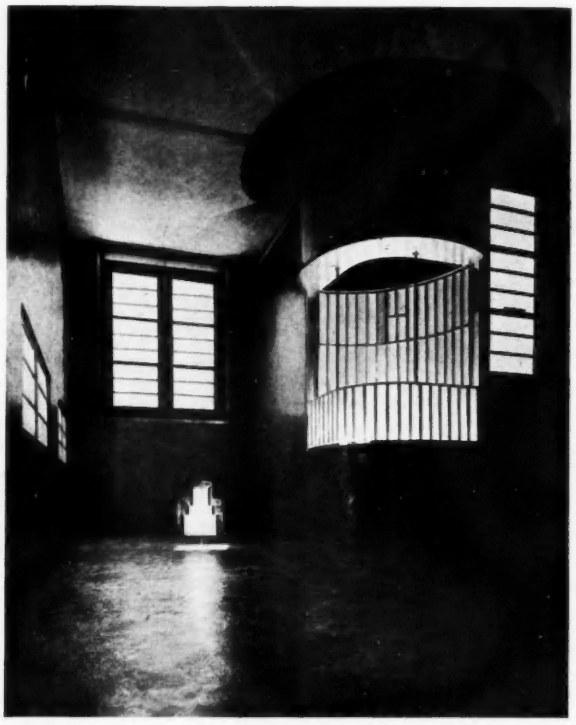


A section on the centre-line at right angles to the main front. On the first floor are shown crush hall and council chamber; on the ground, entrance hall, corridor, garden court, transverse corridor and drawing office.

The entrance hall, looking towards the main staircase, which is contained in a lobby to the right as one enters the building. The floor is paved with San Stefano marble tiles, and all four walls have pilastered treatment with semicircular arches above. Scumbled glaze gives a uniform pale buff finish to walls and woodwork.



The main staircase has three shallow square flights, leading to the crush hall. The balustrade is of brass, with mottled bright and dark finish.



[By Nicholls and Hughes.

The crush hall, on the first floor. The same variety of scumbled finish is used here, but with several tones, ranging between buff and pale cinnamon.

The main entrance, from High Holborn. The base of the building is faced with black marble ; the door is of stainless steel.

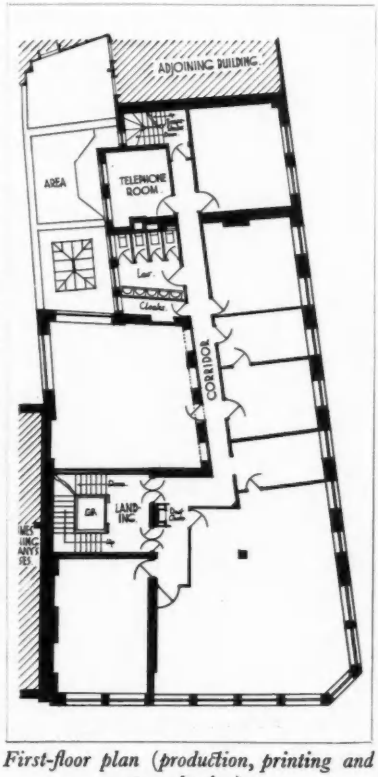
NUMBER 233

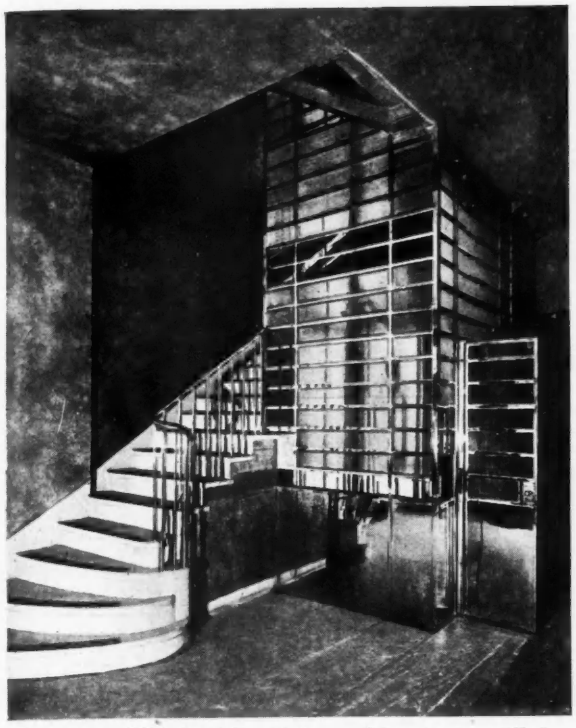
My New Building

BY SIR WILLIAM

F. Etchells and H. A. Welch

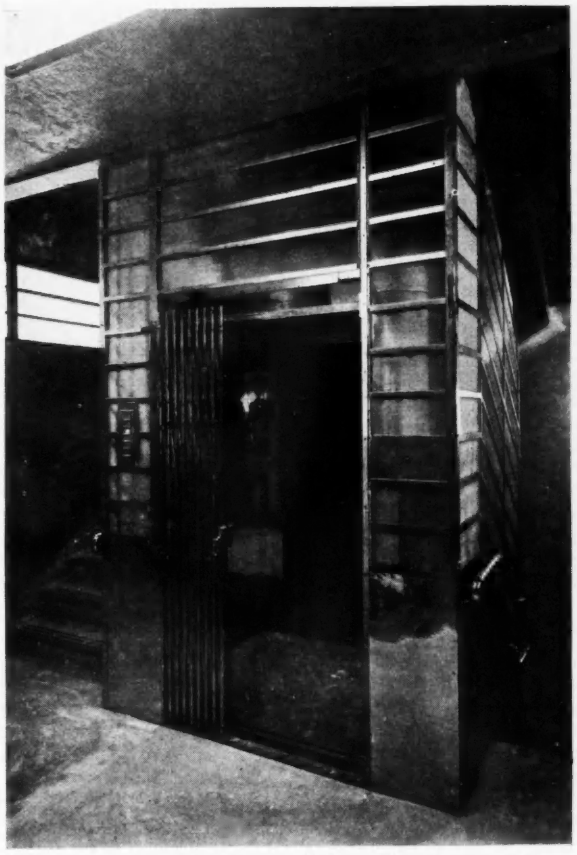


Ground-floor plan. In the basement are printing and photography services, etc.



I HAVE built a modern building for my business—and they ask me why. They all ask me; all the business men who visit me. They come in from outside and shake my hand and say, "Well! So this is the new Crawford's! It is beautiful; and it is tremendously *modern*, isn't it? *And* inside! Now, tell me why . . .?"

As if there were any need to say why! I wanted a building for my business. I wanted a building evolved from the needs of my business. I wanted light and air; the brightness of freely-admitted sunshine; cleanliness; comfortable temperatures; the freedom from obtrusive trivialities which induces, because it symbolizes, the business man's ideal state of mind. And I wanted the design, the choice of material—everything—to be subordinated to these simple and obvious requirements. Because, in the past, the big business offices have been designed arbitrarily, to conform to this or that æsthetic convention, instead of functionally, the new Crawford's is unusual. The logically obvious is too often unusual.



I have heard—and read—that my building is Teutonic. It is not. An English architect—Frederick Etchells—designed the façade and many of the special internal features. His ideas

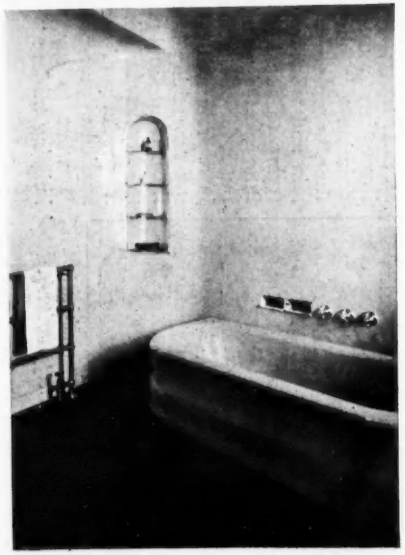
are English—as English as the steel and the concrete into which we translated them. Mr. Herbert Welch, also an Englishman, planned and created many new internal features, and was responsible for the whole of the fabric. My offices, built round a modern English business, are modern English. But the attitude towards building that the new Crawford's typifies is not English; it is not German, though Berlin may, for the moment, lead; it is a world-wide attitude.

In every civilized country men are beginning to build for today, instead of building to the accepted standards of yesterday. It is a clean break with tradition; a substitution of honesty for sentimentality; and it has made, as innovation must always make, its enemies. "You are ahead of your time," people say—as they have always said and will always say. "You are trying to live in the future—and the future, at present, does not exist." But I, for one, make no attempt to live in a problematical future. I live, as my advertising business must live, in the present—and not a moment behind it. My new building is of the present—a product of present-day thought applied to present-day materials.



I want to say this to the British building trades: "You are living, too

many of you, in the past." This modern trend, this deliberate turning of architecture towards new forms, new methods, new material, is your opportunity. You ought, in your own interests, to be fostering this movement. The universal application of this new conception of building, the universal appreciation of this new beauty—a beauty resulting from honest functional design, like the beauty of a liner or an aeroplane—is inevitable. Nothing can stop it. But much can be done to hasten it. And the building trades can help to hasten it.

They have, in the advertisement pages of the building and architectural press, a means ready to hand. It is in these pages that architects see the raw material of their dreams. What shall they be shown? It depends on the building trades. I know how I, in similar circumstances, should use this means of propaganda. I should preach, week in, week out, the gospel of revolution; and I should leave no doubt in any mind that I, better than any foreign competitor, was prepared and competent to supply the building revolutionaries' munitions — modern building materials!

Our architectural press is among the leaders of professional and trade publications. The advertisement pages should be more extensively used by all manufacturers and makers to tell the story of their productions to the architects and builders.

There is no power in industry so great today as the power of the well-conceived advertising campaign.

If demand is to increase, then manufacturers must grasp boldly this modern instrument of advertising.

NEW WAYS IN ARCHITECTURE

BY HUGH MACINTOSH

The author thinks it is one of the most encouraging signs of the times that there is a growing public interest in, and appreciation of, architecture. The lecture he delivered at the Town Hall, Croydon, last week, from which the following summary has been prepared, was addressed to the general public, and it is a significant fact that his audience filled the hall and obviously listened with interest.

IT is evident today that a new kind of building is emerging. Differences between this new style and the older traditional styles are radical and marked. In this country, since the time of Inigo Jones, the design of large buildings, other than Gothic churches and cathedrals, has been based, broadly speaking, on what is known as Classical Architecture. This style of design has as its first raw material proportion of mass: the incorporation in the design, with endless variations in individual treatment, of the column, in its three great orders embracing pedestal, base, shaft, capitol, architrave, frieze and cornice, together with the pediment, the plinth, the attic, the lintol and the arch. All these features and others were and are used under the influence of tradition. Even in buildings where the more ornate features could not be afforded, the basis of the design lay back in the same traditions. Great architects arose again and again, giving fresh interpretations, individual renderings. Yet we can say that although they by their genius discovered new harmonies they played on the old scale.

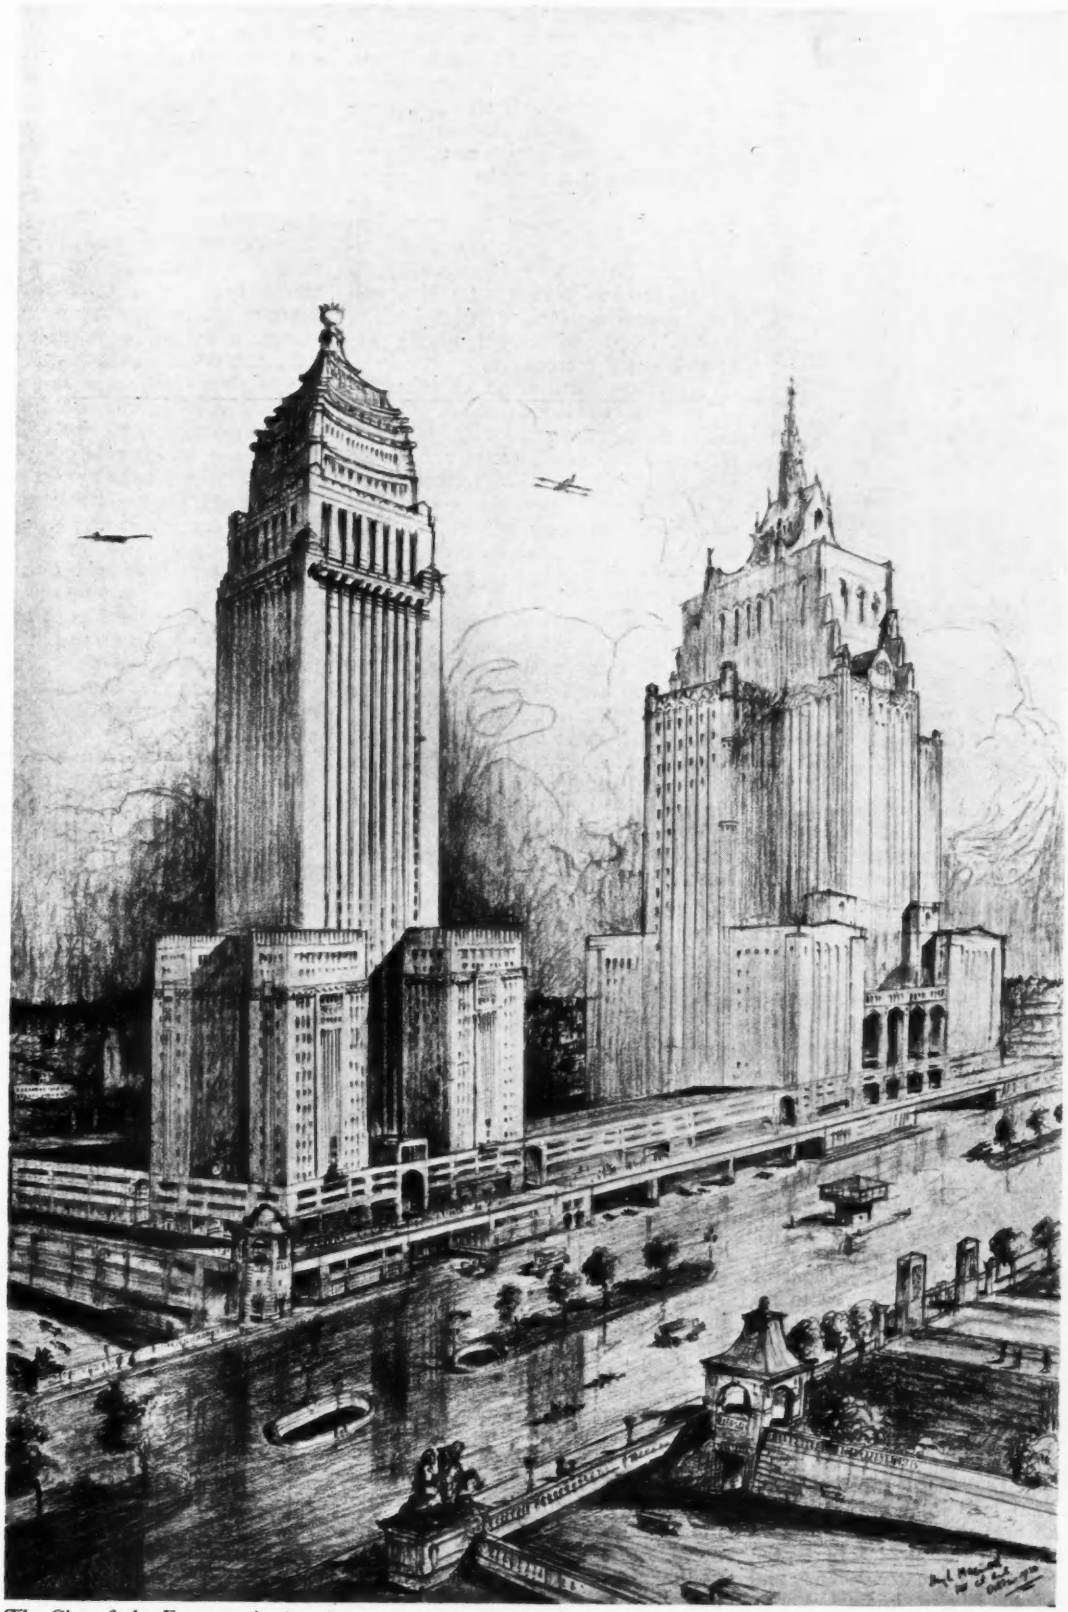
Today a distinctly different range of notes is struck, a new sound is produced. We have heard nothing quite like it. We are not certain whether all these novel combinations of sound are harmonies or discords. I have used the simile of music, because identically the same phenomena have arisen in that realm — Stravinsky, Bartók, Scriabin. What do they mean? Do they mean anything?

Take also sculpture. Epstein, save for a few wonderful exceptions, staggers his contemporaries into speechless rage or doubts of their own sanity. Frank Dobson, Henry Moore and others on occasion join in what the public is sometimes tempted to think a rather ponderous and expensive joke. And yet these men have a great deal to say quite seriously, for themselves in particular and for art in general.

One phase of these modern conditions has had and is having its effect upon architecture precisely as it has had and is having its effect upon the arts of music and sculpture. What is that phase? It is a mental condition. How did it arise and what are its characteristics?

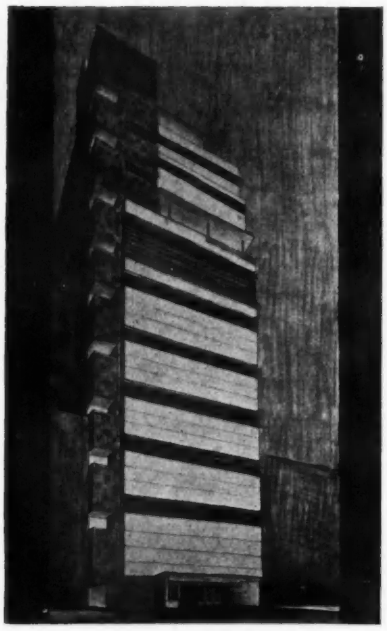
I am not going to put the modern mentality down to the war. The war merely marked and precipitated the end of an age, speeding up a process already advanced. It *smashed* suddenly what was already crumbling. What was crumbling? I answer: tradition. A new world, immensely larger, was already in process of birth. The modern eyes saw farther—backwards to the origin of things; outwards to the farthest stars; onwards to ever-fresh conquests of science. The modern man found himself moving with incredible rapidity, utilizing inventions to accomplish more in a month than his grandfather could overtake in six.

I say the modern man, because one feature of the new world was the swift and widespread dissemination of ideas and advantages. All classes of the community began to share in what previously had been the freehold of the favoured few. And the process of adjusting the old to this sudden new environment and life became increasingly difficult—to many minds impossible, or, at any rate, not worth while. The traditionalists say to me: You ought to finish your wall with a cornice. I say: There is no ought about it. I finish my wall by stopping where I want to, slick and clean, with none of your meaningless fuss. What, anyway, is the *use* of it? This modern school of thought has its champions—le Corbusier in France, Bruno Taut and Mendelsohn in Germany, and many others.



They insist that the modern architect, instead of going to Rome or Greece for inspiration, should turn rather to the aeroplane, the motor-car, the dynamo. There you have products of the human mind, untrammelled owing to the nature of the case by tradition, for there are no traditions.

So they approach the designing of a building. What is it? Essentially a box in which human beings live. The earth for a bottom, the roof for a lid. Apertures in the sides to admit light and air and permit egress and ingress. Inside the box, human beings carry on the functions of eating, drinking, sleeping and the necessary corollaries to these occupations. The interior of the box must be considered as a machine. Everything in it must first of all be designed in terms of life efficiency.



One factor, particularly on the Continent, has greatly helped this movement. That is poverty. It has been economically necessary to simplify and to standardize, and if you standardize it is essential to consider first the greatest common good according to the current conception of what is the greatest common good.

Some of the results of this new approach to design have been good. For buildings serving modern uses—such as the vast modern store or the modern factory — both having no ancient traditions behind them, and both being in their essence of the nature of machinery—the new view is possibly the right view, and out of it good architecture will come.

As to the house, I am not sure. Family life is not entirely mechanical. A man admittedly does not live on the outside of his house, but there is a

The City of the Future. An imaginative sketch by Hugh Macintosh. "I imagine a city . . . with your shopping centres above and away from traffic; immediately under, your business, professional and administrative population; and, at street level, warehouses. Churches, halls and meeting-places can occupy the topmost stories."

Preliminary study for a Museum of Modern Art, New York. "The purposes intended could have been attained less blatantly, more politely, with greater decency and consideration."

personal satisfaction in presenting something more than a bold and unadorned, even naked, front to one's neighbours. And in the beautiful traditions that cling around the British home, there is something we ought not to surrender.

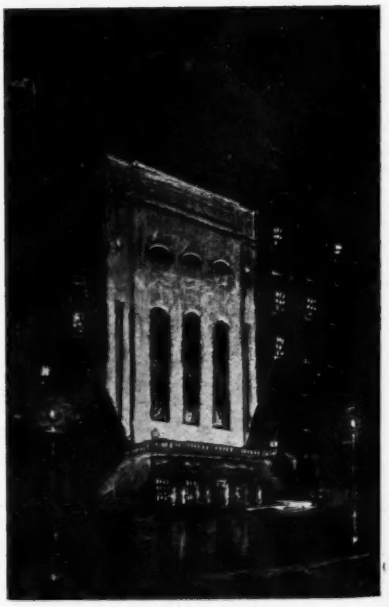
Between old and new there will, however, be something of a fight, the end—let us hope—being the absorption of a sane simplicity and honesty from this new domestic architecture, combined with the best elements of the old.

What I have said is, I hope, fair to some of the best aspects of the new architecture for which there appears to be a future of usefulness, but there is —I venture to suggest—no future for certain developments based, it seems to me, on affectation, blatantly displaying the new merely because it is new, and apart from considerations of efficiency, going out of its way to fly in the face of conventions which, after all, are the foundations of good breeding.

A design for a Museum of Modern Art in New York (reproduced on this page) has been copied from a photograph just received from America by my friend, Mr. Cyril Spackman, to whom I am indebted for it. What it means I don't know. That it is intensely ugly I do know, and that the purposes intended could have been attained less blatantly, more politely, with greater decency and consideration, I also know. For a museum of art is a kind of building with great and honourable traditions. "Modern" art is a thing of a day and nothing more, *unless* it has at least some reverence and respect for the past. I am under the impression that Titian will, in spite of all, outlive some of our modern jazz-cubists. I will not, however, believe that all modern art can descend to so low a level as to deserve the perdition of having to be hung on the walls of this architectural nightmare. Dante never glimpsed an infernal palace of proportions so outrageous. There is an element of revolt in the modern movement which will have, sooner or later, to adjust itself to reality. And reality contains the past as well as the present.

I must now turn to the second phase of modern conditions as they affect architectural design. This phase is physical. It is concerned with materials—increased confidence born of experience in the use of steel and reinforced concrete; greater precision and uniformity in manufacture, giving a greater factor of safety in mathematical calculations of strains and stresses; the evolution and perfecting of the lift and the escalator; the more perfect approximation of artificial lighting to daylight; more efficient systems of ventilation, heating and engineering services generally.

I will deal first with reinforced concrete and steel construction apart from particularly lofty buildings. The effects of these methods of construction have been most interesting. Designers have been driven back—because of the elimination of the arch—to earlier styles. To the Greeks, to the Egyptians, who used the lintol. Sir John Burnet in this country was a pioneer. The first London building he executed in this manner was Koh-i-noor House in Kingsway. He and his partners have developed the same style, particularly in Adelaide House, London Bridge, and latest in *The Daily Telegraph* Office, Fleet Street.



But more is happening by the use of reinforced concrete. Mendelsohn in Germany, in particular, is realizing buildings as plastic. The shape can be anything, governed solely by the idea of efficient use.

Just in passing let me refer to another interesting development arising out of the more perfect use of electric light externally. I have made a sketch (reproduced on this page) of an imaginary cinema front not unlike a very successful front in Whitehall. Now, here is a problem in design. These buildings are for night use principally. For effective flood-lighting plain white uninterrupted surfaces are best. You are flooding almost vertically. Imagine pediments, cornices, projections, casting meaningless blobs of black over your building. On the other hand, two little setbacks give two black bands: an effective picture in black and white.

Briefly I now deal with the lofty building, which, without doubt, has come to stay and is bound to have an increasing influence on town planning and the layout of future cities. The skyscraper is only possible by reason of the perfecting of the steel-framed building, by the perfecting of the elevator and the approximation of artificial lighting to daylight.

The drawing I have made for this subject (reproduced on page 657) shows two buildings of fifty stories, housing about 15,000 tenant population in each, 30,000 in the two. Consider the effect on the traffic problem. In a commercial community housed in such buildings two-thirds of the journeys are vertical instead of horizontal, and at the rate of 750 feet per minute. There is the untold advantage of concentration — personal contact between man and man, office and office.

I imagine a city laid out on these lines, with your shopping centres above and away from traffic; immediately under, your business, professional and administrative population; and, at street level, warehouses. Churches, halls and meeting-places can occupy the topmost stories. A building of fifty stories carries forty lifts. Each lift takes fourteen persons and can descend and ascend within two minutes—if you hustle. I can clear a congregation of 1,000 persons in five minutes from the fiftieth story, and if they have not enjoyed the sermon they have, at any rate, been breathing mountain air.

An imaginary cinema. "For flood-lighting plain white uninterrupted surfaces are best. . . . two little setbacks give two black bands: an effective picture in black and white."

ENGLISH PRECEDENT No. 139

HOUSE IN MAIN STREET, SITTINGBOURNE, KENT

This house is a peculiar mixture of finished and delicate detail, with features that are the descendants of earlier forms.

Both the doorway and the small three-light window over it just fail to hold their place between the heavier bays, and under the too heavy cornice. One is led to wonder whether the copy-books or the London joiner are in any way responsible for the finer parts of the design.

—[E. MAXWELL FRY]

LETTERS FROM READERS

A Form of Slow Death

SIR,—Your moving leading article on "A Form of Slow Death" has no doubt been read with great sympathy by many people, and I therefore venture to put forward two practical remedies that might well be worthy of the support of architects.

All must agree that in London and elsewhere basement dwellings are most undesirable. Will architects in the future try to persuade their clients *not* to erect any more buildings with living accommodation provided under the street level? In London some £60,000,000 has been or will be spent on housing, and yet buildings are being erected that may become slums in the next generation.

But the root difficulty in London is the lack of adequate control. Some 243,000 new dwellings have been provided by all sources in Greater London since the War, and yet overcrowding still exists. This is partly due to the fact that every day families are swarming into the Metropolitan District, and, in many cases, as soon as a family is removed to a new dwelling, the vacant rooms are inhabited again. If only health committees would co-operate more closely with housing committees and administer existing powers more rigorously, the present evil would be greatly diminished. A few London boroughs are tackling this problem bravely. They are clearing bad basements and preventing them again being occupied. If all medical officers of health in Greater London and their inspectors made fuller use of their opportunities, this appalling evil would be partially remedied.

B. S. TOWNROE

Official Architecture

SIR,—Were I able to write verse, and abusive verse withal, I should probably commence my effort, in reply to Mr. Owen, thus:

When I'm in the sere and yellow,
And my faculties are dim,

and so on through the usual rhyming reiteration to the climax that, having reached this pleasant state of senility, I should be equipped to function as an official architect.

But, as I say, I am congenitally incapable of jerking abusive doggerel.

J. R. LEATHART

SIR,—I have followed with interest the correspondence which has arisen out of the debate upon the above. Viewing the subject impartially, it would appear that Mr. Leathart has mistaken the shadow for the substance, inasmuch as by giving central prominence to a misinterpreted extract from the context of Mr. Wynn Owen's case for official architecture, he has misled himself and probably others.

There was no "vitriolic attack" upon a "famous architect"; the case was, in my opinion, stated in logical and restrained terms throughout. In the analysis of most subjects, comparisons (though sometimes apparently odious) are necessary in order to arrive at a conclusion by a logical sequence of facts.

I may say that I attended the debate and, from my own observations, the delicacy of the situation arising out of the question of comparisons was fully appreciated by Mr. Wynn Owen, who stressed the fact that the comparisons were of works and not men.

HARRY HOLLAND

SIR,—I cannot agree with the attitude of "Business Man," as outlined in his letter which appears in your issue for October 8.

His suggestion that we should seek the services of architects in the cheapest market does not appear to me to be good business. Perhaps he means in the best market, but that is not quite the same thing.

The architecture of a business building should surely seek to proclaim the dignity of the business housed therein, and where the "official" architect cannot supply this, and one at the figure quoted by your correspondent probably could not, it would be money well spent to secure the services of a man with the ability to do so.

The staff architect whom "Business Man" appears to have in mind would, without doubt, be commanding a much higher salary if he could give the better work both in planning and design of elevation which are considered necessary for progressive concerns.

ISIDORE SALMON
(J. LYONS & CO., LTD.)

The Architects' Golden Opportunity

SIR,—If in the leading article published in your issue of October 1 I have said anything that might be read as disparaging the efforts of Letchworth to create a new type of garden-town, making it suffer by comparison with its neighbour, Welwyn, I make haste to withdraw the offending remarks.

The whole trend of the article laid stress upon the return to questions of purely urban planning, tracing the gradual evolution of garden village, and suburb planning, through Letchworth and Welwyn back to the great towns. In so far as these towns forsook the principles of monumental city planning in favour of looser principles evolved out of their adoption of the best features of the English village they became *ipso facto* suburban instead of urban. The winning design for Birmingham Civic Centre was urban. The same can be said of Letchworth in only a limited degree.

YOUR LEADER WRITER

Scottish National Library

SIR,—In his admirable letter on the present architectural problems of the Scottish capital, Mr. Morton Shand has omitted to mention what has always seemed to me the clinching argument against the site on George IV Bridge for the National Library. It is a matter of available area. The site selected is 27,000 square feet in extent, compared with the 35,000 square feet of the projected public library in Manchester and the 70,000 square feet of the Welsh National Library. It is about one-half of the area of the public library in Boston, Massachusetts.

It must be borne in mind that, not only is it to be a national and not merely a municipal library, but that, as one of the four copyright libraries, it must find space for an enormous number of new books every year. And, as it happens, there is on the other, i.e. the east, side of the Parliament House a site available of 65,000 square feet with a contiguous 67,000 square feet which could later be brought into use. At the same time, one does not see why a building of such supreme national importance as this library should not have the finest available site in the city, and why, on the Calton site now saved from Mr. Lansbury, a superb expression in stone of Scotland's zeal for letters should not be built. After all, as compared with Wales, Scotland is £219,740 short of her quota of Government money for libraries, and at the present rate of progress will be £400,000 short in five years' time. She need not rely entirely then on Sir Alexander Grant's conditioned munificence.

GEORGE MALCOLM THOMSON

A New Housing Scheme

SIR,—My Federation is convinced that it is impossible for private enterprise to build houses to rent to tenants without financial assistance by means of subsidies and loans on mortgage. It is the opinion of the Committee that if the facilities outlined in a report, which has been submitted to the Government, are afforded to the members of the house-building industry, the houses for the working classes, apart from the housing of the very poor, can and will be provided very rapidly by private enterprise. The activities of the local authorities can then be curtailed strictly within the limits of rehousing slum dwellers and

providing living accommodation for those of the lower-paid working classes who may be described as the very poor.

Following are extracts from the report :

Subsidy schemes are still necessary because of the continued restriction of the rents of pre-war houses under the Rent Restriction Acts, and no real normal position can be attained until all restrictions are withdrawn and housing once again is a free and unfettered industry. The withdrawal of the restrictions might cause a very temporary inconvenience in some cases, but the adjustment of all rents to an economic basis would bring housing into its old position and would prove the most rapid and economical and efficient method of solving the housing problem of the country.

It is evident to the house builder that it is a practical proposition to build houses which are required by the working classes, given assistance which will not be greater than that now afforded to the local authorities; and if the recommendations of this report are adopted, it can be confidently asserted that houses will once again be provided by private enterprise and provided in adequate numbers, so that the expensive and unsuitable schemes of the local authorities may be discontinued and the acute overcrowding of the working-class districts of our great cities may become a thing of the past.

In drawing up the scheme, the Federation has had in mind the demand for small, comfortable houses containing two and three bedrooms, bath and all modern requirements, to be let at approximately 7s. 6d. to 9s. 6d. per week, excluding rates.

The scheme is as follows :

1 : Subsidy.—The full 1924 Act subsidy of £11 5s. per annum for forty years without liability of withdrawal on a sale to be available for houses built by private enterprise; or, alternatively, a lump sum subsidy of £100 per house. The lump sum subsidy of £100 is approximately equal to half the amount of the full 1924 Act subsidy.

2 : Rents.—The maximum rent to be fixed for the whole period of the yearly subsidy, or where lump sum is granted to be fixed for five years, after which the house to be free from restrictions.

3 : Density.—A density of twenty to the acre to be allowed. The measurements to include all roads and adjoining open spaces.

4 : Roads.—Where wider roads or more expensive specifications than those of the town-planning roads provided in the model clauses and the local town-planning schemes are required, the extra cost to be defrayed by the public authority.

5 : Blocks.—Rows or blocks of eight houses to be allowed.

6 : Loans.—Loans on mortgage to be provided where required, amounting to 90 per cent. of value on forty years' repayment terms at 5 per cent. interest. Each scheme to be approved for loans and all particulars to be agreed before building operations commenced.

7 : General.—The Ministry to refuse to grant subsidy facilities to any local authority where subsidy to private enterprise on above terms is not granted. Where subsidies and loans are refused by a local authority to private enterprise and the houses are proved to be required, the Minister of Health to make grants and/or loans direct to the builder.

---

1 : Subsidy.—The lump sum subsidy would facilitate the sale to investors in house property, who would not be attracted to an investment where they had to apply for a grant to their local authority every year for the next forty years.

2 : Rents.—The withdrawal of the maximum rent condition after five years, on the grant of a lump sum subsidy would further encourage investors who would not look with favour on property the rents of which were restricted for forty years.

3 : Density.—The density of twelve to the acre is an impossible regulation for low-rented houses : a house covering, say, 400 ft., or 44 yds., stands on a plot of land of 400 sq. yds., the remainder of the land—356 sq. yds.—being open and having to be paid for, sewered or cultivated. At twenty to the acre this house will stand on a plot of 242 sq. yds., and will only occupy one-sixth of the area, five-sixths being open to the light and air. In most town-planning schemes it is permissible to cover one-third of the area with buildings. The restriction of twelve to the acre should be altered, and cottages built at a density of at least twenty in industrial areas.

4 : Roads.—The cost of roadmaking, which is largely for the public benefit, was the subject of a resolution in the House of Commons on February 24, 1930, when it was agreed :

"That this House views with regret the excessive burdens placed upon the occupiers of new houses by the incidence of the present rating system and by street-paving charges, and the detrimental effect of such burdens upon future housing development, and urges the Government to consider proposals for the reduction of such burdens in connection with any future legislation dealing with the question of housing."

5 : Blocks.—The row of eight houses for working-class accommodation has many advantages over the semi-detached style of building. It is much more economical to build; it provides for greater warmth or "cosiness" in the house; it is more neighbourly and gives many people a greater feeling of security.

6 : Loans.—The forty-year repayment scheme is of great advantage in keeping the rent down, for the repayment of a loan at thirty years requires 1½ per cent. on the mortgage, whilst at forty years the percentage is only 16s. 6d.

I should like to point out that my Federation does not build houses nor carry on any business; it is the only representative of the private house builder. We have local associations in eight areas and individual members in all parts of the country.

NORMAN M'KELLEN
(SECRETARY, NATIONAL FEDERATION OF HOUSE BUILDERS)

QUESTIONS THAT ARISE

Testing Dampcourses

M. writes : "*What tests should be applied in comparing samples of bituminous damp-proof courses, and what result in each test is it reasonable to demand of an efficient material ?*"

Roll bitumen courses are presumably meant, and an office test rather than a laboratory one. I would test for 1 : softening point, and choose that which stood the highest temperature without running ; 2 : resistance to pressure—rejecting any which exuded under pressure applied by an ordinary office press; 3 : pliability—bending back and forth until cracking took place, and choosing the sample which stood this test best in conjunction with the two preceding ones. Probably all samples would be found resistant to absorption tests, so that these are unnecessary. If a laboratory test is desired it would probably cost more than using a less chancy material.

A. B.

Restoring Terra-Cotta

B. writes : "*Is there a satisfactory method for treating terra-cotta where the face has perished and broken away by the action of the atmosphere and weather ? Is there any method of repairing it with coloured cement in the way perished stonework can be restored ?*"

Firms specializing in stone restoration would no doubt give a price for re-surfacing decayed facings, and such treatment would probably be successful in arresting further decay, but whether the appearance could be expected to be satisfactory would depend on the type of terra-cotta in question. Either red or yellow impervious material would be practically impossible to simulate in cement, but the varieties having more the appearance of stone could no doubt be repaired so as to be almost unnoticeable, or, of course, if the whole face required treatment and not patches only the change would not matter.

W. H.

Specification for Repairs

A. N. writes : "*What is the best method of tackling a specification for works, chiefly for external redecoration of a large city office, seven floors in height, with two main elevations and several areas? Other than redecoration, the work will include a number of repairs, such as cutting out and facing up cills, repairing cornices, stacks, etc. Will it also be necessary to supply the builder with a plan of each floor ?*"

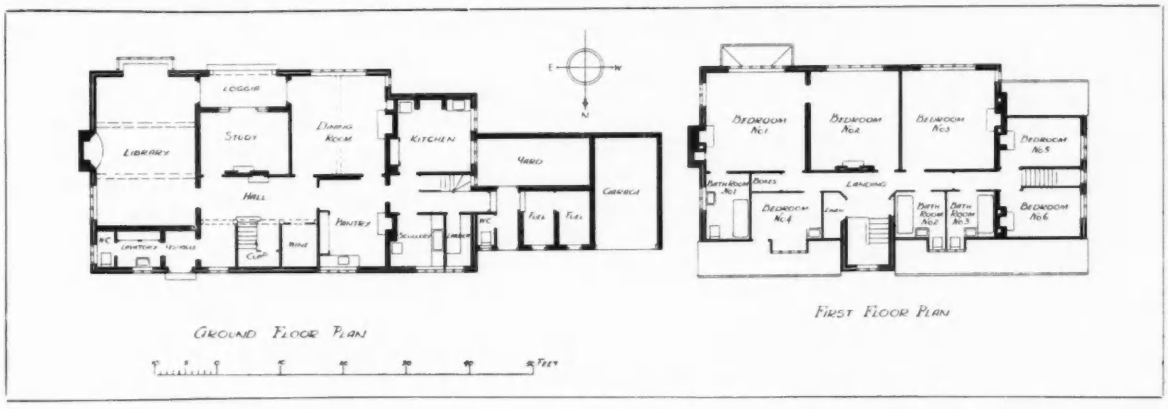
So many specifications for repairs and small alterations are not sufficiently clear to the builder, the writer usually inserting so many covering clauses and including for work in various parts of the building under one heading, probably fearing repetition.

Plans are not generally necessary for external repair work, but in the case quoted a small-scale block plan should be attached to the specification, and the areas lettered A.B.C., etc., according to the number of the areas. A set of plans should be available for inspection at the architect's or surveyor's office.

The writer should then specify the work *in all trades* to each elevation, each area, and work on the roof with, of course, the usual preliminary clauses.

Your correspondent should have no fear of repetition ; builders are not usually unnerved by a bulky specification, unless the bulk is caused by threatening and meaningless clauses.

L. W. H.

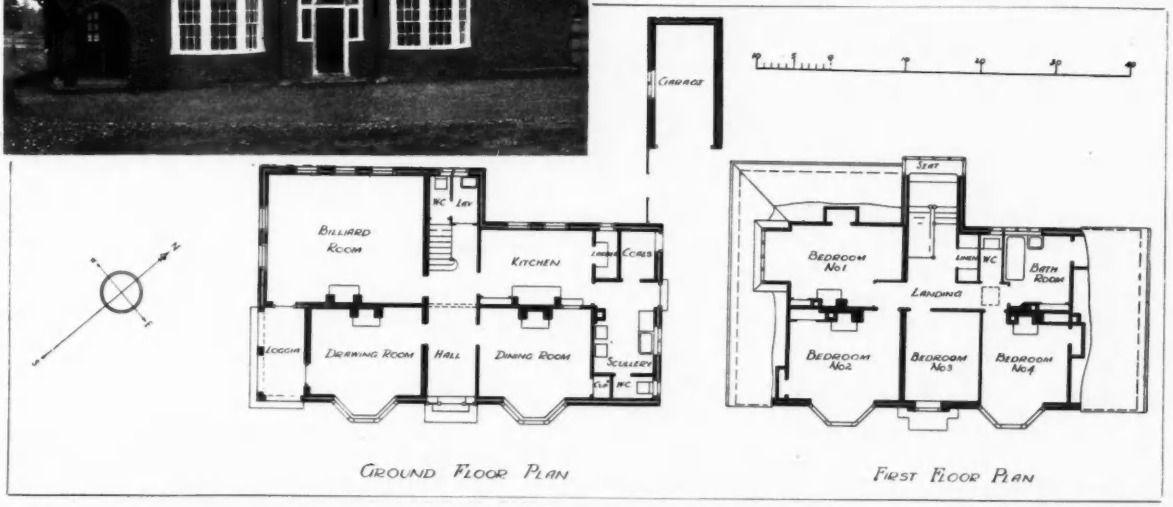


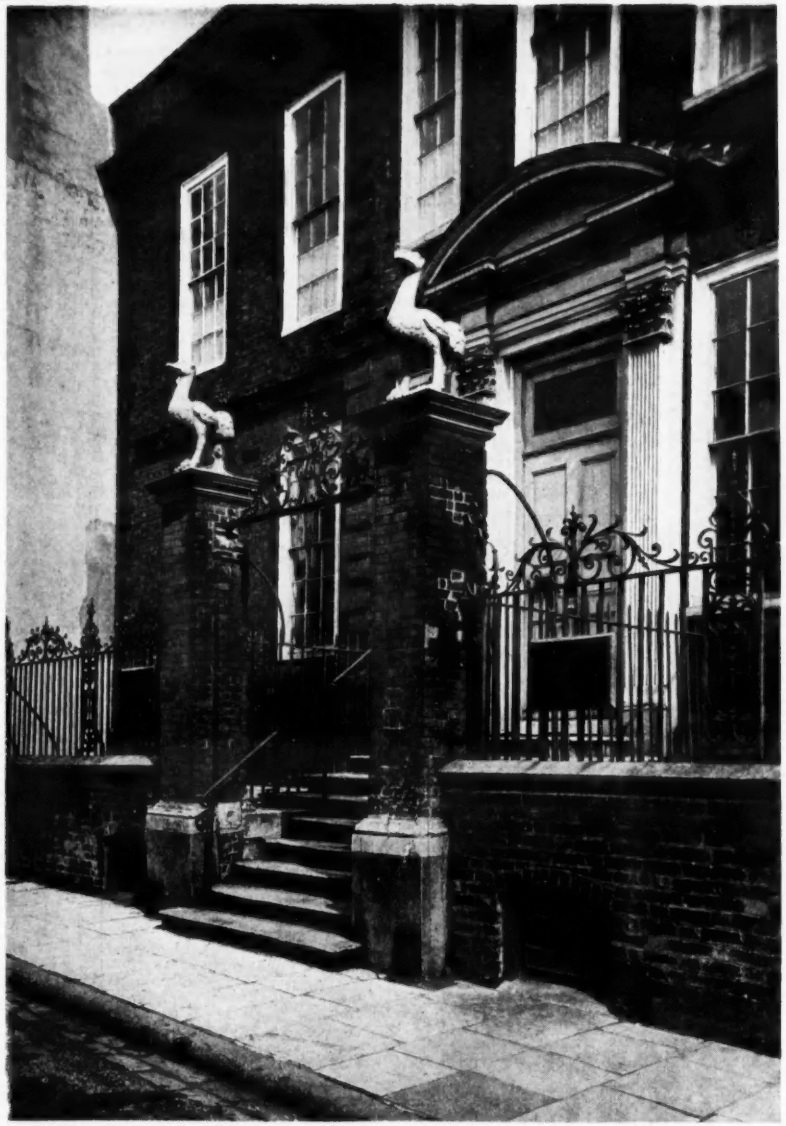
TWO HOUSES IN SURREY

DESIGNED BY THOS. R. CLEMENCE

BOTH these red brick and tile houses at Guildford have loggias on their sunnier aspects. Downlands is built of 2-in. hand-made Daneshill bricks and Twyford red hand-made tiles.

The larger house has, as its principal room, a library with a southward-looking bay window, and the central loggia opens out of the study, about which the remaining ground-floor rooms are grouped. The stairs are at one end of the building, and the long corridor is a feature of the first floor. A garage and fuel stores are built on to the house. The whole of the joinery is in oak, while the steel casements are glazed in squares. The cost was £4,816.

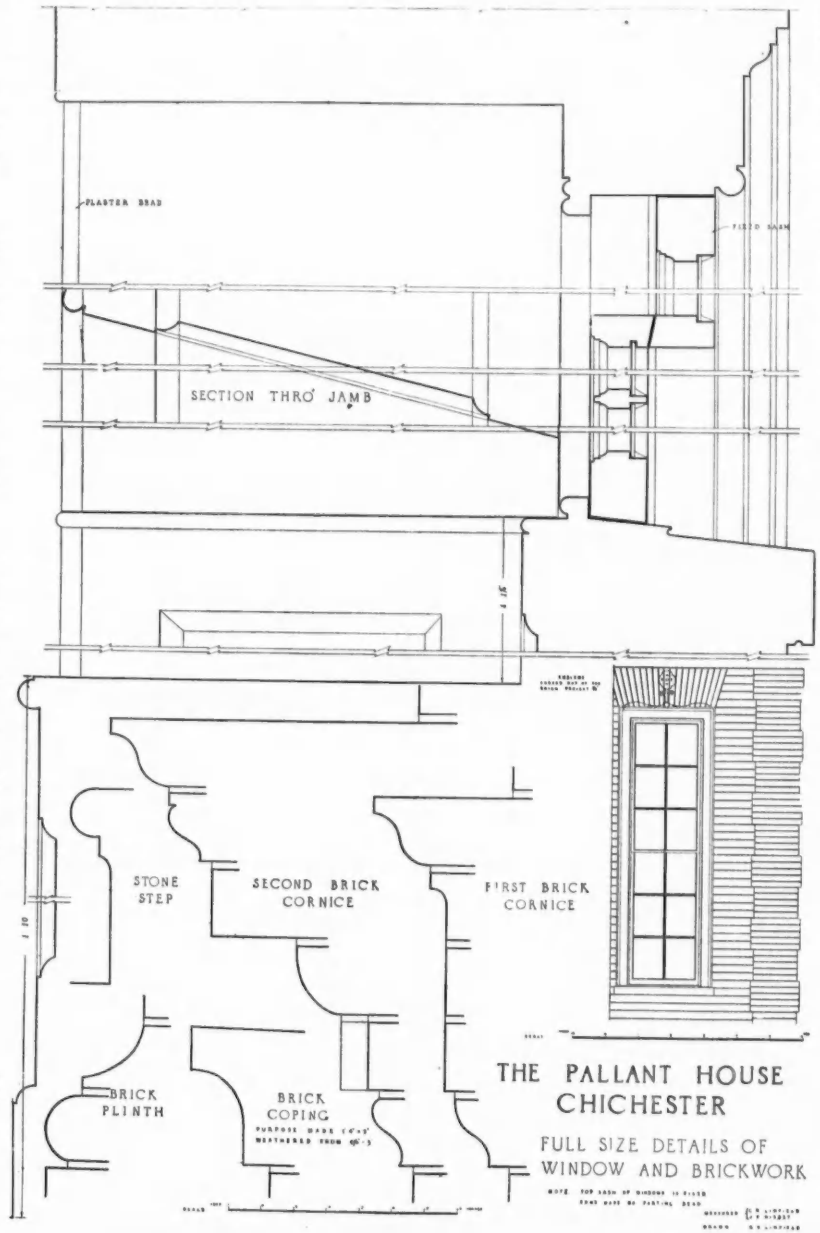




Downlands, of which the garden front is shown, includes a large library, six bedrooms and three bathrooms. Royston has a billiards-room and four bedrooms.

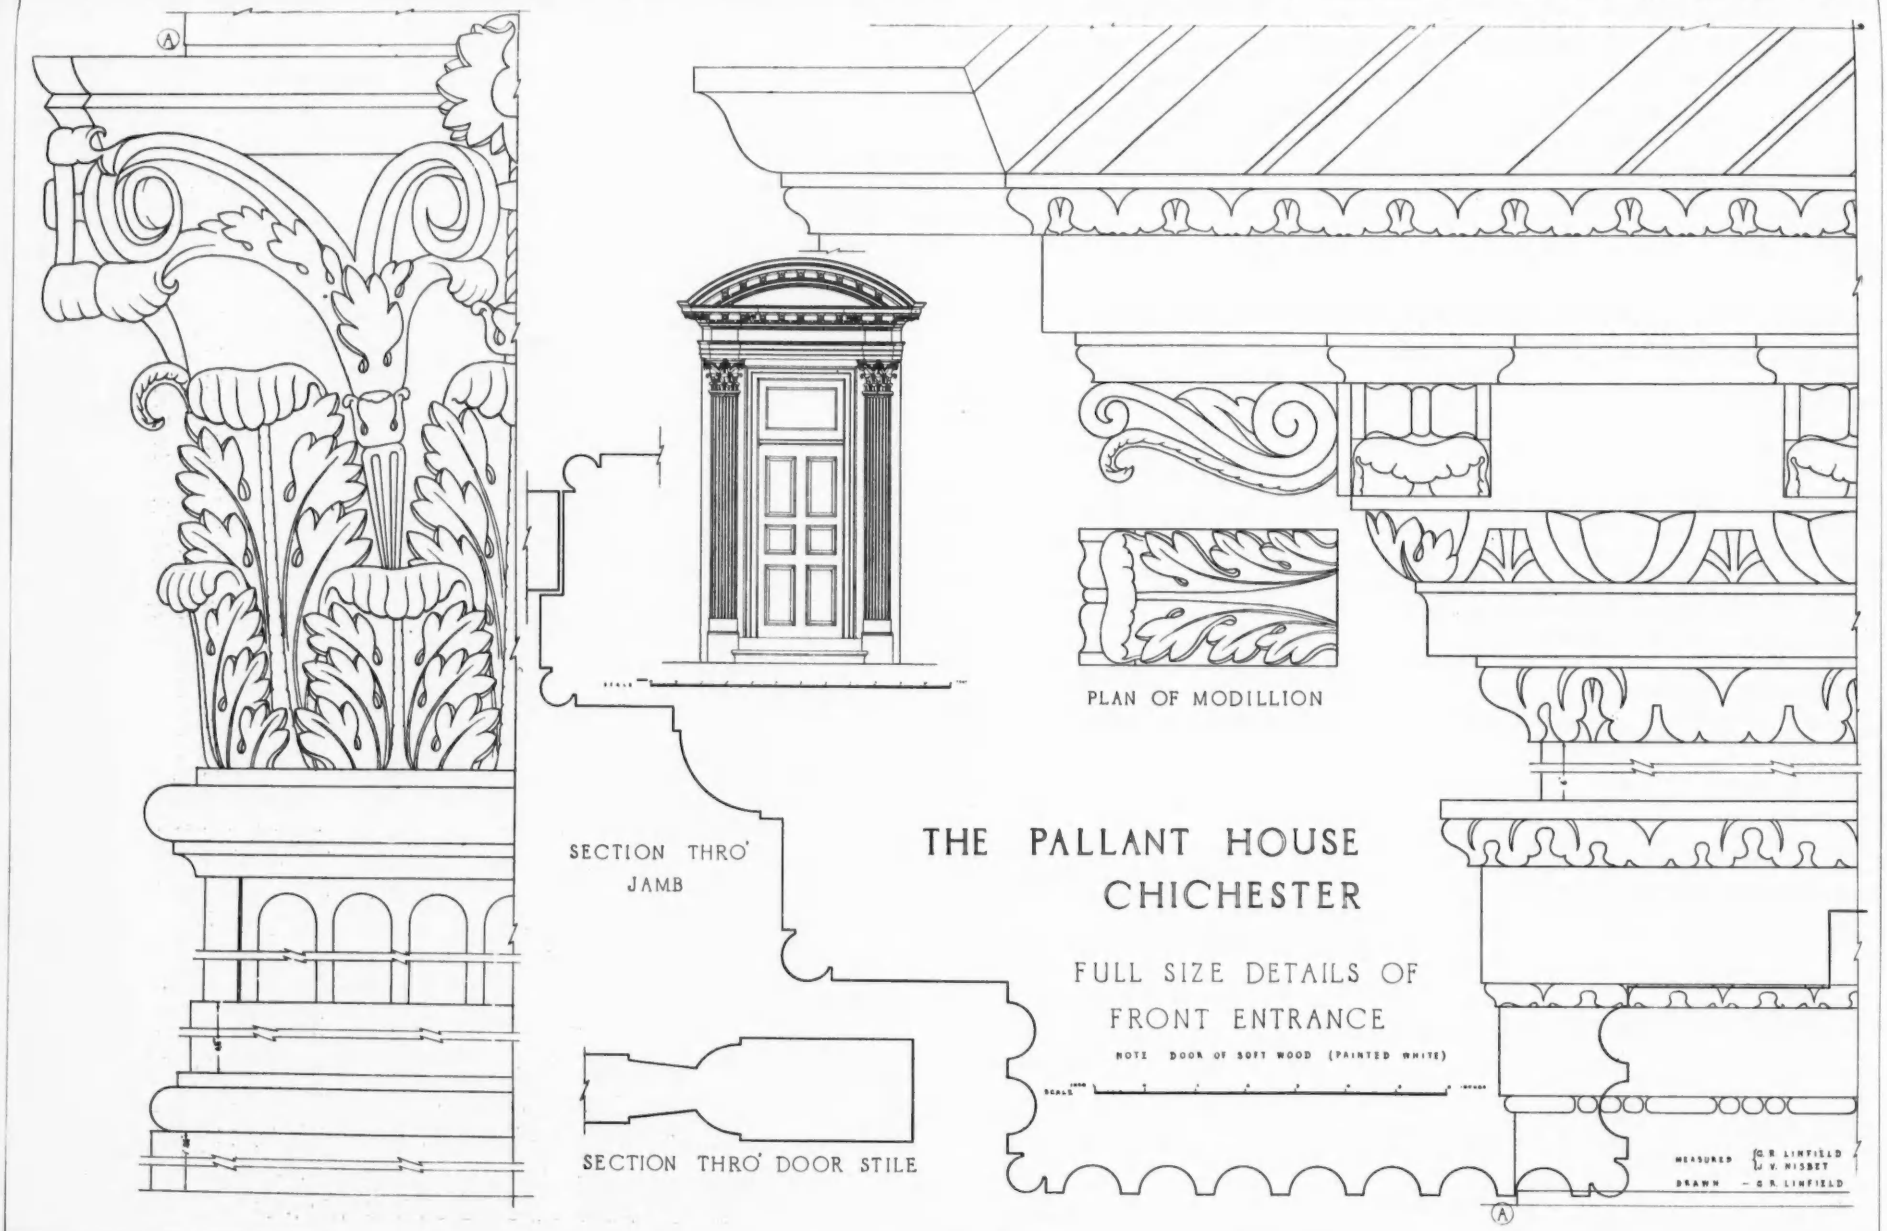
Royston, though smaller, yet provides a billiard-room, some 20 ft. by 17 ft., as well as drawing- and dining-rooms, both with splayed bays. Here the loggia is planned on the southerly corner, wooden sliding sashes are employed, and the floors generally are of polished oak. The cost was £3,228.

Pallant House, Chichester. Built 1711 ; attributed to Wren. A view of the front, showing, in addition to the doorway and window, of which details, measured by J. V. Nisbet and G. R. Linfield, and drawn by the latter, are reproduced on this and the facing pages, the fine ironwork in the forecourt.



Except for the parapet angle coping stones, the whole of the house is built in red brick. Two kinds of cut-brick quoins were used for the angles and sides respectively.

There are also differences in the forms of the window-heads, each of which has a device — fleur-de-lis, thistle, rose, and so forth—carved in the brick. The sashes, of which the upper portions are fixed lights, lie flush with the wall, and stone cills are absent.



The whole of the fine doorway is of timber construction, and the door itself leads direct into a spacious hall, lit by the windows close beside it on either hand.

Within is a staircase of noble proportions, of which, together with the panelling in the hall, further measured drawings will appear in a future issue.

[The accompanying photograph and that reproduced in the last issue are by F. R. Yerbury.]

J. V. Nisbet and G. R. Linfield, and drawn by the latter, are reproduced on this and the facing pages, the fine ironwork in the forecourt.

THE SPECIFICATION WRITER

Daylight Illumination: The Effect of Internal Decoration

By JOHN W. T. WALSH, M.A., D.SC.

IN a room in which the ratio of the depth of room to height of window does not exceed, say, 1·5 to 2, the state of the internal decoration of the walls and ceiling does not greatly affect the illumination at the back of the room. Matters are otherwise, however, in the case of a really "deep" room, especially if the window head be low. In such a room much of the light reaching the working plane at considerable distances from the window is obtained by reflection from the brighter parts of the ceiling. As this reflected light is necessarily proportional to the reflection factor of the ceiling, it becomes of importance to determine how much of the light at the different parts of such a room far from the window is received directly from the window itself and how much is reflected from the walls and ceiling.

Such a problem is most conveniently attacked by the model method, and work on these lines is now in progress at the National Physical Laboratory. The building used for such work was specially designed for the purpose and erected in 1922. As will be seen from the photograph (figure seven), it is a skeleton building with a glass roof and open sides provided with steel roller shutters which can be rolled up at will so as to leave a clear and unobstructed view from inside. This building houses a sectional wooden building specially constructed so that rooms of various dimensions can be readily built up to face in any desired direction.

For the particular purpose of investigating the problem of the deep room, for instance, a model room 9 ft. wide, 18 ft. from window to back and 11 ft. high, has been constructed, and this model has been covered with wallpapers of different reflection factors, so that the effect of change of reflection factor may be determined. Further, the size of the window opening can be varied at will, so that the effect of this factor in the problem can also be studied.

LIGHT-WELL EFFICIENCY

Another problem which is being investigated by means of models is the efficiency of light wells of various dimensions and with different kinds of internal lining. The frequent necessity for the use of light wells to illuminate the rooms in the inner portions of buildings covering a large floor area has made it important that exact information should be available on the amount of light to be expected in a room facing a well of a given dimension at any stated depth below the opening. For this purpose it is necessary to know the brightness of that wall of the light-well which faces the windows of the room in question. A knowledge of this brightness, expressed as a percentage of the brightness of the sky above the well, enables the light reaching the interior of the room at any point to be calculated precisely, using the method now commonly adopted for this purpose.[1]

Small-scale models of light-wells are being used for this investigation, the mouth of the model in use being placed opposite to a white surface uniformly illuminated so as to form an artificial "sky." The models used range in section from a square to a rectangle of 10 : 1 ratio of length to breadth. The effect of the reflection factor of the material used for facing the walls of a well is found by painting the interior of the model with different paints ranging in reflection factor from about 80 to about 25 per cent.

The fall of reflection factor of a well-facing, owing to accumulation of dirt, is, naturally, a matter which greatly affects the efficiency of the well for lighting purposes. Measurements of the rate at which this fall takes place are being made in actual wells exposed to a city atmosphere.

(To be concluded: for previous article see issue of October 15)

[1] See *Penetration of Daylight and Sunlight into Buildings*. Technical Paper No. 7 of the Illumination Research Committee, D.S.I.R.

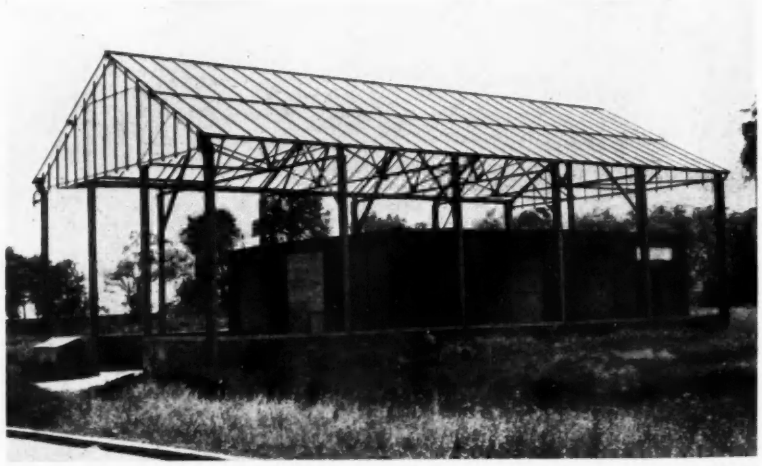
IN a paper read by Dr. H. T. Calvert at the annual meeting of the Institution of Municipal and County Engineers, the need for the collection of statistics about the operation of water purification at swimming-baths was emphasized. The mere fact that a water-purifying plant has been installed and is operated was no guarantee of proper results. Simple tests which could be made and collected by baths superintendents would be of great value, in view of the dearth of knowledge of the actual conditions of running. It was urged that no person should be allowed to enter a swimming-bath without first taking a shower bath, preferably with warm water and soap as a preliminary. Even with this precaution the filters installed should be large enough to deal with the whole contents of the bath within a period of four hours or less. The pump must be properly adjusted so as not to overload the filters; a coagulant is generally essential, and the water should be maintained in a slightly alkaline condition. Mechanical filtration alone is ineffective in the removal of bacteria.

Repairing Roof Coverings

(An article on "The Repair of Old Roofs" appeared in this section on October 1 last)

THATCH

IN specifying repairs to thatched roofs it may be only necessary to give a thin coating of new thatch about 6 ins. in thickness, and the inordinately thick covering on old cottages is the result of constant applications in this manner. On the other hand, when the roof has been long neglected, the ash saplings which were frequently used in place of battens may have rotted, and the whole should



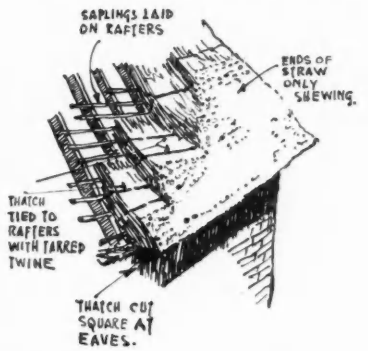


Figure seven. The model building at the National Physical Laboratory, constructed for the researches into interior illumination referred to in this article. It was equipped with steel roller shutters, not here shown.

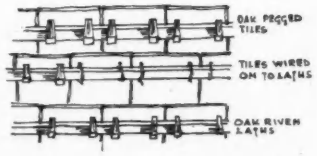
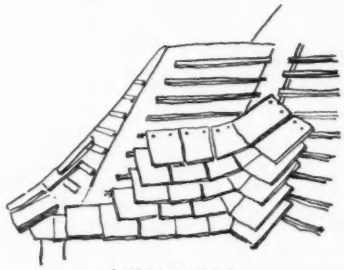
then be stripped and re-thatched. It may be better to insert new battens in the intermediate spaces without disturbing the construction.

The method of thatching differs in various districts and is best left to the thatcher, but it should be stipulated that little more than the ends



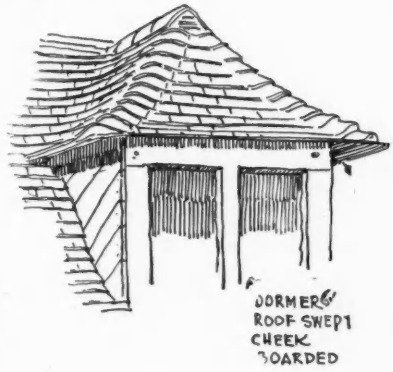
of the straws are to show externally, and that no straggly or bruised straw may be used. This last point should be carefully watched, as straw that had passed through a mechanical threshing machine is useless for thatching. Stout, well-tarred hemp twine should be specified for tying the bundles in place. A thatcher is often careless over these little points in material, though most careful in his work. Thatch should be thoroughly damped before use, and a soaking in alum water is a precaution against fire where straw thatch is used.

TILES



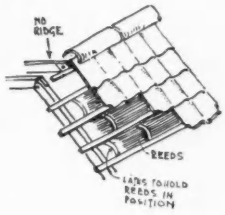
The difference between old and modern plain tiles should be considered in repairing ancient roofs. Modern tiles are usually nibbed and holed, but old tiles have only two square holes in the upper end for the oak pegs on which they were hung. These holes are a sure sign of genuine old tiles, and un-nibbed tiles with round holes when offered for sale as old should be viewed with suspicion.

Where tiles have slipped owing to the



decay or loss of the oak pegs they can be pushed back into place and wired to the battens. If new tiles are necessary they should be made the same thickness and size as the old, and should have the distinctive double camber which makes them watertight. They must be pegged or wired to the lathing, as nails will split these old oak rent laths. When complete, the tiles should be torched from the inside with lime mortar containing a large quantity of long goat hair. It is a mistake to board old roofs under the tiles, as this destroys their elasticity in high winds. One cause of the good condition of old tiles as compared with new is probably due to the greater freedom of movement in sudden emergencies. Boarding also prevents repairs being undertaken from inside, but in the open roof, when the tiles are bedded in hay, this sometimes rots and falls upon the ceiling joists, making damp patches on the ceiling below. In any case this hay or straw is best removed as it is a refuge for vermin.

Lead was very seldom used in flashing old roofs, and various dodges were used to keep out the weather. Verges at gable ends and where the sloping roof abuts against a wall were given a tilt upwards to throw the water away from the weak places. Valleys were swept or laced, and in specifying the new work

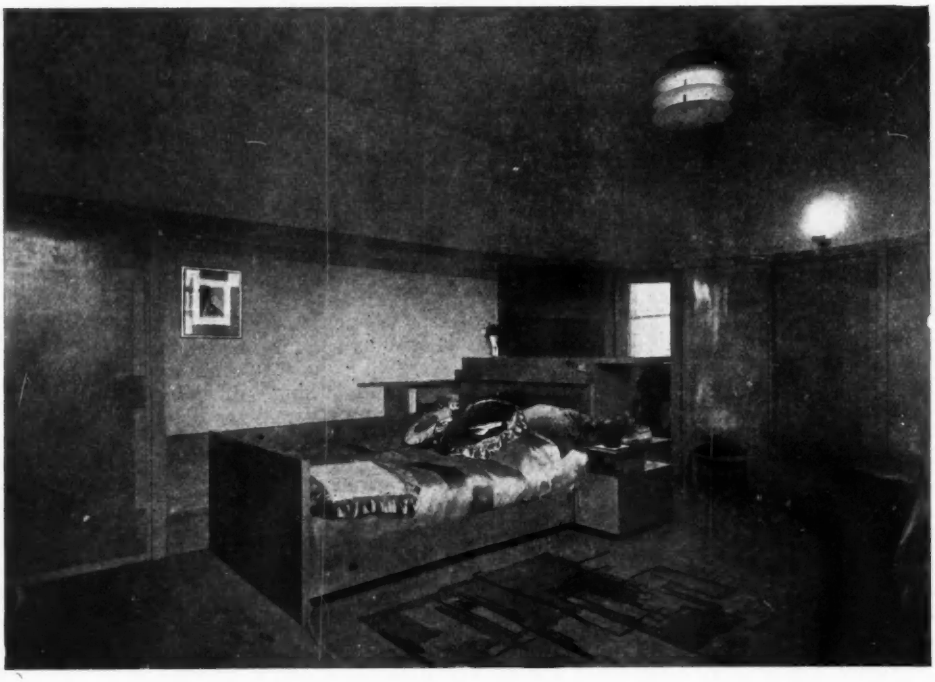


it should be noted which was the old practice. Where the valley between two roofs is to be swept, the pitch must be the same. The roofs of dormers can be swept, but not the cheeks, which were seldom tiled, but commonly plastered or boarded. One should be careful never to ask the tiler to do the impossible.

PANTILES

Pantiles are lighter, cheaper, and can be laid to a less pitch than plain, and when this has been said, it is an end of the catalogue of their virtues. They are less watertight, and when laid on modern roofs have usually an elaborate arrangement of boards, battens and impervious material beneath.

If the roof is letting water it may be necessary to strip it and relay in the modern way, but many old roofs have the pantiles laid over reeds, set horizontally between the battens, on which mortar fillets are placed vertically under the joints of the tiles. These reeds tend to pick up the damp and prevent it from dripping on to the ceiling below. When pantiles are laid to a steep pitch and the timbers show signs of sagging, a close examination will probably show that the original covering was thatch, and in this case it would be proper to specify the removal of the tiling and the restoration of the thatch, rather than go to an expensive strengthening of the roof timbers.



LL. E. W.

A *MEMORANDUM has been issued by the Witney and District Joint Town Planning Committee, making suggestions as to materials and designs suitable for this locality. Stone, preferably undressed for domestic work, is recommended and in the case of brick or concrete the following renderings :—* a *: Two-coat Portland cement rough cast, colour-washed light stone ;* b *: undercoat of waterproofed Portland cement, finishing coat, lias lime and sand (float finished) ;* c *: two-coat light Portland cement (float finished) ;* d *: undercoat of waterproofed Portland cement, finishing with smooth stucco painted in subdued light colourings. As regards roofs, the various pitches recommended are : Stone tiles, 53°–60° ; concrete or clay tiles, 47°–53° ; natural slates or asbestos cement pantiles, 25°–35° ; corrugated asbestos cement sheeting, 15°–30°. Eaves should have a minimum projection of 9 in. The use of barge boards is not recommended, and in the case of concrete or clay tiles, hips are often preferable to gables. Plain segmental or "saddleback" ridge tiles are the most suitable. Chimney stacks should be constructed in stone.*

Ground-floor window openings should not much exceed in height twice their width, second-floor windows being one and a-half times their width in height, and attic or dormer windows square. There are also some hints on the colours of exterior paintwork, buff or dark green being recommended for joinery, though doors and windows may be white or cream.

D

A bedroom in sycamore. By R. Mallet-Stevens. From Modern French Decorative Art, *second series. "A book for the architect, the decorator, the student, the craftsman, and the emancipated patron of the decorative arts."*

LITERATURE

MODERN FRENCH DECORATIVE ART

THE unceasing search by architects and decorators after new motifs, both in interior design and in the more mundane forms of domestic utensils, is exemplified in this well-produced and intriguing book. During the five years which have passed since the first volume of this series was published, there has occurred an even greater reaction to traditional form which, but a short decade since, was considered typical of all that was desirable in interior design. In addition to the pronounced simplification of fundamentals, there has been an imaginative and courageous extension of the scope of glass, metal, plywood and veneers, as applied to interior forms and to those of furniture also. Above all, the realization that artificial illumination could be utilized as an inherent and integral part of decorative design has widened the prospect for the modern designer in a manner hitherto unthought-of.

A few years ago the prevailing obsession was to drape a room with indiscriminate and stock-designed electric chandelier fittings, usually hung with precision in the centre of the ceiling and casting a baleful glare and gaunt uncouth shadows; this is no longer regarded as a final state of perfection.

Significant of modern progress, too, is the demise of the period room. It is apparent that the tendency to think of a room in terms of Tudor or Empire or Jacobean styles is being vigorously discouraged on the Continent; instead, it is realized that we are actually living in the present year of grace, and not that of a sham regenerated area of antiquity. Of this it is easier to persuade the Frenchman than the Englishman, whose ideal home is persistently that of a bijou baronial mansion of the Tottenham Court Road Jacobean period. The impediment to the modern movement in this country is the client who "knows what he wants," and until he can be persuaded to entrust the decoration of his home to specialists in modern thought and design, so long will the standard of English creative art be depressingly low.

Among many subjects illustrated in this book are works by R. Mallet-Stevens, André Lurçat, Maurice Dufrène, Gabriel Guévrékian, and Marcel Guillemard, whose interiors, so simple, clean-cut, and withal so gracious, are all examples of superlative achievement in the field of modern French art, at which posterity will surely have no cause to sneer.

There is a tendency sometimes to force values, to over state, to trick wall surfaces with changes of plane and shape for which there is no apparent structural necessity; Mallet-Stevens's study in a villa at Hyères is not quite guiltless of this affectation; neither is Chareau in the Tours Hotel reading-room; but the results are so stimulating and provocative that these caprices can be regarded more or less tolerantly.

Mallet-Stevens's hall is brilliant in conception; the handling of the staircase flight with the cantilever landing reveals the touch of a man supremely sure of himself. There is no groping here, no tentative experiment, but a direct and masterly exposition of modernism.

A large portion of the book is devoted to illustrations of furniture, fabrics, eating utensils, and articles for personal adornment and use. Some of the fabric and wall-paper designs are merely eccentric, too self-conscious to be of interest as serious contributions to the subject; in particular Foujita's printed silk design of a mass of worms rampant is depressingly puerile. Jean Lurçat's tapestry is another example of modern imbecility. On the other hand, the printed silks of Sonia Delaunay are magnificent. All that it is possible to say in the design of knives, forks and spoons, coffee-pots, plates and saucers, has surely been said already; nothing of pre-eminent originality is revealed in the examples illustrated in this section of the book.

The furniture designs illustrated are good, nearly good, and not nearly so good. The examples range from beautiful expressions of the object to banal efforts at originality for the sake of being a trifle different.

The ironwork is extraordinarily virile and fresh in treatment, and ranks high in achievement. The standard of craftsmanship is amazingly high, and

gives fitting expression to the imaginative and beautiful designs.

Modern French Decorative Art is a book for the architect, the decorator, the student, the craftsman, and the emancipated patron of the decorative arts. The illustrations are selected to cover an extraordinarily wide field, but some indication of the colour schemes of the various rooms added beneath the titles of the examples would have been of great assistance in further appreciating the effect of the actual rooms. A YEAR-BOOK AND DIARY

THE *Year Book and Diary* of the Berks, Bucks and Oxon Architectural Association, recently issued, serves to show that a year-book of a professional society can be of daily interest, instead of the usual addition to the recipient's bookshelf. In addition to the transactions and proceedings of the Association, the names of the officers of the council, past officers, etc.—information which is to be found in the year-book of every society—there have been incorporated a useful calendar and diary for 1931. Each page in the diary is devoted to two days—as compared with three days in the last year's edition.

The frontispiece of the book is a portrait of the president of the association, Mr. H. Hult, F.R.I.B.A.

The 1930 Year-book and the 1931 Diary of the Berks, Bucks and Oxon Architectural Association. Reading: The Philip Palmer Press, Ltd. Price 2s. 6d.

SOCIETIES AND INSTITUTIONS

THE R.I.B.A. STATUTORY EXAMINATION

Two candidates presented themselves for the recent R.I.B.A. Statutory Examination for candidates for the office of district surveyor, and one candidate, Mr. S. G. Skrimshire, was successful.

ROADS BEAUTIFYING ASSOCIATION

At the annual meeting of the Roads Beautifying Association, held at the Royal Horticultural Hall, London, on October 21, Lord Clinton, who presided, said they had got to recognize that there were certain forces in opposition to them. He did not think this opposition arose from any real objection to æsthetic aims, but from the overpowering demands of industry. The Association must seek to guide those demands into better channels.

Some county authorities were dealing with acts of vandalism very effectively, but in the long run they must trust to education and the force of public opinion. It would be exceedingly unfortunate if, while the Association had struck a note that appealed to so many people, there should be a continual spoiling of these country districts, not only by great roads, but by ribbon development, the substitution of ugly concrete viaducts for beautiful old bridges, and, perhaps most of all, by the use of ugly materials for public buildings.

The work that had been done by the

[*From* Modern French Decorative Art: Second Series

Drawing room, designed by Marcel Guillemard, and executed by "Primavera."

Association was reviewed by Dr. Wilfred Fox, hon. secretary of the Association.

A letter from Mr. Herbert Morrison, Minister of Transport, congratulating the Association on their work, was read during the meeting.

BAD HOUSING DESIGN

Strong criticism of the types of houses that are being erected, not only in the London suburbs, but elsewhere, was made by Dr. Raymond Unwin, in addressing the conference of the Association of Municipal Corporations, held in London. Much of the housing done by municipalities, he admitted, was a credit to them, but the standard of design of the houses that are going up haphazard all round our towns he described as a disgrace to those who build them and a degradation to those who live in them.

The greatest part of their ugliness, he said, was due to the patching on of lumps of so-called ornament. It was a disgrace to a people with the finest tradition of good simple cottage architecture in the world that we should allow the design of our buildings to degenerate to so low an average that it became a positive pain to go about the new roads and streets and see how they were disfigured for want of design.

TOWN AND REGIONAL PLANNING

Mr. R. B. Donald, M.INST.C.E., gave an address at a recent meeting of the Belfast Literary and Debating Society on "Town and Regional Planning."

He said the underlying principle of town planning was, after careful and deliberate thought, to place on a plan what was considered to be the ideal scheme, prepared in the best interests of the community as a whole, so that in any future development of the area or any alteration such as the result of slum clearance, the well-considered layout might gradually, as circumstances permitted, be given effect to. A scheme must provide, in broad outline, zones for special purposes—industry, business and residences, roads and open spaces. It would also be necessary to limit the number of houses to be built per acre on any particular area, and to control elevations.

NORTH WALES ARCHITECTURAL SOCIETY

At the end of September the above Society held another of their summer excursions, to the district of Llanfairfechan to inspect various work which had been carried out by Mr. H. L. North, F.R.I.B.A., and the late Mr. Kennedy. A most enjoyable afternoon was spent, particularly in the inspection of Mr. North's work. The party were afterwards entertained to tea by Mr. and Mrs. North.

The last excursion in connection with the Society was made to Howell's School, Denbigh, where an inspection was made of the large extensions which have just been completed to the designs of Sir Aston Webb and Son.

The members were conducted over the works by Mr. Cameron, representing the architects, and Miss Robinson, the Principal, who gave every facility to the visitors for full inspection and afterwards entertained them to tea. At the close of the meeting the members passed a vote of condolence with Mr. Maurice Webb and family on the death of his father.

ITALIAN ARCHITECTURE

Sir Banister Fletcher, P.R.I.B.A., lecturing at the Central School of Arts and Crafts last Wednesday, gave a brief outline of the Mediæval or Romanesque architecture of the cities of the hilltops and plains of Central Italy. Each city, he explained, guided by its great families, developed its own resources and strove to outshine neighbouring cities with town-planning schemes, and by the erection of palaces and churches. Thus it was possible for cities like Pisa to undertake grand works of architecture, magnificent enough to go down to posterity.

CAST CONCRETE PRODUCTS ASSOCIATION

The following have been elected as officers and members of the council of the Cast Concrete Products Association for the ensuing session: Chairman, Mr. W. H. Jenks; vice-chairman, Mr. W. R. E. Honner; executive committee: Messrs. W. H. Jenks, W. R. E. Honner, G. B. Brader, G. W. Butchard, E. L. Cotterell, R. P. Girling, and Major F. G. P. Gedge. The council comprises the whole of the executive committee and Messrs. O. A. Aisher, J. G. Ambrose, W. A. Hutchings, A. G. James, H. Peace, D. Y. Smith and N. Thomas.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATION

30374. Berry, A. F. Manufacture of reinforced blocks, etc. October 10.

SPECIFICATIONS PUBLISHED

331179. Verity, H. Coin-freed revolving doors by which means entrance can only be made after the coin has been inserted in the coin-freed mechanism. Also, a master claim covering such operations. Working in conjunction with this invention will be another for mechanically operating such revolving doors, which would automatically stop in case of obstruction between the doors and wings.

335187. Marsil, P. Extensible buildings.

335816. Arnold, E. Reinforced concrete unit for the construction of shafts, tunnels, and the like.

335959. Bradshaw, F. W. Reinforced concrete posts, beams or girders, and the construction thereof.

335999. Moir, Sir E. W. Renewal or repair of bridge piers.

336135. Bennett, jun., J. H. Reinforcing members for steps of concrete and the like.

COMPETITIONS OPEN

November 17.—The Scarborough Education Committee invites architects to submit competitive designs for a proposed new Council school to accommodate approximately 800 children, to be erected on a site in Clarence Street. Assessor: Morris Thompson, F.R.I.B.A. Premiums: £100, £60, and £40, for designs placed first, second and third, respectively. Applications for conditions of the competition should be made to R. Underwood, Director of Education, Education Offices, Huntriss Road, Scarborough, not later than November 17. Deposit £1 1s. Latest date for submission of designs: January 17.

November 30.—The Burton-on-Trent Local Education Authority invites architects to submit competitive designs for a proposed new Council school to accommodate approximately 800 children, to be erected on a site in Clarence Street. Assessor: H. T. Buckland, F.R.I.B.A. Premiums: £150, £100 and £50 for the designs placed 1st, 2nd and 3rd, respectively. Applications for the conditions of the competition and site plan should have been made before September 8 to L. E. Burgess, Secretary and Director of Education, Education Offices, Guild Street, Burton-on-Trent. Latest date for submission of designs: November 30.

November 30.—The Guildford Cathedral Committee invites any architect, who has been engaged in the design of cathedrals or churches, to submit for examination drawings and other illustrations of his works; or a design for a cathedral. Not more than three sets of drawings may be submitted, packed in one large portfolio. The Committee, with the assistance of Mr. Walter Tapper, A.R.A., will examine the portfolios, and select a limited number of architects for the Final Competition. Each architect selected for the final competition will receive 500 guineas, whether his design is accepted or not. Portfolios should be addressed to The Venerable the Archdeacon of Surrey, The Diocesan Office, Lloyds Bank Chambers, Guildford, not later than November 30.

December 25.—A prospectus giving full particulars of the international competition for the Ukrainian State Theatre, organized by the Kharkov Town Council, Russia, has recently been issued. The theatre is to be erected in the centre of Kharkov, on the site of the present Comsomolsky Square (Young

Communist Square), and will contain a mass musical stage, and seating capacity for 4,000 persons. The competition will be assessed by a jury comprising a president, vice-president and fifty-six members. Prizes: 1st, 10,000 rub.; 2nd, 8,000 rub.; 3rd, 6,000 rub.; 4th, 5,000 rub.; 5th, 4,000 rub.; 6th, 3,000 rub.; 7th, 8th and 9th, 2,000 rub.; 10th, 11th, 12th, 1,500 rub. Drawings should be sent to the Kharkov Town Council on or before December 25. Copies of the prospectus are obtainable from the Embassy of the Union of Soviet Socialist Republics, Harrington House, 13 Kensington Palace Gardens, London, W.8.

December 31.—The Incorporated Association of Architects and Surveyors invites competitive designs for a Model Petrol Filling and Service Depot. The competition has the full support of the Automobile Association, the Scapa Society and other bodies which have at heart the preservation of the countryside, as well as the principal motor-trade journals. Assessors: Alfred Stephens Cross, M.A. (CANTAB.), V-P., I.A.A.S.; Edward H. Fryer, Deputy Secretary of the Automobile Association; and Walter Groves, Editor of *The Motor*. Prizes: 50 guineas, 20 guineas and 10 guineas for first, second and third places, respectively. Smaller awards may also be made on the advice of the assessors, and at the discretion of the Council of the Association. In addition a prize of 10 guineas and two prizes of 5 guineas each will be awarded to laymen for the best suggestions submitted with or without sketches. Full particulars, etc., are obtainable from the Secretary, the Incorporated Association of Architects and Surveyors, 1 Wilbraham Place, London, S.W.1. Latest date for submission of designs: December 31, 1930.

February 1.—The Norwich Corporation invites architects practising in Norwich and in the County of Norfolk to submit competitive designs for a proposed new fire station to be erected on a site in Bethel Street, Norwich. Conditions of the competition are obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. Deposit, £1 1s. Latest date for submission of designs: February 1, 1931.

No date.—The Committee of the Foundation Hospital and the Rectorate of the Royal Yugoslavian University of Zagreb invites competitive designs for the general rebuilding plans of the Foundation and Clinic Hospital of Zagreb. Assessors: 1. Dr. Srkulj Stjepan, Burgomaster and Chairman of the Foundation, as president of the jury. 2. Henauer, W., architect, of Zurich (or his representative, Ch. Thevenaz, architect, of Lausanne), for the Swiss Engineers' Association of Germany. 3. Dr. Ing. Kreis Wilhelm, of Dresden, for the Engineers' Association of France. 4. Arch. Expert H.R., of Paris, for the Engineers' and Architects' Association of France. 5. Dr. Culumovic Pavao, Primarius, for the Medical Association of Zagreb. 6. Ing. Gabric Franjo, for the Yugoslavian Association of Engineers and Architects, Zagreb section. 7. Dr. Rasuhin Josip, deputy for the Directors of the Institute of Hygiene Foundation Hospital of Zagreb. 8. Prof. Dr. Prasek Emil, for the medical faculty of Zagreb. 9. Dr. Durst Franjo, for the medical faculty of Zagreb. 10. Arch. Heinzel Vjekoslav, Alderman of the City of Zagreb. Committee representative of the jury: Ing. Jurkovic Mato, Stadtbaurat in Zagreb. Prizes: 1st, 20,000 Swiss francs; 2nd, 15,000 Swiss francs; 3rd, 10,000 Swiss francs. 15,000 Swiss francs have been set aside for any further work which may be required. Programme and particulars of the competition will be sent on or after August 15, 1930, on application to the Stadtvorstand of Zagreb (Mr. Matica, secretary), Room No. 70, 2nd floor, on payment of 200 dinar. Latest date for submission of designs: January 15, 1931.

THE ARCHITECTS' DIARY

WEDNESDAY, OCTOBER 29

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Exhibition of Members' Holiday Sketches. Until November 27.

LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. Opening address by the President, Professor Patrick Abercrombie, F.R.I.B.A. **5 p.m.**

SOUTH-EASTERN SOCIETY OF ARCHITECTS. At the School of Art, Maidstone. "The Relation of Light to Decoration." By R. W. Maitland, A.R.I.B.A. **5.30 p.m.**

ST. PAUL'S ECCLESIOLOGICAL SOCIETY. At the R.I.B.A., 9 Conduit Street, W.1. "Stained Glass." By Sir Charles Nicholson, Bart., F.R.I.B.A. **8 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Last of three public lectures on "Danish Castles and Manor Houses." By J. H. Helweg. (Lantern Illustrations.) **5.30 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Italian Mediæval Architecture: The Romanesque Period in North and South Italy." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

THURSDAY, OCTOBER 30

ARCHITECTURE CLUB. At the Architectural Association, 34 Bedford Square, W.C.1. Annual General Meeting, followed by a Supper Discussion on "Function—As Expressed in Modern Swedish Architecture," to be opened by Professor C. H. Reilly, F.R.I.B.A. **7.30 p.m.**

SOCIETY OF ANTIQUARIES, Burlington House, Piccadilly, W.1. "The Date of Cissbury: Report on Excavations undertaken by the Worthing Archæological Society." By E. C. Curwen and R. P. Ross Williamson.

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Yates Lectures. Third of eight public lectures on "Greek Myths and their Representation in Art." By Professor A. E. Gardner. (Lantern Illustrations.) 5 p.m. First of five public lectures on "Re-plannings of London, *c.* 1520-1920." By Miss E. Jeffries Davis. 5.30 p.m. **5 p.m.**

BURTON-ON-TRENT COUNCIL SCHOOL COMPETITION. Latest date for submission of designs.

FRIDAY, OCTOBER 31

OVERHEAD LINES ASSOCIATION. At the Georgian Restaurant, Harrods, Ltd., Knightsbridge, W. Third Annual Conversazione and Supper Dance. Reception by the President, 8.30 p.m. **8 p.m.**

NETTLESON PLAYERS. At the King George's Hall, 1 Great Russell Street, W.C.1. Two plays entitled "Talma" and "It Pays to Advertise." **7.30 p.m.**

SATURDAY, NOVEMBER 1

Sunrise, 6.52 a.m. Sunset, 4.34 p.m.

HORNIMAN MUSEUM, Forest Hill, S.E.23. "London in the Stuart Age." By D. Martin Roberts, M.A. (Lantern Illustrations.) **3.30 p.m.**

MONDAY, NOVEMBER 3

R.I.B.A., 9 Conduit Street, W.1. Allied Societies Conference, 2 p.m. Meeting of the Board of Architectural Education, 2.30 p.m. Council Meeting, 4.30 p.m. Opening General Meeting; address by the President, Sir Banister Fletcher, P.R.I.B.A., F.S.A., 8.30 p.m. **2 p.m.**

NORTHERN POLYTECHNIC, Holloway Road, N.7. "Style in Architecture." By R. A. Duncan, A.R.I.B.A. **7 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. Mersey and North Wales (Liverpool) Centre. At the Laboratories of Applied Electricity, the University, Liverpool. "The Steam and Electric Power Plant of Imperial Chemical Industries, Ltd., at Billingham" (to be illustrated by a cinematograph film). **7 p.m.**

TUESDAY, NOVEMBER 4

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Practice Standing Committee.

INSTITUTION OF CIVIL ENGINEERS, Gt. George Street, Westminster, S.W.1. Opening Meeting. Sir George William Humphreys, K.B.E., will deliver an address, followed by the presentation of medals awarded by the Council. **6 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Public lecture on "Egyptian Statues." By Miss M. A. Murray. (Lantern Illustrations.) **5.30 p.m.**

MORLEY COLLEGE, Westminster Bridge Road, S.E.1. "Industry." By Sir Walter Layton, C.H. **8 p.m.**

WEDNESDAY, NOVEMBER 5

R.I.B.A., 9 Conduit Street, W.1. Meetings of the Art Standing Committee and the Board of Architectural Education Examinations Committee.

SOUTH-EASTERN SOCIETY OF ARCHITECTS. Tunbridge Wells Chapter. At the Rose and Crown Hotel, Tonbridge. Joint Luncheon with members of the Southern Counties Federation of Building Trades Employers and Builders in the Chapter area. 1.15 for 1.30 p.m. **1.30 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Italian Mediæval Architecture: The Gothic Period in North Italy." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. At the Swedenborg Hall, 20 Hart Street, Bloomsbury, W.C.1. Sessional Meeting. "The Operation of the Heat Pump, and its Possible Applications to Heating Problems, particularly Swimming Bath Heating." By T. G. N. Haldane, M.A., A.M.I.E.E. **7 p.m.**

WEDNESDAY, NOVEMBER 5 (*continued*)

INSTITUTION OF SANITARY ENGINEERS. Annual Dinner, to be held at the Holborn Restaurant, W.C. **7 p.m.**

THURSDAY, NOVEMBER 6

SOUTH-EASTERN SOCIETY OF ARCHITECTS. Brighton Chapter. At the Municipal School of Art, Brighton. "Modern Buildings." By Francis R. Yerbury. (Lantern Illustrations.)

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Yates Lecture. Fourth of a course of eight public lectures on "Greek Myths and their Representation in Art." By Professor A. E. Gardner. (Lantern Illustrations.) 5 p.m. Second of a course of five public lectures on "Re-plannings of London, *c.* 1520-1920." By Miss E. Jeffries Davis. 5.30 p.m. **5 p.m.**

VICTORIA AND ALBERT MUSEUM, Cromwell Road, South Kensington, S.W.7. Lecture Theatre. "English Mediæval Building: Its Sculpture and Painting." By Professor E. S. Prior (Lantern Illustrations.) **5.30 p.m.**

SATURDAY, NOVEMBER 8

Sunrise, 7.4 a.m. Sunset, 4.23 p.m.

MONDAY, NOVEMBER 10

SOCIETY OF MOTION PICTURE ENGINEERS. At the Royal Photographic Society, 35 Russell Square, W.C.1. "Sound Film Studio." By C. W. Glover, A.M.INST.C.E., M.I.STRUCT.E. **7.45 p.m.**

TUESDAY, NOVEMBER 11

MORLEY COLLEGE, Westminster Bridge Road S.E.1. "Life and the Countryside." By J. W Robertson Scott. **8 p.m**

WEDNESDAY, NOVEMBER 12

TUESDAY, NOVEMBER 18

ROYAL ACADEMY, Burlington House, W.1. "The Theory of Colour and its Application to Painting." By A. P. Laurie, D.SC. **4 p.m.**

LAW REPORT

BLOCKS OF FLATS: CONSTRUCTION OF AN ACT

Towle (H.M. Inspector of Taxes) v. Improved Industrial Dwellings Co., Ltd., and the Company v. Towle. Court of Appeal. Before the Master of the Rolls and Lords Justices Romer and Slesser

The hearing of these appeals, which had stood over from the end of last term, was resumed by the Court.

They raised interesting questions as to the methods to be employed in assessing blocks of flats for income-tax purposes.

The appeal was by the Dwellings Co. from the judgment of Mr. Justice Rowlatt, sitting in the King's Bench Division, allowing the appeal of the Crown from a decision of the Income Tax Commissioners and dismissing a cross-appeal by the company.

The flats, which were erected for the housing of the working classes, are situate at Morrison Buildings South, Commercial Road, Whitechapel, and had been assessed as separate flats. The company contended that by the grouping of the flats they were deprived of their legal right to claim allowances on income tax in respect of voids of one or more, while the whole block in which they were situate was not empty. They also submitted that a reduced scale of allowance for repairs would be allowed under such grouping as compared with the larger allowance made in the case of each flat being assessed separately. The company pointed out that the ground-floor flats were approached by passages direct from the street and the upper flats by staircases leading to landings and passages on to which the front doors of the flats opened. Each flat was self-contained. In 1925 the Stepney Borough Council, under the Valuation (Metropolis) Management Act, 1869, assessed the flats as separate flats. No objection was made by the then Inspector of Taxes. The company submitted under the circumstances that each flat in fact and in law was a separate house or flat for all the purposes of the Income Tax Act and should be so assessed.

The Crown contended that notwithstanding the Valuation (Metropolis) Act, 1869, the unit of assessment was each group of flats, and that the amount of the assessment was the amount of assessment of each group.

The Commissioners came to the conclusion that the gross assessment of the several flats made under the 1869 Act were conclusive for the purposes of the Income Tax Acts during the quinquennial period, 1925–30. But if the Court were of opinion that determination was wrong and the flats should be reassessed during the quinquennial period, then the Commissioners determined that under the Income Tax Rules the flats should be assessed together in blocks or groups, consisting of those approached from the street by a separate entrance.

The Crown appealed from the first decision and the company from the second.

Mr. Justice Rowlatt held that the contention of the Crown was right, and allowed the appeal, and dismissed the company's cross-appeal.

Mr. Latter, K.C., for the company, submitted that in this case it was clear that each flat must be held to be a separate house under the Income Tax Act and must be assessed and charged separately. The flats were within the area to which the Valuation (Metropolis) Act, 1869, applied and under it each hereditament was separately valued and assessed.

Mr. Stafford Cripps, K.C., for the Crown, said, bearing in mind the main objects of the Income Tax Act, 1853, and the Act of 1869, the decision of Mr. Justice Rowlatt was right. The annual value was arrived at quite irrespective of section 36 of the Act of 1869, the main object of which was to allow the landlord to get into touch with the authorities instead of the tenant. Under it the landlord was to be assessed. He might be charged twenty different times, but both the assessment and the charge which he had to pay was to be a single charge.

The Court reserved its judgment.

TRADE NOTES

The Ripplesay, one of the latest models of electric fires illustrated in the new catalogue just issued by Messrs. Best and Lloyd, Ltd., does not set out to imitate the live coals of an ordinary open fire, but has been designed to represent the abstract qualities of intense heat. This has been done by means of a glowing flame-like pattern which is always moving and always changing. To produce this effect the light from a 30-watt metal filament lamp is passed through bubbling water contained in a bulb, and the image of the filaments is projected on a glass screen and shows as a system of flame-like lines. The effect is heightened by the moulded ripples on the glass screen and by the reflection from the facets of the sheet metal forming the back of the fire.

*

The rapid progress made by Messrs. W. H. Gaze and Sons, Ltd., in the erection of the Dorking Public Halls has stimulated the following eulogy from a local newspaper: "Such good progress is being made in the erection of the Dorking Public Halls that the work is about a week in advance of the contract date. To the resident of Dorking who passes the halls daily the rate of progress is not so noticeable, but to the infrequent visitor to Dorking the progress being made is amazing. Unless something exceptional happens, the halls will be ready for opening next January."

Mr. Charles Lidbury has been appointed chief general manager of Westminster Bank, Ltd., in succession to Mr. John Rae. Mr. Walter Bentley, an assistant general manager of the bank, has been appointed a joint general manager.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

Coulsdon and Purley U.D.C. offices, Brighton Road, Purley (pages 647–651). General contractors, H. Bacon and Son, Ltd. Sub-contractors: Associated Asphalt Co., Ltd., asphalt; Thomas Laurence and Sons, Ltd., facing bricks; Patent Victoria Stone Co., Ltd., artificial stone; Edward Wood & Co., Ltd., structural steel; J. A. King & Co., Ltd., hollow floor tiles; Siegwart Fireproof Floor Co., Ltd., fireproof construction; Ames and Finnis, tiles; Hollis Bros. & Co., Ltd., oak flooring and teak block flooring; Waterex & Co., Ltd., waterproofing materials; Norris Warming Co., Ltd., central heating; G. Matthews, Ltd., stoves; Croydon Gas Co., gasfitting; County of London Electric Supply Co., Ltd., electric wiring and electric heating; Wm. Whitehouse & Co., Ltd., and L. Dernier and Hanlyn, Ltd., electric light fixtures; City Iron Co., sanitary fittings; Carter and Aynsley, Ltd., door and window furniture; Reliance Telephone Co., Ltd., telephones; Ratner Safe Co., Ltd., strong-room doors; Wenham and Fowler, iron railings and lamp standards; James Walker, decorative plaster; Thomas Elsley & Co., Ltd., metalwork; John P. White and Son, Ltd., panelling to Council chamber; Anselm Odling and Sons, Ltd., marble; Carter & Co. (London), Ltd., tiling; John P. White and Son, Ltd., benches for Council chamber; B. Cohen and Sons, Ltd., chairs in Council chamber and furniture for committee rooms.

No. 233 High Holborn, W.C.2 (pages 644, 652–655). General contractors, E. A. Roome & Co., Ltd. Sub-contractors: Abbey Heating Co., heating; Asbestos Cement Products, Ltd., Decolite floors; Concrete Ltd., fireproof floors and roofs; Diespeker & Co., Ltd., terrazzo floorings; Jacob, White & Co., Ltd., electrical work; W. James & Co., Ltd., steel windows; Medways Lift Co., Ltd., lifts; Metal Propellers, Ltd., Staybrite metalwork; Anselm Odling & Co., Ltd., marble; Raines and Porter, Ltd., external cement rendering; Salter, Edwards & Co., Ltd., asphalt; Speirs & Co., ironmongery and sanitary fittings; Sturtevant Engineering Co., Ltd., vacuum cleaning plant; W. E. Whiteside, Ltd., metal lift enclosures; H. Young & Co., Ltd., steelwork.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Mr. George Lansbury, the First Commissioner of Works, has announced a Government offer of £90,000 to assist the trustees in the restoration of ALEXANDRA PALACE. The sum required is £200,000.

The Essex County Council proposes to erect a secondary school for boys on a site of eleven acres of land, near High Street, BARKINGSIDE.

Plans for the erection of three new schools in CROYDON have been forwarded to the Board of Education for approval.

Plans have been submitted to the ESHER-DITTONS U.D.C. for the development of the Broom Hill estate, with provision for a new road off the Portsmouth Road and twenty-nine houses and flats; also for the development of Hooklands estate, Long Ditton, in connection with which new roads and 197 houses are proposed to be erected; and for the development of part of the Hinchley Wood estate, Thames Ditton, twenty-one acres of land in extent, for 177 houses and for shops near the new Hinchley Wood station.

A new church, school and presbytery are to be built at FELTHAM, Middlesex.

The Hackney B.C. has passed plans, submitted by Mr. Clifford Aish, for additions at the Empress Electric Theatre, Mare Street, HACKNEY.

The HENDON R.D.C. has decided to purchase land adjoining the proposed cemetery in the Pinner Road for housing purposes.

A new elementary school is to be erected at HOUNSLOW, at a cost of £44,000.

The Kent Education Committee proposes to erect a school between ORPINGTON and Green Street Green.

At a general meeting of the members of the Devonshire Club, St. James's Street, PICCADILLY, W.1, a report of the committee, giving proposals for a rebuilding scheme, was adopted. Mr. Septimus Warwick, F.R.I.B.A., has prepared plans, showing work to be carried out at an estimated cost of £47,500.

Plans have been prepared by Messrs. Swan, Norman and Clay, for the erection of a private theatre in Grove Road, ST. JOHN'S WOOD, N.W.

The WESTMINSTER City Council is to erect a tuberculosis dispensary and a maternity and child welfare centre at Ebury Bridge, at a cost of £21,000.

The WESTMINSTER City Council has decided to construct a subway, at a cost of £10,500 (in continuation of the subway to be made by the Central London Railway Company at Marble Arch) from the north-east corner of Park Lane to Cumberland Gate, Hyde Park.

SOUTHERN COUNTIES

Plans passed by the HASTINGS Town Council: Conversion of two houses into shops, 274 and 276 Bexhill Road, St. Leonards; six dwelling-houses, Abbey Drive, St. Mary's Estate, St. Leonards; twelve dwelling-houses and two shops, Hythe Avenue, St. Mary's Estate, St. Leonards, for Mr. H. H. Ford, architect; four dwelling-houses, 190–196 Bexhill Road, St. Leonards, for Messrs. Ward, Son and Wray, architects; two houses, 283 and 284 St. Helen's Road, Hastings, for Mr. H. M. Jeffery, architect; house and garage, Fairlight Road, Hastings, for Mr. J. Hunt, architect.

Plans passed by the HOLLINGBOURNE U.D.C.: Two cottages and a garage, Stede Court, Harrietsham, for Sir Robert Gooch; bungalow, Gravelly Bottom, Broomfield, for Messrs. J. Vincent and C. E. Message; bungalow, Water Lane, Thurnham, for Mr. J. W. Bridge; bungalow, The Street, Wychling, for Mr. H. R. Halford; house, Pilgrim Road, Detling, for Mr. T. Cook.

Plans passed by the WOKING U.D.C.: Four houses, Pyle Hill estate; sixty detached bungalows, off Saunders Lane; fourteen detached bungalows, Maple Grove; six detached bungalows, Lime Grove; four detached houses, Westfield Road.

Improvements are to be carried out to the WESTCLIFF swimming baths, at a cost of £3,000.

SOUTH-WESTERN COUNTIES

The BRISTOL Town Council has decided to embark on large and comprehensive schemes for the relief of the unemployed, involving a total of nearly £120,000 spread over about five years.

MIDLAND COUNTIES

The AMPTHILL U.D.C. has decided to acquire a site of 6,874 acres of land in Station Road, for housing purposes.

The ASTON R.C. is to erect about 112 houses on sites at Ravenstone, Oakthorpe, Swannington and Thringstone.

The BASFORD R.D.C. has approved the recommendation of the Housing and Town Planning Committee to erect thirty-two houses on the Swingate site at Kimberley, subject to proposed road-widening modifications.

Messrs. Leonard Barnard and Partners, architects, have prepared plans for a new cinema to be erected on a site in Westgate Street, GLOUCESTER.

The KETTERING U.D.C. has received sanction to borrow £36,560 for the erection of 100 houses on the Piper's Hill estate.

Plans passed by the KETTERING U.D.C.: Two houses, Trafalgar Road, for Messrs. Mace and Wooding; extension to Poor Law Institution, London Road, for the Northants C.C.; three houses, Gypsy Lane, for Messrs. A. P. Lewis and Son, Ltd.

The LEAMINGTON T.C. is to erect 190 houses on the Shrubland estate.

Plans passed by the STRATFORD-ON-AVON T.C.: Alterations, Green Dragon inn, for L. L. Dussault; dwelling house, Bishopston, for B. C. H. Underhill; house, Bishopston, for G. E. Boshier; garage, 119 Loxley Road, for Mr. French; alterations, 47 Sheep Street, for the Stratford-on-Avon Corporation; alterations, 5 and 6 Evesham Road, for H. Carter.

NORTHERN COUNTIES

At a meeting of the Blackpool Branch of the National Federation of Building Trade Operatives a resolution was passed, urging the BLACKPOOL T.C. to erect 2,000 houses.

The CARLISLE T.C. has agreed to purchase the Currock House estate, comprising thirty-nine acres of land, for housing purposes, at a cost of £6,000.

The DENNY AND DUNIPACE Town Council has decided to erect 120 houses on a site at Herbertshire Park, Denny. A proposal to build a hostel for single persons is under consideration.

The HEBBURN U.C. has appointed Messrs. J. Page and Son as architects for the proposed 100 additional houses.

Negotiations are proceeding for the erection of an hotel in the new Paragon Street, HULL, at a cost of about £200,000.

The LANCHESTER R.D.C. has received sanction to build another 100 houses.

Subject to the approval of the MANCHESTER City Council, a scheme for the establishment, at Mode Wheel, of a huge cattle market is immediately to be proceeded with.

The Rutson Hospital Management Committee, NORTHALLERTON, has under consideration a rebuilding scheme, at an estimated cost of £15,000.

The PREESALL U.D.C. has instructed their Surveyor to prepare a comprehensive scheme for the improvement of the Esplanade at Knott End.

Messrs. Smith and Cross have prepared plans for new branch premises for Lloyds Bank, Ltd., on a site in Yorkshire Street, ROCHDALE.

Compulsory powers to acquire land at Tunstall, for the erection of thirty-six Council houses, are being sought by SUNDERLAND R.D.C.

The WHISTON R.C., on the recommendation of their Town Planning Committee, has passed plans for 200 houses and two shops which the Liverpool Corporation propose to erect on the Speke estate.

A new Primitive Methodist chapel is to be erected on a site at Upholland, WIGAN, from plans prepared by Mr. William Thornley, L.R.I.B.A.

WALES

At a meeting of the CAERPHILLY U.D.C. the Council resolved that plans should be submitted to the Ministry of Health for the erection of twenty houses on the Grange site, Caerphilly, and thirty houses on the Pwllypant site, Llanbradach.

The Ninian Cinema, Grangetown, CARDIFF, is to be rebuilt. The scheme provides additional accommodation for over 500 persons.

At a meeting of the council of the King Edward VII Welsh National Memorial Association, it was reported that a sub-committee of the association had met the property committee of the CARDIFF City Council to discuss the question of a Cathays Park site, and that as a result the city council were now offering to allocate to the association a site between North Road and King Edward VII Avenue, and between College Road, for the erection of head offices.

About 100 acres of land near PENRHYN Old Hall is to be built upon. It is stated that about 200 houses will be erected on the site

SCOTLAND

The GLASGOW Corporation has passed plans submitted by William Griffin, for the erection of a cinema in Dumbarton Road, Yoker.

The KIRKINTILLOCH T.C. has decided to erect sixteen four-apartment and twenty-eight three-apartment semi-detached houses on a site adjoining Lenzie Road.

The MUSSELBURGH Town Council has decided to proceed with a scheme for the erection of 100 houses for persons displaced by the closing of insanitary houses.

The following figures show the progress that has been made in State-aided housing schemes in SCOTLAND to September 30, 1930: 1919 Act, by local authorities, 25,129: 1919 Act, by public utility societies, 421; private subsidy schemes, 1919 Additional Powers Act, 2,324; slum clearance schemes, 12,030; under construction, 2,207: 1923 Act, by local authorities, 4,033; 1923 Act, by private enterprise, 18,647; under construction, 969: 1923 Act, by public utility societies, 80: 1924 Act, by local authorities, 45,837; under construction, 6,059: 1924 Act, by private enterprise, 2,929; under construction, 59: 1924 Act, by public utility societies, 127; under construction, 16: demonstration houses, 17; steel houses erected on behalf of Government by Scottish National Housing Co., 2,552. Total completed, 114,126. Total under construction, 9,310. Total, 123,436.

IRELAND

The DOWNPATRICK U.D.C. proposes to erect 300 cottages, at a cost of £115,000.

The construction of the Altnaheglish Dam, for the LONDONDERRY County Borough Council, is expected to begin within the next few weeks. The reservoir will have a capacity of 500 million gallons, the dam being constructed of concrete and having a height of 100 ft. The Ministry of Labour has sanctioned an expenditure on the dam and work No. 3 of a sum not exceeding £176,000.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* NAVVY, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0
Screened ballast or gravel, add 10 per cent. per yd.			
Clinker, breeze, etc., prices according to locality.			
Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.

Transport hire per day:

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0

Exceeding 6 ft., but under 12 ft., add 30 per cent.

In stiff clay, add 30 per cent.

In underpinning, add 100 per cent.

In rock, including blasting, add 225 per cent.

If basketed out, add 80 per cent. to 150 per cent.

Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd. £0 1 6

SPREAD and level, including wheeling, per yd. 0 1 6

FILLING into carts and carting away to a shoot or deposit, per yd. cube . 0 10 6

TRIMMING earth to slopes, per yd. sup. 0 0 6

HACKING up old grano. or similar paving, per yd. sup. 0 1 3

PLANKING to excavations, per ft. sup. 0 0 5

DO. over 10 ft. deep, add, for each 5 ft. in depth, 30 per cent.

IF left in, add to above prices, per ft. cube 0 2 0

HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup. . 0 2 1

DO. 6 in. thick, per yd. sup. . . 0 2 10

PUDDLING, per yd. cube 1 10 0

CEMENT CONCRETE, 4-2-1, per yd. cube 1 17 6

DO. 6-2-1, per yd. cube 1 12 6

DO. in upper floors, add 15 per cent.

DO. in reinforced-concrete work, add 20 per cent.

DO. in underpinning, add 60 per cent.

LIAS-LIME CONCRETE, per yd. cube . £1 14 0

BREEZE CONCRETE, per yd. cube . . 1 7 0

DO. in lintels, etc., per ft. cube . . 0 1 6

CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube 0 3 9

FINE concrete benching to bottom of manholes, per ft. cube 0 3 0

FINISHING surface of concrete spade face, per yd. sup. 0 0 9

DRAINER

LABOURER, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* BRICKLAYER, 1s. 8½d. *per hour;* PLUMBER, 1s. 8½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. *6 in., per ft.*	0	1	3
DO. *9 in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. *6 in., per yd.*	0	8	0
Portland cement and sand, see "Excavator" above.			
Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft. . . 0 4 3

DO. 6 in., per ft. 0 5 0

DO. 9 in., per ft. 0 7 9

CAST-IRON DRAINS, jointed in lead, 4 in., per ft. 0 8 3

DO. 6 in., per ft. 0 10 3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.

Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
Midhurst white facing bricks, per M.	5	0	0
Multi-coloured facings, per M.	7	7	9
Best red facings, per M.	7	7	9
Rubbers, 9½ in., per M.	12	0	6
Staffordshire blue, per M.	9	5	0
Firebricks, 2½ in., per M.	9	5	0
Glazed salt, white, and ivory stretchers, per M.	21	10	0

Colours, extra, per M.	5	10	0
Seconds, less, per M.	1	0	0
Cement and sand, see "Excavator" above.			
Lime, grey stone, per ton	£2	11	6
Mixed lime mortar, per yd.	1	6	0
Dampcourse, in rolls of 4½ in., per roll	0	2	6
DO. *9 in., per roll*	0	4	9
DO. *14 in., per roll*	0	7	6
DO. *18 in., per roll*	0	9	6
BRICKWORK in stone lime mortar, Flettons, or equal, per rod . .	30	0	0
DO. in cement do., per rod . .	32	10	0
DO. in stocks, add 25 per cent. per rod.			
DO. in blues, add 100 per cent. per rod.			
DO. circular on plan, add 12½ per cent. per rod.			
DO. in backing to masonry, add 12½ per cent. per rod.			
DO. in raising on old walls, etc., add 12½ per cent. per rod.			
DO. in underpinning, add 20 per cent. per rod.			
HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup. . .	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run .	0	6	0
FLAUNCHING chimney pots, each .	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS, fair, per ft. sup. extra .	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra . .	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra .	0	0	10
WEATHER pointing, do. do. . .	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup.	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities, in finishing to steps, etc., per ft. sup. . . .	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each . .	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup. . . .	0	11	0
SLATE DAMP COURSE, per ft. sup. .	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ¾ in., per yd. . .	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup. . .	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each .	0	0	3

MASON

MASON, 1s. 8½d. *per hour;* DO. *fixer,* 1s. 9½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour.*

Portland Stone:			
Whitbed, per ft. cube	£0	4	6
Basebed, per ft. cube	0	4	9
Bath stone, per ft. cube	0	3	0
Usual trade extras for large blocks.			
York paving, av. 2½ in., per yd. super	0	11	0
York templates, sawn, per ft. cube	0	7	6
Slate shelves, rubbed, 1 in., per ft. sup.	0	2	6
Cement and sand, see "Excavator," etc., above.			

HOISTING and setting stone, per ft. cube £0 2 2

DO. for every 10 ft. above 30 ft. add 15 per cent.

PLAIN face Portland basis, per ft. sup. £0 2 8

DO. circular, per ft. sup. . . . 0 4 0

SUNK FACE, per ft. sup. 0 3 9

DO. circular, per ft. sup. . . . 0 4 10

JOINTS, arch, per ft. sup. . . . 0 2 6

DO. sunk, per ft. sup. 0 2 7

DO. DO. circular, per ft. sup. . . 0 4 6

CIRCULAR-CIRCULAR work, per ft. sup. 1 2 0

PLAIN MOULDING, straight, per inch of girth, per ft. run 0 1 1

DO. circular, do., per ft. run . . 0 1 4

HALF SAWING, per ft. sup. . . . 0 1 0

Add to the foregoing prices, if in York stone, 35 per cent.

DO. Mansfield, 12½ per cent.

Deduct for Bath, 33⅓ per cent.

DO. for Chilmark, 5 per cent.

SETTING 1 in. slate shelving in cement per ft. sup. £0 0 6

RUBBED round nosing to do., per ft. lin. £0 0 6

YORK STEPS, rubbed T. & R., ft. cub. fixed 1 7 6

YORK SILLS, W. & T., ft. cub. fixed . 1 10 0

ARTIFICIAL stone paving, 2 in. thick, per ft. sup. 0 1 3

DO. 2½ in. thick, per ft. sup. . . 0 1 6

SLATER AND TILER

SLATER 1s. 8½d. *per hour;* TILER, 1s. 8½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*

N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200:						
Portmadoc Ladies				£14	0	0
Countess				23	0	0
Duchess				32	10	0
Old Delabole	*Med.*	*Grey*		*Med.*	*Green*	
24 in. × 12 in.	£42	11	3	£45	1	0
20 in. × 10 in.	31	4	3	33	0	6

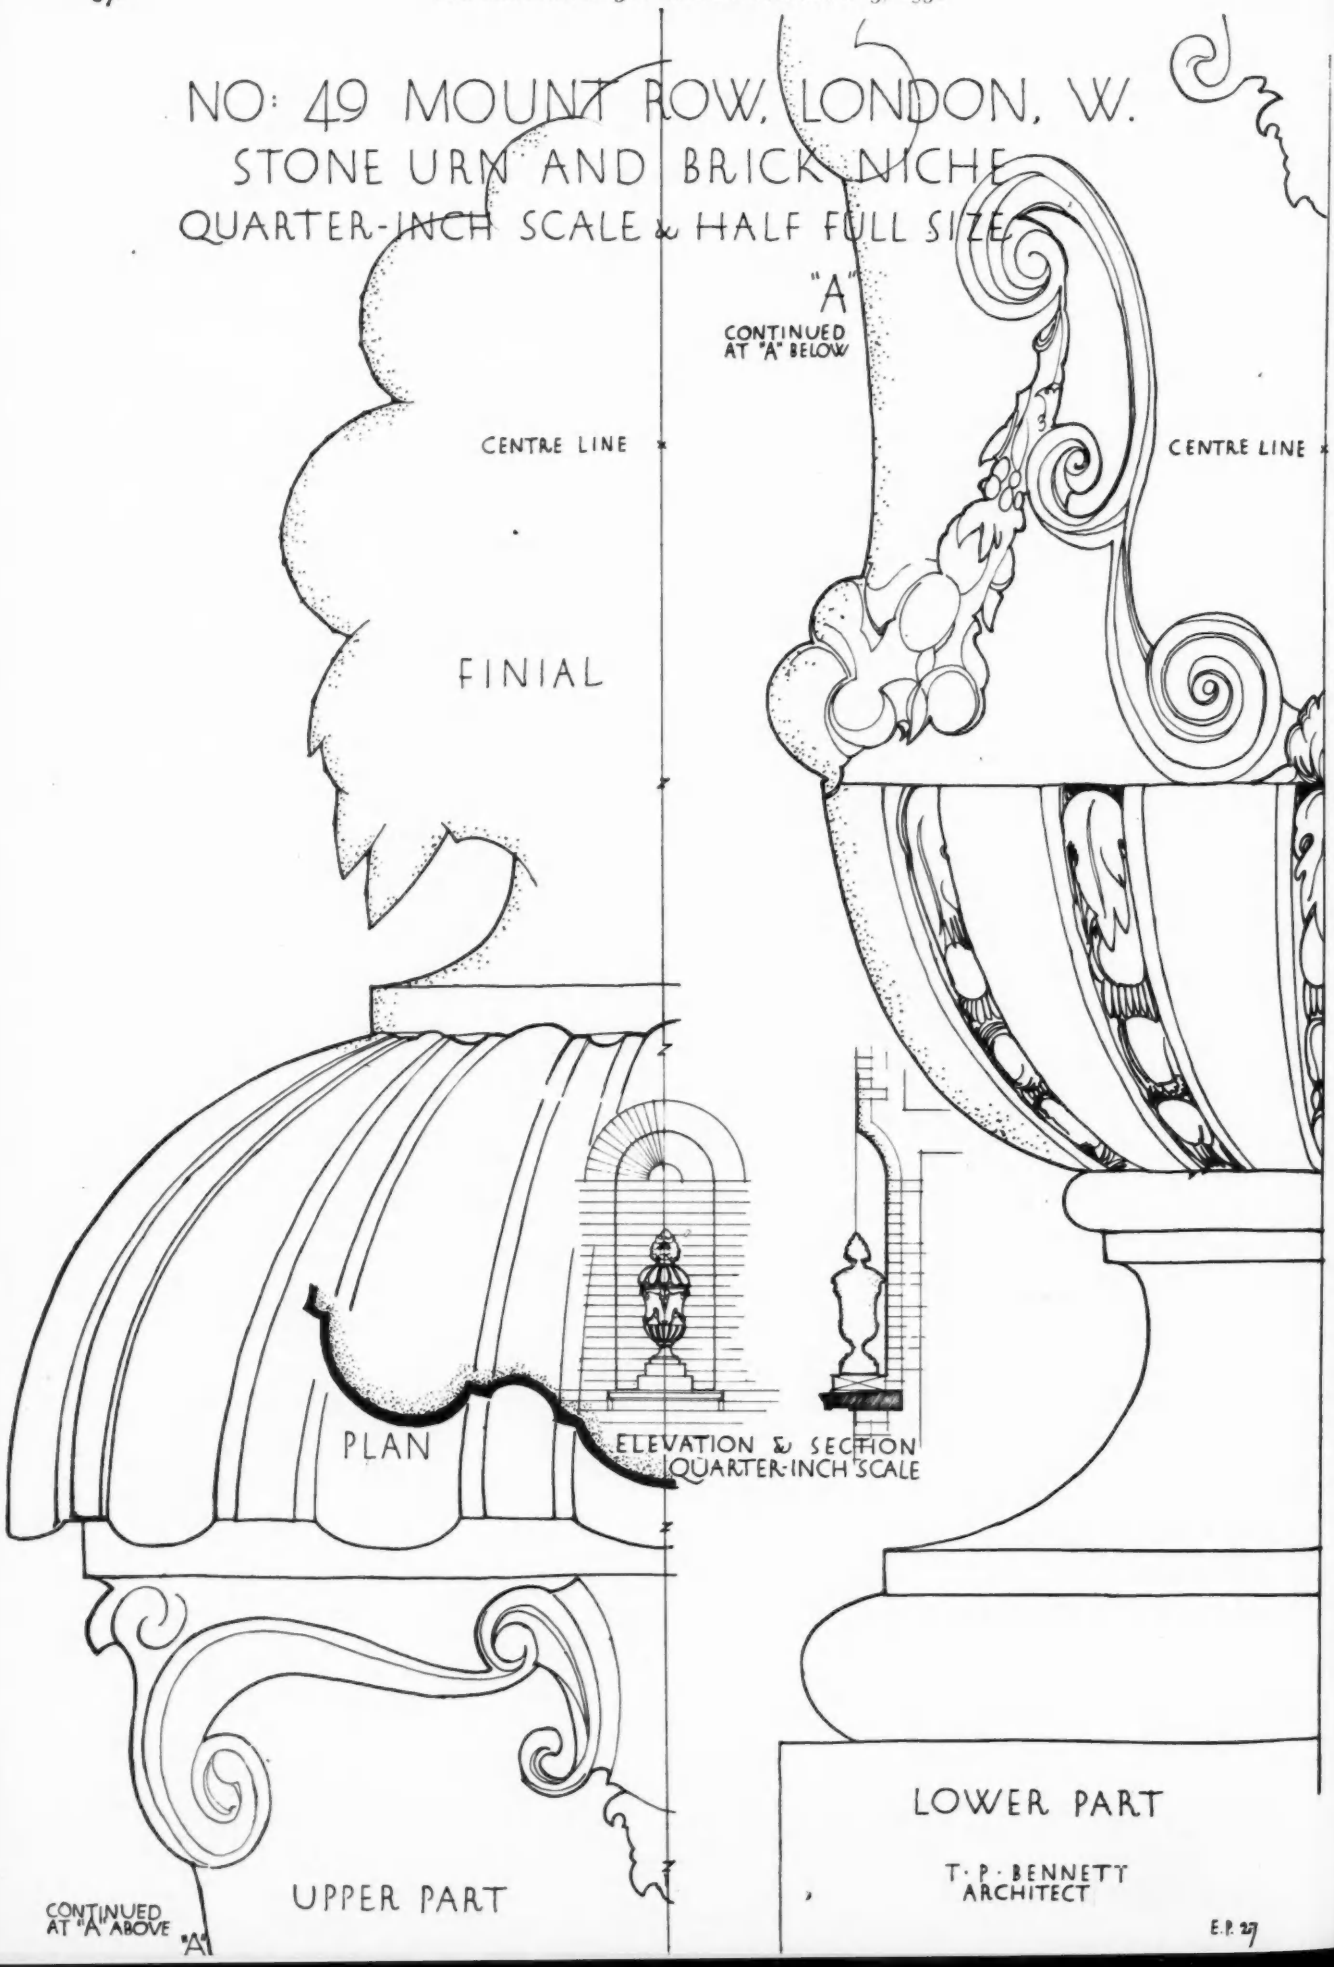
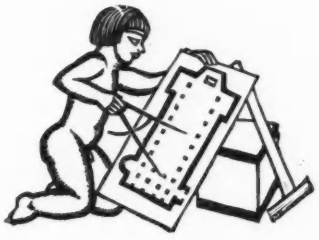
SCALE DETAILS:
A WEEKLY SERIES





STONE URN,
NUMBER 49 MOUNT ROW, LONDON, W.
Designed by T. P. BENNETT AND SON

THIS week's photograph shows a stone urn placed in a brick niche with a rubbed brick quarter dome above, which is part of a refacing of a house in Mayfair. It is one feature of a scheme carried out in an attempt to give interest and dignity to what was originally a rather dull and uninteresting façade.

The urn, of which a detail, half full size, is given on the next page, is carved in Portland stone. It is of a traditional late-eighteenth-century type and is a fine example of modern craftsmanship; as is also the brickwork to the head of the niche which receives it. The composition in its entirety forms an effective focal point in the wall.

The drawing may be read with architects' ordinary scales.

HOUSING: THE COUNTER-REVOLUTION

" It should be understood that old days, thank heaven, will never come again. . . . The housing of poor people has come to be regarded as, in some part, the care of the community."

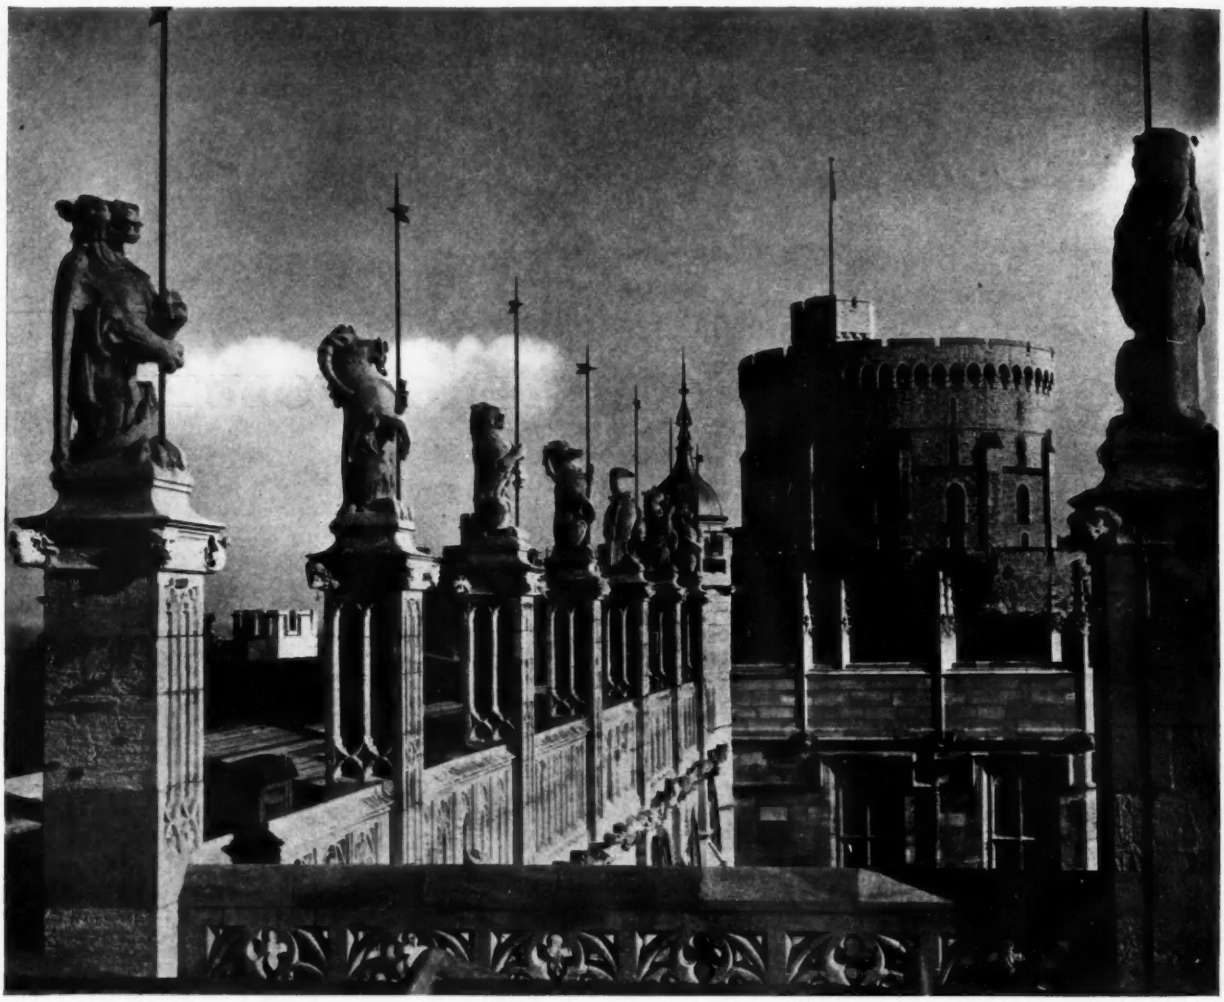
SOONER or later it was bound to happen that the standards of government and municipal housing which have contributed so largely to the rehabilitation of the country after a period of extreme shock should be attacked with accusations of extravagance and idealism. It is fitting that the first stone should have been thrown by an Association representing the interests of a section of the building community which was mainly responsible for the unimaginative housing of pre-war days. Be that as it may, the charge has been made, and, as often occurs, its bias towards financial " interestedness " is steadied by more than a grain of allowable criticism against the system of open development by which post-war housing has been characterized.

Briefly, the report of this Association, the gist of which was contained in a letter in the JOURNAL of last week, suggests that it is time that housing should be turned over to private enterprise, so that local authorities should be free to tackle slum clearance.

Private enterprise, the report avers, can build houses to rent at from 7s. 6d. to 9s. 6d. per week if the 1924 Act subsidy is maintained as an annual grant, or, better still, as a block grant of £100 per house, if the restrictions upon rent, upon the density of building, upon the amenities of road construction, open space, and if all the other safeguards against deterioration ARE ABOLISHED.

It is very likely that the Association would hotly deny the truth of this indictment, yet their report implies that housing is what it was in pre-war days —a form of investment, and not the housing of poor people. The report suggests that the housing policy instituted by the Conservative Government, and supported vigorously by the present Government in both its terms of office, is wasteful and idealistic, and that nothing can be done towards providing slightly cheaper forms of houses if these ideals are not thrown entirely to the winds and the field given over to the old-time jerry-builder.

It would be an evil day for this country if the Government were to accept the spirit of that report. It should be understood that old days, thank heaven, will never come again. We have made many mistakes since the war, and private enterprise has been responsible for a mass of meretricious and irresponsible house-building, but we have at least set ourselves higher standards of development, and the housing of poor people has come to be regarded as, in some part, the care of the community. The idea of mean rows of mean houses has become, definitely, a thing of the past.



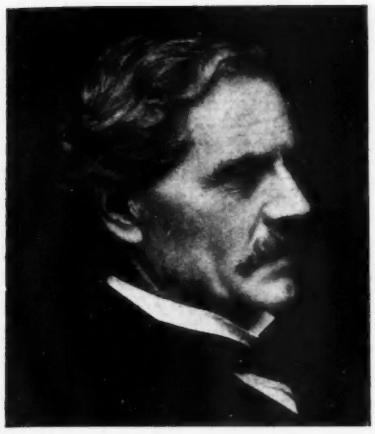
And now we are asked to drop these standards and this better way of thinking, to adopt the bad old property investors' ideas, and to make money the one incentive where now we have other and better considerations to couple with it.

It would be an evil day, we repeat, if the housing of the working classes were to be handed over to the Philistines; and architects more than others, and for purely unselfish motives, would have cause to regret the passing of an era of housing that was the reflection of their sense of artistic responsibility to the community.

No. Rather than a relaxation of principles which have gained nearly universal support, let us again examine the system in order to see why and in what way it fails to supply the needs of certain sections of the population. To increase density and length of blocks, to lower standards of road-making, is to bring on disintegration of the whole fabric, which architects should rather be prepared to add to than destroy.

We suggest that this manifesto, for such it is, should be very carefully examined by the R.I.B.A. It contains the seeds of dissension, and foreshadows the possibilities of new lines of approach to the great problem of housing the poorer strata of the working classes.

*** *At the moment of going to press we have received an important letter on this subject from an experienced authority on housing; this will appear in the issue for November 12.*



THE "KING'S BEASTS" AT WINDSOR

Yesterday, November 4, the historic Garter Chapel of St. George's, Windsor Castle, the restoration of which is now complete, was reopened. The King, as head of the Order of the Knights of the Garter, and the Queen, as its Lady, were present at the service. The above photograph, taken looking towards the Round Tower, shows the "King's Beasts," an important detail of the restoration work, which, in all, has involved an expenditure of £175,000.

The resurrection of the "King's Beasts"—first set up by Henry VII, then removed by Sir Christopher Wren—forms a romantic episode in the history of St. George's.

The church was erected at the end of the fifteenth and the beginning of the sixteenth centuries. The "Beasts" were part of the original design, and the loss of them has been a serious detriment to the beauty and probably also to the stability of the building for some two hundred and fifty years. The trouble experienced with the roof of the chapel has been attributed to their absence, due to the fact that their weight was needed for steadying it.

Sculptured by Mr. Joseph Armitage, they are not replicas of the old "Beasts," which, in fact, had long since disappeared, but they are instinct with the spirit of the old work.

NEWS & TOPICS

The Rt. Hon. J. Ramsay MacDonald and the Rt. Hon. the Earl of Derby, K.G., G.C.B., G.C.V.O., etc., who, being deemed by the Council of the R.I.B.A. to be "eligible and qualified" for membership, were proposed by that body for election as Honorary Fellows at the general meeting held to inaugurate a new session at No. 9 Conduit Street, on Monday.

AT THE R.I.B.A

AT the opening general meeting of the session Sir Banister Fletcher, F.S.A., the President, announced that the Council propose to submit to His Majesty the King the name of Sir Edwin Cooper, A.R.A., as the recipient of the Royal Gold Medal for the year 1931.

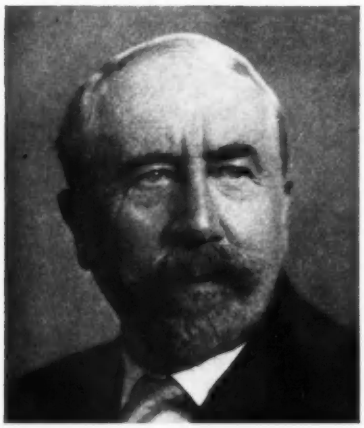
*

Sir Banister Fletcher, in the address with which he inaugurated his second presidential year, passed in review the recent achievements and present activities of the Institute, among which the development scheme, registration and the new premises in Portland Place loom largely. His peroration made a telling point about the unique position of architecture. It was indeed wholesome for us to be reminded that no man living within civilization can shut himself off from the sight of some form of architecture—good, bad or indifferent—though he evade manifestations of all the other arts.

MR. GREY WORNUM'S "DIAGONAL VIEWS"

In choosing the intriguing title, "Diagonal Views," for his presidential address to the Architectural Association on Monday of last week, Mr. G. Grey Wornum may or may not have had in mind a new *modus operandi* arrived at by referees for scrutinizing activities on the football field along a diagonal line. At all events he has the keen eye proper to a referee and took a very similar stance in looking across the present-day field of architecture. It was inevitable that in presenting a cross-section of it he should include references to the technique of functionalism, and these were made all the more telling by being thrown on the screen of the mind side by side with cross-sections of earlier eras.

*



He was able to cite buildings where functionalism had ruled towards an innate beauty and dignity, comparable with that characteristic of the best eighteenth-century work. But both he and Sir Richard Paget, who joined in the subsequent discussion, showed that they were alive to the insidious dangers of the cult. All too easily it might lead designers into just such a dead end as the traditionalism that has persisted right up to the present day in clothing the buildings of a hundred years past, buildings called into being by the industrial revolution of the beginning of last century, with ornaments from this or that style. Verily, man cannot live by functionalism alone.

FUNCTIONALISM FURTHER DISCUSSED

Functionalism is inevitably a burning topic of the day. The "Supper Discussion" of the Architecture Club last week on "Function as expressed in Modern Swedish Architecture" was a very pleasant affair, and revealed the fact that there is among its members a real zest for debate and the requisite cleavage of opinion such as results in the special quality which should belong to a deliberative body. It is difficult to exaggerate the value of such frank interchanges of views between architects themselves and laymen interested in architecture. Unfortunately, owing to indisposition, Professor Reilly was not able to open the debate as had been arranged, but his place was taken by Mr. Charles Marriott, who succeeded in putting the case for the Stockholm Exhibition in a provocative way. A remarkable feature of the debate was that even among the "modernists" there appeared to be a strong tendency to express dissatisfaction with the Exhibition as a whole. Not that there was much open hostility manifested, because most of the speakers appeared anxious to discover what was best in such an interesting architectural experiment. The gaiety of the colouring, largely due to the repetition of flags, the lightness and cheapness of construction of the various booths were duly praised. But some of the experienced planners of the "traditionalist" school could not help being a little scornful of the illogical and chaotic layout of the Exhibition, and the omission of its designer to take full advantage of the magnificent site.

*

And as for "function" in architecture, which was to have been the main problem to be tackled, the debate indeed revealed a confusion of tongues. Many of the speakers appeared to be quite certain what it was not. Mr. Ivor Brown revealed a prejudice which I do not remember having encountered in his dramatic criticisms, namely, a passionate hatred of old oak. He was sure that whatever a "functional" building should or should not be, it must at least be entirely devoid of old oak, that worst of all the symbols of architectural sentimentality. On the other hand, Mr. Clough Williams-Ellis complained that there was not enough sentiment in the design of the small houses exhibited at Stockholm, and that they could only be lived in by people with an almost inhuman gift of tidiness. He thought, however, that the people who will really be able to appreciate "functional" architecture "are now busy with their bottles."

Mr. Rudolf Dircks, who is about to retire from the post of librarian of the R.I.B.A. He has held it for thirty-eight years, during which period he has seen a four-fold increase in membership of the Institute; for the past nine years he has been editor of the R.I.B.A. Journal.

THE RETIREMENT OF MR. RUDOLF DIRCKS

The retirement of its librarian will leave the R.I.B.A. bereft; for Mr. Dircks is recognized not only as a librarian but as a person, and during the thirty-eight years he has been in charge of the library he has been well known to all who have frequented No. 9 Conduit Street, and has established friendships with many; in fact, as one of those friends lately remarked, his personality has given the Institute an atmosphere of hospitality and cheerfulness rarely associated with a learned society, and any members who may be unconscious of this debt to him will assuredly become aware of it when he goes.

★

When Mr. Dircks first took charge, the duties of librarian did not call for the whole of his time. He was then, and for many years after, a writer contributing general articles and stories to various magazines, and one of a group of men of letters some of whom have since become famous. He was, however, more particularly known as a contributor on art subjects to *The Saturday Review*, *The Art Journal*, *The Outlook* and other leading periodicals. His work as an editor in this field is recorded in the long list of entries under his name in representative libraries; and his monograph on Rodin, published in 1908, first introduced the sculptor to English appreciation. The friendship then established between the two men lasted till Rodin's death, and the book is still sold in France.

★

In 1893, when Mr. Dircks became its librarian, the Fellows and Associates of the Institute numbered, we believe, 1,456, and the grand total of all degrees of membership, 2,122; today the figures are 4,149 and 9,852, and the work of its librarian long ago increased so as to take up the whole of his time. A full account of the library, which contains some 25,000 volumes and is reputed to be the first architectural library in the world, is to be found in a paper read before the Institute by Mr. Dircks some years ago; but the duties of the librarian and his assistants are made heavier than would generally be supposed by the questions, calling for more or less research, which are daily asked by post, telegraph and, particularly, by telephone. That the Institute should be able to extend to its members, and others, the service of free library research, is an admirable thing; but the maintenance of such a service must obviously depend upon a reasonable discretion in those who avail themselves of it.

Nine years ago Mr. Dircks became also editor of the *R.I.B.A. Journal*, and, as is well known, his services to the Institute have often extended beyond those of librarian, as when, at short notice, he took over the arrangements of the R.I.B.A. section at Vienna of the International Architectural Conference. For about thirty years he was Secretary to the Architects' Benevolent Society; and for four years during the war—first as secretary to the architects' war committee and afterwards as its vice-chairman—he was responsible for collecting and administering the Institute's War Loan Fund, totalling between twenty and thirty thousand pounds, and in organizing the Civic Surveys of Greater London, and of the provincial centres. Architects who gave themselves to the furtherance of schemes for relief during those difficult years are warm in their acknowledgment of the debt to Mr. Dircks's single-minded energy; and those who benefited remember in gratitude his unfailing kindliness, cheerfulness and courtesy. He has now reached an age when men who are able to do so are glad to retire, and preparations for reinstalling the library in the shortly-to-be new Institute premises make the moment a suitable one. Few men go into private life with such assurance of leaving affection and esteem behind them and of taking with them the warm good wishes of so many friends. Mr. Dircks has wide interests and a keen enjoyment of many sides of life, so that for him leisure will be no burden, and all may wish him happiness with light hearts.

LIGHT AND AIR IN LONDON

I wrote, last week, of the fire-risk veto on higher buildings in London. The interim report of the conference of representatives of the R.I.B.A., the London Society and the Town Planning Institute, the text of which is now available, takes a broader view of the problem of height-regulation. Far from condoning the present maxima, it is of opinion that only wide streets and big lots can carry buildings from 80 to 100 ft. high, and that immediate steps should be taken to regulate the increase of height and volume permissible under existing rules.

★

With irresistible logic it points out that there must be a definite relation between street capacity for vehicular and pedestrian traffic and the floor area of the adjacent buildings served, and considers that heights should be adjusted to the actual adequacy of light and air instead of to the private rights irrespective of such adequacy. Furthermore, a definite scale should be laid down to govern the width of streets, having regard to the use of the neighbourhood served, and any owner who proposes a material enlargement of floor space should be required to provide equivalent space for the resulting additional traffic.

★

The conference, in fact, comes down heavily for a comprehensive zoning scheme, urging special consideration for, among others, historic areas and the neighbourhoods of important buildings, ancient or modern. The mere fact that a new building faces a large existing open space in no way justifies any special increase in height. It is believed that by the adoption of a zoning policy more latitude could be given to designers, with a resultant gain in the quality of the buildings erected in the various districts. And special stress is laid on the fact that, in these latitudes, the maximum angle of the sun in winter is only 15 degrees, so that an angle of 45 degrees cuts off the light of the sun for a period of six months.

NEW CHAIR AT LONDON UNIVERSITY

The week has brought an announcement that, although it primarily concerns London, is bound to mark the beginning of a far-reaching influence. London University contemplates the foundation of a new Chair—in the History of Art; and as part of the scheme for training art critics and experts an Institute, presided over by the professor holding this chair, is to be provided on the site awaiting development for University purposes in Bloomsbury. It is some three years since a provisional committee, including among its members Sir Martin Conway, Professors Ernest Gardner and A. E. Richardson and Mr. Samuel Courtauld, met under the presidency of Lord Lee of Fareham. Their aims have been lucidly set forth by Lord Lee in a long article in *The Times* of October 27.

★

"Throughout their deliberations," he sums up, "the promoters of the scheme have endeavoured never to lose sight of the practical and business considerations which must largely determine success or failure . . . but they have also been animated by the belief that in these hard and unlovely times too much attention is perhaps being concentrated on material things and too little on things of the spirit." Here is a thing that needed doing, and few will quarrel with Lord Lee's reasons for London alone being the place to do it.

★

With the lead shown by Mr. Courtauld, who has undertaken responsibility for the building and equipment of what it is proposed should be known as "The Courtauld Institute of Art," and for guaranteeing a share of the necessary endowment; by Sir Joseph Duveen, who has promised £20,000 towards the undertaking; by Sir Martin Conway, who proposes to present to the Institute his important collection of photographs and other reproductions of works of art; and by Lord Lee himself, who contemplates bequeathing to it his own treasures, it is unthinkable that the further £100,000 required should not be found to make the times less hard and more lovely for posterity.

LONDON SQUARES

When the Royal Commission on London Squares presented its report it urged that Parliament should give legal effect to its recommendations at an early date. This Parliament was prepared to do at that time; but, as everyone knows, Parliament has not been able to get through anything like the amount of work laid down in its programme. It has therefore been left to the L.C.C., three years after the presentation of the report, to draft its own Bill and get it before Parliament with the least possible delay. This Bill, the London Squares Preservation Bill, 1931, will cover the essential points of the Commission's report. Once passed, attention must then be directed to promoting legislation to deal with the detailed recommendations, which lack of time has not allowed to be included in this Bill.

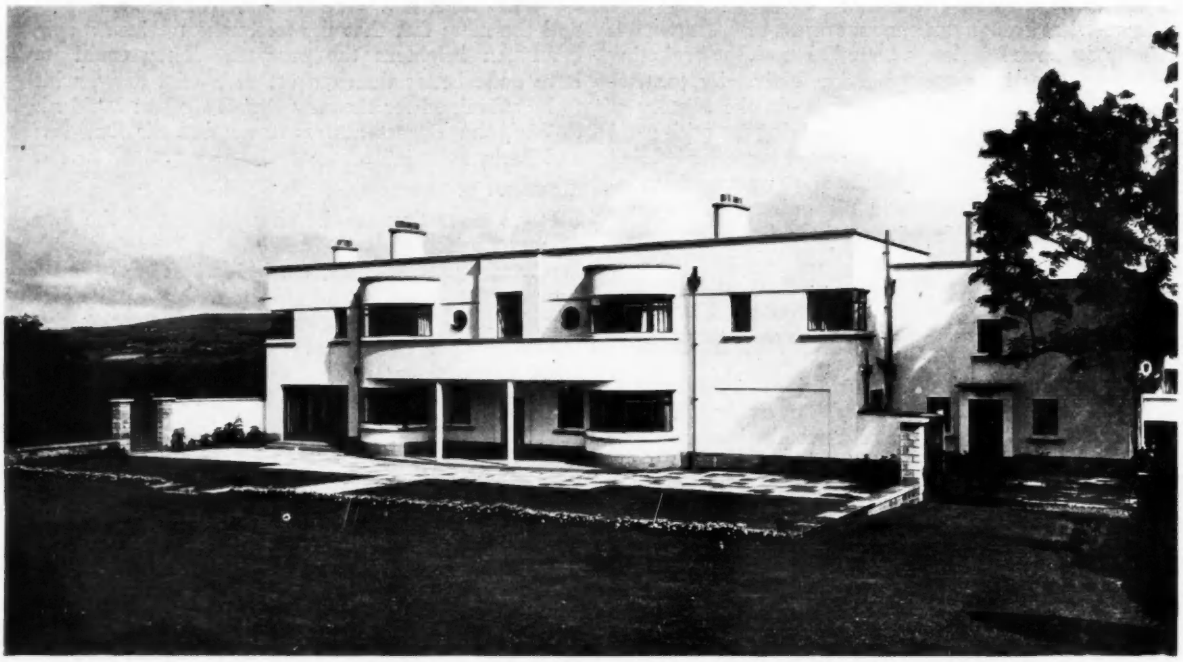
COMELY STEEL BRIDGES

The British Steelwork Association is to be heartily congratulated on its decision to produce a series of designs for steel bridges in which well-known architects are to collaborate with the engineers. All up and down the country the reconstruction of old and the construction of new roads will involve the emplacement of new bridges, inevitably either of steel or of concrete. Many graceful things have been flung across railways and river-beds in the latter material. Nevertheless, we can do with more; and the mere fact that the steelmakers evince a spirit of emulation brightens the prospect. They could hardly have done better than entrust their trial essay, which is to be submitted for the new bypass road at Maidenhead, to Sir John Burnet and Partners and Sir Douglas Fox and Partners.

A PUZZLE IN BRICKS

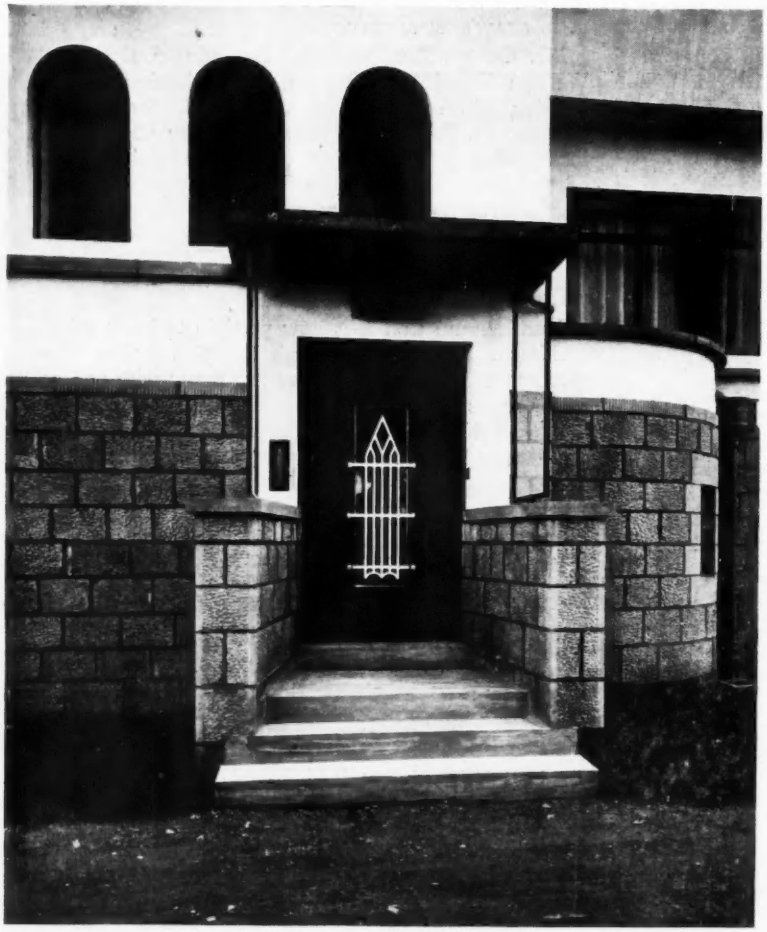
I was discussing the housing schemes of the London County Council with an architect the other day, and was inexpressibly shocked to learn that foreign bricks had been, or were being, used instead of British. My architect friend, who, by the way, is in no way connected with the schemes, remarked that the future housing programme of the Council would entail the use of at least eight or ten hundred million bricks during the next five years. A great uneasiness settled upon me when I realized how much of this material might be ordered from abroad. What is the solution of this extraordinary riddle? Are our British firms unable to supply a sufficient number of bricks to meet the demands of the Council, or are their prices too high? I was assured by my friend that the needs of the Council for the next five years could easily be met by British brickmakers. If, then, it is a question of cost, would it not be wise for the Council to reflect how foolish it might be to think of a lower-priced foreign brick in view of the huge amount of unemployment in this country? A British material of higher cost might eventually prove to be the more economical.

G. B. SHAW'S IMPAIRED VISION



Mr. George Bernard Shaw has been reported to the Welwyn Rural District Council for having begun the erection of an engine room at his Hertfordshire home at Ayot St. Lawrence before depositing plans with the local authority. The Council decided to remind Mr. Shaw of the requirements of the local bylaws. G. B. S., by undue profundity, has perplexed his thought. Venus herself would vanish from the firmament by a scrutiny too direct or too sustained.

A SIGN OF THE TIMES



I understand that it is now possible to learn all about architectural acoustics through the post by means of a correspondence course. There are many who will prefer to, or needs must, take advantage of this form of tuition in a special subject. I can think of the student living in the country district, but particularly of the older practitioner. Crabbed age and youth cannot learn together. ASTRAGAL

IN our issue of October 22 we published a reproduction of a leaflet issued by "the —— Tracing and Planning Co." We much regret that the caption beneath the illustration indicated that the designs referred to were not original.

We are now assured that the whole of the designs in question, published and sold by the Adelphi Tracing and Planning Company, are, in fact, the sole and original work of Mr. G. A. Pilborough, architect, who carries on business under that name, and we offer him, hereby, an unqualified apology for the erroneous imputation which we conveyed.

The garden front faces south. The main walls are brick, 16½ ins. thick, with a 3-in. cavity, and faced with textured stucco. The roof is of concrete, covered with rock asphalt. Balconies are reinforced concrete ; and floors are concrete, covered with joists and boards.

The main entrance doorway on the north front is sheltered by plate-glass "wind screens," and contains a concrete letter-box. The architect's working drawing appears on page 686.

A MODERNISTIC

DESIGNED BY

FIVE OAKS, Ben Rhydding, Yorkshire, is built on the site of an earlier house which was completed about 1902, and destroyed by fire in 1927. The site slopes steeply from south to north, and has wonderful views to the north across Wharfedale, which here runs east and west. To the south there is little except the garden of the house. There was the advantage of a garden already formed, but the disadvantage of the ruins of the former house, which had to be cleared.

The leading problem facing the architect building on a site of this sort is one of view *versus* sunshine, and in this case it was decided that the sun was the more important, but the view was not to be forgotten. The former house was entered from the south, and visitors had to cross the south, or garden, front. In the new house it was decided to enter from the north at any cost, and retain complete privacy on the garden front. Owing to the fall of the ground, this involves a front entrance on the basement, or lower ground-floor level, and access to the hall and main ground-floor level is up eleven shallow steps.

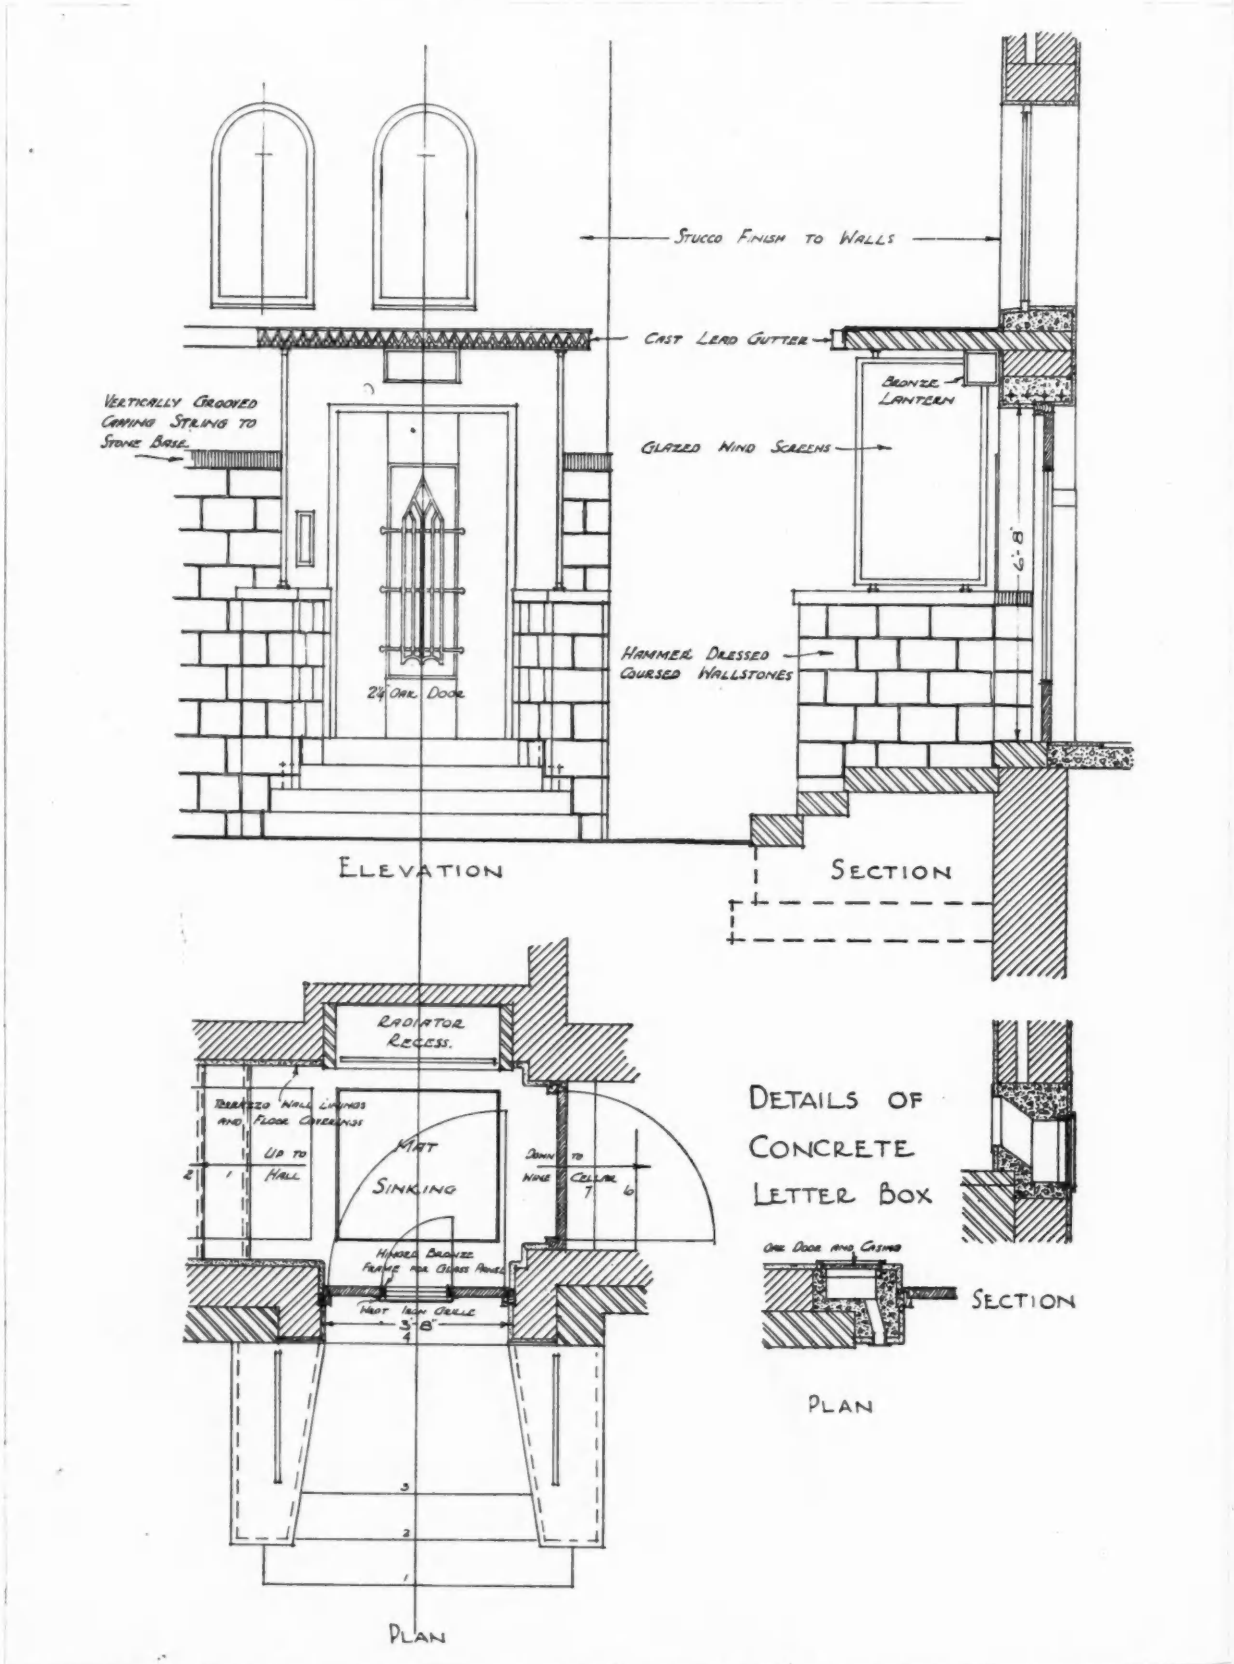
Having settled considerations of general layout, the question of the style of the building came up for review. Local tradition prompted a stone house with a stone-slated roof in the Yorkshire manor-house feeling, while the importance of light and sunshine indicated a complete breakaway from the customs of the district.

The entrance or north front affords magnificent views of Wharfedale and the surrounding countryside. Owing to the steep slope of the site the main entrance to the house is at basement level. Over the garage, which accommodates four cars, is the chauffeur's flat.

COUNTRY HOUSE

JOHN C. PROCTER

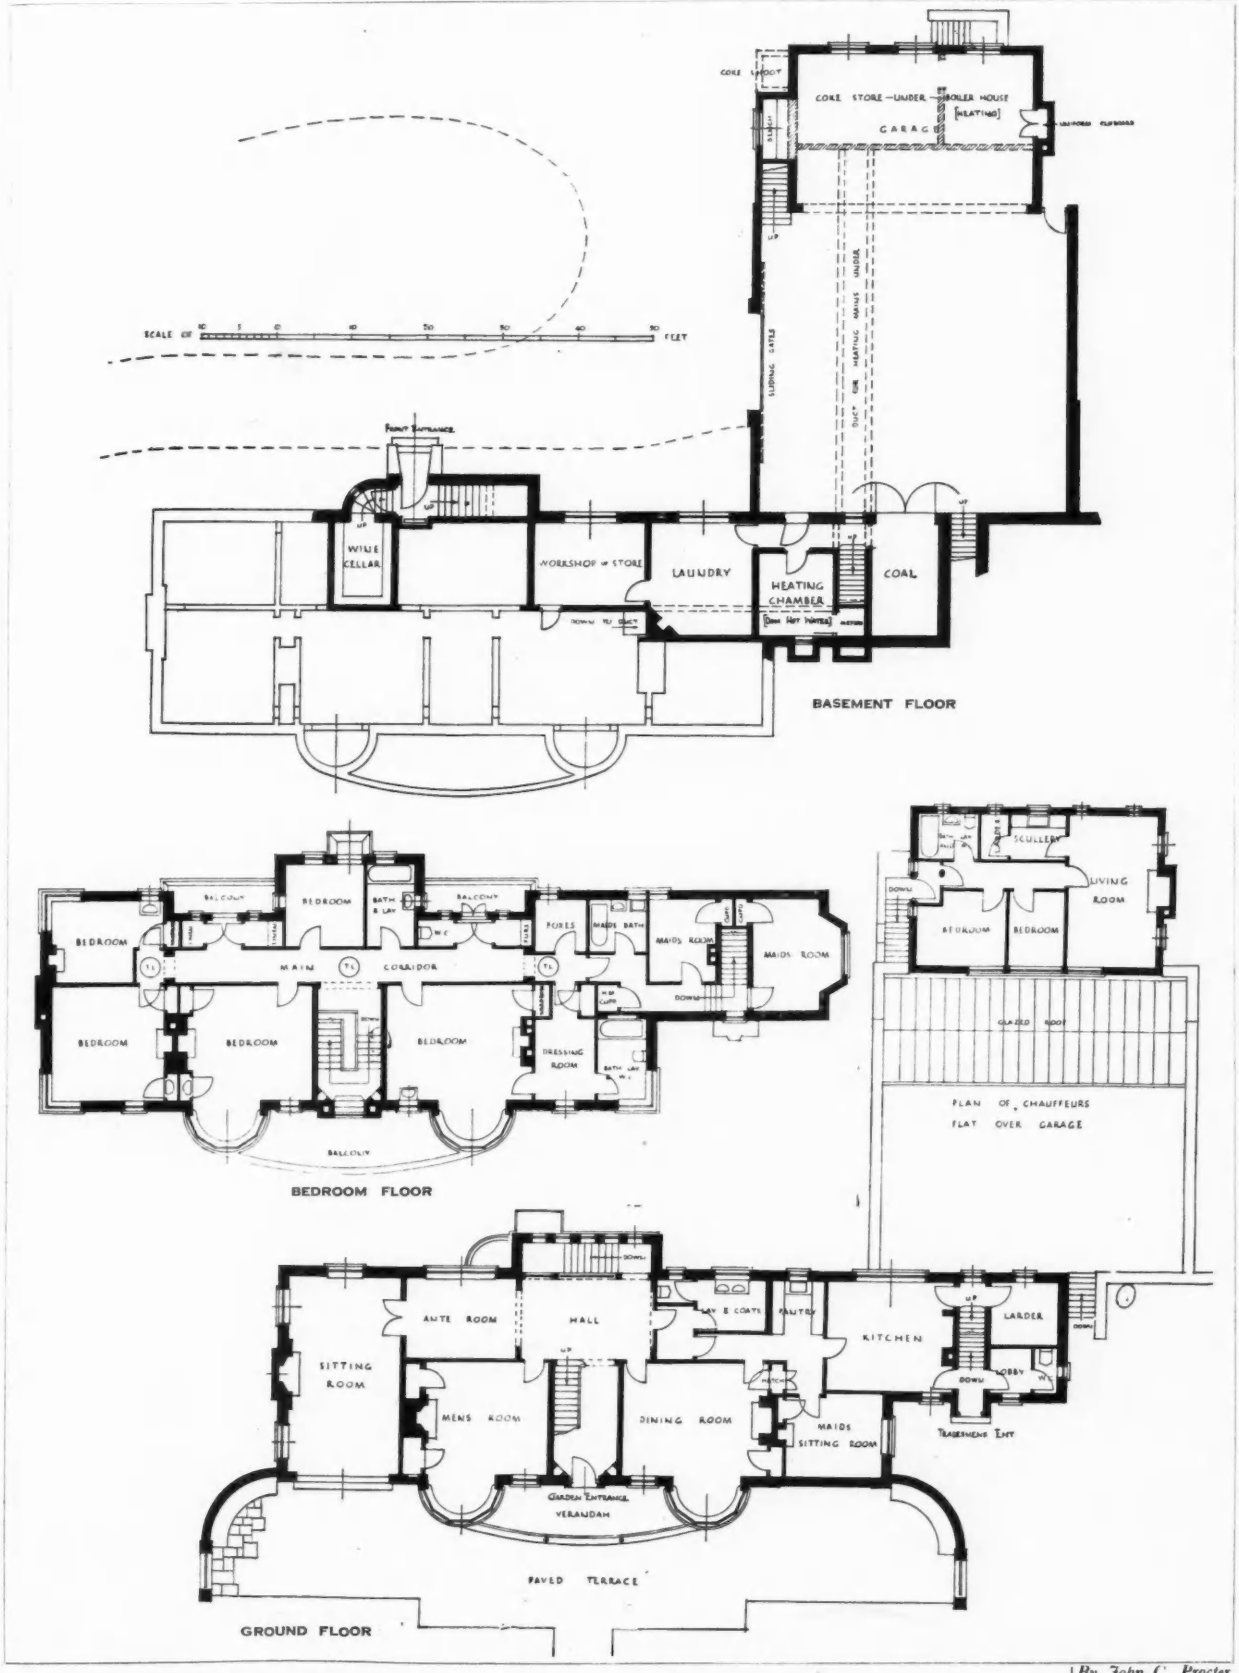
The client was treated fairly by being given two schemes, and without hesitation backed the one now built, which might be called transitional, and perhaps a too-timorous approach to the architecture of today. While not cut down to the bare bones of functionalism, considerations of style have not hampered planning or fenestration. The result is a house full of light, with a feeling of spaciousness for its size, and one voted very easy to run.



The front entrance on the lower ground-floor level is flanked by a wine cellar, a laundry, workshop, boiler-house for domestic hot-water supply, and a coal-house into which a lorry can be backed.

The garage for three or four cars has a 30-ft. clear opening, with "round-the-corner" sliding doors. Outside it is a glass-roofed car-wash, 41 ft. by 15 ft., spanning the yard.

On the ground floor of the house the ante-room is separated from the hall by a curtained arch, and access to the sitting-room is through double doors, so that these three rooms may be used *en suite*. The sitting-room has windows on three sides, that to the south being of the folding type, so that practically the whole south end of this room can be thrown open to the garden. All the ground-floor doors are of hospital type, in quartered walnut, and an ebony line takes the place of any moulding. These doors have special furniture in antique silver.



A view looking through the garden gate along the flagged terrace. The garden front offers complete privacy, access to the house being planned from the north side.

House at Ben Rhydding, Yorkshire.]

Dining-room. Skirtings and architraves are largely granite-stippled in a warm smoke grey. In the dining-room they are ebony and silver. Floors in main rooms are light polished oak.

CHEMICAL LABORATORIES AT NORTHWICH

DESIGNED BY L. H. BUCKNELL

THE site of the new laboratories for the Imperial Chemical Industries, Ltd., lies west of the firm's main works and offices at Northwich, Cheshire. It is in the form of a truncated triangle, and is fairly flat. The main approach is at the west (narrow end) of the triangle, and the rail approach for goods is at the east end. Owing to the nature of the research work (both chemical and engineering) carried out, it was considered desirable to incorporate in the scheme all dependent units such as administrative offices, library, etc.

The plan is disposed in three main groups. In the front, on two floors, with fixed benches on each long side and down the centre of the room. The services to the side benches are run along the walls, and special service channels are sunk in the floor for the centre benches and wastes. Two ranges of fume cupboards are installed.

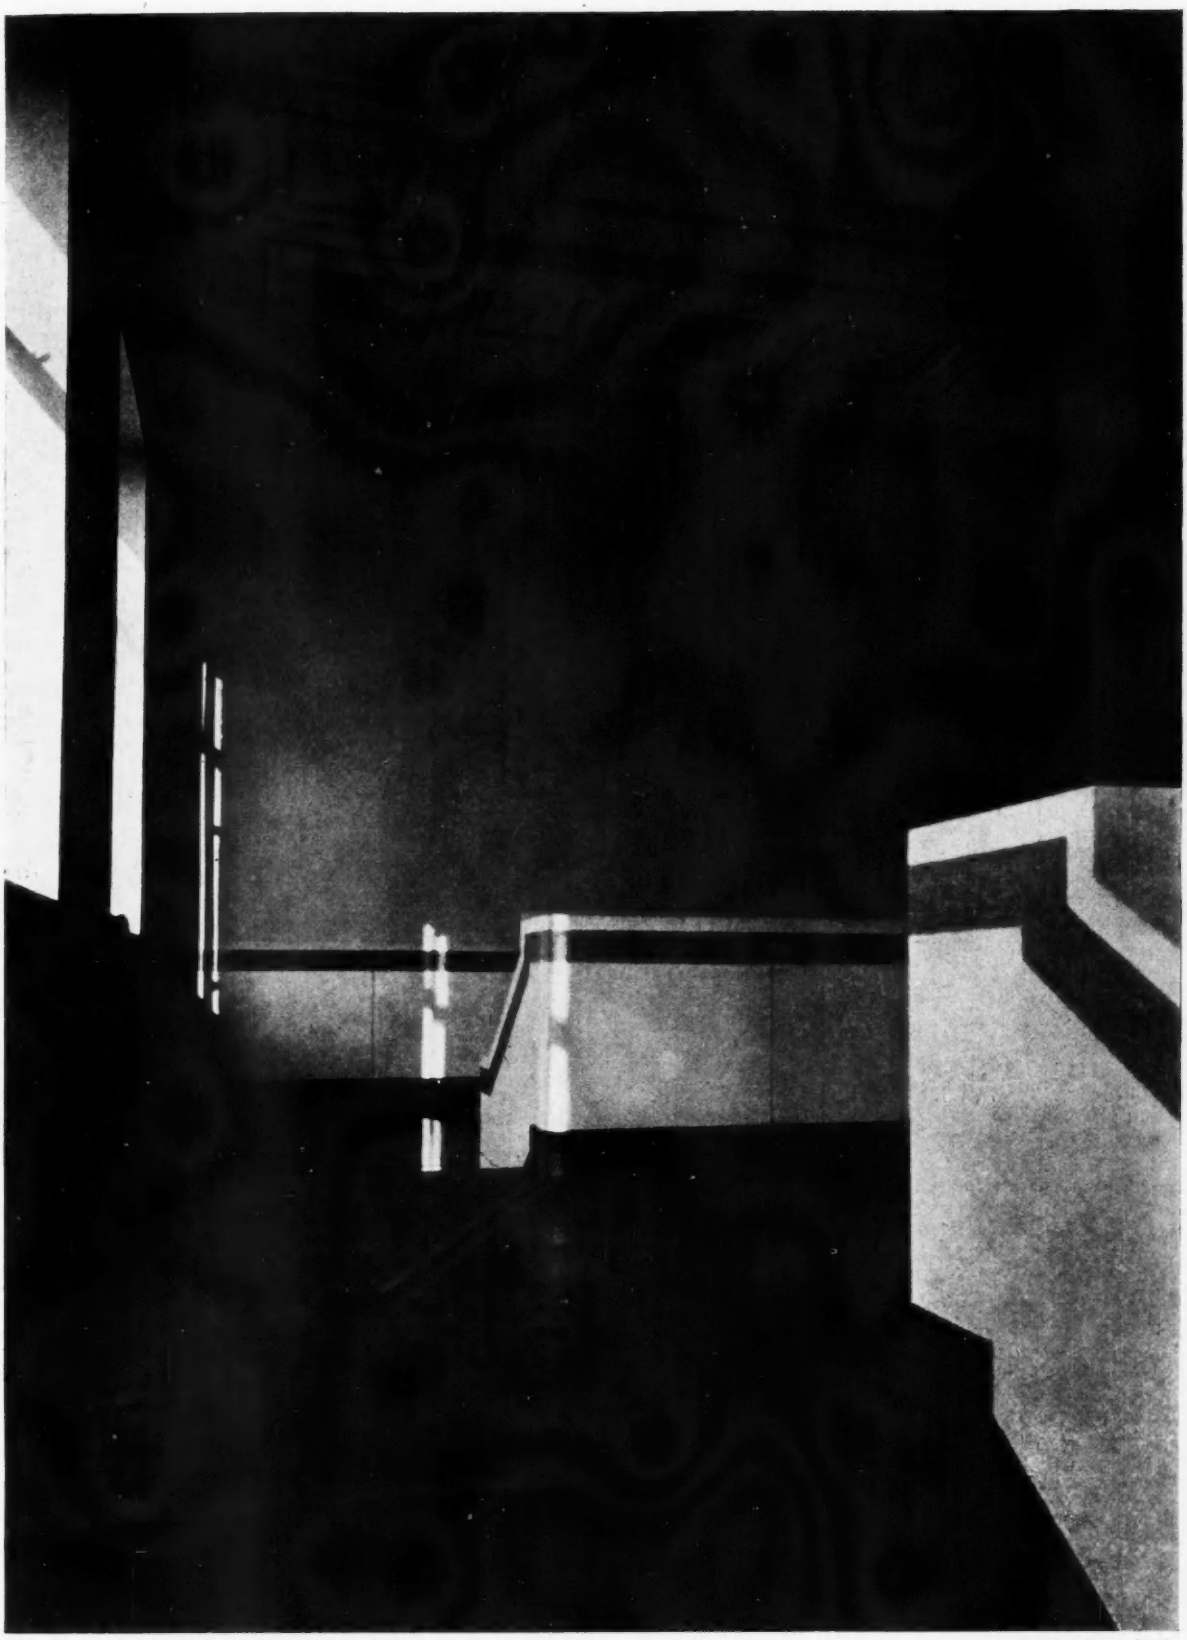
In the research laboratory the benches are not fixed, but are of a lighter type and capable of being moved as required by the work undertaken. This laboratory is provided with fume cupboards, balance and galvanometer rooms. The arrangement of services and wastes is as for the analytical laboratory. Adjoining are six offices for research chemists' private work.

The heating and ventilation plant, consisting of six units, each containing air washer, heater and fan, is situated under the chemical stores. It is a double duct Plenum system. For the greater portion of the building the ducts are carried under the floors and in the roofs, and the rooms are fitted with mixing dampers to regulate the temperature to individual requirements.

The central block of the main front, showing the principal entrance. The elevations are of white bricks, with stone dressings and with metal windows of good proportions. The front portion of the roof is covered with rustic slates and the back with grey slates.

is the administrative section, the centre is occupied by the chemical stores, lavatories and small offices, and at the back are the main laboratories and engineering shops.

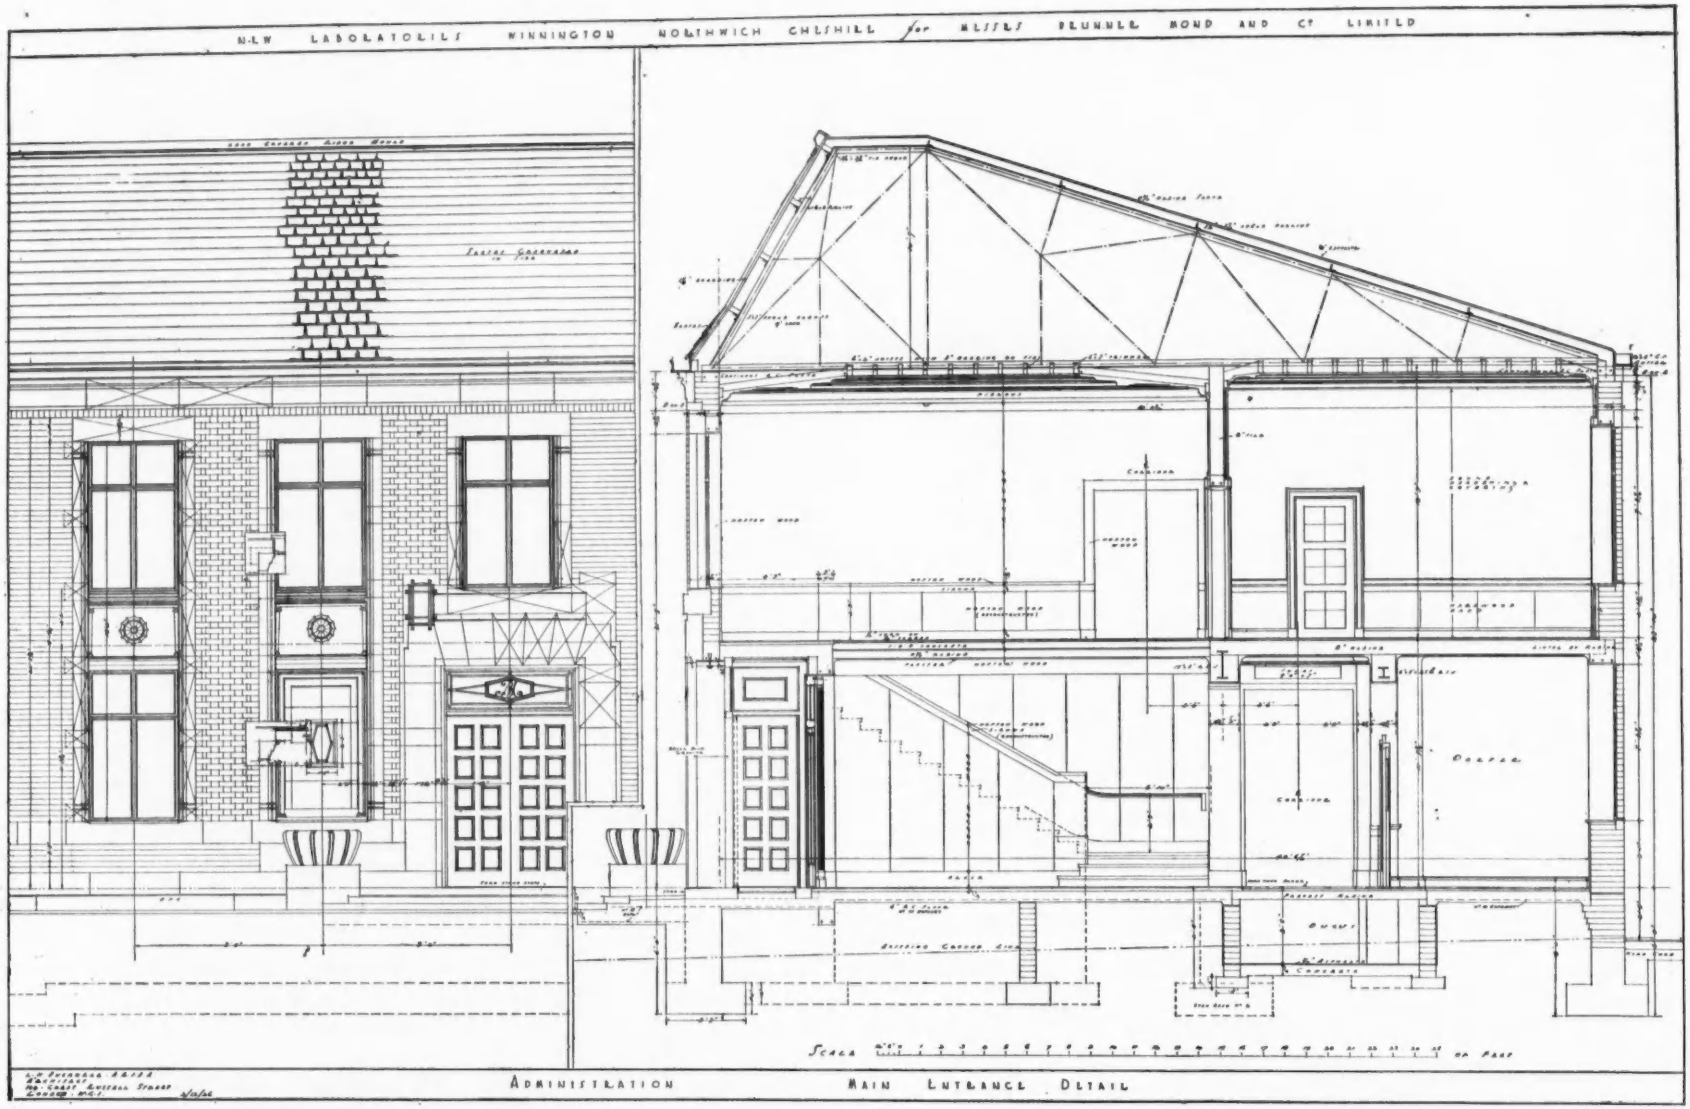
These run east and west and are north top- and side-lighted. A gallery connects all the units on two floors, and continues between the analytical and the research laboratories. This gallery (like the G.E.C. laboratories at Wembley) is designed to accommodate all the main service pipes and allow of their easy connection to any point.



The analytical laboratory is equipped

The semi-technical laboratory is equipped for carrying out experimental work with light machinery, and contains an electric travelling crane. A flexible system of engine beds was required for the machinery owing to the changing type of work dealt with. Sleepers were laid flush with the floor finish and a narrow-gauge railway provided. Adjoining the laboratory are a 50-ft. tower and six offices for engineers.

The arrangements for the engineering workshop are similar to those for the semi-technical laboratory, except that provision had also to be made for heavy



Internally, all finishings are designed to be as simple and plain as possible and to avoid the collection of dirt.

The conference room is acoustically treated for meetings, lectures, etc. A lantern screen is provided, concealed in the head linings of the double doors connecting to the adjoining room. The lantern is operated from the latter room. The walls above the dado are lined with Cabot quilting covered with plain silk; the joinery and furniture are in Indian laurel wood, inlaid with satinwood; and the floor is of compressed cork.

Chemical and Engineering Laboratories, Northwich. [*By L. H. Bucknell.*

The front entrance doorway of the administrative department. There are painted cast-iron panels between ground and first floor windows.

Chemical and Engineering Laboratories, Northwich. [*By L. H. Bucknell.*

The library. The woodwork is of maple; the floor of compressed cork. Note special lighting arrangement between book cases.

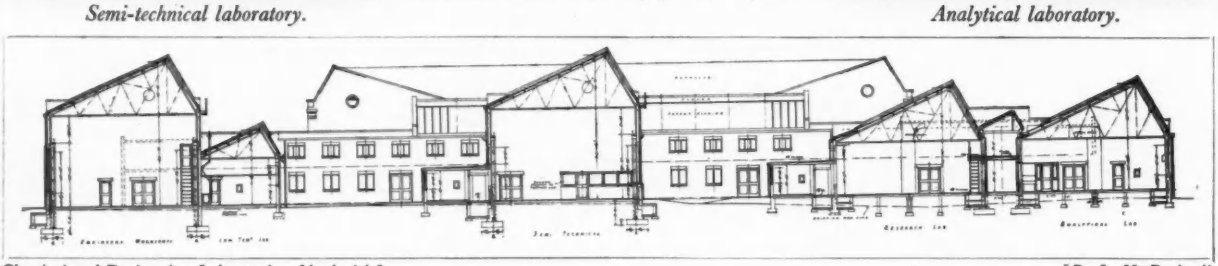
The architect's working drawings of the main front. The centre portion houses the administration department.

Semi-technical laboratory.

In the library, cases run along the faces of the walls and there are study tables under the windows; all forming part of the wall treatment. Isolated cases are also provided, having a special lighting arrangement to avoid floor obstruction, and at the same time allow small lights to be used between the cases. The woodwork is of maple. The floor is of compressed cork and the ceiling is panelled in celotex.

The floors of the analytical and research laboratories are of jarrah, and those of the semi-technical and low-temperature laboratories, the engineering shop and the chemical store, are of granolithic, with certain portions in duromit. The walls are all fairface white brick, in some cases distempered or painted. Ample wall battens are provided throughout.

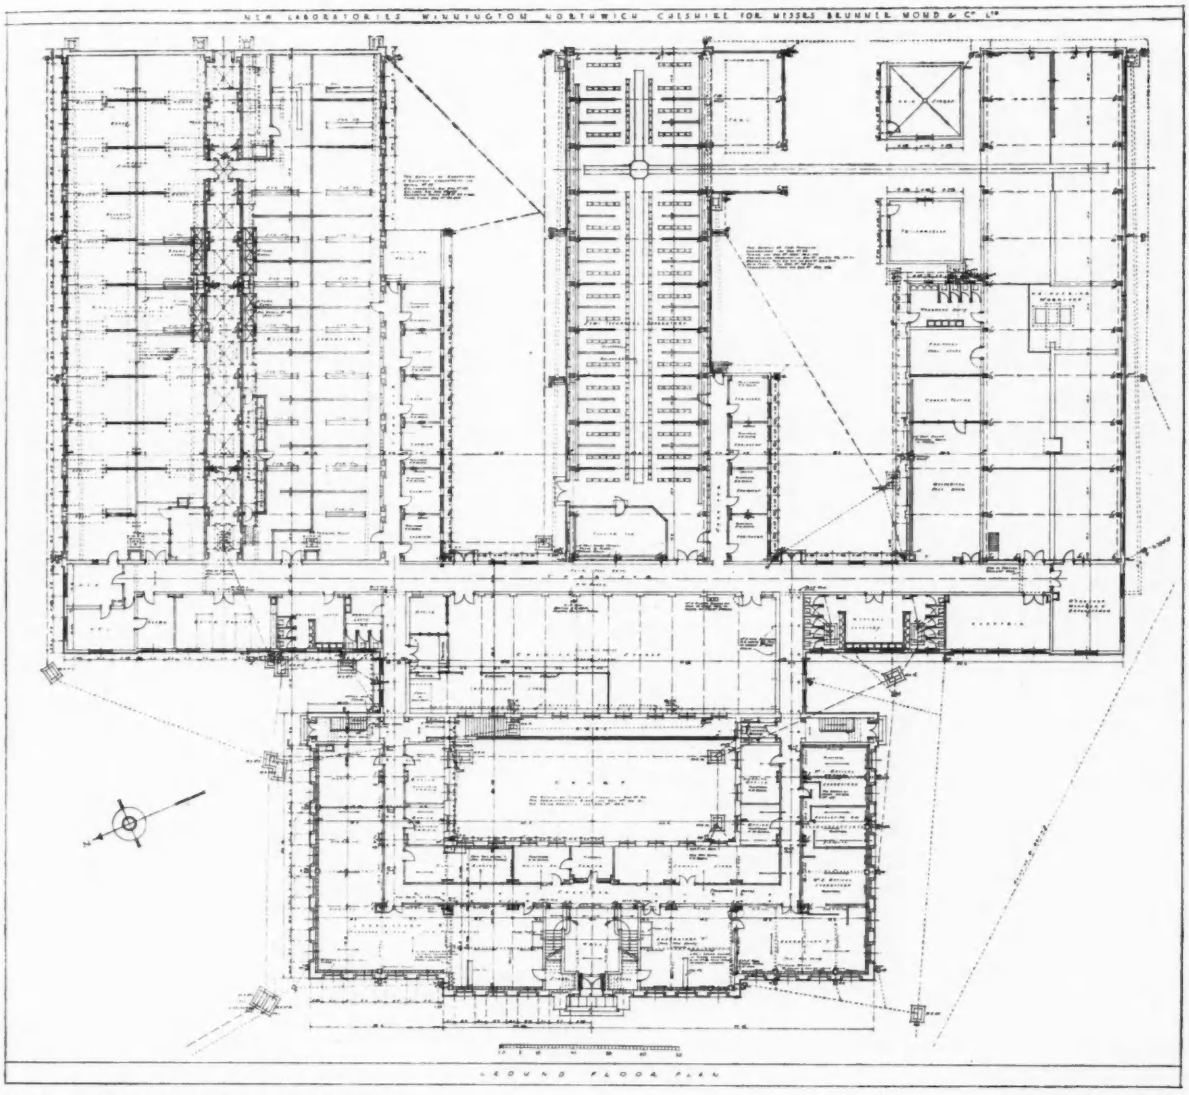
In the offices, corridors, etc., generally oak block floors are used. The internal walls in the back portion are fairface white brickwork, distempered, and in the front portion plastered and distempered. The lavatories have terrazzo floors and white glazed tiled walls with teak divisions and doors.



The ground in front of the building is laid out with ample space for waiting cars. The approach to this "place" is flanked by low stone walls and pylons with evergreen hedges at the sides.

The flush doors in the building are of special construction, finished with specially selected veneer and inlays.

The analytical, semi-technical and research laboratories and the engineering workshops each have a floor area of about 5,500 ft. super. The floor area of the low temperature laboratory is about 1,000 ft. super, and that of the chemical stores about 3,500 ft. super.



Analytical laboratory.

The administration department, front portion, is two stories high. Behind are the laboratories and workshops.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

THE new session of Parliament was opened by the King on Tuesday, October 28. In the Speech from the Throne His Majesty said that his Ministers proposed to introduce legislation to secure for the community its share in the site value of land, and to modify and extend the law relating to town planning and to the preservation of rural amenities.

Housing Act

At question-time Mr. Simon asked the Minister of Health whether he would state the number of houses completed under the Housing Act, 1924, in each year ending September 30, in England and Wales, from the passing of the Act to the present time; and what further houses, if any, were built during each year to be let at rents within the capacity to pay of the working classes.

Mr. Greenwood said that the following statement gave the particulars asked for in the first part of the question :

Year ended September 30	Number of houses completed during the year in England and Wales with State assistance under the Housing (Financial Provisions) Act, 1924
1925	12,385
1926	46,489
1927	97,316
1928	53,792
1929	53,516
1930	51,310

He regretted that he was not in a position to supply the particulars sought in the latter part of the question.

Shops on Housing Estates

Mr. Louis Smith asked the Minister if his attention had been called to the action of any municipalities in building shops on their new housing estates; whether his consent had been asked to this policy; if so, by what towns; and what had been his reply in every case?

Mr. Greenwood said that section 107 (1) of the Housing Act, 1925, empowered local authorities, with the consent of the Minister of Health, to provide and maintain shops on their housing estates. He regretted it was not readily possible to provide the information sought in the latter parts of the question.

Economic Rents

Mr. Ramsbotham inquired whether the Ministry adopted the view that houses built out of public funds should

be let at economic rents, or whether the principle was accepted that the rents charged for subsidy houses should be regulated solely by the ability of applicants to pay them.

Mr. Greenwood replied that the policy of subsidizing houses embodied in the housing legislation promoted by all governments alike since 1919 was based on the view that economic rents for working-class houses had not been and were not attainable.

The Architects' Registration Bill

The Architects' Registration Bill has been reintroduced by Lt.-Col. Moore, the Unionist Member for Ayr Burghs. As the Bill is twenty-fifth on the list of Private Bills, however, it has very little chance of making further progress this Session.

Slum Clearance Schemes

Mr. Grahame White asked the number and scope of slum-clearance and re-housing schemes so far approved under the Housing Act, 1930.

Mr. Greenwood replied that he had received resolutions declaring eleven areas to be clearance areas, one clearance order and one compulsory purchase order. The number of persons occupying the eleven areas was approximately 5,400.

LITERATURE

THE LANES OF LONDON

THE march of civilization evidenced by the erection of huge blocks of offices, banks and other buildings of the skyscraper variety, is tending to blot out entirely the small courts, yards and alleys which have been such a feature of the city for hundreds of years. Many of them date from the twelfth and thirteenth centuries, but especially did they spring up in great numbers during the sixteenth and seventeenth centuries, when much building took place, and they served to divide the large houses one from the other. Up to the end of the eighteenth century people dwelt in the city over their business premises, the lanes running along the backs of the houses and between the gardens.

As time goes on, one by one these landmarks disappear, and the historical associations and memories connected with them are bound to be forgotten and to lose meaning. The author has given us here, before it is too late, a comprehensive and interesting study of the picturesque and old-world byways and lanes of London, and archæologists of the future may well thank Mr. Stapleton for his labours to preserve many historical facts and data that are being carried out of our ken and may, in a few years, be entirely unprocurable. He has traced the lanes down the centuries and gives their names at the various periods; in all, he has discovered over 900 names for these lanes, at some time or now so called.

In the earliest times they were the paths which led up to the inns, palaces and monasteries of the city, and the pathways leading out of the city into the outlying country villages. The houses and palaces of the nobility were approached by their own stairs leading up from the river, and each of these stairs had an approach or "lane." An example of this is Trig Lane, a narrow thoroughfare leading to the river-stairs of the same name, which were called after Sir John Trigg, owner of the stairs in the reign of Edward III. In many cases the names of these lanes show their origin, as Fyefoot Lane, off Queen Victoria Street, which was originally Fivefoot Lane, because it is 5 ft. in width at one end.

Shoe Lane was first mentioned in the City records of 1310, when it was called "Scolane in the ward without Ludgate," whilst a later reference is to the "outlying suburb of Showell Lane." In 1345 Thomas de Donningstone was condemned to be hanged for stealing "one furred surcoat and two double hoods, value four shillings and two linen shirts value forty pence in Sholane near Holbourne."

The charm of this book is much enhanced by a number of drawings in a clear line with graceful shading, which show many beautiful corners where old London lingers still. K. M. H.

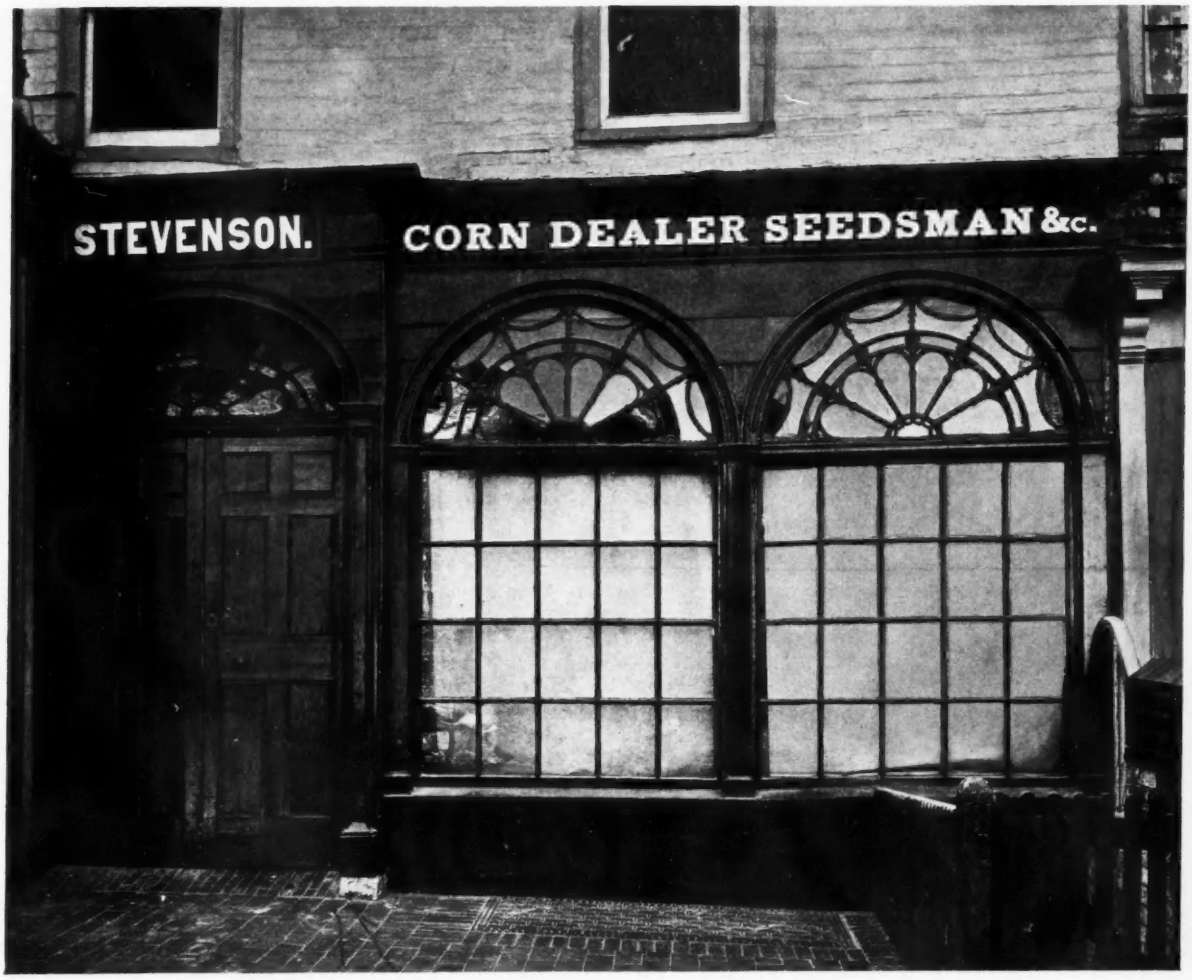
Shoe Lane.

AN APOLOGY FOR ST. PAUL'S

THIS vivid and arresting account of St. Paul's Cathedral has a special interest in this year of its reopening. It is an address the late Canon Scott Holland delivered in Birmingham, before the Ruskin Society, when J. Howard Whitehouse, who has edited the work and written the introduction, was honorary secretary. On this occasion, in 1900, a friendship sprang up between the two, which was only severed by the death of Scott Holland in the last year of the Great War.

Mr. Howard Whitehouse, in his introduction, makes no attempt to cover the same ground as the several studies of Scott Holland which have already appeared, but speaks of him as he knew him. He says:

I love the story which a friend of his tells. He was to preach in St. Paul's, and Scott Holland warned him in the vestry against trying to be intellectual. He might think his audience were all immersed in the problems of Robert Elsmere. Probably they were housemaids. Then he went on: "Did you hear of the unfortunate domestic who gave warning after a year or two in a quite good home, on the ground that she could not stand the words used repeatedly at family prayers: 'O God, who hatest nothing but the housemaid.'"



Everyone will agree that this intimate account of St. Paul's—an account of considerable architectural interest—is in some ways the most personal and loving tribute that the great church has ever received.

An Apology for St. Paul's Cathedral. By H. Scott Holland. Edited by J. H. Whitehouse. London: Oxford University Press. Price 2s. 6d. net.

ENGLISH PRECEDENT No. 140

SHOPFRONT,
NORTH STREET,
LEWES,
SUSSEX

If you can imagine this shop just opened to serve a walking, riding, coaching population, such as our forefathers in the eighteenth century were, it will be seen to be exactly fitting the requirements of the time as to usefulness, degree of refinement and scale.

It might even be said that anything coarser than this was impossible to the way of living and the attitude to building of the craftsmen of that time.

—[E. MAXWELL FRY]

LETTERS FROM READERS

Bungalophobia

SIR,—The important fact which emerges from the entertaining controversy which was started in *The Spectator* on "Bungalophobia," in which Mr. Williams-Ellis and myself were the protagonists, is the admission by Mr. Williams-Ellis that "the British architectural profession as a whole has failed to give guidance where guidance was so obviously needed."

The reason for this seems to me to be that the bungalow is mainly a post-war favourite. It began in the humble form of the army hutment, purchased at a knock-out price from Disposals Boards, sent by train and erected anywhere. The popularity among returned soldiers of this type of home, purchased with a well-earned gratuity, encouraged the original manufacturers of army huts to put on the market improved types of huts. Gradually the transition to full-blooded bungalows was passed, and so imperceptibly the building, design and construction of bungalows never reached the hands of professional architects at all. Today, elaborate and not unpleasing bungalows can be ordered from the manufacturer. They have the appearance of permanent residences of an architectural type, but are, in effect, merely the lineal descendants of the army hut.

Now, my complaint is that these are all that people like myself can get if we decide to have a bungalow built, or look round for one to purchase. There is no alternative at the price which we are likely to pay. The architects here and there build really nice and elegant bungalows, but rarely at a low price, and, in any case, they have made no attempt to put upon the market a really attractive type of bungalow at a price which will compete with the trade article. If, as I suggested, they issued designs classified according to the various districts of England, circulated those designs to local authorities, to local builders and to the Press, there might be some chance of the type of bungalow improving.

Meantime those various societies which are anxious to preserve the countryside should set to work to see that really good designs for bungalows are popularized, approved and taken up by the manufacturers. Instead, I find people like Mr. Harding Thompson (who, according to his letter to *The Spectator*, recently toured Cornwall on behalf of his particular high-brow society) talking such nonsense that it is hardly to be wondered at that the cause of the countryside advances but little. Mr. Thompson tells me that my own bungalow transgresses all those rules of æsthetic elegance which I laid down. Of course it does; that is precisely why I wrote about it. I did not build it (as he presupposes). I bought the thing ready built from someone else. And I bought it because it was comfortable, simple and not outrageous and, above all, because *I could not find any other type of bungalow to buy.* Mr. Harding Thompson not only missed the sole point of the controversy, but proceeded to make a series of brilliant points which I had already made myself!

I conclude, Sir, by offering you a photograph of my monstrosity. I might add that it can be reached by motor car, in case observers imagine that it is inextricably hidden in the forest!

STANLEY CASSON

Official Architecture

SIR,—I note with regret that your issue for October 29 contains a reiteration by Mr. Leathart of an unfortunate and unhappy misconception regarding a large section of the architectural profession—official architects, who represent, I believe, approximately forty per cent. of the membership of the R.I.B.A.

There are times when any man is off his game; so I sincerely hope, for the honour of the profession, that Mr. Leathart, when he wrote the letter in question, was playing below his normal form, and consequently allowed himself to lapse into forgetfulness of the fact that his remarks were directed against fellow-members of the Institute.

This gentleman's three letters on this subject establish beyond doubt the observations which I made at the debate at Olympia, regarding the misconception of present-day official architects, with which a large number of private practitioners still persist in deluding themselves.

The letters further indicate that I was not mistaken when I said that private practitioners have not been marching with the times.

I am therefore constrained to thank Mr. Leathart for the breezy manner in which he has unconsciously come to my aid and supported and strengthened my statements of fact, by the very effective process of personal demonstration.

R. WYNN OWEN

Modern Decoration

SIR,—In your issue of October 29 your reviewer of *Modern French Decorative Art* says that the impediment to the modern movement in this country is the client who "knows what he wants" and will not entrust the decoration of his home to experts. This, of course, means he does *not* know what he wants; if he did, he would find the right experts to supply his needs and entrust everything to them.

Let us cherish the man who really knows what he wants; he is our only hope.

If he be a man of taste, the highest results will be obtained. Even bad taste under these conditions will produce something infinitely more interesting than what is obtained by the feeble followers of fashion who dabble in every new movement without understanding the true significance of what they are doing. Such people produce a mediocre result, which may easily "take in" the less discerning among us and so lower the standard of our creative art.

The client, however, is not always to blame for this state of affairs. The trouble is often due to a lack of mutual support among the experts employed. For instance, too often the artist

Mr. Stanley Casson's bungalow on the Cornish coast. "... it can be reached by motor car, in case observers imagine that it is inextricably hidden in the forest!"

decorator and furniture designer suffer from the rabbit architect.

I have no use for "The Man Who Knows What He Wants." Let us suppress him, or at any rate let us be careful not to introduce him to the architect who knows what is wanted but does not dare to do it.

It is alliances such as these that produce that stagnant state of affairs so noticeable in the decoration of our homes. MARY ADSHEAD

QUESTIONS THAT ARISE

Stains in Polished Woodwork

R. E. writes: "*I have just remodelled an old house, in the course of which I had polished some old oak woodwork. Although the woodwork is on the first floor and is free from dampness, a milky appearance has become noticeable under several parts of the polish. How can this be removed?*"

There is only one remedy I can suggest that will solve your correspondent's query; that is, to remove all the polish down to the woodwork. This should be done with a paint remover, free from alkali and made principally from acetone. This may be used without its being necessary to apply any acid after the polish is removed, the surface being simply wiped down with a piece of waste dipped in turpentine or white spirit. Before repolishing, great care should be taken to see that the surface is quite dry.

K. W.

Sound Insulation

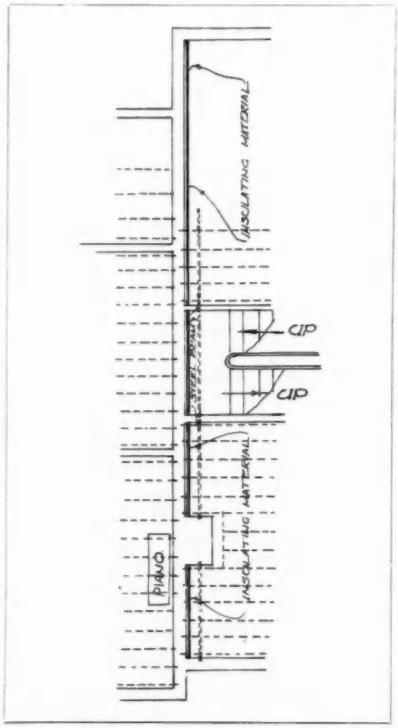
W. H. writes: "*A client has consulted me with regard to sound insulation, and I should be glad to know if you could give me some information as to the prevention of sound travelling through from one to the other of a pair of semi-detached houses. For a few hours every day a piano is played (indifferently) and is an intolerable nuisance to my client, as it can be heard from basement to attic floor. The accompanying sketch gives an idea of the situation, and the suggested treatment. The houses were built about fifty years ago, so it may be assumed that the walls are solid. I have suggested the cutting clear from wall of all joists supported in the party wall, and bearing them on steel joists, as shown by the double dotted lines, in each floor, and then building up against the party wall with some proved insulating material, leaving a small cavity, and plastering over, inside the rooms.*

"*Will this be absolutely efficacious, or could your expert give me any better suggestion or information for dealing with the case?*"

I think your correspondent's surmise is correct, namely, that most of the noise is travelling along the joists through the party wall, and no doubt the somewhat drastic remedy he suggests will have effect. Personally, I should recommend that the new partition be built entirely separate from the wall in wallboard sheeting, but it would be extremely valuable if, in the space between this and the wall, he could fix loosely another layer of insulating sheeting, but the former should be between fillets which would allow of vibration of the sheet, and must pass right down the depth of the floor.

It is impossible to say if this will be absolutely efficacious, as, of course, sound may travel out of the window and be reflected back in the other window off the opposite wall.

Care would, of course, be taken that the wall is made good where the ends of the joists are taken out.



"DELTA"

Sinking a Well

B. G. writes: "*Am I infringing any law, or can any action be subsequently taken against me for sinking a well on my own property, or on property which I have with my landlord's consent, if such a well seriously interferes with the supply in a public well just outside the property? The well in question is not very much used except in times of drought.*

Your correspondent will infringe no law through sinking a well on his own property or on the property of his landlord with the landlord's consent. I assume that his sinking a well will not disturb necessary support for your neighbour's land. No action can be successfully brought for depriving your neighbour of his supply of well-water. I assume that there is no local Act of Parliament dealing with the particular district affected. See the House of Lords case: *Mayor and Council of Bradford* v. *Pickles*, 1895. A.C. 587.

A. B.

A correspondent's suggested treatment for sound insulation (see query by "W. H.")

Manufacture of Plaster

M. R. writes: "*What temperature is required to burn or dry magnesium limestone gypsum to produce alabaster (plaster of Paris), and what is the best method of manufacture? Could you also inform me of some publication which would deal with this matter, including particulars of erection and design of kilns?*"

Alabaster is not the same as plaster of Paris, but is a soft rock which, when polished, resembles marble. It is not made artificially, but is quarried as a natural stone and worked into the desired shapes by the methods ordinarily employed for working stone. Magnesium limestone gypsum is not suitable for plaster of Paris unless it is almost free from magnesium compounds. The material would, therefore, require to be tested chemically before anything further could be done with it.

The method of manufacture consists in heating finely pulverized pure gypsum in an iron vessel (known as a "kettle") to a temperature which must not exceed 400 deg. Fahr., whereby a product is formed consisting of two molecules of calcium sulphate combined with one molecule of water. The product is sifted, and may be re-ground in order to produce superfine plaster. The best present use of true alabaster is to make it into "fittings" for electric lights, vases, etc. There is a material known as alabaster which is not composed of gypsum but of aragonite; this is a true marble, and does not form plaster of Paris when heated.

Various books and encyclopædias give outlines of the process, but your correspondent, before taking any action in the matter, would be well advised to consult an expert. The manufacture of plaster of Paris is an industry requiring great technical skill, and for this reason is not to be lightly started by those having no experience. R. H.

SOCIETIES AND INSTITUTIONS

OFFICIAL ARCHITECTURE

THAT official architecture is one of the most vital questions in the architectural world today was stressed by Mr. W. G. Buck, F.R.I.B.A., in his presidential address to the Sheffield, South Yorkshire and District Society of Architects, held in the University, Sheffield.

The practising architect, he said, can only look upon the tendency to employ official architects to design public buildings required by a Government, a municipality, a county or a district, as a menace to his existence. This menace to independent practice was now being carried farther than the work of elected public bodies. Large limited liability companies were being formed for the purpose of carrying on the trade of builders. These companies were often controlled by financiers who knew nothing about the crafts and science of building, but employed a building manager and an architect. They were ready to inform clients (some of whom were large companies, controlled or partly controlled by the same financiers) that there was no need to employ a practising architect as they were in a position to do everything from making the first sketch plan to completing the building.

In the operations of these bodies, which had the spending of money collected by way of rates and money borrowed on the security of the ratepayers' property, there was, in addition to the question of beauty of proportion and design, the consideration of economy or extravagance. In saying this he (Mr. Buck) did not suggest that it would be wise to delete from a building anything that was necessary or advisable for its efficiency for the function for which it was required, or for its beauty as an asset to the dignity of its surroundings. But there was often considerable margin as between buildings of equal perfection and usefulness in general economy of design and construction, and this, he thought, was more likely to be obtained as the result of competitive designs than by having plans prepared in a municipal or Government office.

The community would sooner or later find that in municipalized architecture and building they were not always getting the best, or the best value for their money, and if there was a consequent reaction the independent architect might again be in a position to show the public the best way to obtain the most satisfactory buildings. Until then the present methods would have an anti-stimulating effect that would tend to destroy the ambition of the profession.

In some cases the enormous amount of work made it impossible for the official architect to give it much personal supervision and the work would be left in the hands of assistants. These assistants might be and frequently were architects of equal ability, but they were responsible only to their chief, and the work they did would never have any recognized connection with their names.

Under the circumstances it was hardly likely that assistants would burn the midnight oil in an effort for honour and glory which would not be theirs, and although the men might be right the system was obviously wrong, and the art of architecture suffered.

A vote of thanks to the president was proposed by Mr. J. Lancashire, L.R.I.B.A. (vice-president), and seconded by Mr. J. M. Jenkinson, A.R.I.B.A.

STRUCTURAL ENGINEERS

Mr. R. H. Harry Stanger, F.R.C.S., A.M.INST.C.E., in his presidential address at the first meeting of the 1930-31 session of the Institution of Structural Engineers, called attention to the British Standard Specifications.

The tests laid down in standard specifications, he explained, were the result of co-operation between the scientist and the manufacturer, but while it had become the practice to specify that the materials used in constructions should comply with the requirements of standard specifications where such existed, it should also be possible to ascertain the qualities of the materials from the structural engineer's point of view.

Concrete, he thought, was the structural engineer's best friend, but like all true friendships it was essential that he should be able to understand it in all its moods.

The structural engineer had been accustomed to work by tradition. He was satisfied if the cubes of concrete sent to the laboratory showed the strength laid down in his specification. If the contract was of sufficient importance he might, before the commencement, have the aggregates which he proposed to use sent to the laboratory for making into cubes and testing for compressive strength. The fact that cubes made on the job always gave lower strengths than cubes made in the laboratory was certainly disquieting, but, as it invariably happened, this difference came to be looked upon as something only to be explained by the fact that the laboratory, for some insidious reason, was always supposed to try to obtain the greatest possible strength. Actually the difference was due to the controlled conditions in the laboratory, and as this became recognized, efforts were made to introduce more exact control in the field by the improvement of the machinery for the better mixing of the materials and for the smoother depositing of the finished product. These, however, were but a minor part of the craft of the concrete maker.

By far the most important was the knowledge of how to make proper use of the materials at hand to meet the particular requirements in view.

The research laboratories of the world had done an immense amount of work to show how more scientific methods of control can help in getting the best out of the improved methods of manufacture, and most engineers had been quick to adopt their suggestions.

ROMANESQUE ARCHITECTURE

The Romanesque Architecture of Northern and Southern Italy and Sicily was the subject of an address by Sir Banister Fletcher, P.R.I.B.A., at the Central School of Arts on Wednesday last. Everywhere, he said, in the styles of the buildings was visible the impress of the seals, not only of successive conquests, but of varieties of religions.

MODERN ARCHITECTURE CONGRESS

The third International Congress of Modern Architecture will be held in Brussels, from November 27 to 29. The subject of the exhibition will be the "Rational Ground Layout for Minimum Size Dwellings," and also "Horizontal Sliding Windows."

Further information is obtainable from Mr. Patrick Cutbush, Secretary, English Group, Architectural Association, 34 Bedford Square, W.C.1.

BRITISH STEELWORK ASSOCIATION

At the annual meeting of the British Steelwork Association, held on Thursday last, Mr. Arthur Dorman (joint managing director of Messrs. Dorman Long & Co., Ltd.) was elected president, and Mr. J. H. Humphreys (chairman of directors of Messrs. Braithwaite & Co., Engineers, Ltd.) vice-president for the coming year.

MEASURED DRAWINGS SCHOLARSHIP

Messrs. J. Howard Cooke, A.R.I.B.A., Manning D. Robertson, A.R.I.B.A., and the Professor of Architecture in University College, Dublin, are to act as assessors in connection with the 1930 Kerner - Greenwood Scholarship for measured drawings.

This scholarship, value 25 guineas, is offered for competition for the best set of measured drawings of a building or part of a building of architectural and historic importance in Dublin. The winner is required to make a further set of drawings of a building of similar importance in a district other than Dublin.

By Robert Mauchlen (Watercolour : 8″ × 12″)

The Castle, Loches.

By Robert Mauchlen (Watercolour : 10¾″ × 17″)

The Saint-Antoine Tower, Loches.

By Robert Mauchlen (Watercolour : 8″ × 12″)

A street in Loches.

IN this session are included drawings by two prize-winners, Messrs. R. Mauchlen and Frederick W. Baldwin, in the last of the Holiday Sketches Competitions. Most of the subjects are sufficiently well known, but from Mr. Mauchlen's notes the following has been condensed :

The town of Loches, lying 25 miles south of Tours, is probably the least known of all the mediæval towns in Touraine. It has been described as one of the oldest and best-preserved towns in Europe ; it takes little imagination to restore it to its mediæval beauty.

The castle, comprising royal abode, collegiate church and fortress, towers above the town on a plateau of chalk, with defensive works rising sheer on all sides. From gloomy donjon and torture chambers to the delightful Early French Renaissance apartments in the chateau, the buildings offer a remarkable display of architecture from the twelfth to the seventeenth centuries.

From the thirteenth-century castle gate, a perfect example of the period, the descent to the town is via the High Street, its Renaissance houses rich with carving and delightful ironwork.

The town hall, at the bottom of the street, a pure specimen of the Renaissance period, lies against the Picoys Gate ; this and the Cordelier's Gate are the only two remaining out of the original five in the town wall. The Sainte-Antoine tower (a belfry built in the sixteenth century as a bell tower for the two parish churches) dominates the town.

From gloomy donjon and torture chambers to the delight-

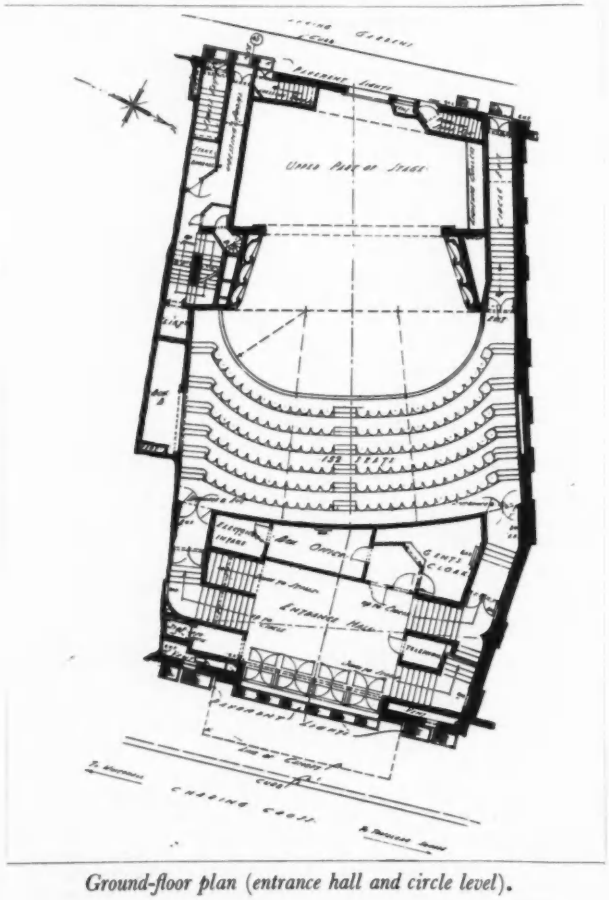
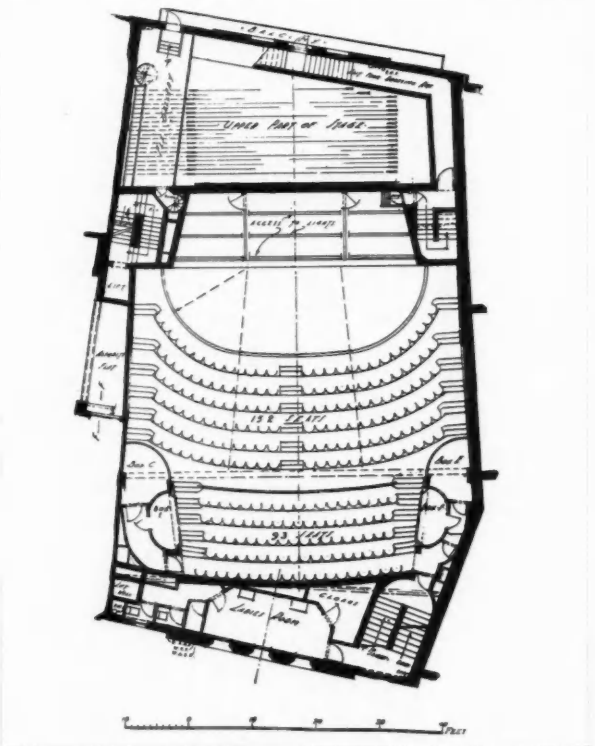
THE WHITEHALL THEATRE, LONDON

E. A. STONE AND PARTNERS, Architects



THE Whitehall Theatre, recently completed in Whitehall from the designs of E. A. Stone and Partners, is illustrated in the November issue of *The Architectural Review*. It is the latest of the many theatres erected in London and district by this firm. In the *Review*, which is filled with features of singular interest, is also an illustration of another theatre, that built at Parma in 1618 by Aleotti for the private use of Duke Ranuccio II.



Perhaps the features of outstanding popular interest are the assessor's report and awards in the competition for the decoration and furnishing of the dining-room and the living-room in Lord Benbow's apartments.

Plan of lower ground-floor (stalls level).

Ground-floor plan (entrance hall and circle level).

Plan of upper part of circle.

The Whitehall Theatre, London.] *[By E. A. Stone and Partners.*

Boxes in the circle. The front of the balcony is of fibrous plaster, capped with an ebony handrail. The dome of the ceiling of the theatre and the semicircular-headed arches to the boxes are of the same material, silvered. Walls are of plaster in brilliant colourings of silver, black, red and green.

It will be recalled that the Editor of *The Architectural Review* offered a first prize of £100, a second prize of £50, and a third prize of £25 for the best schemes submitted.

The awards of the assessor are as follows :

First prize — £100 : Raymond McGrath, "Finella," Cambridge. Suggested collaborators, E. McKnight Kauffer (rugs), Paul Nash (fabrics), Edward Bawden (paintings and wallpapers), Raymond McGrath (electric fittings and furniture), Maurice Lambert (sculpture).

Second prize—£50 : Paul Nash, Oxenbridge Cottage, Iden, Sussex, in collaboration with Denham Maclaren (furniture and light fittings), Edward Wadsworth (paintings), Paul Nash (carpets and fabrics).

Third prize—£25 : Vanessa Bell, 8 Fitzroy Street, London, W.1, in collaboration with Vanessa Bell and Duncan Grant (paintings), Humphrey Slate (carpets and fabrics), John Skeaping (sculpture), Robert Medley (furniture and light fittings).

The designs placed first and second are illustrated in the *Review*, and it is announced that the third design will be reproduced in the December issue. Arrangements have been made for the winning design to be carried out and put on exhibition at Waring and Gillow's showrooms in Oxford Street, London. The following firms have undertaken to make the various accessories : Rugs, hand-made, Wiltons Royal Carpet Factory; electric fittings and fires, Harcourts, Ltd.; wallpapers, John Line and Sons, Ltd.; fabrics, Donald Bros., Ltd.; furniture, Waring and Gillow.

Of unusual archæological and architectural interest is the illustrated article by Robert Byron on "The Black Pagoda at Kanarak." Its material is a dull rusty sandstone, except the roof, which is of a silvery colour. Both stones, says the author, have blackened extensively, like Portland stone in London, so that the carving and structural ornament are thrown into double relief. But since these features, unlike those of many Indian buildings, are contrived with a sensitive regard for the general lines of the mass, he points out that the effect is admirable, particularly in the case of the roof. He states that the base is carved with such lavish elaboration, yet with such a classic sense of pure design and form, as to render it the loveliest of the many lovely monuments of India and, beyond any other, the most sympathetic to a European taste formed under the Early Renaissance.

Elizabethan Carpets

English embroidered table carpets of the Elizabethan age are extremely rare, and the beautiful pair till lately in the possession of Lord St. John of Bletso has been acquired for the Victoria and Albert Museum. The purchase was made possible by the National Art-Collections Fund, which provided half the purchase money, and through the co-operation of Messrs. Durlacher.

One of the carpets is traditionally associated with the Lady Margaret Beaufort, Countess of Richmond (1443–1509), but is probably not earlier than 1550. The other was made for the marriage of Oliver St. John, first Earl of Bolingbroke, with Elizabeth, the daughter and heiress of William Paulet.

LAW REPORT

IMPORTANT DECISION AS TO LIABILITY FOR PENALTY

Archibald D. Dawnay and Sons v. *Holloway Bros. King's Bench Division. Before Mr. Justice Branson*

THIS case raised, on a preliminary point, an issue as to the liability of sub-contractors, who fail to carry out work under their sub-contract by the stipulated time, to a penalty, if the corresponding penalty has not been exacted under the head contract.

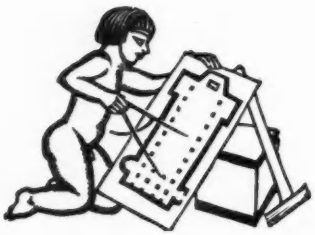
The action was by Archibald D. Dawnay and Sons, Ltd., of Steelworks Road, Battersea, against Holloway Bros., of The Wharf, Grosvenor Road, Westminster, to recover the sum of £2,000, moneys due under a contract of August, 1928, for work and labour done.

Defendants by their defence admitted that the amount was due, but set up a counter-claim under which they said that the plaintiffs failed to carry out the contract in the stipulated time, and that the sum of £2,000 was due from plaintiffs to defendants by way of liquidated damages. This the plaintiffs disputed, and this was the issue that now came up for decision.

Mr. Pritt, K.C., for the plaintiffs, said the matter came before the Court on a preliminary point of law, and it was a simple point. Defendants were the main builders and contractors to build the Masonic Peace Memorial in Great Queen Street, and in the ordinary course of business they employed sub-contractors for a great deal of the steel-work, and plaintiffs were one of the sub-contractors. Plaintiffs were guilty of some delay. There was a provision in the sub-contract under which the plaintiffs were liable for certain liquidated damages for delay, and there was a corresponding penalty exacted from defendants under the head contract. In the events which happened, defendants under the head contract were not compelled to pay any damages, the architect having paid in full and having extended their time under the contract. The defendants now, however, said to the plaintiffs, "We want damages from you as we have actually suffered." The plaintiffs said in answer, "That the provision for liquidated damages is exhausted, as there is now no question of delay."

The contract between the parties was made in August, 1928, and the sub-contract provided for liquidated damages for delay of £200 a week. The plaintiffs had to supply the constructional steelwork required. The penalty was afterwards agreed at £100 a week. Here the defendants had not to pay any penalty to their building owners, and counsel contended that that put an end to the question of damages as far as plaintiffs were concerned.

Mr. Croom-Johnson, K.C., for the defendants, argued that the concession to the defendants in no way affected the defendants' claim for liquidated damages against plaintiffs, and that the counter-claim was a good one.



His lordship, after hearing the legal arguments, said this matter came before him on the preliminary point raised as to the construction of the penalty clause under the circumstances of the case. He came to the conclusion that the intention of the penalty clause was to provide for the payment of damages in case of default. But such damages were only to be recovered if the penalty was exacted under the agreement between the defendants and the building owners. This penalty had not been exacted, and in his view the question now raised must be decided in favour of Dawnay and Sons, Ltd.

COMPETITIONS OPEN

November 17.—The Scarborough Education Committee invites architects to submit competitive designs for the Seamer Road New School. Assessor: Morris Thompson, F.R.I.B.A. Premiums: £100, £60, and £40, for designs placed first, second and third, respectively. Applications for conditions of the competition should be made to R. Underwood, Director of Education, Education Offices, Huntriss Road, Scarborough, not later than November 17. Deposit £1 1s. Latest date for submission of designs: January 17.

November 30.—The Guildford Cathedral Committee invites any architect, who has been engaged in the design of cathedrals or churches, to submit for examination drawings and other illustrations of his works; or a design for a cathedral. Not more than three sets of drawings may be submitted, packed in one large portfolio. The Committee, with the assistance of Mr. Walter Tapper, A.R.A., will examine the portfolios, and select a limited number of architects for the Final Competition. Each architect selected for the final competition will receive 500 guineas, whether his design is accepted or not. Portfolios should be addressed to The Venerable the Archdeacon of Surrey, The Diocesan Office,

SUBSCRIPTION FORM

Please send me "The Architects' Journal" weekly for twelve months for £1 3s. 10d. beginning

This form should be handed to your usual newsagent, or posted under halfpenny stamp to The Manager, The Architectural Press, 9 Queen Anne's Gate, Westminster, S.W.1, who will debit you with the amount of your subscription

THE ARCHITECTS' JOURNAL

Lloyds Bank Chambers, Guildford, not later than November 30.

December 25.—A prospectus giving full particulars of the international competition for the Ukrainian State Theatre, organized by the Kharkov Town Council, Russia, has recently been issued. The theatre is to be erected in the centre of Kharkov, on the site of the present Comsomolsky Square (Young Communist Square), and will contain a mass musical stage, and seating capacity for 4,000 persons. The competition will be assessed by a jury comprising a president, vice-president and fifty-six members. Prizes: 1st, 10,000 rub.; 2nd, 8,000 rub.; 3rd, 6,000 rub.; 4th, 5,000 rub.; 5th, 4,000 rub.; 6th, 3,000 rub.; 7th, 8th and 9th, 2,000 rub.; 10th, 11th, 12th, 1,500 rub. Drawings should be sent to the Kharkov Town Council on or before December 25. Copies of the prospectus are obtainable from the Embassy of the Union of Soviet Socialist Republics, Harrington House, 13 Kensington Palace Gardens, London, W.8.

December 31.—The Incorporated Association of Architects and Surveyors invites competitive designs for a Model Petrol Filling and Service Depot. The competition has the full support of the Automobile Association, the Scapa Society and other bodies which have at heart the preservation of the countryside, as well as the principal motor-trade journals. Assessors: Alfred Stephens Cross, M.A. (CANTAB.), V-P., I.A.A.S.; Edward H. Fryer, Deputy Secretary of the Automobile Association; and Walter Groves, Editor of *The Motor*. Prizes: 50 guineas, 20 guineas and 10 guineas for first, second and third places, respectively. Smaller awards may also be made on the advice of the assessors, and at the discretion of the Council of the Association. In addition a prize of 10 guineas and two prizes of 5 guineas each will be awarded to laymen for the best suggestions submitted with or without sketches. Full particulars, etc., are obtainable from the Secretary, the Incorporated Association of Architects and Surveyors, 1 Wilbraham Place, London, S.W.1. Latest date for submission of designs: December 31, 1930.

No date.—The Committee of the Foundation Hospital and the Rectorate of the Royal Yugoslavian University of Zagreb invites competitive designs for the general rebuilding plans of the Foundation and Clinic Hospital of Zagreb. Assessors: 1. Dr. Srkulj Stjepan, Burgomaster and Chairman of the Foundation, as president of the jury. 2. Henauer, W., architect, of Zurich (or his representative, Ch. Thevenaz, architect, of Lausanne), for the Swiss Engineers' Association of Germany. 3. Dr. Ing. Kreis Wilhelm, of Dresden, for the Engineers' Association of France. 4. Arch. Expert H.R., of Paris, for the Engineers' and Architects' Association of France. 5. Dr. Culumovic Pavao, Primarius, for the Medical Association of Zagreb. 6. Ing. Gabric Franjo, for the Yugoslavian Association of Engineers and Architects, Zagreb section. 7. Dr. Rasuhin Josip, deputy for the Directors of the Institute of Hygiene Foundation Hospital of Zagreb. 8. Prof. Dr. Prasek Emil, for the medical faculty of Zagreb. 9. Dr. Durst Franjo, for the medical faculty of Zagreb. 10. Arch. Heinzel Vjekoslav, Alderman of the City of Zagreb. Committee representative of the jury: Ing. Jurkovic Mato, Stadtbaurat in Zagreb. Prizes: 1st, 20,000 Swiss francs; 2nd, 15,000 Swiss francs; 3rd, 10,000 Swiss francs. 15,000 Swiss francs have been set aside for any further work which may be required. Programme and particulars of the competition will be sent on or after August 15, 1930, on application to the Stadtvorstand of Zagreb (Mr. Matica, secretary), Room No. 70, 2nd floor, on payment of 200 dinar. Latest date for submission of designs: January 15, 1931.

THE ARCHITECTS' DIARY

WEDNESDAY, NOVEMBER 5

R.I.B.A., 9 Conduit Street, W.1. Meetings of the Art Standing Committee and the Board of Architectural Education Examinations Committee.

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Exhibition of Members' Holiday Sketches. Until November 27.

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Inaugural meeting and presentation of medals awarded during the session 1929–1930. **8.30 p.m.**

OBITUARY

We regret to record the death, which occurred on October 29, of Mr. George Mitchell, one of the managing directors of the Limmer and Trinidad Lake Asphalt Co., Ltd.

He had been associated with this company for over twenty years, during which time he had seen it develop to its present strong position in the road and building business.

Mr. Mitchell was Past-Master of the Paviors' Company. He was connected with many charitable organizations and was president of the Brotherhood of Cheerful Sparrows.

Mr. John Thomas Johnstone, F.S.I. L.R.I.B.A., of Merstham, left £11,682 (net personalty £10,096).

TRADE NOTES

At a meeting of the Council of the Rubber Growers' Association (Incorporated) a memorandum from the board of Rubber Roadways, Ltd., was submitted, outlining suggestions for expediting the commercial development of rubber roadways. The memorandum stated that having regard to the advantages of rubber roadways, the placing on the market of such a material at a competitive price would undoubtedly create a permanent new industry which would absorb a large quantity of crude rubber annually. The board felt confident that the commercial development of rubber roadways would be greatly stimulated by further technical research, subsidies of crude rubber, and financial assistance. It was pointed out that the question of financial assistance for the provision of plant and machinery with the object of expediting the manufacture of blocks should receive favourable consideration. This would encourage manufacturers to deal with rubber blocks as a definite branch of their business, and, with subsidies of rubber, the growers would necessarily have a voice in marketing policy. Encouragement, it was said, should also be given to pooling of operations so that any type of block required by a road authority could be speedily turned out in quantity. It might also be necessary to subsidize special areas, e.g. rubber roads adjacent to hospitals. The Council, in adopting the memorandum, supported the view that the time had arrived for some bold and concerted effort to be made to encourage the commercial development of rubber roadways, and decided in the first instance to make an immediate appeal to producers to agree to supply to Rubber Roadways, Ltd., standard quality rubber for a period of five years on a certain basis. It is proposed that the rubber should be devoted to the manufacture of, or experiments connected with, rubber roadways and to cognate purposes, and would not be realized for the purpose of providing funds. It is also intended that assents to the scheme shall not be binding unless producers representing a production during 1929 aggregating not less than 150,000 tons have agreed to contribute rubber on the basis outlined. The measure of response to this appeal will have considerable bearing upon the question of technical research and other matters dealt with in the memorandum, in regard to which the Council have decided upon a course of action.

*

On Friday last the Nettleson Players, comprising members of the various branches of the staff of Messrs. Nettlefold and Sons, Ltd., presented *It Pays to Advertise*, a farcical comedy in three acts, at the King's Hall, Caroline Street, W.C.1. The whole cast of twelve players performed exceptionally well, particularly Mr. Hugh Nettlefold, who played the leading part of Rodney Martin—a young man who possessed so keen a business acumen that he expended great sums of money on advertising tablets of soap, needless to say with excellent results! His lucky slogan was "13 Soap, Unlucky for Dirt." The play was a performance preliminary to two that are to be given at the Scala Theatre on January 5 and 6, 1931, in aid of the R.M.T.B. & B. Society, etc.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors, specialists and sub-contractors for the buildings illustrated in this issue :

New Laboratories, Imperial Chemical Industries, Ltd., Northwich, Cheshire (pages 690–695). General contractors, Gerrard and Sons. Acoustic consultant, Hope Bagenal. Quantity Surveyor, D. Cameron, F.S.I. Sub-contractors : Faldo & Co., Ltd., asphalt ; James Akeroyd and Sons, Ltd., stone (Dungeon) ; Kleine Patent Fire-Resisting Flooring Syndicate, Ltd., patent floors ; Macfarlane & Co., c.i. vent grills; British Air Conditioners, Ltd., Saunders and Taylor, H. and J. Lonsdale, Ltd., and Mathews and Yates, heating and ventilating equipment; O'Brien Thomas & Co., Ltd., sliding-door gear; Ramsay & Co., ironmongery; Robert Adams, ironmongery (floor springs); Sutton and Sons, road top dressing; Vronlog Green Slate Quarries, and Moore and Brock, slates; Dent and Hellyer, Ltd., sanitation; Doulton & Co., Ltd., mercury traps; Mather and Platt, sprinklers; Hollis Bros., wood block floors; Marble Mosaic Co., terrazzo and mosaic ; Fram Reinforced Concrete Co., cork floor; Aeronautical and Panel Plywood Co., Ltd., flush veneered doors; Jackson and Sons, Ltd., fibrous enrichment; J. Gibbs, Ltd., ceiling lights in library; Mander Bros., and Mond Staffordshire Refining Co. (Naylor Bros.), paint; Jefferys and Sons, blinds and curtains; May Construction Co., Ltd., acoustic work; Gray and Son, Ltd., lightning conductors; Gregory Quarries, stone pots by front entrance; Hope and Sons, w.i. and c.i. grilles and patent glazing; Smith and Ansell, lanterns by front entrance, and special library lighting fittings; Pirie & Co., grip handles to front doors; Bath Artcraft, conference room table and chairs and library table and chairs; Chubb and Sons, steel screens; J. Gibbs, Ltd., metal windows; Luxfer, Ltd., glass louvre windows and floor lights; Wood & Co., structural steel; Indented Bar and Concrete Engineering Co., and Expanded Metal Co., reinforcement; Brunner Mond & Co., bricks and electrical work; H. Burn, Dixon & Co., planting; Merchant Trading Co., Ltd., Celotex.

House, garage and chauffeur's flat, "Five Oaks," Ben Rhydding, Yorkshire (pages 684–689). General contractors, William Irwin & Co., Ltd. Sub-contractors : Tunstall & Co., Ltd., waterproofing materials, dampcourses, asphalt and special roofings; Expanded Metal Co., Ltd., reinforced concrete; Leonard Cooper & Co., Ltd., and George Depledge & Co., Ltd., structural steel; Terra Wood Brick, partitions; Mellowes & Co., Ltd., patent glazing and casements; J. Lindley, cast lead, gasfitting and plumbing; Young, Austen and Young, central heating; Triplex Foundry, Ltd., stoves; Burrett and Walford, grates and door furniture; H. G. Bailey & Co., electric wiring; R. Troughton and Young, electric light fixtures; Doulton & Co., Ltd., sanitary fittings; Art Pavements and Decorations, Ltd., stairtreads and tiling; Joseph Raye and Sons, Ltd., door furniture; P. C. Henderson, Ltd., folding gates; Dixon and Powner and Sons, iron staircases; Cowling and Hobson, plaster; Leeds Marble Works, Ltd., marble; Frederick and Harland Schofield, Ltd., textiles and furniture; Merchant Trading Corp., wallpapers (Salubra); Bath Cabinet Makers Co., Ltd., furniture.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated, readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

Maufe; seven houses, Beauchamp and Livingstone Roads, for Mr. E. W. Pritchett; amended plan for six houses, Stafford Road, for Messrs. Smith & Co.; sixty-eight houses, Mitcham Road, for Mr. H. Macintosh; house and garage, Fitzjames Avenue, for Mr. A. W. Dawson; factory, Bensham Lane, for Mr. W. Cooper; lock-up shops, Whitehouse Lane, for Mr. L. R. Whittle; two bungalows, Orchard Rise, for Messrs. L. B. Hart & Co.; alterations to club premises, Scarbrook Road, for Mr. C. H. Ridge; workshop and factory, 15 Whitehorse Road, for Messrs. Bridges and Clarke; two houses and garages, Wickham Avenue, for Mr. S. A. Skipper; ten lock-up garages, Lodge and Greenwood Roads, for Mr. H. Elliott; house and garage, 47 Woodmansterne Road, for Messrs. C. Midmer and Son.

The DEPTFORD B.C. has made application to the L.C.C. for a loan of £8,662, for the erection of the Old Town Library.

Plans passed by the EAST BARNET U.D.C.: House, Brookhill Road, for Mr. J. Taylor; twelve houses, Belmont Avenue, for Mr. C. Winkley; house, Crescent Road, for Mr. W. J. Bryant; sixteen houses, Alverstone Road, and sixteen houses, Lovelace Road, for Messrs. W. C. Leak and Sons; also plans for the development of Wyatt's Farm estate, Pricklers Hill.

Plans passed by the WEALDSTONE U.D.C.: Nine houses, Headstone Drive; three houses, Tudor Road; thirty-eight houses and fourteen garages, Malvern Gardens; eighteen houses, Westfield Drive.

SOUTHERN COUNTIES

The BATTLE U.D.C. has received sanction from the Ministry of Health for loans of £10,924 and £326 for the erection of twenty-eight houses on the Lower Lake site, and for road works respectively.

The reorganization of GILLINGHAM schools at a cost of £100,000 is to be spread over a period of two or three years.

A fund to provide twelve more churches in the ROCHESTER diocese has reached £20,085.

Plans passed by the SLOUGH U.D.C.: Sixteen houses off St. Paul's Avenue, for Mr. H. D. Mines; four houses, Ragstone Road, for Mr. W. Varney; four houses, Ragstone Road, for Mr. G. W. Newitt; three houses, Windsor Road, for Messrs. C. Morgan and Son; two houses and shops, Bath Road, Cippenham, for Mr. F. E. Cullimore; two houses, off Willoughby Road, Langley, for Messrs. T. S. Ellis and Son; two houses, Westlands estate, Taplow, for Mr. F. W. West; house, Bath Road, Taplow, for Forest Products, Ltd.; house, shop, garage and store, Baylis Court estate, for Mr. J. Bowyer; bungalow and garage, Huntercombe Lane, Taplow, for Mr. W. Warren; house, Albert Street, for Messrs. Smart and Fretwell; bungalow, Langley Road, for Mrs. E. M. Humphreys; bungalow, Meadfield Road, Langley, for Mr. A. H. Simpson; house and garage, off Leeds Road West, for Mr. T. W. Hanson; lock-up shop and workshop, Windsor Road, for Messrs. Renacre & Co.; three lock-up garages, Leeds and Carlisle Roads, for Mr. W. Warren; ten garages, Leeds Road West, for Mr. H. Bishop; sub-station, Chadell Hill, Chalvey, for the Slough and District Electric Supply Co.

The SURREY C.C. has decided to seek the approval of the Ministry of Health in relation to a scheme for the reconstruction or improvement of twenty-nine bridges in the county, all, with two exceptions, being main road bridges.

EASTERN COUNTIES

Plans passed by the CHESTERTON R.D.C.: House, Girton Road, Girton, for Mr. G. L. Smith; house and shop, High Street, Great Shelford, for Mr. P. Melbourn; garage, Shelford Road, Trumpington, for Mr. L. A. Shanks, Cambridge; house, Leys Avenue, Cambridge, for Mr. W. J. Staines; bungalow, Westfield Road, Great Shelford, for Mr. F. R. Fordham; house, Newington, Willingham, for Mr. F. R. Roberts; house, Waterbeach Road, Landbeach, for Mr. C. Hall.

Specification and bills of quantities are being prepared for the proposed new Council offices and public convenience for LETCHWORTH. The architects are Messrs. Bennett and Bidwell.

The LETCHWORTH Council has received sanction from the Ministry of Health for the erection of forty non-parlour and ten parlour-type houses on the Welbury Housing Scheme, Part II.

The cost of the new elementary school, to be erected in Maidenhall Road, LUTON, is £27,442.

Preliminary designs have been prepared for the new Merchant Taylors' School to be built at Sandy Lodge, near RICKMANSWORTH. The site has an area of 250 acres of land.

SOUTH-WESTERN COUNTIES

Plans passed at POOLE: Eight houses and two garages, Pine Avenue, for Mr. S. G. Ward; house, garage and office, Gorse Hill Road, for Mr. J. N. McDermott; house, Twemlow Avenue, for Mr. D. A. Wood; two houses, Brownsea View Avenue, for Messrs. Maggs and Maggs; two semi-detached houses, Binnie Road, and house, Bourne Vale Road, for Messrs. Philpotts and Manners; amended block plans of four houses, Mossley Avenue, for Messrs. Opperman and Jones; two semi-detached houses, Woodlands Avenue, two houses, Hinchcliffe Road, and two houses, Sandbanks Road, for Messrs. Bartlett and Whiffen; house, Frankland Crescent, for Mr. B. C. Short; three houses, Enfield Road, for Messrs. L. J. Newell and Son; house and shop, corner of Wroxham and Sherringham Roads, for Messrs. Crabb and Crabb; house, Canford Cliff Avenue, for Mr. E. B. Chinchen; eight houses, Gorse Hill Road, for Mr. C. E. Maloney; eighteen houses, off Fernside Road, for Messrs. Brailsford and Wood, Ltd.; house, Sandecotes Road, house and garage, Brownsea View Avenue, house, Canford Cliff Avenue, house, The Crescent, Hamworthy, two houses, Lulworth Avenue, and four houses, Church Road, for Mr. K. Wilson; house, Livingstone Road, house, Sherringham Road, and two houses, Alchester Road, for Mr. E. de Wilde Holding.

MIDLAND COUNTIES

The BEACONSFIELD U.D.C. is applying for a loan of £52,000 for housing purposes.

The BIRMINGHAM Corporation has approved the scheme for the erection of a central fire-station, at a cost of £164,875.

The DERBY T.C. has decided to erect 1,000 dwellings during the next twelve months.

The NUNEATON T.C. is to erect and furnish municipal offices at a cost of £79,000, and a public library at an outlay of £13,670.

The ROTHWELL U.D.C. is to erect sixteen houses on a site recently acquired by the Council.

NORTHERN COUNTIES

A new bridge over the River Aire is to be erected on the Harrogate–Bradford main road at APPERLEY BRIDGE, Yorkshire.

Plans have been approved for the erection of a cinema on a site in Market Street, BAKEWELL, for the Holmewood Picture Palace Co., Ltd. Messrs. Wilcockson and Cutts are the architects.

A new building scheme involving the erection of 600 houses is contemplated by the BEDLINGTON U.D.C. The Council has also decided, subject to the approval of the Ministry of Health, to build houses suitable for aged and retired miners in various parts of the district.

A new Primitive Methodist church is to be erected on the site of the present old church in Chapel Street, BLACKPOOL, at an estimated cost of £16,000. Designs have been prepared by Mr. Halstead Best.

At a meeting of the GATESHEAD T.C. amended plans for the provision of new public baths in the borough, embodying modifications suggested by the Ministry of Health, were approved. The cost of the modified scheme is estimated at £75,000.

A scheme for the erection of a ladies' swimming bath and a children's swimming bath at the rear of the open-air baths in Albert Avenue, HULL, has been approved by the Corporation Baths Committee.

The copper refinery of the Bwana M'Kubwa Copper Mining Co. is to be erected on MERSEYSIDE, at a cost of £2,000,000. Negotiations are now proceeding to determine whether the refinery will be built at Liverpool, Bromborough Pool or Widnes.

Mr. J. H. Stansfield proposes to erect a picture-house on a site opposite the gas showroom in St. Petersgate, STOCKPORT, with accommodation for 1,700 persons, at a cost of £27,000. The architect is Mr. John Knight.

The Minister of Health has sanctioned the borrowing by the SUNDERLAND Corporation of £38,214 for the erection of forty-six houses on the Barley Mow South estate, and fifty-two houses on sites in Leechmere Road, Margaret Street and Ocean Road: also £3,300 for works in connection with the schemes.

SCOTLAND

The DUMFRIES Dean of Guild Court has approved of the plans for the erection of a new cinema to be built near the junction of Shakespeare and English Streets by the Scottish Cinema and Variety Theatres, Ltd. There will be seating accommodation for 1,693 persons in the building, the estimated cost of which is £17,000.

The GLASGOW Dean of Guild Court has sanctioned plans for the erection of more than 1,000 houses by the Corporation Housing Department. The houses are to be built on three different sites in the city, namely, Torbreck Street, Bellahouston; Netherton; and West Drumoyne. All three projects are to consist of three-story tenements. On the Torbeck Street site will be 168 houses of three apartments and thirty of four apartments; at Netherton, 184 houses of three apartments and thirty-eight of four apartments; and at Drumoyne, 582 houses of three apartments and 138 of four apartments.

The Committee of Management of St. Margaret's Church (Church of Scotland), KNIGHTSWOOD, is to erect a church at the corner of Knightswood and Great Western Roads.

WALES

The GLAMORGAN County Education Committee has approved a three-year building programme for 1930–33, at an estimated cost of £900,320.

The Ministry of Health has approved a scheme for the erection of an abattoir at RHYL, at a cost of £7,000. Plans have been prepared by Mr. A. A. Goodhall.

The LLANDUDNO Council has passed plans for the colonnaded shelter which is to be constructed on the Happy Valley Road, at a cost of over £6,000.

IRELAND

The central school which the County Down Education Committee proposes to erect in HOLYWOOD will occupy a site on the Dixon estate. It will comprise both an elementary and a technical school, and will provide accommodation for 600 pupils. Plans are being prepared by Mr. Castor J. Love, architect, of Belfast. Tenders will be invited in about six months' time.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

• In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* NAVVY, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

	£	s.	d.
Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.

Transport hire per day:

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0	1	6
SPREAD and level, including wheeling, per yd.	0	1	6
FILLING into carts and carting away to a shoot or deposit, per yd. cube	0	10	6
TRIMMING earth to slopes, per yd. sup.	0	0	6
HACKING up old grano. or similar paving, per yd. sup.	0	1	3
PLANKING to excavations, per ft. sup.	0	0	5
DO. over 10 ft. deep, add, for each 5 ft. in depth, 30 per cent.			
IF left in, add to above prices, per ft. cube	0	2	0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup.	0	2	1
DO. 6 in. thick, per yd. sup.	0	2	10
PUDDLING, per yd. cube	1	10	0
CEMENT CONCRETE, 4-2-1, per yd. cube	1	17	6
DO. 6-2-1, per yd. cube	1	12	6
DO. in upper floors, add 15 per cent.			
DO. in reinforced-concrete work, add 20 per cent.			
DO. in underpinning, add 60 per cent.			
LIAS-LIME CONCRETE, per yd. cube	£1	14	0
BREEZE CONCRETE, per yd. cube	1	7	0
DO. in lintels, etc., per ft. cube	0	1	6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube	0	3	9
FINE concrete benching to bottom of manholes, per ft. cube	0	3	0
FINISHING surface of concrete spade face, per yd. sup.	0	0	9

DRAINER

LABOURER, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* BRICKLAYER, 1s. 8½d. *per hour;* PLUMBER, 1s. 8½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. 6 *in., per ft.*	0	1	3
DO. 9 *in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. 6 *in., per yd.*	0	8	0
Portland cement and sand, see "Excavator" above.			
Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft. 0 4 3
DO. 6 in., per ft. 0 5 0
DO. 9 in., per ft. 0 7 9

CAST-IRON DRAINS, jointed in lead, 4 in., per ft.	0	8	3
DO. 6 in., per ft.	0	10	3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
Midhurst white facing bricks, per M.	5	0	0
Multi-coloured facings, per M.	7	7	9
Best red facings, per M.	7	7	9
Rubbers, 9¼ in., per M.	12	0	6
Staffordshire blue, per M.	9	5	0

Glazed salt, white, and ivory stretchers, per M.	21	10	0
DO. *headers, per M.*	20	10	0
Colours, extra, per M.	5	10	0
Seconds, less, per M.	1	0	0
Cement and sand, see "Excavator" above.			
Lime, grey stone, per ton	£2	11	6
Mixed lime mortar, per yd.	1	6	0
Dampcourse, in rolls of 4½ in., per roll	0	2	6
DO. 9 *in., per roll*	0	4	9
DO. 14 *in., per roll*	0	7	6
DO. 18 *in., per roll*	0	9	6
BRICKWORK in stone lime mortar, Flettons, or equal, per rod	30	0	0
DO. in cement do., per rod	32	10	0
DO. in stocks, add 25 per cent. per rod.			
DO. in blues, add 100 per cent. per rod.			
DO. circular on plan, add 12½ per cent. per rod.			
DO. in backing to masonry, add 12½ per cent. per rod.			
DO. in raising on old walls, etc., add 12½ per cent. per rod.			
DO. in underpinning, add 20 per cent. per rod.			
HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS, fair, per ft. sup. extra	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra	0	0	10
WEATHER pointing, do. do.	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup.	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities, in finishing to steps, etc., per ft. sup.	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup.	0	11	0
SLATE DAMP COURSE, per ft. sup.	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ¾ in., per yd.	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup.	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each	0	0	3

MASON

MASON, 1s. 8½d. *per hour;* DO. *fixer,* 1s. 9½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour.*

Portland Stone:			
Whitbed, per ft. cube	£0	4	6
Basebed, per ft. cube	0	4	9
Bath stone, per ft. cube	0	3	0
Usual trade extras for large blocks.			
York paving, av. 2½ in., per yd. super	0	11	0
York templates, sawn, per ft. cube	0	7	6
Slate shelves, rubbed, 1 in., per ft. sup.	0	2	6
Cement and sand, see "Excavator," etc., above.			
HOISTING and setting stone, per ft. cube	£0	2	2
DO. for every 10 ft. above 30 ft. add 15 per cent.			
PLAIN face Portland basis, per ft. sup.	£0	2	8
DO. circular, per ft. sup.	0	4	0
SUNK FACE, per ft. sup.	0	3	9
DO. circular, per ft. sup.	0	4	10
JOINTS, arch, per ft. sup.	0	2	6
DO. sunk, per ft. sup.	0	2	7
DO. DO. circular, per ft. sup.	0	4	6
CIRCULAR-CIRCULAR work, per ft. sup.	1	2	0
PLAIN MOULDING, straight, per inch of girth, per ft. run	0	1	1
DO. circular, do., per ft. run	0	1	4
HALF SAWING, per ft. sup.	0	1	0
Add to the foregoing prices, if in York stone, 35 per cent.			
DO. Mansfield, 12½ per cent.			
Deduct for Bath, 33⅓ per cent.			
DO. for Chilmark, 5 per cent.			
SETTING 1 in. slate shelving in cement, per ft. sup.	£0	0	6
RUBBED round nosing to do., per ft. lin.	£0	0	6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1	7	6
YORK SILLS, W. & T., ft. cub. fixed	1	10	0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0	1	3
DO. 2½ in. thick, per ft. sup.	0	1	6

SLATER AND TILER

SLATER 1s. 8½d. *per hour;* TILER, 1s. 8½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*
N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200:

Portmadoc Ladies				£14	0	0		
Countess				23	0	0		
Duchess				32	10	0		
Old Delabole	*Med.*	*Grey*		*Med.*	*Green*			
24 in. × 12 in.	£42	11	3	£45	1	0		
20 in. × 10 in.	31	4	3	33	0	6		
16 in. × 10 in.	20	18	0	22	4	9		
14 in. × 8 in.	12	1	0	12	16	3		
Green Randoms, per ton				8	3	9		
Grey-green do., per ton				7	3	9		
Green peggies, 12 in. to 8 in. long, per ton				5	13	9		

In 4-ton truck loads, delivered Nine Elms station.

Clips, lead, per lb.	£0	0	6
Clips, copper, per lb.	0	2	0
Nails, compo, per cwt.	1	6	0
Nails, copper, per lb.	0	2	2
Cement and sand, see "Excavator," etc., above.			
Hand-made tiles, per M.	£5	18	0
Machine-made tiles, per M.	5	8	0
Westmorland slates, large, per ton	9	0	0
DO. *Peggies, per ton*	7	5	0

SLATING, 3 in. lap, compo nails, Portmadoc or equal:

Ladies, per square	£4	0	0
Countess, per square	4	5	0
Duchess, per square	4	10	0
WESTMORLAND, in diminishing courses, per square	6	5	0
CORNISH DO., per square	6	3	0
Add, if vertical, per square approx.	0	13	0
Add, if with copper nails, per square approx.	0	2	6
Double course at eaves, per ft. approx.	0	1	0

SLATING with Old Delabole slates to a 3 in. lap with copper nails, at per square.

	Med.	*Grey*		*Med.*	*Green*	
24 in. × 12 in.	£5	0	0	£5	2	0
20 in. × 10 in.	5	5	0	5	10	0
16 in. × 10 in.	4	15	0	5	1	0
14 in. × 8 in.	4	10	0	4	15	0
Green randoms				6	7	0
Grey-green do.				5	9	0
Green peggies, 12 in. to 8 in. long				4	13	6

TILING, 4 in. gauge, every 4th course nailed, in hand-made tiles, average per square	3	17	6
DO., machine-made do., per square	3	7	6

Vertical Tiling, including pointing, add 18*s.* 0*d.* per square.

FIXING lead soakers, per dozen	£0	0	10
STRIPPING old slates and stacking for re-use, and clearing away surplus and rubbish, per square	0	10	0
LABOUR only in laying slates, but including nails, per square	1	0	0

See "Sundries" for Asbestos Tiling.

CARPENTER AND JOINER

CARPENTER, 1s. 8½d. *per hour;* JOINER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*

Timber, average prices at Docks, London Standard, Scandinavian, etc. (equal to 2nds):

7 × 3, per std.	£22	0	0
11 × 4, per std.	30	0	0
Memel or Equal. Slightly less than foregoing.			
Flooring, P.E., 1 in., per sq.	£1	4	6
DO., *T. and G., 1 in., per sq.*	1	4	6

Teak, per ft. sup. of 1 in.	0	1	2
DO., *ft. cube*	0	14	0
FIR fixed in wall plates, lintels, sleepers, etc., per ft. cube	0	4	6
DO. framed in floors, roofs, etc., per ft. cube	0	4	6
DO. framed in trusses, etc., including ironwork, per ft. cube	0	8	6
PITCH PINE, add 33⅓ per cent.			
FIXING only boarding in floors, roofs, etc., per sq.	0	13	6
SARKING FELT laid, 1-ply, per yd.	0	1	6
DO., 3-ply, per yd.	0	1	9
CENTERING for concrete, etc., including horsing and striking, per sq.	2	0	0
TURNING pieces to flat or segmental soffits, 4½ in. wide, per ft. run	0	0	4½
DO. 9 in. wide and over, per ft. sup.	0	1	2

[*continued overleaf*

CARPENTER AND JOINER: *continued*

SHUTTERING to face of concrete, per square	£1	10	0
DO. in narrow widths to beams, etc., per ft. sup.	0	0	6
USE and waste of timbers, allow 25 per cent. of above prices.			
SLATE BATTENING, per sq.	£0	12	6
DEAL boarding to flats, 1 in. thick and firrings to falls, per square	2	10	0
STOUT feather-edged tilting fillet to eaves, per ft. run	0	0	6
FEATHER-edged springer to trimmer arches, per ft. run	0	0	4
STOUT herringbone strutting (joists measured in), per ft. run	0	0	6
SOUND boarding, ⅞ in. thick and fillets nailed to sides of joists (joists measured over), per square	2	0	0
RUBEROID or similar quality roofing, one-ply, per yd. sup.	0	2	3
DO., two-ply, per yd. sup.	0	2	6
DO., three-ply, per yd. sup.	0	3	0
TONGUED and grooved flooring, 1¼ in. thick, laid complete with splayed headings, per square	2	5	0
DEAL skirting torus, moulded, 1¼ in. thick, including grounds and backings, per ft. sup.	0	1	0
TONGUED and mitred angles to do.	0	0	6
WOOD block flooring, standard blocks laid herringbone in mastic:			
Deal 1 in. thick, per yd. sup.	0	10	0
DO. 1¼ in. thick, per yd. sup.	0	12	0
Maple 1¼ in. thick, per yd. sup.	0	15	0
DEAL moulded sashes, 1¼ in., with moulded bars in small squares, per ft. sup.	0	2	6
DO. 2 in. do., per ft. sup.	0	2	9
DEAL cased frames, oak sills and 2 in. moulded sashes, brass-faced pulleys and iron weights, per ft. sup.	0	4	6
MOULDED horns, extra, each	0	0	3
DOORS, 4-panel square both sides, 1¼ in. thick, per ft. sup.	0	2	6
DO. moulded both sides, per ft. sup.	0	2	9
DO. 2 in. thick, square both sides, per ft. sup.	0	2	9
DO. moulded both sides, per ft. sup.	0	3	0
DO. in 3 panels, moulded both sides, upper panel with diminished stiles with moulded bars for glass, per ft. sup.	0	3	6
If in oak, mahogany, or teak, multiply 3 times.			
DEAL frames, 4 in. × 3 in., rebated and beaded, per ft. cube	£0	15	0
Add for extra labour, per ft. run	0	0	1
STAIRCASE work:			
DEAL treads 1¼ in. and risers 1 in., tongued and grooved, including fir carriages, per ft. sup.	0	2	6
DEAL wall strings, 1¼ in. thick, moulded, per ft. run	0	2	0
If ramped, per ft. run	0	4	6
SHORT ramps, extra, each	0	7	6
ENDS of treads and risers housed to strings, each	0	1	0
2 in. deal mopstick handrail fixed to brackets, per ft. run	0	1	6
4½ in. × 3 in. oak fully moulded handrail, per ft. run	0	5	6
1¼ in. square deal bar balusters, framed in, per ft. run	0	0	6
FITTINGS:			
SHELVES and bearers, 1 in., cross-tongued, per ft. sup.	0	1	6
1¼ in. beaded cupboard fronts, moulded and square, per ft. sup.	0	2	9
TEAK grooved draining boards 1¼ in. thick, and bedding, per ft. sup.	0	4	6
IRONMONGERY:			
Fixing only (including providing screws):			
TO DEAL—			
Hinges to sashes, per pair	0	1	2
Do. to doors, per pair	0	1	7
Barrel bolts, 9 in., iron, each	0	1	0
Sash fasteners, each	0	1	0
Rim locks, each	0	1	9
Mortice locks, each	0	4	0

SMITH

SMITH, *weekly rate equals* 1*s.* 8½*d. per hour*; MATE, *do.*, 1*s.* 3½*d. per hour*; ERECTOR, 1*s.* 8½*d. per hour*; FITTER, 1*s.* 8½*d. per hour*; LABOURER, 1*s.* 3½*d. per hour.*

Mild Steel in British standard sections, per ton	£12	10	0
Sheet Steel:			
Flat sheets, black, per ton	17	0	0
DO., *galvd., per ton*	18	0	0
Corrugated sheets, galvd., per ton	17	10	0
Driving screws, galvd., per grs.	0	1	10
Washers, galvd., per grs.	0	1	1
Bolts and nuts per cwt. and up	1	18	0
MILD STEEL in trusses, etc., erected, per ton	25	0	0
DO., in small sections as reinforcement, per ton	16	0	0
DO., in compounds, per ton	17	0	0
DO., in bar or rod reinforcement, per ton	22	10	0
WROT-IRON in chimney bars, etc., including building in, per cwt.	2	0	0
DO., in light railings and balusters, per cwt.	2	5	0
FIXING only corrugated sheeting, including washers and driving screws, per yd.	0	2	0

PLUMBER

PLUMBER, 1*s.* 9*d. per hour*; MATE OR LABOURER, 1*s.* 4*d. per hour.*

Lead, milled sheet, per cwt.	£1	5	0
DO. *drawn pipes, per cwt.*	1	5	6
DO. *soil pipe, per cwt.*	1	8	6
DO. *scrap, per cwt.*	0	14	0
Copper, sheet, per lb.	0	1	0
Solder, plumber's, per lb.	0	1	0
DO *fine, per lb*	0	1	6
Cast-iron pipes, etc.:			
L.C.C. soil, 3 in. per yd.	0	3	0
DO. *4 in., per yd.*	0	3	8
R.W.P., 2½ in., per yd.	0	1	5
DO. *3 in., per yd.*	0	1	8
DO. *4 in., per yd.*	0	2	5
Gutter, 4 in. H.R., per yd.	0	0	11
DO. *4 in. O.G., per yd.*	0	1	2½
MILLED LEAD and labour in gutters, flashings, etc., per cwt.	2	6	0
LEAD PIPE, fixed, including running joints, bends, and tacks, ½ in., per ft.	0	1	8
DO. ⅝ in., per ft.	0	1	10
DO. 1 in., per ft.	0	2	6
DO. 1½ in., per ft.	0	3	3
LEAD WASTE or soil, fixed as above, complete, 2½ in., per ft.	0	6	6
DO. 3 in., per ft.	0	7	9
DO. 4 in., per ft.	0	10	6
WIPED soldered joint, ½ in., each	0	2	6
DO. ⅝ in., each	0	3	2
DO. 1 in., each	0	3	8
BRASS screw-down stop cock and two soldered joints, ½ in., each	0	11	0
DO., ¾ in., each	0	13	6
CAST-IRON rainwater pipe, jointed in red lead, 2½ in., per ft. run	0	1	4
DO 3 in., per ft. run	0	1	8
DO. 4 in., per ft. run	0	2	0
CAST-IRON H.R. GUTTER, fixed, with all clips, etc., 4 in., per ft.	0	1	6
DO. O.G., 4 in., per ft.	0	1	9
CAST-IRON SOIL PIPE, fixed with caulked joints and all ears, etc., 4 in., per ft.	0	3	0
DO. 3 in., per ft.	0	2	0
Fixing only:			
W.C. PANS and all joints, P. or S., and including joint to water waste preventers, each	2	5	0
BATHS, with all joints	1	3	6
LAVATORY BASINS only, with all joints, on brackets, each	1	10	0

PLASTERER

PLASTERER, 1*s.* 11½*d. per hour*; LABOURER, 1*s.* 3½*d. per hour.*

Chalk lime, per ton	£2	17	0
Hair, per cwt.	2	5	0
Sand and cement, see "Excavator," etc., above.			
Lime putty, per cwt.	£0	2	9
Hair mortar, per yd.	1	7	0
Fine stuff, per yd.	1	14	0
Sawn laths, per bdl.	0	2	5
Keene's cement, per ton	5	15	0
Sirapite, per ton	3	10	0
DO. *fine, per ton*	3	18	0

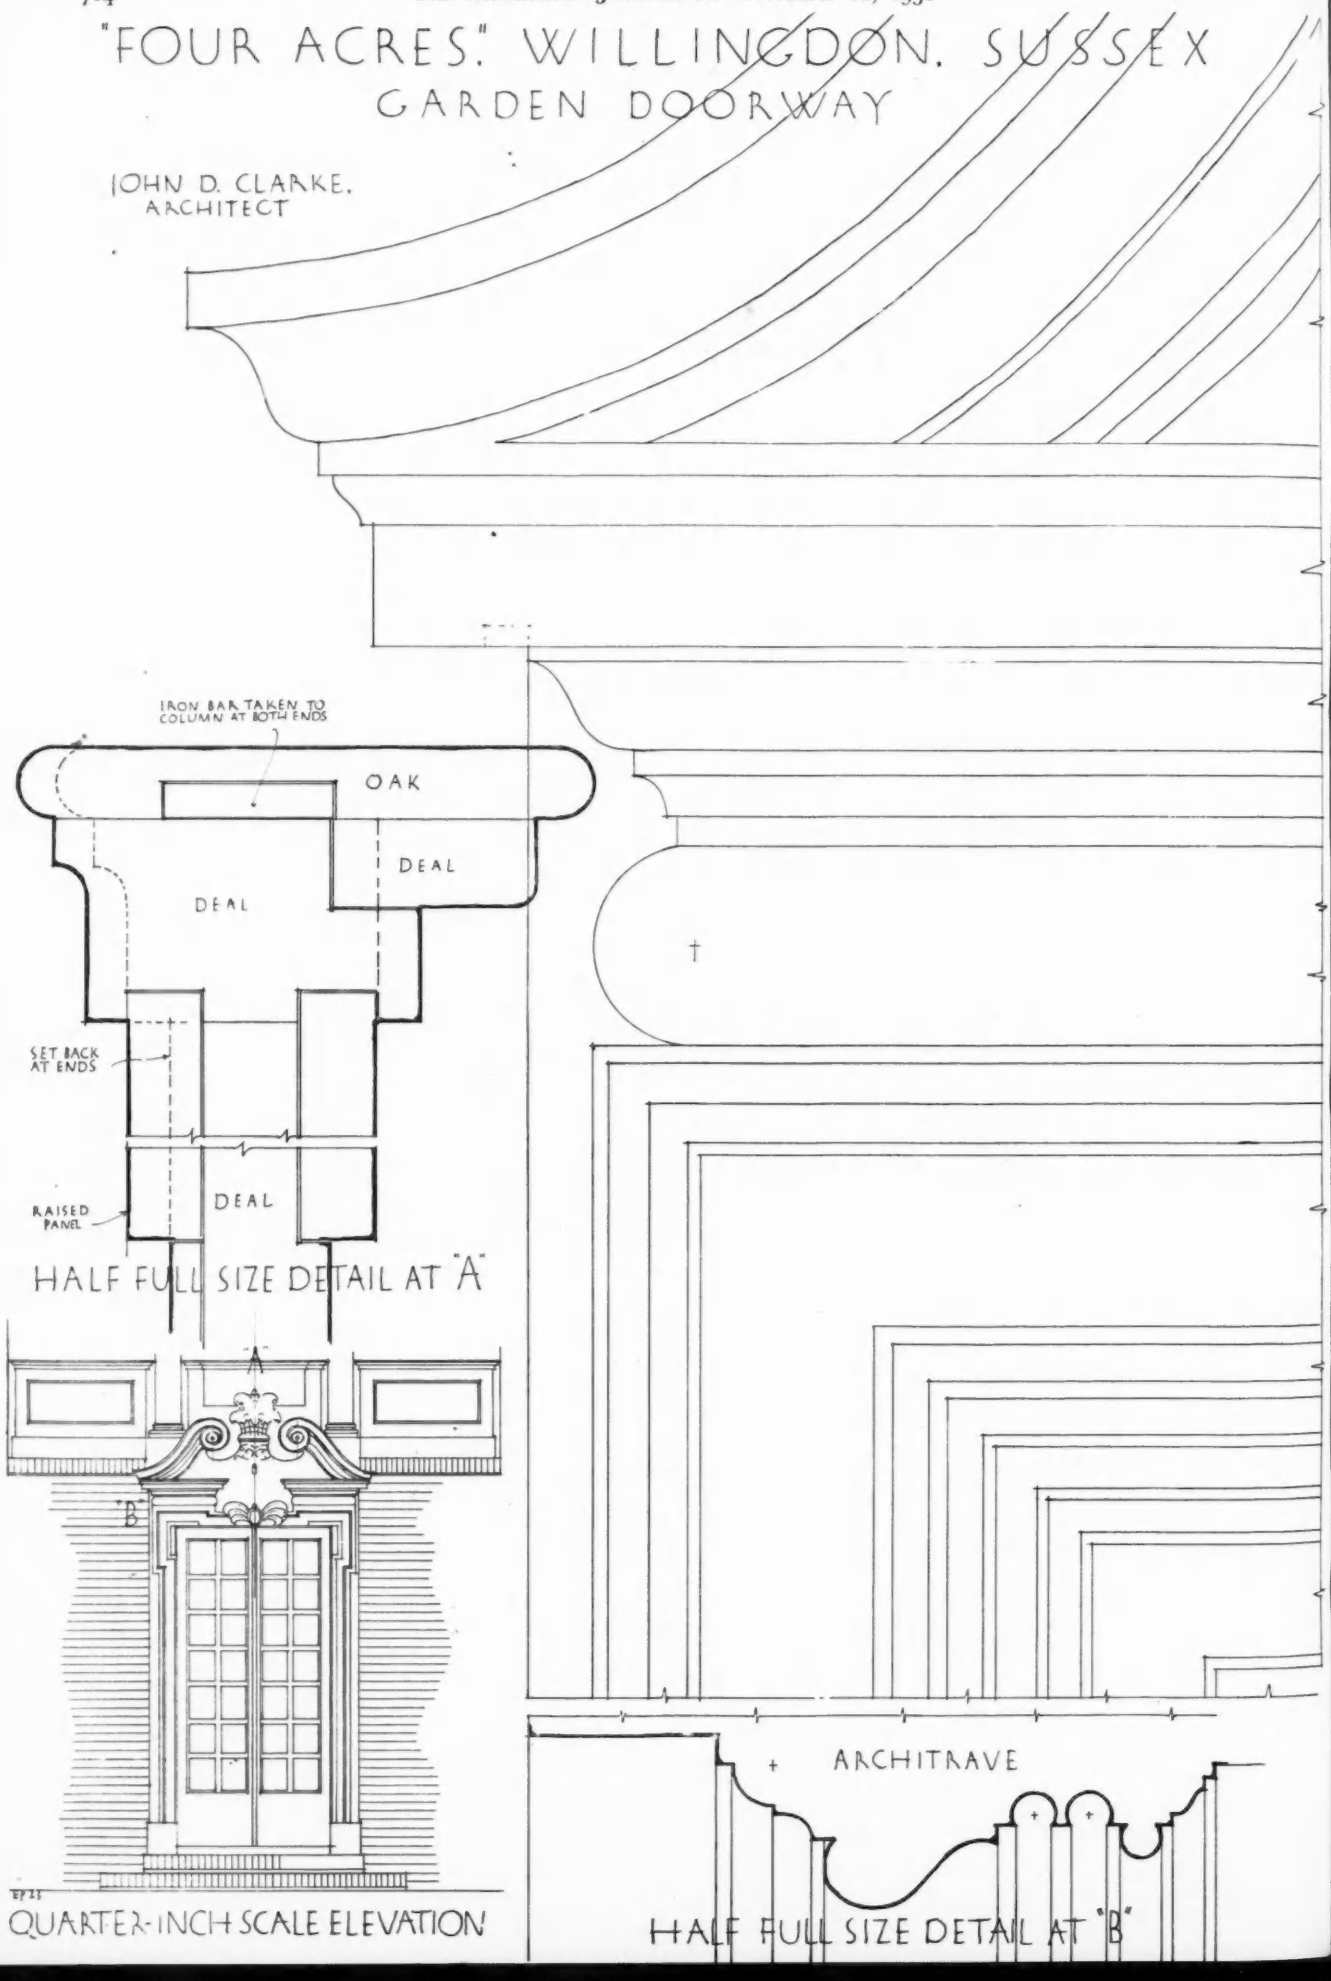
SCALE DETAILS:
A WEEKLY SERIES

GARDEN ENTRANCE AND SLEEPING PORCH, WILLINGDON, SUSSEX
Designed by JOHN D. CLARKE

THE photograph shows the garden front and sleeping balcony of Four Acres, a house about two miles from Eastbourne.

In the centre of the bay projection which carries the sleeping balcony is the garden door forming the subject of the working drawing reproduced overleaf. Besides an elevation of door and of balcony balustrade, this gives a detail, half full size, of the architrave, cornice and return end of the scroll pediment.

The solid panels of the balcony front are an interesting change from the more usual balusters and handrail, but whilst keeping out draughts from the floor of the balcony they do perhaps to some extent obstruct the view. They are kept rigid by means of a wrought-iron bar which is encased under the oak capping and extended to allow of their being built into the brick piers at the corners of the balcony or the columns in the centre.



Reference to the detail of this capping, which concerns the centre bay with a raised panel, will make this construction clear.

The drawings reproduced overleaf may be read with architects' scales.

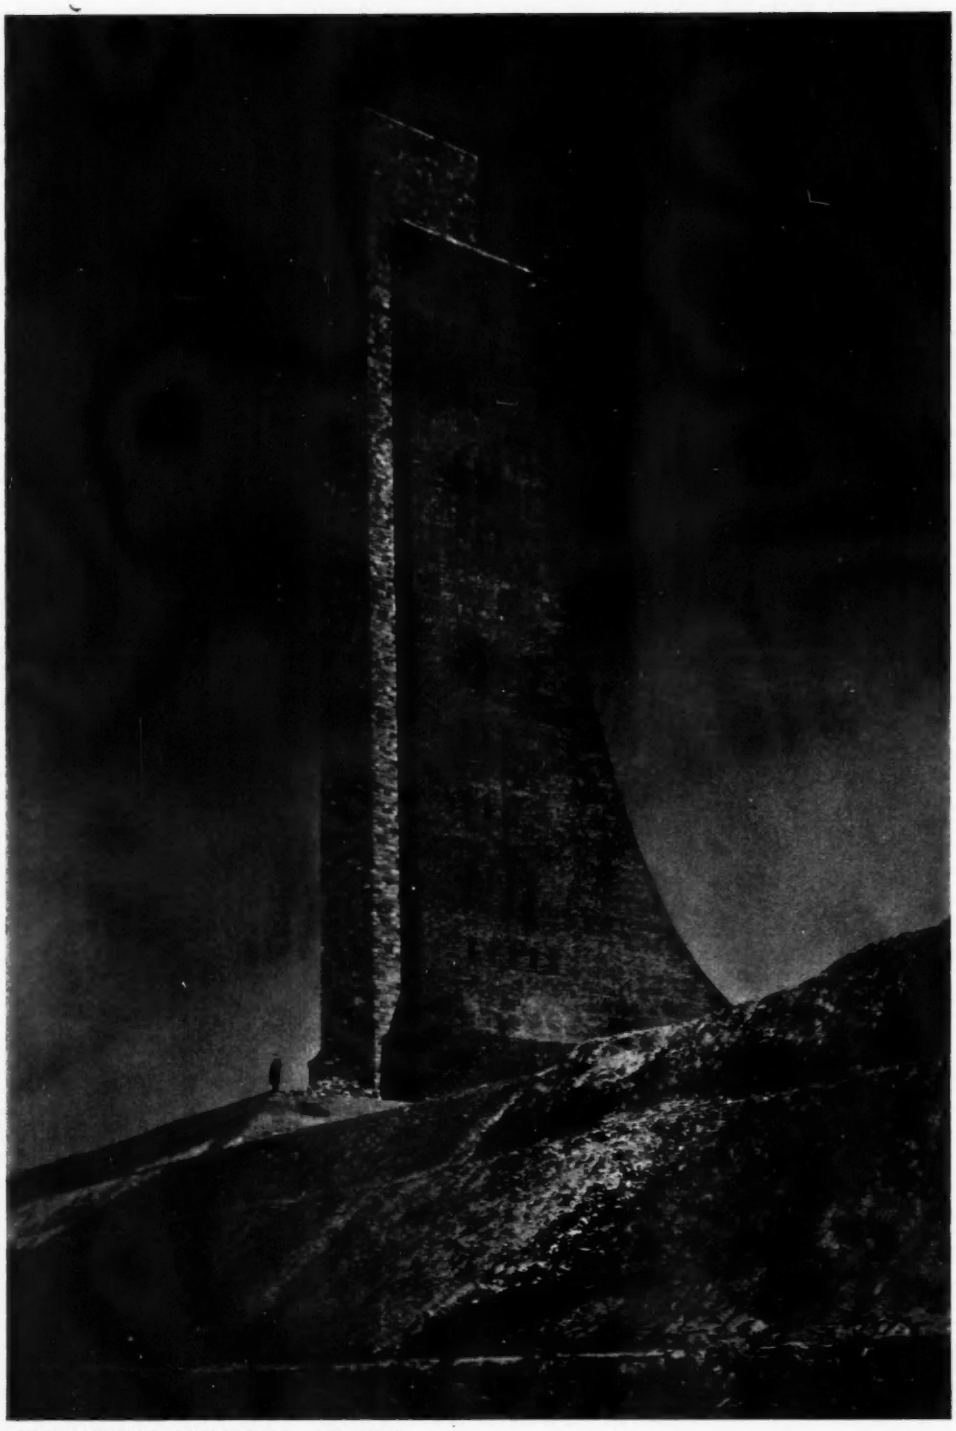
ENGLISH-MADE BRICKS

THERE are those who never tire of lamenting the breakdown of local building traditions. The erstwhile traditional methods of the Cotswolds, of Sussex, of Cornwall are wellnigh obsolete, and brick and concrete, tile and slate, not to mention all the substitutes made of compressed anything, are becoming ubiquitous. Modern conditions, particularly facilities of transport and travel, are, for the most part, responsible for this change. To some extent the change may be justified, but a great deal of nonsense is talked by advocates whose common sense is unequal to their efforts of advocacy.

Some even go so far as to advocate the building of houses with any material rather than with those generally acknowledged to be the best for the purpose; and England is a country particularly rich in brick-making earth. It has been stated that the inability to build brick houses today is not so much due to a shortage of bricks or bricklayers as of plasterers. Well, if that be so, let us build houses without plaster. Let us fair-face the inside of our brickwork and lime-whiten it. By this means, and by the use of wall-boarding, the plasterer may be altogether dispensed with. An insistence on a plastered covering to brickwork either arises from ignorance or is a species of snobbery. And we are inclined to think that a plasterless brick house would be preferable to a plasterless steel house.



Be that as it may, it is, to say the least of it, ironical that the country should be suffering from such an acute shortage of dwellings, a country, moreover, so rich in good brick-making earths, while at the same time brickyards cannot sell their products. Are there causes for this which can be in any way altered?

Various suggestions have been put forward from time to time to remedy the present difficulties of the brick-making industry in England. One proposal is for the imposition of a special tariff under the Safeguarding of Industries Act; another is that the Government subsidy should be given only to houses which have been constructed with materials of which a given minimum percentage is of English origin.

Now it is true that for certain articles small sales at high prices and restricted output may be desirable—desirable, that is, both as regards profits to the manufacturer and service to the community, but bricks and tiles are not such commodities; nevertheless, the manufacturers adopted that policy in the years immediately following the war, and it was one of the contributory causes of the collapse of the Addison scheme. We are not at all convinced that there has been any change of policy in the intervening years; if this be so, it is surely a contributory cause today of these unpleasant conditions. The success of the foreign competitor is due not a little to the fact that he can give prompt delivery of large quantities of goods.

Another contributory cause of the inroads made by foreign competition is, though to a decreasing extent, to be found in the use of obsolete plant. Manufacturers in the past have not been over-eager to avail themselves of the most modern apparatus, and it will be remembered that England was one of the last countries to adopt the Hofmann kiln. Yet a third cause, and one which we hesitate to mention for fear it shall be said that we have an axe to grind in so doing, is the difference in the quantity of advertising between the distributors of the foreign goods and the manufacturers of the British. The merchant looking for fresh markets knows that without the aid of advertising his task would be an impossible one, but the old-established manufacturer is apt to think that he can do without an ally of whom his father and grandfather perhaps did not stand in need.

But something more fundamental than any of these matters is giving the foreigner an advantage, and that is the attitude today towards work. It is possible to suggest many causes for the alarming growth of hostility towards work, but the fact remains that so long as it exists, so long as work is evaded or grudgingly performed in England, the nation is competing at a disadvantage with those countries which have different ideals, and the decay of its trades and manufactures must inevitably continue.

THE MARINE MEMORIAL AT KIEL

The first and most important section of this memorial has now been completed from the designs of G. A. Munzer, of Düsseldorf. From a high bluff of the coast the tower rises sheer, on its seaward side, to a height of over 325 feet above water-level. The aim has been to take account both of its purpose and of the character of the locality. Fragility of detail has been avoided in the effort to secure a stark and massive effect. In the brickwork a strong contrast is obtained between the rustic finish of the seaward side and the much darker colour of the sweeping slope towards the land.

The complete layout provides for a large ceremonial space, to accommodate 10,000 people, enclosed by arcades connected to a hall of memory, enshrining memorial tablets and inscriptions. On the site of a former vast subterranean artillery coast defence, an underground hall of consecration is projected. The photograph and these notes on the work are reproduced by courtesy of Die Baugilde.

NEWS & TOPICS

PARLIAMENTARY NOTICES
HOUSE OF COMMONS
AT 11
Rabbits Bill and Architects (Registration) Bill, second readings.
—*The Times*, Nov. 7, 1930.

FORTUNE has this Session favoured the Architects (Registration) Bill, which is, indeed, in danger of becoming one of those "hardy annuals" with which the House of Commons is all too familiar. Lt.-Col. Moore, who sponsors it this year, secured only the twenty-fifth place in the ballot, and it seemed as if once more the hopes of the promoters would be doomed to disappointment. The Bill was put down as the second Order for last Friday, which meant that, in all probability, it would not be reached and hence would be indefinitely postponed. But, as Fate would have it, the Rabbits Bill, which was the first Order, was disposed of in a couple of hours, and another two hours or so proved sufficient to convince the House that the Architects Bill ought to go to a Standing Committee. Yet another stroke of luck occurred when, in the middle of Col. Sinclair's speech, a member called a "count"—it may be remembered that Major Tasker counted the Bill out in 1928—but this time the necessary quorum of forty members was easily found within the two minutes allowed by the Standing Orders, and the debate proceeded.

*

The further progress of the measure now depends on the willingness of the promoters to make concessions to bodies outside the R.I.B.A. This has always been the stumbling-block, but Lt.-Col. Moore, on Friday, was so persuasive and so ready to meet all criticisms in Committee, that the prospects of agreement appear to be brighter than they have yet been. Mr. Short, the representative of the Government, rather damned the measure with faint praise, but neither he nor any other member voted against its second reading. It was as long ago as 1927 that the Bill was first introduced in the Commons. In that year it went to a Select Committee, who advised that it should be withdrawn and reintroduced next Session in an amended form. This advice was taken, but next Session the Bill was "counted out." The following year the Bill was introduced into the House of Lords by Lord Crawford, but, after a speedy passage through the Upper House, the Dissolution of Parliament, in May, 1929, prevented its consideration by the Commons.

HOUSING : THE COUNTER-REVOLUTION

Last week's leading article drew attention to what was termed the counter-revolution in housing. This was no mere alarmist description. I learn that the Minister of Health has already replied to the remarkable proposals of the National Federation of House Builders, that included sweating, so to speak, more houses, in closer blocks, on to the land, and publication of that reply will be awaited with keen interest. The letter of "Cui Bono?" that I understand is to appear upon another page expresses the considered opinion of specialized experience in the matter. But the Federation's manifesto that provoked this rejoinder is not the only sign of a new way of thinking; witness the case of Slough.

THE CASE OF SLOUGH—

It may be recalled that one among the "Letters from Readers" published on July 2 last disclosed a certain state of affairs in regard to Council houses at Slough. Rents, it then appeared, had averaged 25s. per week, whereas the average wage among an industrial population seldom exceeded 55s. per week. The Council was urged to build dwellings that could be let at rentals, including rates, of 10s. 6d. to 15s. per week, and the local ratepayers' association accordingly addressed the Ministry of Health on the question of relaxing the density rule of houses per acre in favour of twenty in place of twelve. The Ministry's reply, about the terms of which some uncertainty seems to have existed, occupied a large part of the proceedings at the Council meeting a week or two ago.

*

Presumably the Ministry would be loth to sanction a greater density were subsidy houses in question; but Slough does not want subsidy houses—"they would not consider further adding to the ratepayers' burdens." If building without the subsidy were in view, fifteen or sixteen, it appears, might very well be allowed. Now Slough is in a hurry for its houses, and there was some difference of opinion at the meeting as to whether it would save time to forward for sanction the interim layout of twenty to the acre or formulate a new one, with sixteen. Eventually, the former course was agreed to on the understanding that plans should immediately be got in. This done, the housing committee "would have plenty of time to vary the number of houses."

*

And it is over these plans that Slough, too, looks like falling from grace. For, if I understand the position aright, what it means to do is to invite *builders* to submit proposals for erecting houses on land belonging to the Council, such houses not to cost more than £300. It is estimated that land, roads and sewers would swallow up another £100—making £400 per house, against the £550 for the parlour-type, semi-detached dwellings of which experience has already been had. The words "architect" and "architecture" do not occur in the report of the proceedings; yet, if there ever was a situation that cried aloud for the exercise of just those functions which architects exist to fulfil, this is one.

—AND OF MANCHESTER

It is evident enough that the problem of securing cheaper houses is exercising many minds. There is more to hope from investigation on the lines of the motion carried in the name of Mrs. E. D. Simon at Manchester. A special committee is to report why Manchester houses are too dear, and what can be done to cheapen their cost. And the reason why this course looks hopeful is that, according to opinions collected by *The Daily Express*, houses that are now costing Manchester £500 could be built for £400 to £420 if the work were improved in organization.

THE PROBLEM OF RENT RESTRICTION

The Government has instituted two Committees to inquire into the present working of the Rent Restriction Acts. One is to survey the whole aspect of the question, while the other will deal only with the Acts as they relate to agricultural workers. It has been obvious for some time that these Acts have been in operation for a long enough period to have become riddled with anomalies, in some cases amounting to a complete reversal of their original intention, which was to safeguard poor people from the crushing effects of unjustifiably increased rents in the period immediately following the war. The continuance of rent restriction keeps alive an artificial state of affairs which many interests would like to see altered, and it is

difficult to know what alterations could be made to do justice all round, and yet prevent the upheaval which their entire removal would precipitate.

"A FORM OF SLOW DEATH"

Meanwhile, the recent leader under this title disclosed a heartrending aspect of the slum evil, the major social problem of our times. Mr. Greenwood, the Minister of Health, who will be remembered for his fine work in this cause, is making impassioned appeals to city authorities to start upon large-scale reclamation of slum property under the Wheatley and Greenwood Housing Acts. At the recent Manchester Housing Conference he addressed a large meeting. "I cannot rest," he said, "while people as good as we are live . . . in conditions which are not decent in a stud farm. . . . Whilst we have got to kill the slums that are, we have also to prevent the creation of more, and to attack the problem of the semi-slum, the areas that will be condemned in another five years."

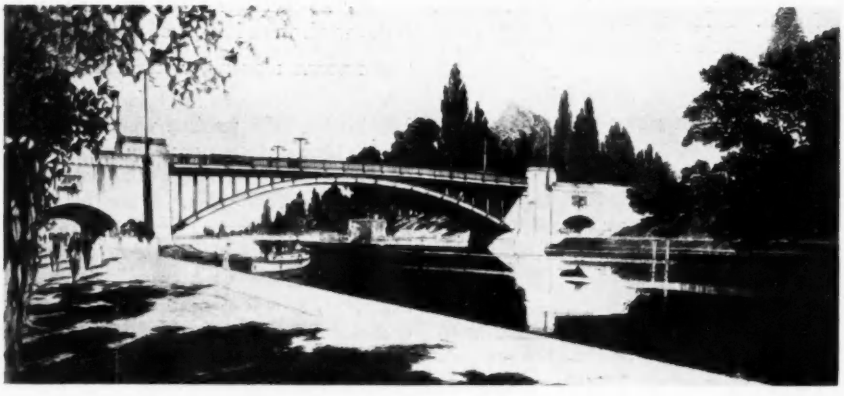
★

The point of the whole slum problem lies in its large-scale clearance, because if slums are economically wasteful when considered from the large and the humane aspect, their substitution by properly-planned decent habitations is a saving to the community and to the country which can only be measured when we make the whole national reckoning. Individuals make profits from slums by keeping them slums; communities will make profits of other kinds as well, by making them safe to live in.

GERMAN TOWN-PLANNING EXPERT FOR RUSSIA

I shall not be in any way surprised to find that Russia, formerly the most backward and isolated of European nations, has in a few years' time placed herself above all other nations in the march of so-called progress. Whether the national-capitalistic system which underlies the Five Year Plan will survive its term or not, Russia will have so largely benefited by the enormous effort to reorganize upon scientific lines, that the other individualistic, custom-ridden nations may easily find themselves at a disadvantage. Be that as it may, architecturally Russia is to benefit by the services of the most advanced of German municipal architects, for Ernst May, whose Frankfort housing schemes have placed him in the front rank of active modernists, has signed a five-year contract as town planning and architectural adviser to the Soviet Government.

★



If he is given the opportunity, and if there is money available to carry out work on a really large scale, we may judge from our own knowledge how great and lasting will be his impression upon a country which the new industrialized future is so largely to remodel. Herr Ernst May's work at Frankfort has been expensive, despite its bald simplicity, and one imagines that his powers will be hardly taxed by the necessity for extreme economy which will obviously prevail in Russia.

ARCHITECTS AT GOLF

When the enterprising planner's not a-planning—why, golf may profitably occupy his time. Hence the newly-formed Architects' Golfing Society. Perfect weather and a course in excellent condition made the first meeting, last month, at the Northwood Golf Club, Middlesex, a most enjoyable occasion. The morning round was a Medal score for the Selby Cup (transferred from the A.A. Golf Section to the new society). This was won by L. E. C. Simpson (12) : 75, with Stanley Heath (scr.) : 77, and H. Ashwell (1) : 78. H. Ashwell (1 down) and H. Chalton Bradshaw (3 down), in the afternoon, won the silver cigarette cases presented by Sir Banister Fletcher, for a round against bogey.

A SIMPLE STORY BY HORATIO JAY

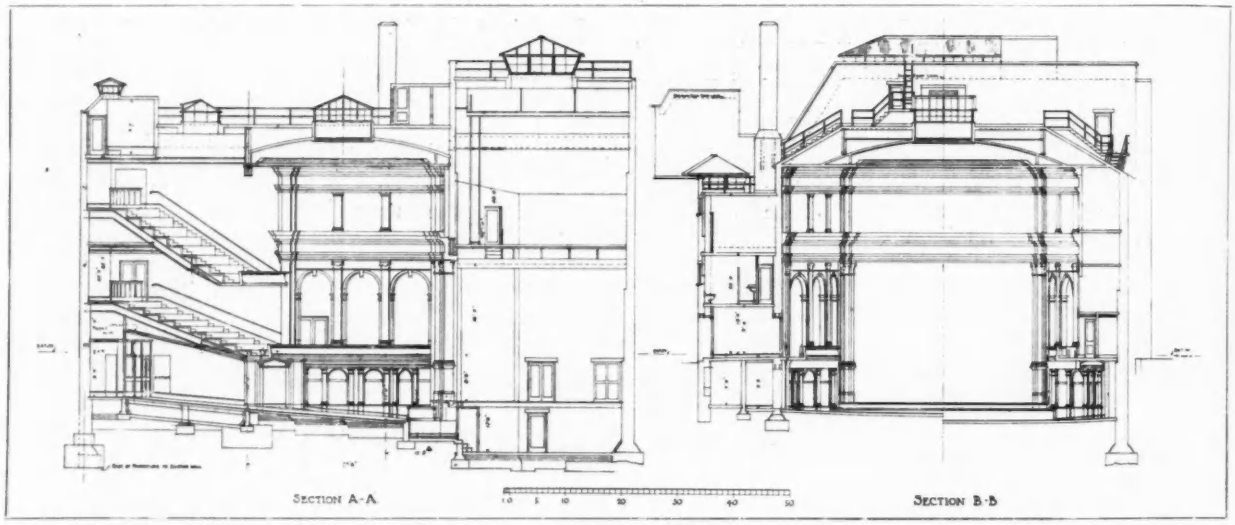
There was once an architect and he designed a house, and being very pleased with the house he took a photograph of it with a camera he had bought, and sent it to the newspaper. And the art editor of the paper looked at the photograph upside down, and thought at once what a funny house it was, and he said to the editor, "This is a funny house," and the editor said, "H'm. It is a funny house. We ought to print that. That's news." And so it was printed just as they looked at it, upside down. But when the architect saw his house printed in the paper upside down he was very angry and he went to the newspaper to complain. But the editor and the art editor looked at the photograph again and said they were quite sure that it was the right way up, and they called the office boy in as well, and he said he was quite sure, and the printers said, of course, they wouldn't have been allowed to print it if it had been upside down. And so at last the architect was convinced that he was wrong, and that the house really wasn't upside down, and the next day the paper printed letters from people saying what a fine house it was, and asking the architect if he would do them some like it. And so the architect said he would be very glad, and he went on doing so till the day he died. And when he died he left instructions telling everybody that he still felt sure it was upside down, but that if they buried him upside down everything would be all right. And so they all laughed and buried him upside down. ASTRAGAL

This is a perspective of the proposed new bridge at Maidenhead, designed by Sir John Burnet and Partners, in collaboration with Sir Douglas Fox and Partners, and referred to by Astragal last week. Its publication has since drawn letters in The Times *from Sir Owen Williams, assuming that it was designed to "use as much steel as possible"; and from Mr. C. J. Kavanagh, of the British Steelwork Association, in disclaimer.*

THE PHŒNIX THEATRE, CHARING CROSS ROAD

SIR GILES GILBERT SCOTT; BERTIE CREWE; CECIL MASEY—ARCHITECTS

THE Phœnix Theatre has been built for Mr. Sidney L. Bernstein, and is intended for use for every variety of entertainment as well as for those plays which follow the more traditional paths. It has been conceived with all the historical traditions in mind of the older Phœnix of the seventeenth century, which had few if any rivals in English theatrical annals. It was the first public theatre to stage an opera, the first to see an heroical play, the first to permit a woman actor on its boards, and the first to use movable and painted scenery.

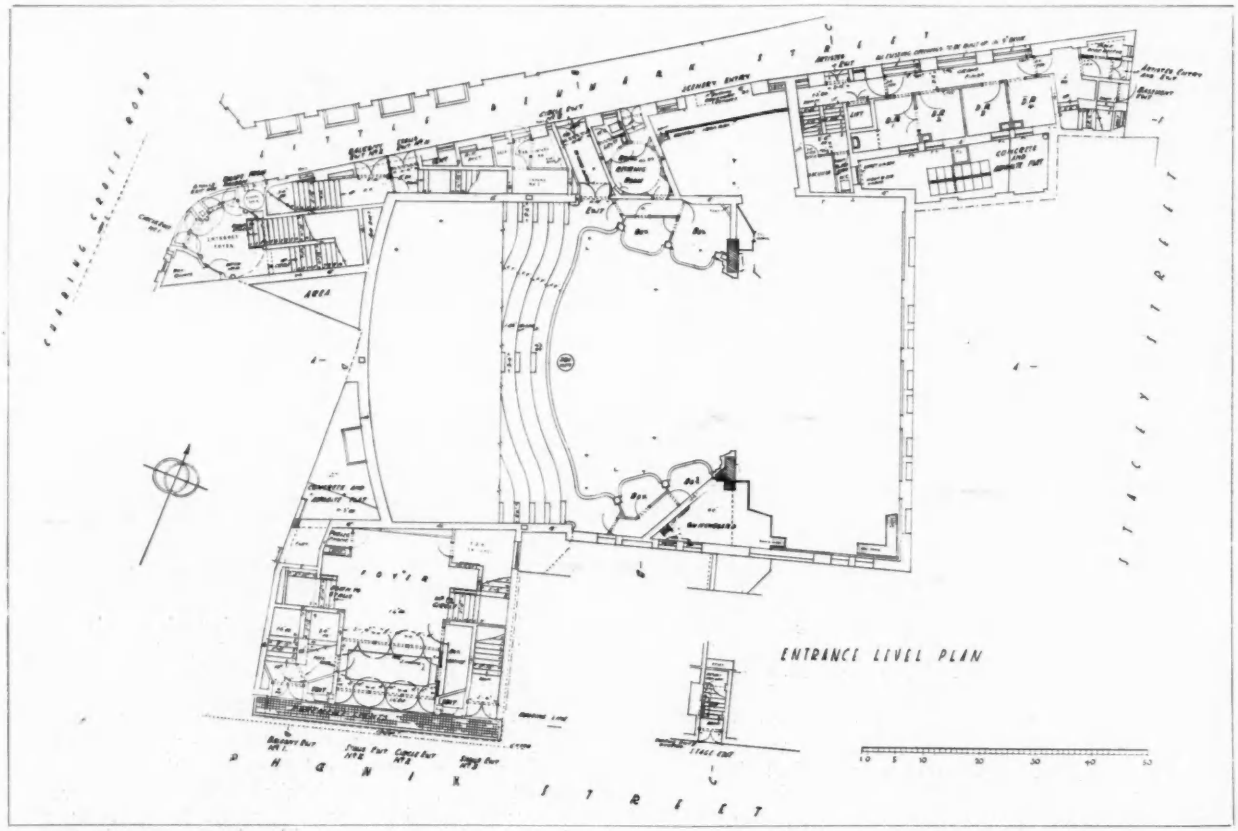


In equipment the new Phœnix allows of the most modern and varied theatrical manipulations it is possible to conceive; in decoration it emphasizes those elements of luxury peculiar to the architecture of the Italian Renaissance princes, and is of that period prior to the transition to the Baroque.

Most of the decorative ideas have been obtained from Raphael, Giulio Ramano, Girolamo da Carpi and Giovanni da Udine. The influence of these artists is noticeable, particularly on the staircase leading from the Phœnix Street entrance to the dress circle and in the gangway or foyer at the back of the stalls. The latter has been adapted from the loggia in the Villa Madama, built by Raphael in 1519, with decorations added three years later by Giovanni da Udine.

The influence of Michelangelo is seen in the columns of the proscenium and the dome above the auditorium. Certain details have been "borrowed" intact and unaltered, such as the coffered ceiling in the Phœnix Street entrance foyer and the columns in the Charing Cross Road front, the originals of which are in the courtyard,

Looking from the upper circle towards the Royal box. The panels of the top cornice and the fireproof curtain contain reproductions of paintings by Sellaio, Tintoretto, Giorgione, Titian, Corbizzi and Pinturicchio. On the fireproof curtain is a copy of Sellaio's "Triumph of Love," at the Oratorio di S. Ansano, Fiesole.



These two sections should be studied in conjunction with the plan reproduced below. Fresh air enters at roof level and, after being washed and cooled or heated, is discharged into the auditorium from the domed ceiling, and the tops of the boxes, circle and stalls. It is extracted under the seats of the stalls and circles, and discharged at ground level.

built in 1538, of the Palazzo Boncompagni at Bologna.

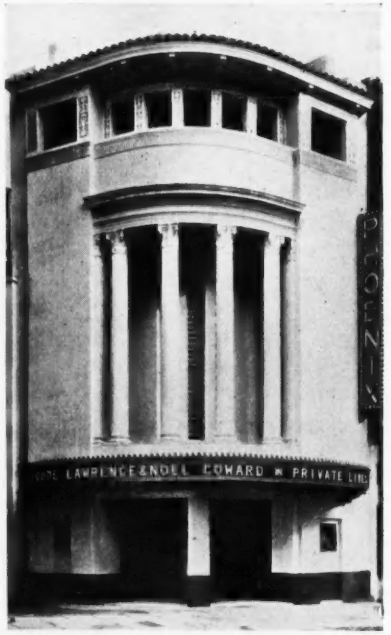
The gayest colours—cream, black, red, amber, blue and gold—are used both externally and internally. Perhaps in the Charing Cross Road foyer the colours are used with the most striking effect.

Messrs. Bertie Crewe and Cecil Masey are the architects for the work, while Sir Giles Gilbert Scott, R.A., has been responsible for the design of the Charing Cross Road elevation, and M. Theo. Komisarjevsky for the interior decorations. The decorative paintings, after a number of famous Italian Renaissance artists, are the work of M. Vladimir Polunin.

The Phœnix Theatre, London.] [*Sir Giles Gilbert Scott; Bertie Crewe; Cecil Masey—Architects.*

Plan at entrance level. There are two entrances to the theatre: one from the corner of Charing Cross Road and Little Denmark Street; the other from Phœnix Street. Each gives access to an independent entrance foyer, containing a box office, and staircases leading to the stalls and circle. Entrance to the Royal box and retiring room is from Little Denmark Street.

(*Right*) *The approach to the circle saloon from top of staircase from Phœnix Street entrance. The two balconies overlook the staircase.*



(*Below*) *The Charing Cross Road entrance, and its foyer.*

(*Above*) *The Phœnix Street entrance, and its foyer.*

(*Left*) *The foyer at the back of the stalls is adapted from Raphael's loggia in the Villa Madama.*

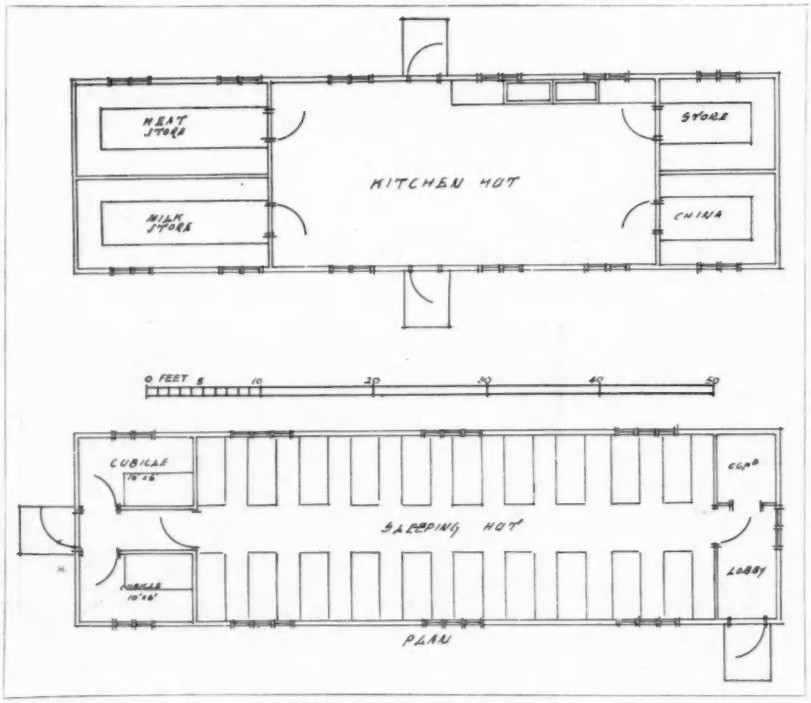
[*Sir Giles Gilbert Scott, Bertie Crewe, Cecil Masey, Architects.*

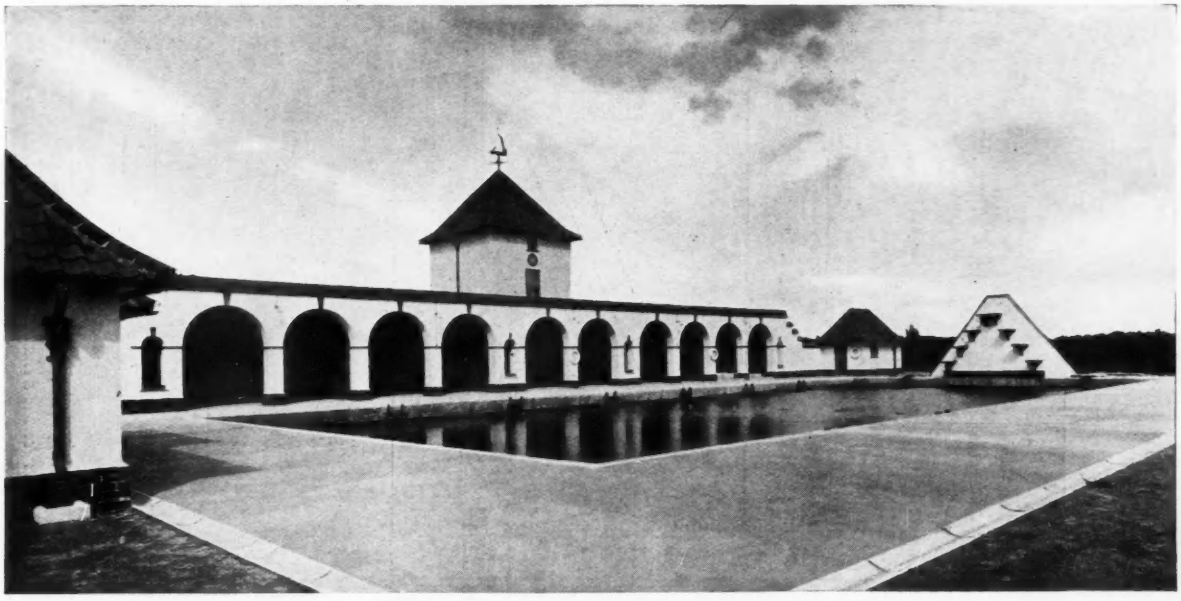
The sports pavilion, looking from the playing-fields. The other side faces the open-air swimming bath, see pages 723 and 725. The camp is at the top of Ashdown Forest, overlooking the South Downs, and giving a glimpse of the sea through Newhaven gap.

SUSSEX SUMMER



DESIGNED BY
(COLERIDGE, JENNINGS

SUSSEX is a county dotted over with health and welfare colonies of one kind and another. One of the most recent, the Isle of Thorns Summer Camp, is situated at Chelwood Gate, not many miles from the well-known Chailey Heritage, sited on the top of Ashdown Forest; the ground overlooks the South Downs and gives a glimpse of the sea through the Newhaven gap. The undertaking is being developed for the Manor Charitable Trust, whose other activities in the East End of London include the running of dental clinics, and of clubs for working boys, devoted to swimming and other sports. Two of the most prominent are in Hackney and Hoxton. At Leyton the Trust have a big sports ground, laid out for Rugby football, tennis, etc.



In deciding to formulate the Isle of Thorns camp the Trust have not only gone a little farther afield, but caught the youngster at an even earlier stage. At the moment the camp is intended for the use of scholars in elementary schools who come in parties, made up at these schools, and stay for a period of two weeks. If they are accompanied by a teacher, the time spent in the camp is regarded as school time by the education authorities, provided a certain part of the day is devoted to lessons. Thus, it is not necessary for parties to be limited in their visits only to the duration of the recognized school holidays. Preference in the use of the camp is being given at present to the poorer classes of London, but it can readily be imagined how valuable it might eventually become to the Toc H, Boy Scouts and other organizations.

At present a beginning only has been made with the sleeping huts, but when complete, the establishment will accommodate about 500 persons.

The principal features of the camp are the large open-air swimming bath, which is 120 ft. long and 50 ft. wide, and the sports pavilion. The latter is of brick and plaster, and consists on the bath side of an open arcade for dressing cubicles and on the playing-field side of a cricket pavilion with

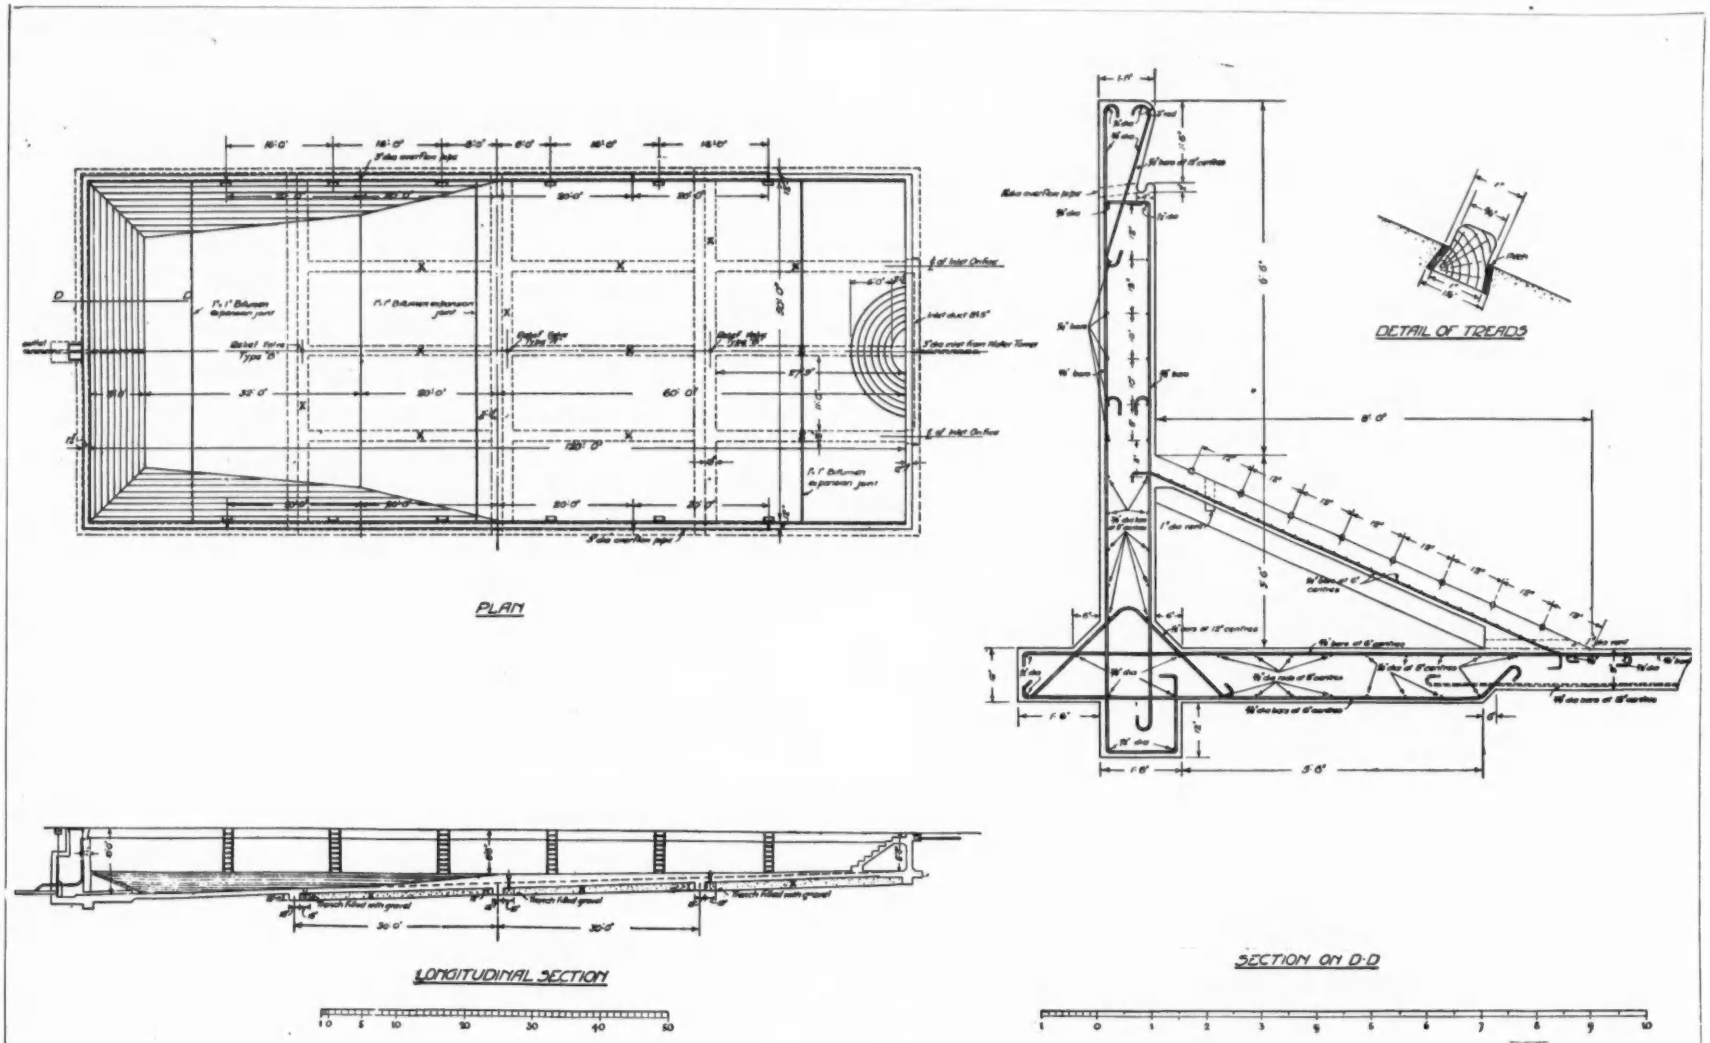
Plans of a kitchen hut and a sleeping hut. They are one story high, and resemble in external design the best type of Army hut. In each sleeping hut are two cubicles for the masters.

The sports pavilion, looking from the swimming pool. In the arcade are the boys' dressing sheds. The small lavatory building on the left of the diving platform is balanced by one of similar design on the right. For detail drawings of pool see page 724.

CAMP FOR BOYS

JOHN COLERIDGE
AND SOIMENOW)

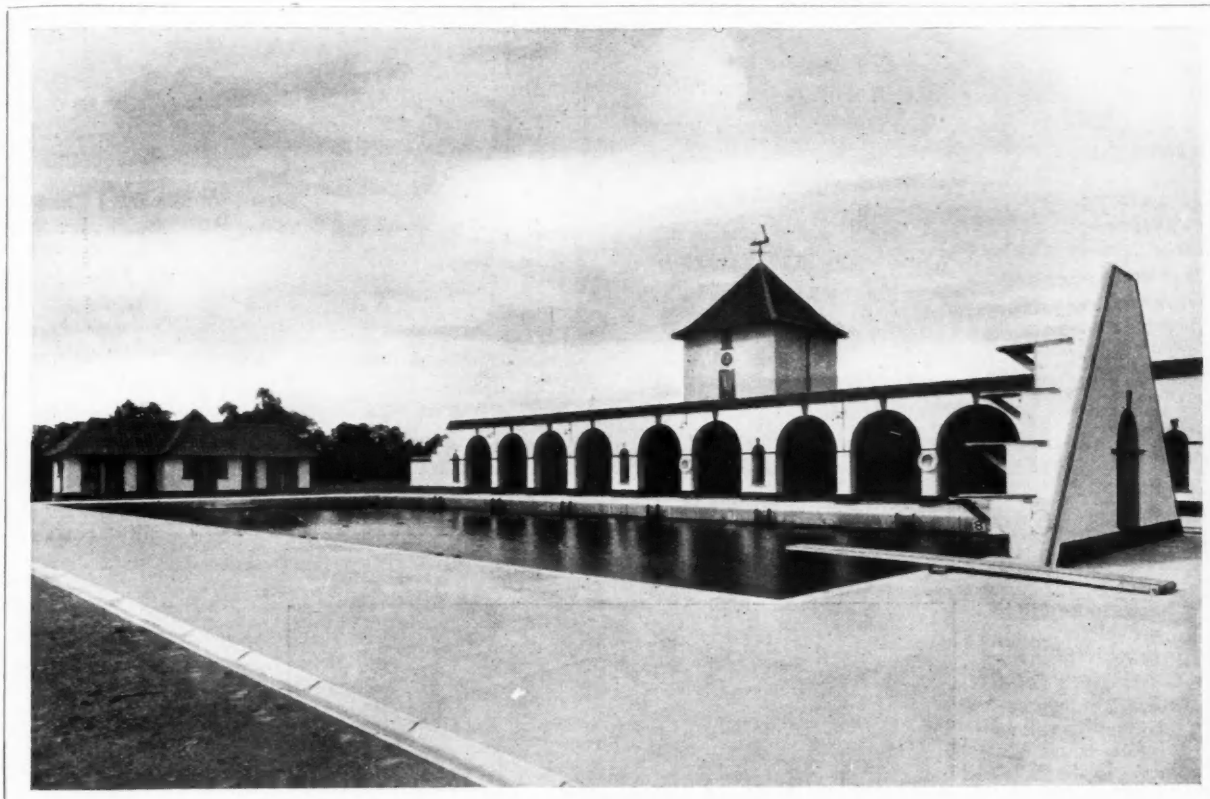
changing-rooms and stores. Surmounting the pavilion is a water tower on which is a curious weathercock of a figure diving. The playing-fields are very large, and include two cricket pitches, two football grounds, and nets, and still there is plenty of ground to spare. A manager's house is built on the estate, and there are kitchen, isolation and disinfecting huts. A stream in the valley has been drained, and a lake formed from which the bath and huts are supplied. The whole of the water is chlorinated before being pumped up the hill. A large electrical plant has been installed to light the finished camp. It would be impossible for the Trust to find a more healthy site, and the contrast between the London streets and this open forest is remarkable.

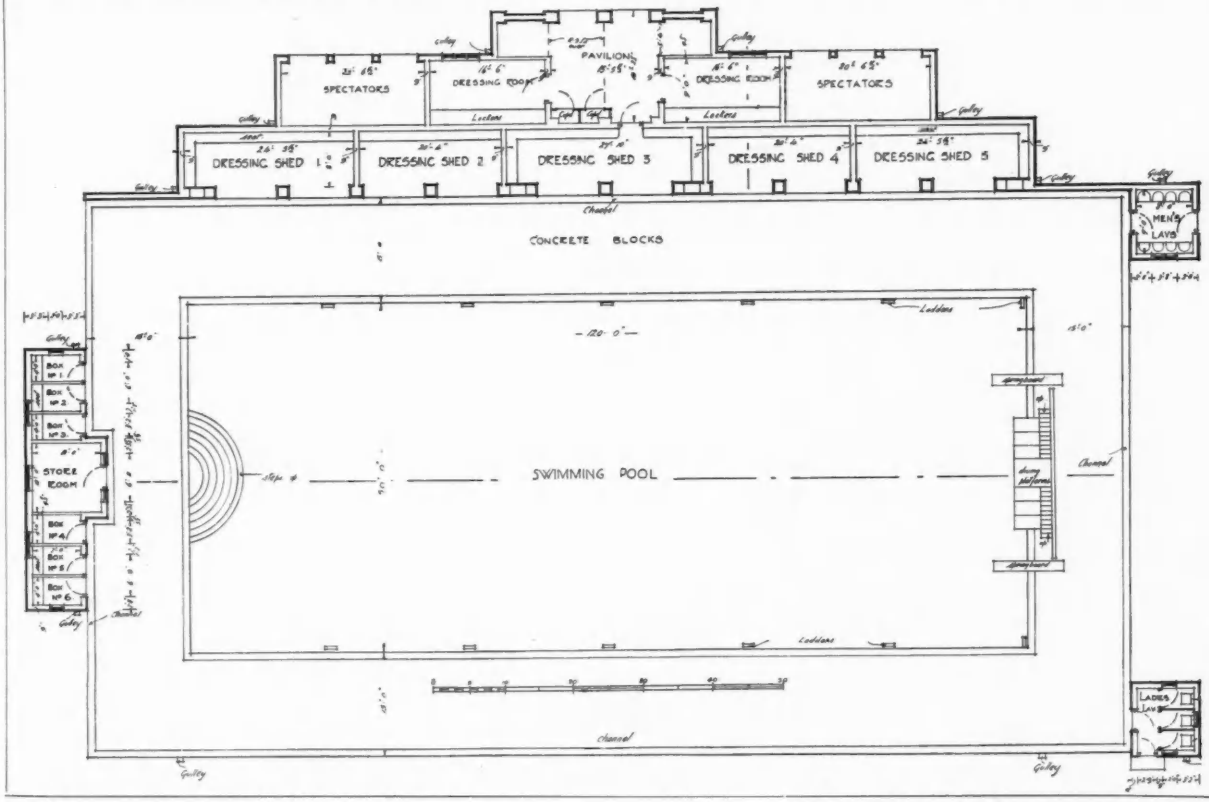


All the buildings are designed in a simple style, with little or no ornament, and include features of unusual architectural and constructional interest. A case in point is the ingenious and economical manner in which the double-purpose sports pavilion has been designed.

The pool itself also has more than one ingenious detail. There is the sloping footway at the deep end, which will be an everyday safeguard to any boy who may get out of his depth and into difficulties in the water. This footway is 8 ft. wide, and extends completely across the deep end, and for a distance of about 55 ft. along either side. At its highest point it reduces the maximum overall depth from 10 ft. to 6 ft. 6 ins. Having regard to the water-level, this brings the swimmer's head well above it.

Again, the channel which runs round all four sides of the pool, about 18 ins. below the top, is unusual. It serves two purposes, providing a groove for the swimmer to hang to, thus obviating the use of the handrail, which has been directly responsible for many a sprained or broken limb, and acting as an overflow. At the shallow end are steps down into the pool, and a small pavilion containing a store room and dressing-boxes for the masters. Along each side are seven ladders for the egress of swimmers.





A typical sleeping hut. Special care has been taken to secure the highest possible degree of comfort, the materials being selected chiefly for their resistance to climatic conditions.

Isle of Thorns Camp, Sussex.] [*By John Coleridge (Coleridge, Jennings and Soimenow).*

Plan and sections of swimming pool. At the deep end is a sloping footway for the use of boys who get into difficulties in the water. At water level is a channel, serving as both handrail and overflow.

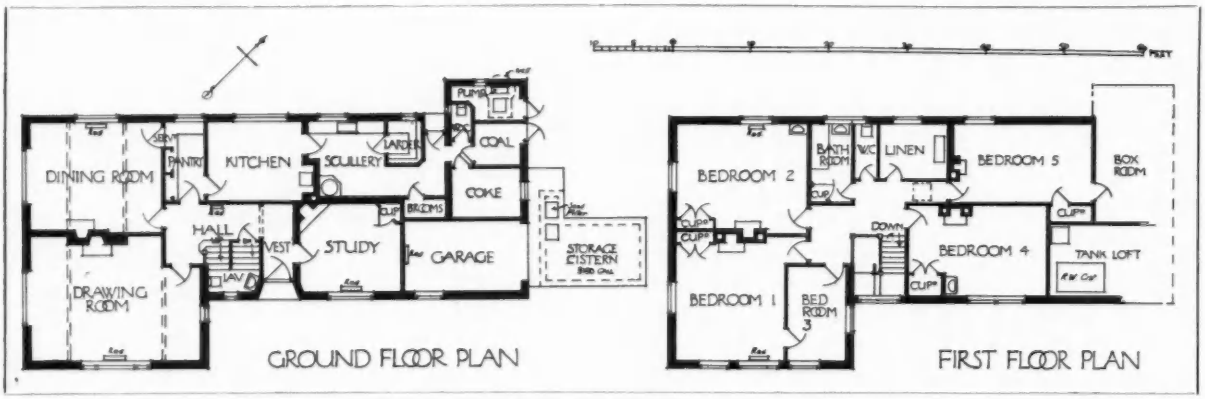
Isle of Thorns Camp, Sussex.] [*By John Coleridge (Coleridge, Jennings and Soimenow).*

The sports pavilion, looking from the diving-platform end of the swimming pool; and plan of the open-air swimming bath, sports pavilion, etc. The bath itself is 120 ft. long by 50 wide. The other side of the pavilion faces the playing-fields (*see page 722*).

The south-east or entrance front of the new rectory at Wolverton-with-Ewhurst. Every fourth course in the brick walls is formed of snapped headers, rather more bluish than the remainder. The roof is tiled; and the weather-vane, with other ironwork, was made by a local smith to the designs of the architect

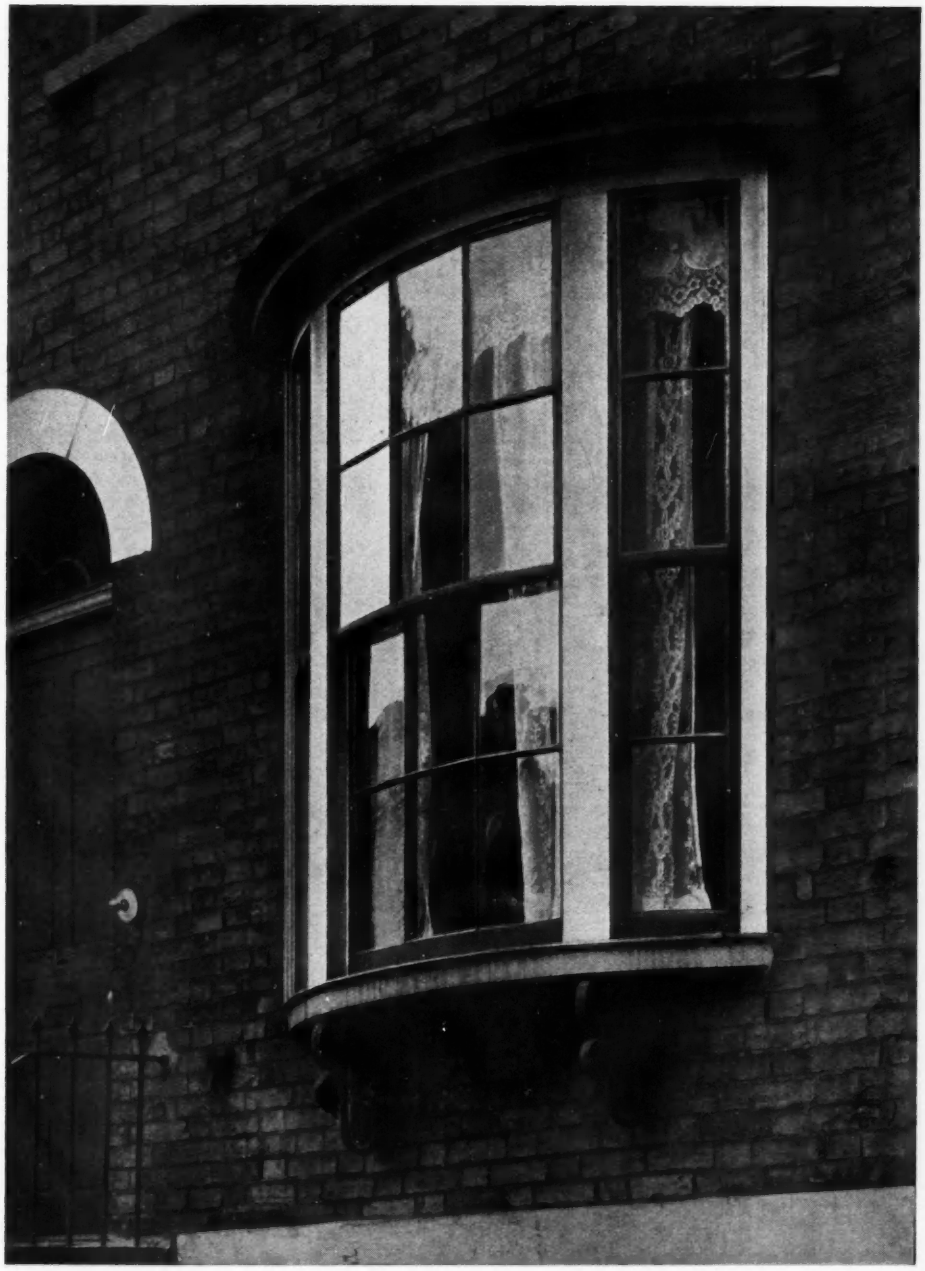
COUNTRY RECTORY IN HAMPSHIRE

DESIGNED BY EDWIN GUNN



THIS house stands on glebe land, roughly triangular, tapering to a point at the N.E., but widening to the dimensions of a tennis court immediately to the S.W. of where it was decided to site the house, beyond which it shelves steeply down towards the main Newbury - Basingstoke Road. These facts fixed the position for garage entrance and main doorway, and made it desirable that the principal rooms should look south-west.

The house is built with 11-in. cavity walls, faced with 2-in. local multicolour bricks. The striped effect, due to the use of a line of bluish snapped headers each fourth course, is much less apparent in reality than in the photograph. The roof is covered with Twyford tiles and the casements are lead-glazed cottage casements in wood frames. Water-supply being often sparse, all the roof water is conserved in roof tanks or underground; the normal supply is by deep well and petrol pump.



The cost of the house, including radiator heating, and septic tank drainage, was approximately £2,500; about £200 more has been expended on the well, water storage, and the pumping set.

The fireplace in the drawing-room, made in wood by the general contractor, encloses a surround of light tiles, for the most part plain, but three bearing printed designs.

The architect's drawings of the ground- and first-floor plans. On the ground floor are drawing-room, dining-room and study, and a garage is incorporated; above are five bedrooms, of which one serves the purpose of a dressing-room.

ENGLISH PRECEDENT No. 141

BAY WINDOW, BEDFORD TERRACE, TUNBRIDGE WELLS, KENT

This illustration, from Tunbridge Wells, Kent, proves once again that curved bay windows with flat sashes are an abomination, if not an impossibility, for even the small single-light sashes here are curved, as may be seen most clearly from the one farthest from the camera. Though the cost of curved joinery is, of course, high, the expense is amply repaid if curved bays are sparingly used to add life and distinction to long, even rows of dwellings. One-story bays, like the one here shown, require some sort of bracket where they do not reach down to the ground. The idea of calling in the blacksmith to supply these brackets is much to be commended, the design of these particular examples less so.

LETTERS FROM READERS

Below we print the letter from an experienced authority on housing announced on last week's leader page.

Housing—The Counter Revolution

SIR,—I write as one intimately connected with what has been done by local authorities since the war in the provision of houses for letting, and I am a little reluctant to believe that any proposal to transfer present housing obligations to private enterprise is made seriously.

The after-war magnitude of the problem of housing shortage demanded that the remedy should be operated by a central authority, and not be left to the unco-ordinated efforts of private individuals. If the present system of municipal building is to be superseded, for whose benefit is the change to be made?

From the scheme submitted by the Secretary of the National Federation of House Builders, it is evident that no relief is to come to the tax- or rate-payer, if the present subsidy is to continue. The tenant is to be deprived of the rent security now available to him in the municipally-owned house, for houses may be sold as well as let, and where a lump-sum subsidy is obtained, rents may be increased by any amount at the expiration of five years.

Definite suggestions are made for a lowering of the present standard, and judging by the inartistic atrocities with which private enterprise has littered the country, aided by the subsidy of the Housing, etc., Act, 1923, the country as a whole stands to lose by further patchwork development. It is unlikely that the building trade operatives will gain, for speculative builders, unfettered by any contract, have been known to depart from local labour conditions.

I can only think, therefore, that the proposals are made in the interest of the members of the Federation. In my opinion, the problem is still too serious to warrant any tampering with the existing and well-organized machinery set up by local authorities which has already achieved a great measure of success. The proposed scheme seeks to benefit private enterprise at the expense of the tax- and rate-payers, for those who are a profitable proposition are to be housed by the speculator, leaving the slum-dweller and the very poor to the care of the local authority. Had the members of the Federation studied the Housing Act of 1930, they would have seen that the only hope of the very poor obtaining reasonable housing accommodation rests upon the possibility of the local authority dealing also with the housing of those who can afford to pay a normal rent.

Some of the points of the scheme may be more closely examined, as, for instance :

1 : *Rents.*—It should be common knowledge that the rents charged by local authorities for houses built under the Housing (Financial Provisions) Act, 1924, are so fixed that, after making provision for proper management and maintenance, they now oblige local authorities to contribute a sum of £3 15s. per annum for a period of forty years. Unless the standard of building is lowered, there is little chance of speculators building equally good houses at lower prices than are current in large contracts. Therefore, tenants will be compelled to pay higher rents for the privilege of occupying speculators' houses. It may be news to the Federation that some local authorities are at present erecting houses with every amenity rented at less than 7s. 6d. net.

2 : *Density and Size of Houses.*—Whilst there may be certain instances in which, to complete a town development, a higher density than twelve houses per acre would seem advisable, generally speaking in the laying out of large estates, after making provision for the necessary open spaces and playgrounds, a density of twelve per acre is not found excessive. Doubtless the speculator will anticipate that the local authority will be responsible for the cost of such open spaces, thereby adding a further burden to that already shouldered by the rate-payer. There should be no objection to building houses in blocks of eight, relieved with smaller blocks of four and six. In fact, these blocks are architecturally preferable to a number of ill-proportioned pairs of houses.

3 : *Roads.*—There is little doubt that considerable saving could still be effected by a reduction in the specification for roads required by many local authorities, though there are naturally limits to which such reduction can be made in view of future maintenance. The saving, however, should go into the pockets of the tenant and not the speculator.

I am afraid that those in need of rented accommodation have little to hope for from the scheme now submitted to the Minister of Health, and I am of the opinion that the Minister will take the wise course of leaving the problem in the hands of the local authorities, relying on their good will and co-operation in carrying out recent housing legislation, both for the relief of the slum-dweller and the provision of adequate accommodation for all persons of the working classes.

CUI BONO ?

Bungalophobia

SIR,—Mr. Casson, in your last issue, states that I have missed the point of his argument. As I understand his views, they are given below, together with my suggestions :

1 : There is no alternative to the factory-made bungalow because those designed by architects are more expensive.

I suggest that this has not been proved, if the cost of maintenance, efficiency of planning, and character of the building are taken into account. Architects frequently design temporary structures for a definite purpose, and they compare favourably in cost with the factory-produced building.

2 : Architects " have made no attempt to put upon the market a really attractive type of bungalow at a price which will compete with the trade article."

This is quite true, for it is not the architect's function to produce at a low initial price a " trade article " which may ultimately cost the owner more in maintenance, and which does not fit the site. The architect's job is to find the best solution for each individual problem, and this implies a study of the site, prospect, aspect, the requirements and means of his employer, as well as the soundness of materials and cost of upkeep.

3 : Mr. Casson suggests that if architects " issued designs classified according to the various districts of England, circulated those designs to local authorities, to local builders and to the Press, there might be some chance of the type of bungalow improving."

This is not a new idea; it has been discussed at length for many years, and so far found impracticable; it has met with only partial success in America, where it is on trial. The alternative is for speculative builders and local authorities to employ architects at a specially reduced fee to prepare designs. This system is in operation in many districts. The housing schemes carried out by architects for local authorities are proof that standardized buildings properly grouped and sited can be both inexpensive and pleasant in appearance; the average cost per house has now been reduced to less than £350, and these are *permanent* structures.

Undoubtedly the cheap factory-made bungalow could be improved if the manufacturers obtained skilled advice on the designs of such temporary buildings as they produce, but it is unlikely they will take this step as long as their customers are satisfied with the kind of building that is purchased from a catalogue. The undiscriminating

public provides the market for these goods.

I would ask Mr. Casson, before he makes further reference to the work of societies engaged in the preservation of the countryside, to investigate the *constructive* work that they are doing, namely, the promotion of more scientific methods of rural development, and the encouragement of a better standard of design in country buildings by arranging for free architectural advice on these matters.

W. HARDING THOMPSON

SIR,—Now that Mr. Stanley Casson has adopted my suggestion and published a photograph of his Cornish bungalow (or at least two gables of it), we are in a more definite position to appreciate his qualifications to speak on such topics.

The angle of the roofs and the chimney cans are somewhat unusual, and show certain subtleties. To say that such bungalows are an adornment to the lovely county of Cornwall or any other part of the country cannot be taken seriously.

No architect of repute wishes to compete with the trade article.

Does Mr. Casson expect to get a suit made to measure at the same price as a ready-made suit ? The one proposition is quite as unreasonable as the other.

WILLIAM DAVIDSON

Official Architecture

SIR,—Mr. Owen has amusingly sidetracked the issue of our exchange of compliments by dragging in the question of qualified men practising as official architects. I can only ask with Mr. Moran, "What's his idea in bringing that up ?" I was not aware that the debate at Olympia was whether the cause of architecture was best served by a relatively small percentage of qualified men among official architects.

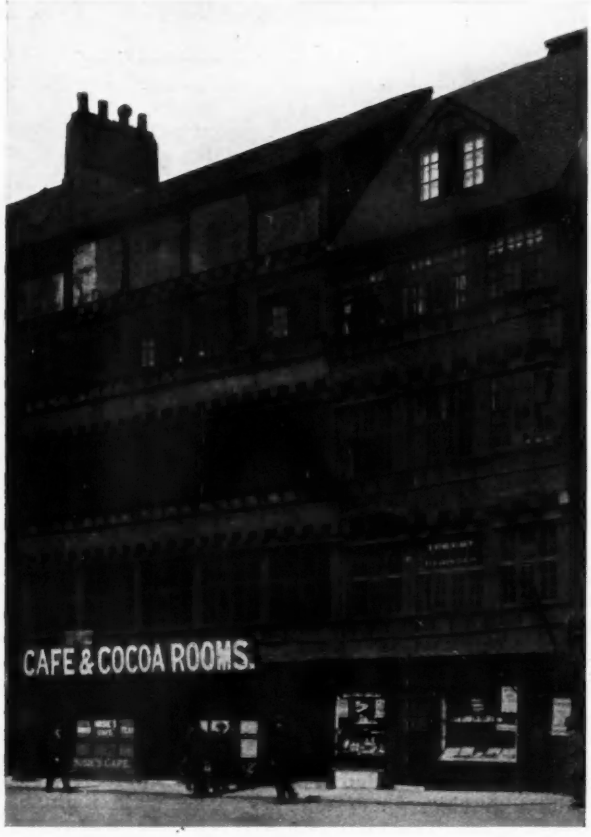
Allow me, Sir, with all humility, to pay my respects to those enlightened and progressive gentlemen who provide us with parking spaces for slot machines, automatic boot cleaners, and bookstalls; to those who have so improved the jug and bottle and saloon bars of our public-houses that they are more than ever homes from home; to those who demolish all visible supports on the ground floors of second-hand buildings and make replacements with sheets of plate glass, crowned with modest facias and adorned with reticent lettering proclaiming in a still small voice to the bemused public the names of their proud owners; to those whose expression of such essentially modern buildings as telephone exchanges finds inspiration in a style of architecture at least 150 years old; to those who convert shops to popular eating-houses with a tasteful use o imitation brawn marble and incrusted panels—the ensemble set off with glass-top tables; to those whose knowledge of mahogany counter fronts, bank grilles, and glazed partitions is unsurpassable; to those who adorn our roads with prettily coloured petrol pumps nestling coyly against a background of asbestos sheeting; to those who rearrange counter fittings and transpose whole departments overnight to the surprise and delight of the regular customers of our great London stores; and last, but not least, to those who embroider our seaside resorts with the balustrade and bandstand style of architecture, and who are the mainstay of the precast stone industry of this country. In the noble name of commerce our towns and countryside are being so improved beyond all imagination.

Lastly, I wish Mr. Owen many happy returns of the outcome of the Calton Jail site business.

J. R. LEATHART

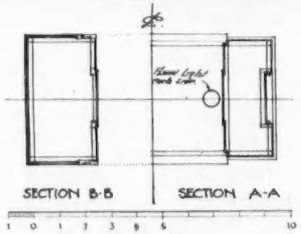
Sixteenth-Century Modernism !

SIR,—I was interested in Sir William Crawford's lively description of his new building in High Holborn, which appeared in the issue of THE ARCHITECTS' JOURNAL for October 29. This building is a good example of the modern functional architecture which is being developed to meet the needs of the times in which we live.



The outside elevation of Crawford's shows it to be a framed building with horizontal window bands along each floor. The windows are placed between about 2 ft. above floor level and the ceiling, and give the maximum possible of useful daylight inside the building. I submit, however, that such an elevation is not *tremendously* modern. On the Sandhill in Newcastle-upon-Tyne are some blocks of sixteenth-century buildings, of which I enclose a photograph. The outside elevation of these buildings shows that they are framed buildings with horizontal window bands along each floor. The windows are placed between about 2 ft. above floor level and the ceiling, and give the maximum possible of useful daylight inside the building !

It is interesting to note that the Elizabethans, with wood and plaster as their materials, solved the problem of the framed building in the same manner as the neo-Georgians with their steel and concrete.

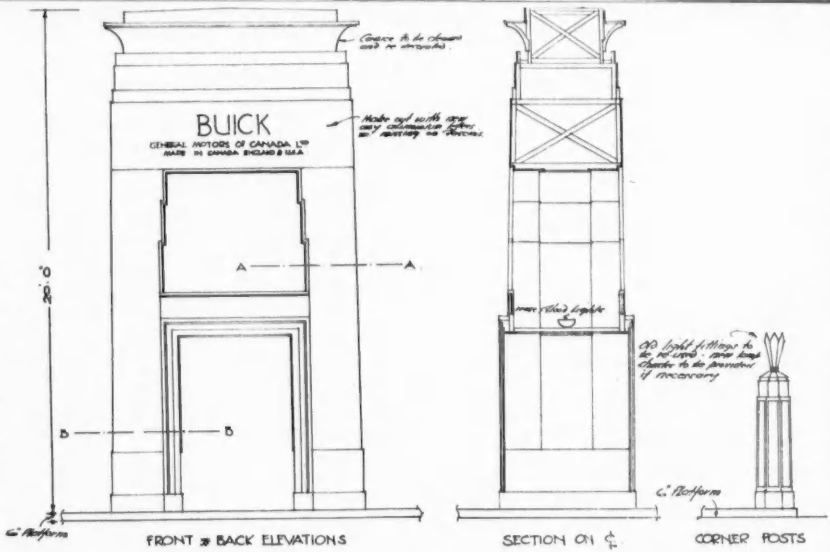


It has been reported Queen Anne is dead, but what about Good Queen Bess?

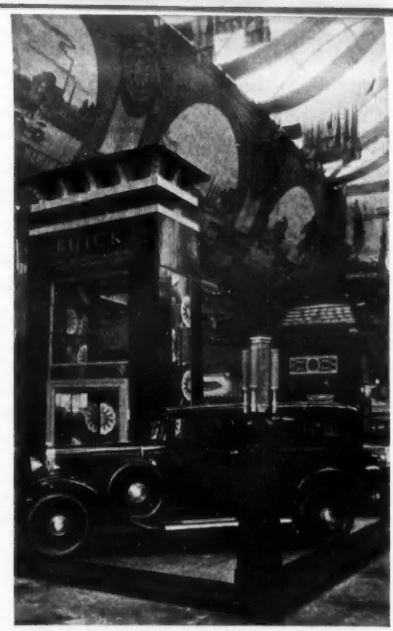
If architecture reflects the spirit of the age, and if Crawford's is an example of the coming architecture, which it is, then it is good to feel that we are becoming akin to the direct-thinking, vigorous Elizabethans.

R. W. GREGORY

Blocks of sixteenth - century buildings on the Sandhill, Newcastle-upon-Tyne, which, a correspondent suggests, reflect the same style of architecture as the new Crawford's building in High Holborn, W.C.

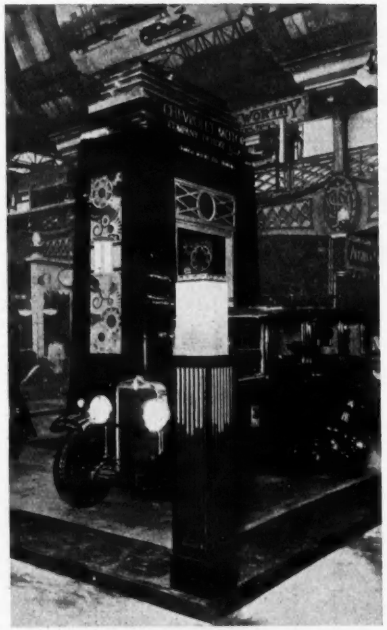


TWO MOTOR STANDS

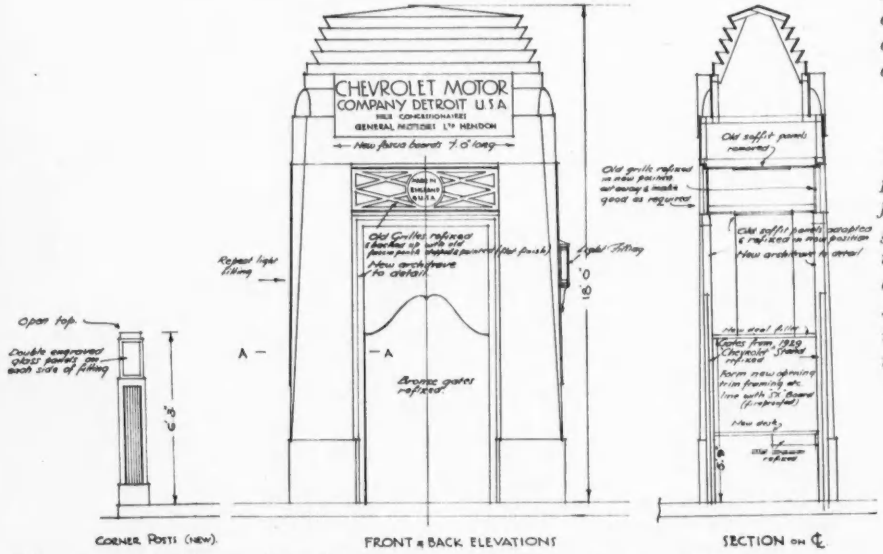


Olympia, 1930

DESIGNED BY BARBER AND WALFORD

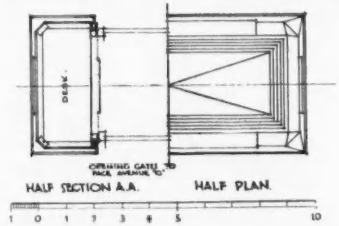


Both were built up mainly of plymax fixed to timber framework, and utilized certain existing decorative units such as bronze panels. The corner-posts were formed from 1 in. deal. On the Buick stand cupboards were provided in the pylon for switch-gear and for literature.

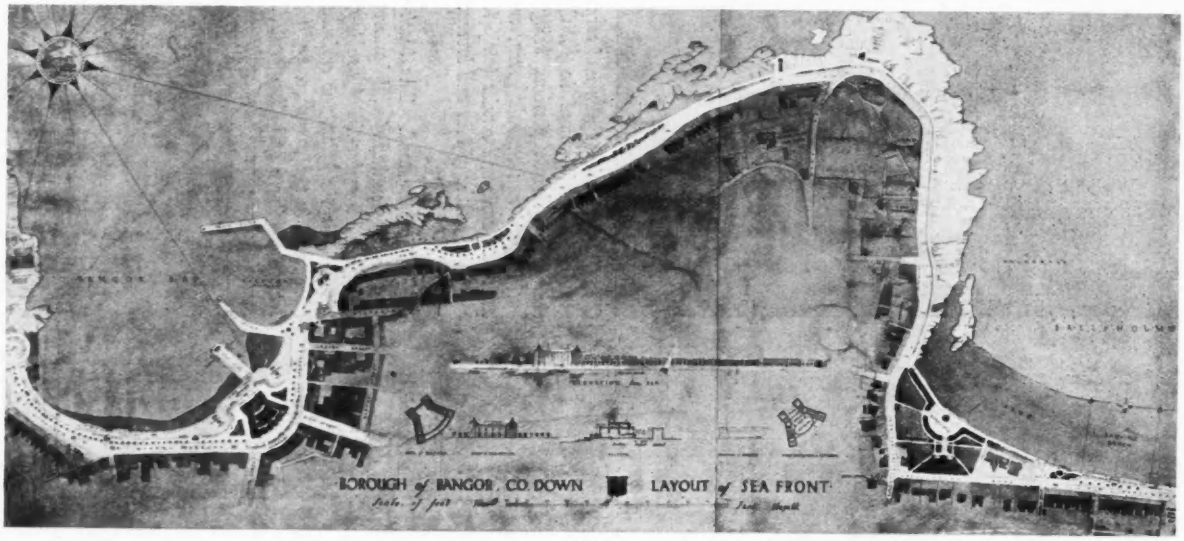


The decorative panels were painted on gilding metal plymax. The black background was designed so as to leave a line of the bright bronze metal showing around it, giving a cloisonné effect. The Trajan lettering was in polished aluminium. The floor was lino, panelled in buff, blue and black.

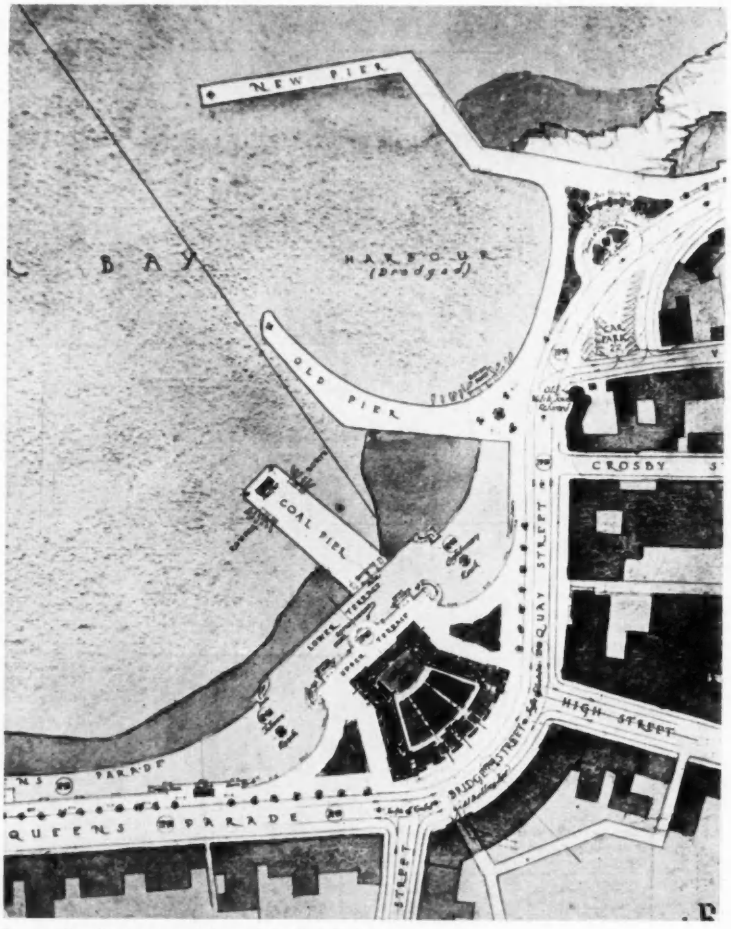
The Buick stand. Pylon and corner-posts were cellulose lacquered in polished rich dark blue, certain portions being picked out in gold and emerald green, while the enriched panels and cornice (strip lit) were in shades of blue and brown.



The Chevrolet stand provided an office, formed by enclosing the pylon with two pairs of gilding metal plymax gates.



This stand and its fellow, which adjoined it, were rather square rectangles. The pylon occupied a central position, with posts at the four corners. The sub-floor of ply was laid out at the contractors' works and much of the lino applied beforehand.



The Chevrolet stand. The black corner-posts and pylon had special hardwood light fittings with amber-tinted double-engraved glass. For the pylon, the enriched panels were toned in red, orange, and yellow, with orange architrave and silver grilles. Construction was generally as for the other stand illustrated, except that the top of the pylon was made of polished aluminium plymax, illuminated with amber-tinted strip lights.

THE BANGOR COMPETITION: WINNING DESIGN

The principal portion of the layout. The aim of the architects has been to retain the natural beauties of the foreshore and to provide carefully designed buildings and promenade layout.

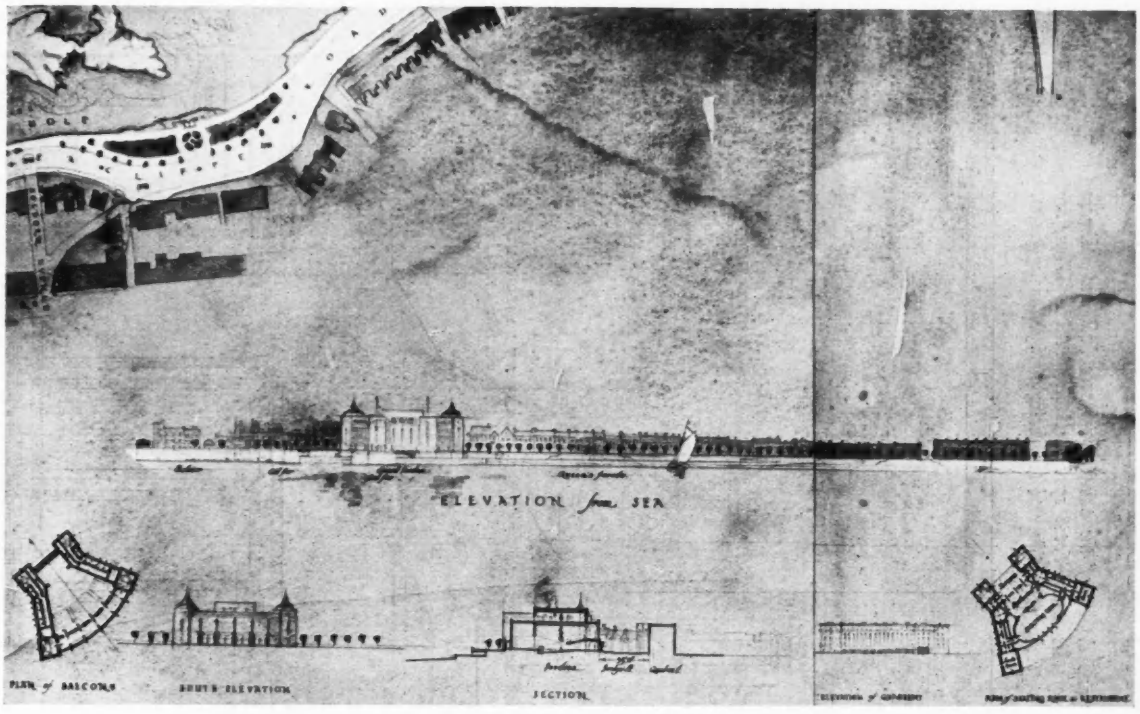
Bangor Sea Front Competition: Winning Design.]

The improvements at Bangor Harbour include a concert hall and skating rink and a new quadrant. It is suggested that a block of commercial buildings, designed as a complement to the concert hall, should be built in the quadrant.

ON this and the facing page is illustrated the winning design in the competition, promoted by the Borough Council of Bangor, Co. Down, for the layout of the sea front. The assessor was Professor Patrick Abercrombie, and his awards are:—

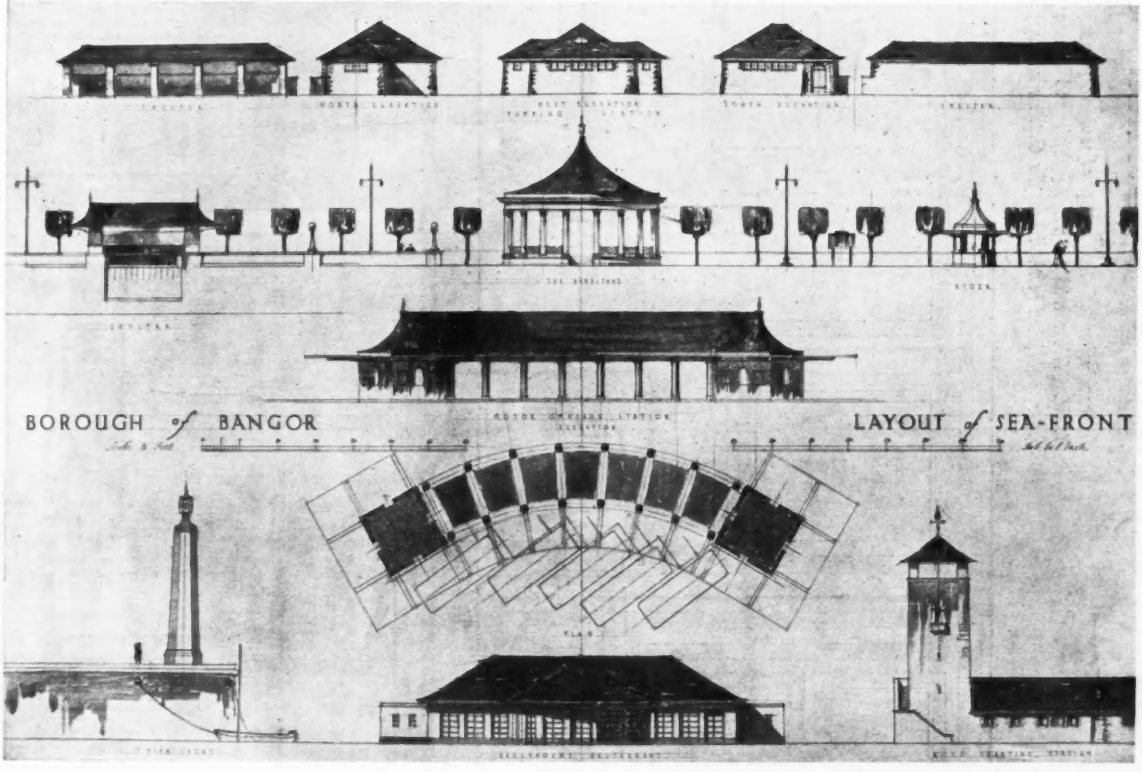
First premium (£150), Alec. G. Jenson and F. Russell Cox, Leamington.

Second premium (£50), Stanley Atkinson, London, W.



Honourable Mention: Herbert Collins, John G. Birkatt and C. M. Lock, Southampton; and C. W. Sharp, Ainsdale, Southport, Lancs.

In their report the authors of the winning design suggest that the existing residential areas of Bangor should be retained as such, and any possibility of industrial or amusement development in those areas prevented by zoning under the Town Planning Acts. The shopping and commercial area should likewise be zoned in the Main and High Street areas. A less conspicuous site inland should be found for the gasworks, off High Street, or, alternatively, the gasholder should be sunk below ground level.

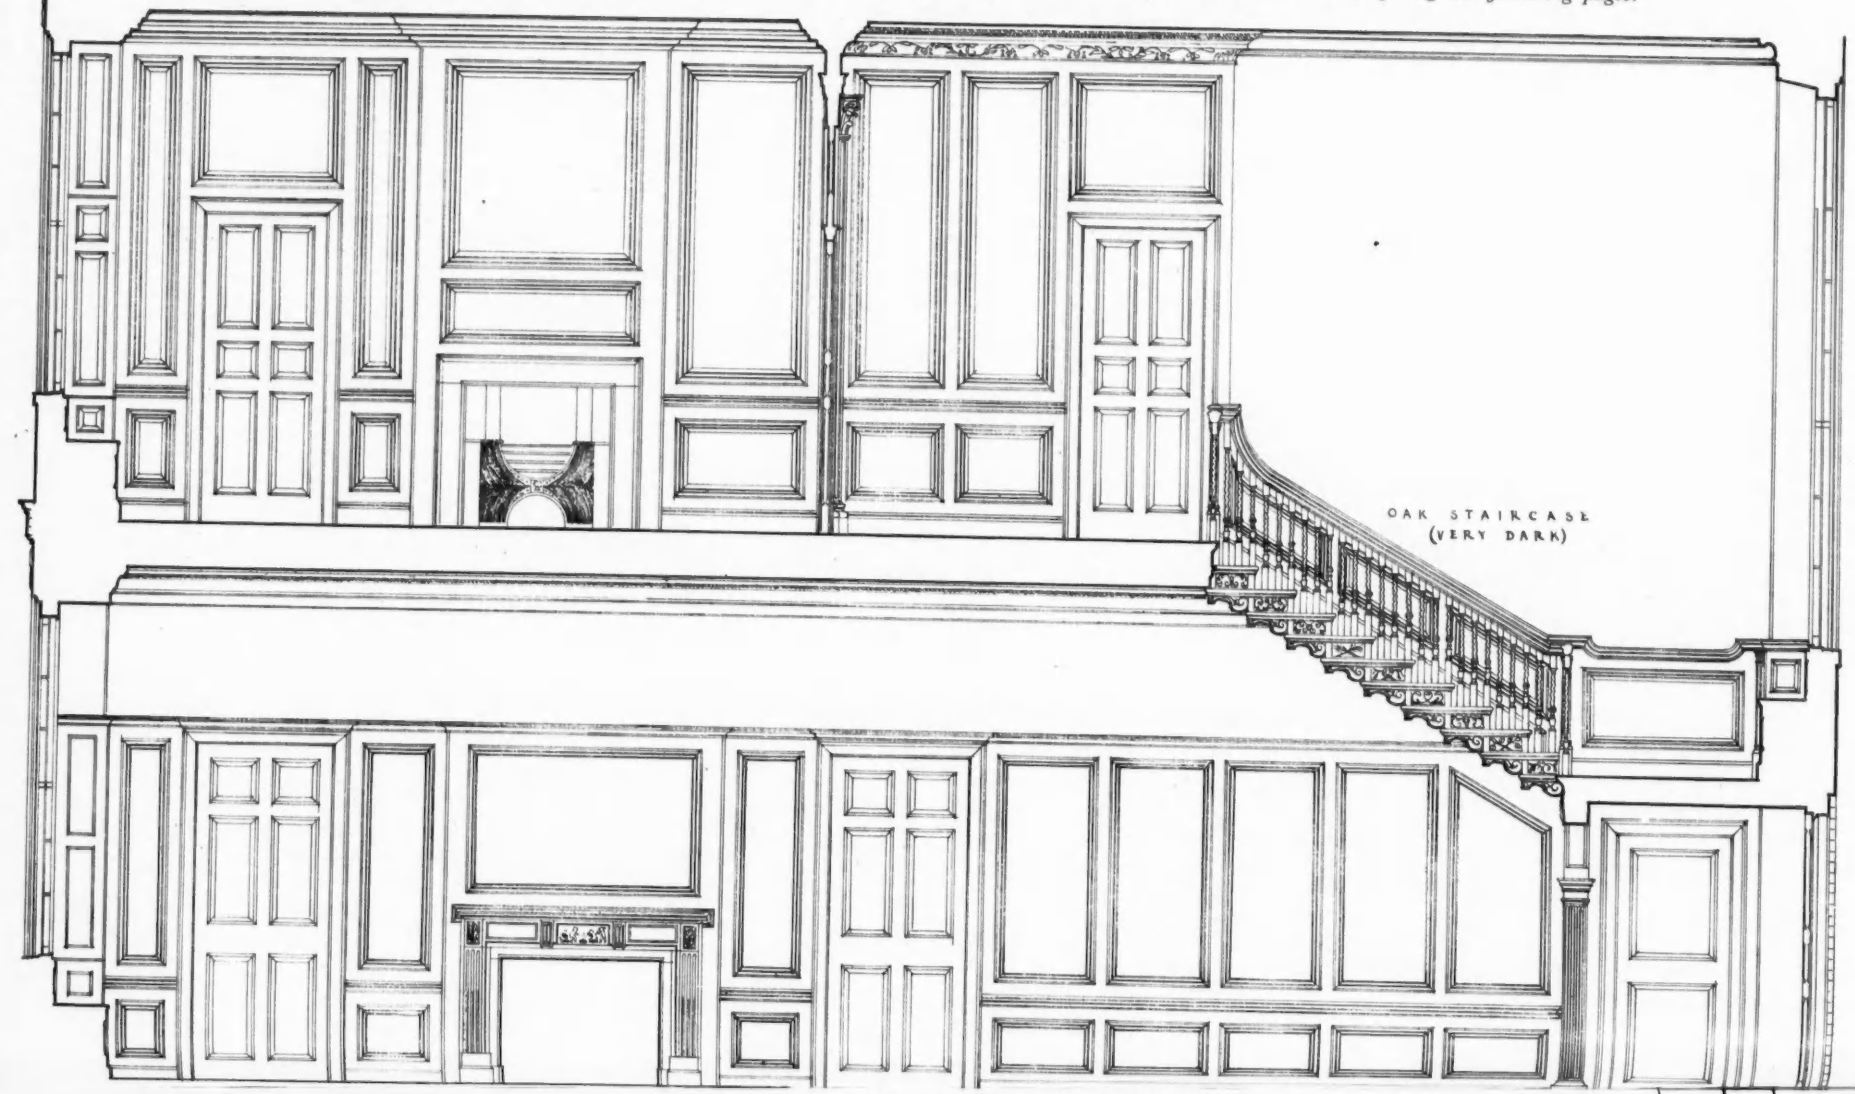


The competition for a new Grammar School at Ramsey, Isle of Man, has been adjudged by the assessor, Mr. T. Taliesin Rees, as follows:

First prize, £250. Messrs. Pearson, Son and Duffy, of Lancaster.

Second prize, £150. Messrs. Gray, Evans and Crossley, of Liverpool.

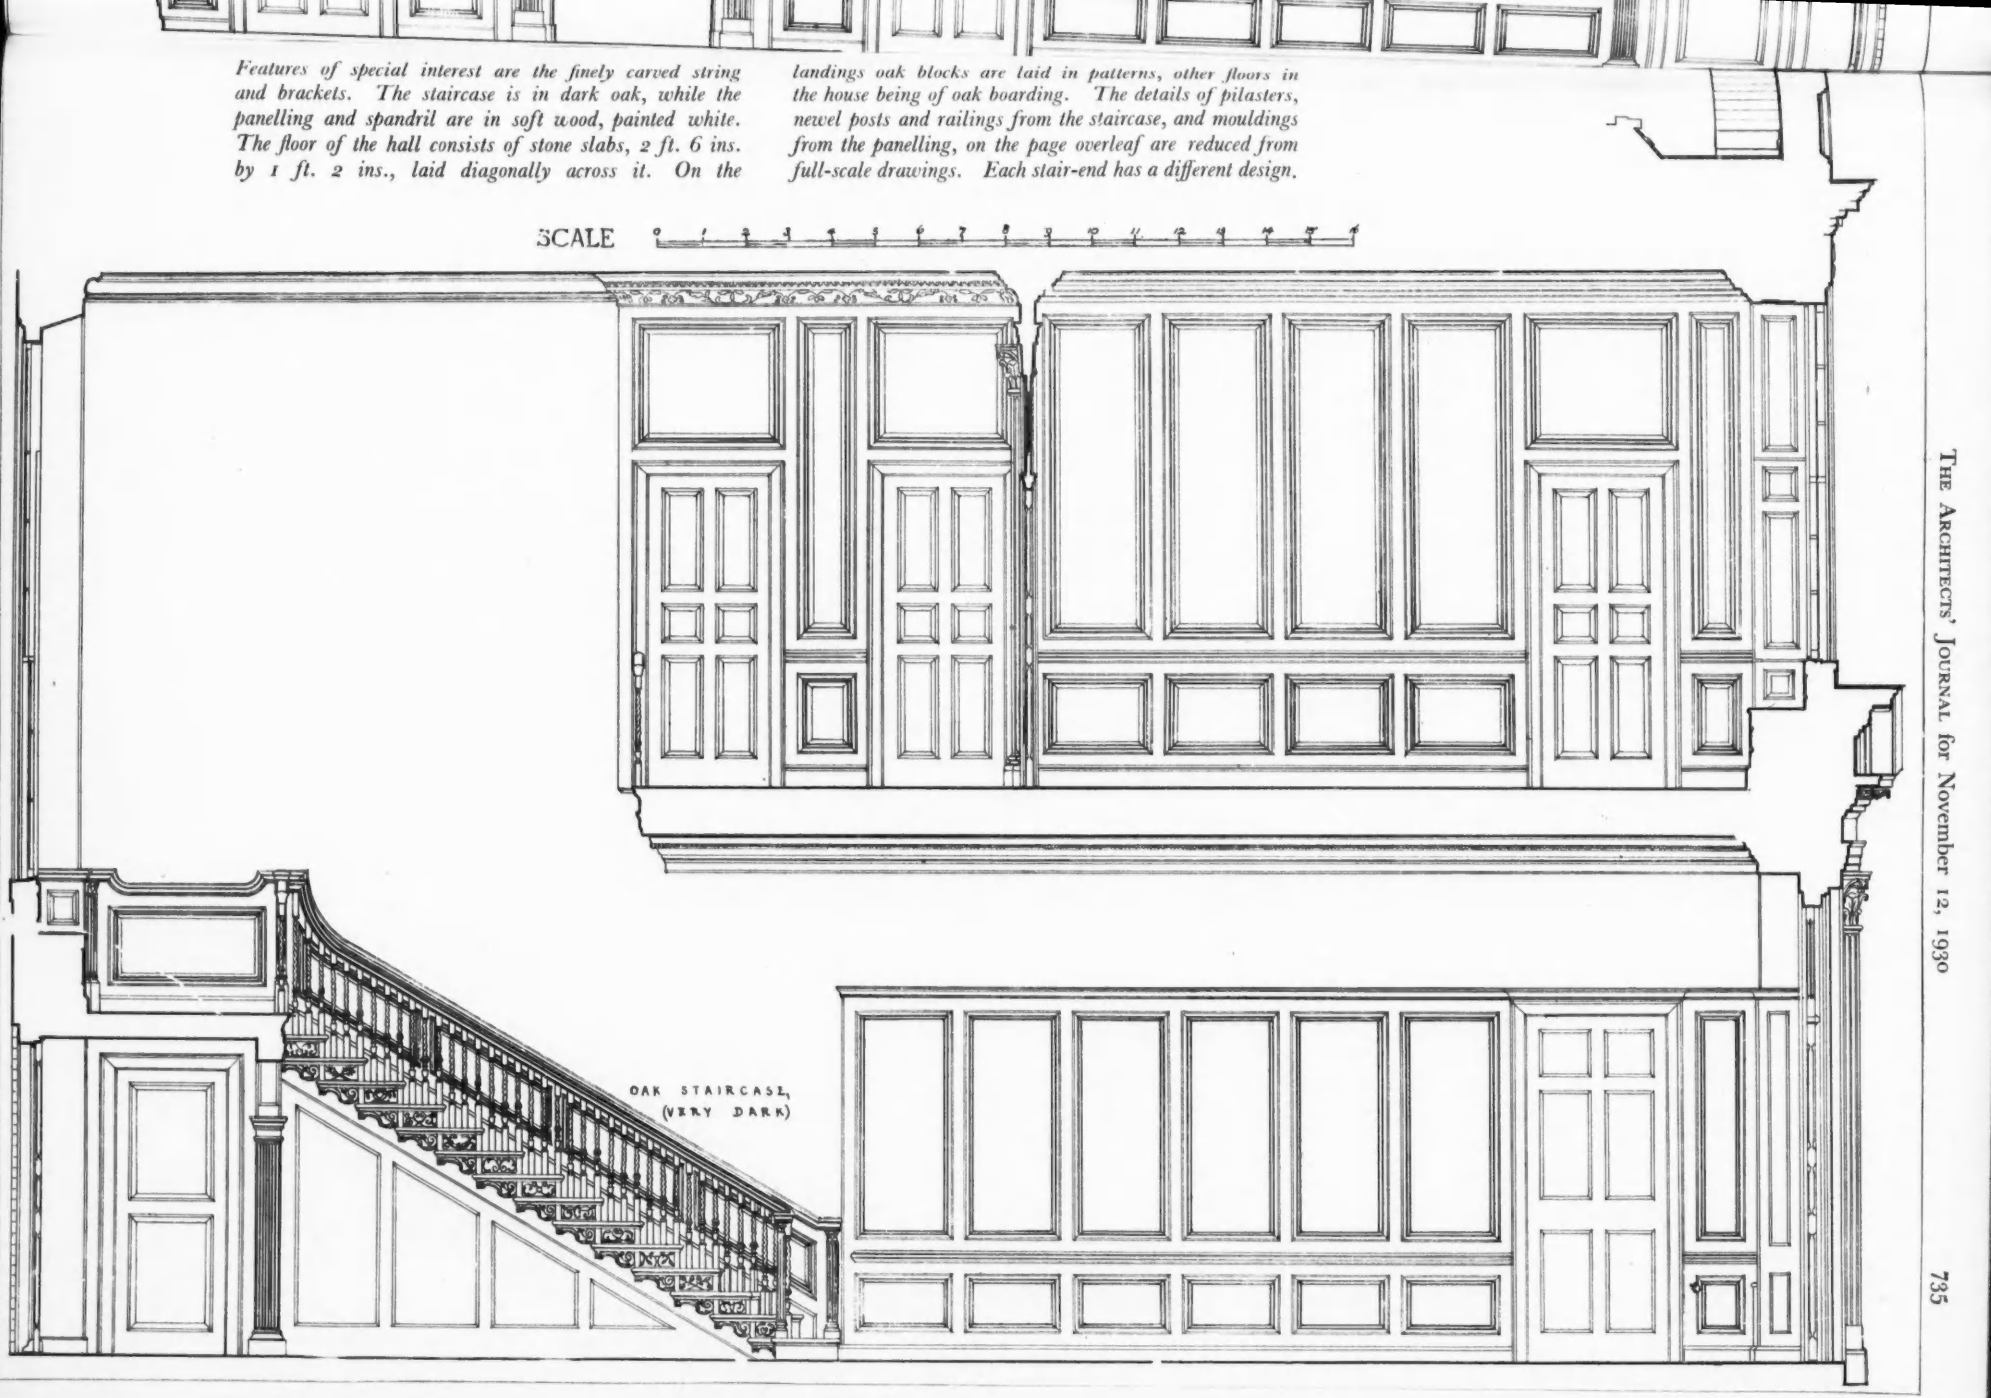
Elevations and plans of the improvements in the Queen's Parade district. A high level promenade is suggested with a sea walk ten feet below. Upon the lower promenade would be kiosks, rest shelters, etc.



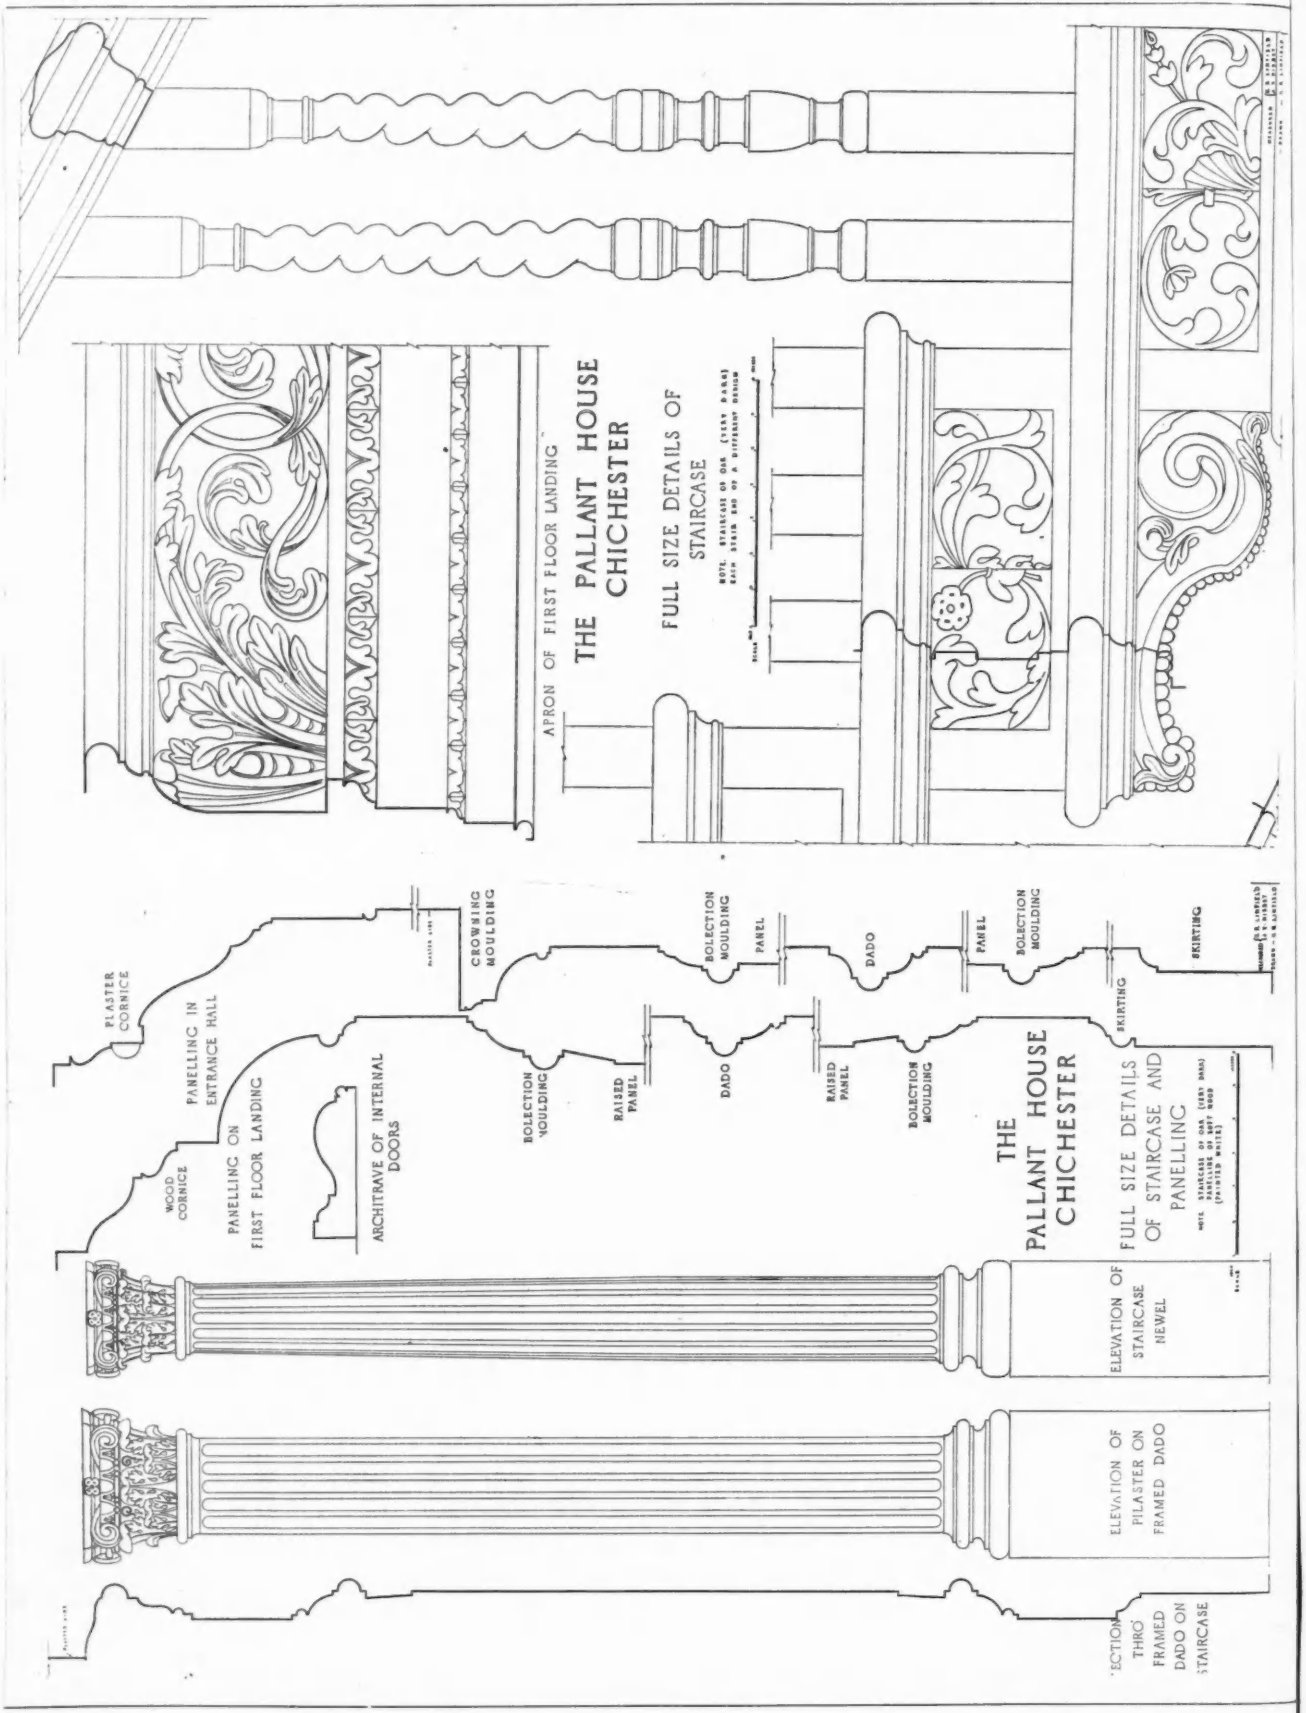
[*By Alec G. Jenson and F. Russell Cox.*

Plans and elevations of some of the proposed new buildings. These include kiosks, shelters, a motor-omnibus station, pier lights, and a starting station for the Royal Ulster Yacht Club. The complete scheme deals with two miles of coast line.

THE PALLANT HOUSE, CHICHESTER



SECTIONS OF ENTRANCE HALL



In conclusion of the series of subjects, measured by J. V. Nisbet and G. R. Linfield, and drawn by the latter, published in the issues for Oct. 22 and 29, sections and details of the panelled entrance hall and staircase of this house, dated 1711, and attributed to Wren, are reproduced on this and the facing and following pages.

Features of special interest are the finely carved string and brackets. The staircase is in dark oak, while the landings oak blocks are laid in patterns, other floors in the house being of oak boarding. The details of pilasters,

Features of special interest are the finely carved string and brackets. The staircase is in dark oak, while the panelling and spandril are in soft wood, painted white. The floor of the hall consists of stone slabs, 2 ft. 6 ins. by 1 ft. 2 ins., laid diagonally across it. On the landings oak blocks are laid in patterns, other floors in the house being of oak boarding. The details of pilasters, newel posts and railings from the staircase, and mouldings from the panelling, on the page overleaf are reduced from full-scale drawings. Each stair-end has a different design.

THE SPECIFICATION WRITER

Daylight Illumination: The Lighting of Picture Galleries

By JOHN W. T. WALSH, M.A., D.SC.

A SPECIAL problem in natural lighting, and one of exceptional difficulty, is the design of a room intended for the exhibition of pictures, especially when—as in the case of all the national collections housed in London — every picture has to be covered with glass. It is well known—in fact, a matter of common experience—that polished glass acts as a mirror reflecting an image of whatever is in front of it, the brightness of this image being about one-tenth of the brightness of the original object. Now, in the case of a dark painting, the image of the spectator's face reflected by the glass may well be as bright as the surface of the painting itself. In the case of some of Rembrandt's portraits, for instance, the average reflection factor of the picture is about 4 per cent. If the reflection factor of the spectator's face, then, is about 50 per cent., he will see an image of his face which is quite as bright as the detail of the picture. It is small wonder, therefore, that it becomes quite impossible in these circumstances to obtain a proper view of the picture and that efforts have been made to avoid the difficulty by putting the spectator into darkness while still providing ample light for the illumination of the pictures.

Galleries have been designed with this object in view, notably by Mr. S. Hurst Seager, and the matter has received much attention from H.M. Office of Works in this country. At their request experiments were undertaken by the National Physical Laboratory even before the Illumination Research Committee came into being. After the formation of that body the work was continued under its auspices and an extensive series of experiments was undertaken. The whole investigation has been described in Technical Paper No. 6 of the Illumination Research Committee,[1] and the results may be briefly summarized as follows:

(1) The picture wall of a gallery may be considered to be adequately lighted when the illumination of the pictures is 3·5 per cent. or more of the illumination of a horizontal surface placed under an unobstructed hemisphere of sky.

(2) Reflections in the picture glass of the spectators themselves and of the pictures and frames on the opposite wall should be avoided.

In a two-sided gallery, such as those almost universal at present, the only method of preventing cross-reflection between opposite walls is to erect a screen for the whole length of the room. The most satisfactory form of gallery is, however, a one-sided room of special design such as that adopted for Room XIII. in the new wing of the National Gallery, Millbank (Tate Gallery). The general features of the design were prepared by the architects in consultation with H.M. Office of Works, and experiments were then made at the National Physical Laboratory to determine the most suitable dimensions for combining adequate illumination of the picture-wall with complete freedom from objectionable reflections.

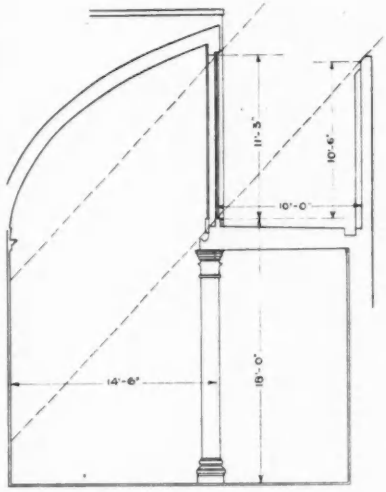

Figure eight. Section of arrangement adopted for special lighting of pictures at the National (Tate) Gallery, Millbank, London, S.W.

The form of section finally adopted was that shown in figure eight. The illumination of the picture-wall at the 4-ft. level was approximately equal to that specified above (daylight factor 3·5 per cent.), while the spectators, so long as they did not advance in front of the line of the pillars, did not receive an illumination of more than one-seventh that of the pictures opposite. It was to be expected, therefore, that the reflections would be almost negligible, and this expectation was fully justified by the results obtained in practice.

Even in the case of the darkest-toned pictures hung in this gallery, it is impossible to detect any reflections and the pictures appear, in fact, to be unglazed. To those interested in the subject of picture-gallery lighting, a visit to this room proves most interesting. The floor area necessary to provide a given area of picture-wall on this system is some 30 per cent. greater than in most galleries of ordinary design, since the room, although one-sided, is approximately two-thirds of the width of the ordinary double-sided gallery of similar construction.

THE PROBLEM OF FADING

Another problem connected with the lighting of picture galleries and museums is the prevention of fading both of the pigments used in painting and of the specimens exhibited, particularly certain kinds of butterflies and moths. This problem has formed the subject of some considerable study at different times, notably by Sir Sidney Harmer, but it is complicated by the fact that the power of the light to produce fading is much affected by other conditions, particularly air-humidity. An investigation is at present in progress to determine the extent to which the rate of fading can be reduced by the use of window materials which absorb the ultra-violet (i.e. the chemically and photographically most active) regions of the spectrum without noticeably altering the colour of the transmitted light.

"JUST ADEQUATE" DAYLIGHT

The figure generally used to express the value of the natural lighting at any point in a room is the "daylight factor"—i.e. the ratio of the illumination at that point to the simultaneous illumination of a horizontal surface exposed to a complete hemisphere of sky. For any given room it is clearly possible to draw contours of equal daylight factor and then, if it be assumed that a given daylight factor represents, for the average occupier, the limit of adequate lighting, the contour for that daylight factor will divide the room into two parts, one adequately and the other inadequately lighted. An attempt is now being made to determine whether or not such a division is actually feasible. A number of offices have been mapped out and contours of daylight factors have been plotted from actual measurements with an illuminometer. These offices have also been visited by a number of architects and other lighting experts competent to judge how much of each room could be regarded as just sufficiently well lighted for the performance of clerical work. It is the object of the investigation to determine whether a comparison of the two sets of observations will lead to a consistent value of the "just adequate" daylight factor.

ARTIFICIAL IMITATION OF DAYLIGHT

In some buildings it is necessary, even on fine days, to supplement the natural

[1] *The Natural Lighting of Picture Galleries.* Published by H.M. Stationery Office.

lighting in certain rooms by means of some form of artificial light. The use of ordinary light sources for this purpose has given rise to much objection and there seems to be a general prejudice against working in a "mixed" light, as it is usually described. The problem of finding the best means of supplementing an inadequate supply of daylight is therefore of great importance to the occupiers of such buildings. A series of experiments carried out at the National Physical Laboratory in 1925 and 1926 have some bearing on this matter. A small room was fitted up so that it could be illuminated by any one of the following four systems :

(i) Artificial daylight distributed as from a window.
(ii) Light of the colour of that given by tungsten filament vacuum lamps, similarly distributed.
(iii) Artificial daylight from a semi-indirect bowl fitting.
(iv) Light from a vacuum lamp in a semi-indirect bowl fitting.

To provide systems (i) and (ii) the window of the room was covered with diffusing material and illuminated artificially from the outside so as to give it a brightness of about one candle per square inch—i.e. about half the normal sky brightness on an ordinary dull day. This gave a very good imitation of the conditions prevailing when the room was illuminated by natural light from an overcast sky, except that there was no ground visible. A number of clerical staff worked for stated periods under these different systems and an attempt was made to determine which was generally considered the most comfortable and the easiest for working.

FUTURE WORK

Enough has been written, probably, to indicate the nature of the work which has been carried on and which is in progress in the field of research on natural lighting problems. There are yet many problems which remain to be attacked.

Among these may be mentioned the development of a simple portable instrument for the measurement of daylight factors. Much more information is needed, too, on the differences which exist between the daylight available in country districts and that which penetrates the comparatively murky atmosphere of some of our great cities and industrial centres. And glare, a subject of great importance in artificial lighting, is by no means an unknown factor in certain daylight problems.

(The above article concludes the series on this subject, begun and continued in the issues for October 15 and 29.)

Chromium-Plating

WITHIN the last four years chromium-plating has obtained a wide vogue; already it has largely replaced nickel-plating, bronzing, and even silver-plating. Its beauty, when skilfully executed, will be universally admitted, while the saving in labour and time resulting from its stainless properties constitutes a remarkable advantage. In this respect it is superior to the more expensive stainless steel, besides being free from the limitations of the latter for manufacturing purposes.

But there are still a great many faults in chromium-plated goods. These are usually, but not always, attributable to poor workmanship on the part of the plater. The purpose of this note is to suggest to the user points for scrutiny.

The manufacturer's first care should be to make sure that the metal to be plated is of good quality. A casting that is spongy, or has air bubbles in it, can never be made into a sound casting. Impurities in the metal may also affect the appearance after plating. Brass castings, for instance, frequently contain grit which cannot be eradicated.

Next, it is very important that the surface should be properly ground and then polished. Every irregularity, scratch, turning or grinding mark must be removed, otherwise the lustrous chromium-plated surface will emphasize these faults and the whole appearance of the article be spoilt.

Given good material, well polished, chromium-plating can be effectively completed, whether the base metal be iron, copper, nickel or an alloy.

On iron goods a heavy coat of copper must first be deposited in order to prevent rust. The thicker this coat is, the longer the iron will be kept from atmospheric influences. Chromium is *not* a rust-preventative, chromium being slightly porous. An extremely heavy (and therefore expensive) coat of nickel, which is not porous, may be substituted for copper, but the latter is to be recommended.

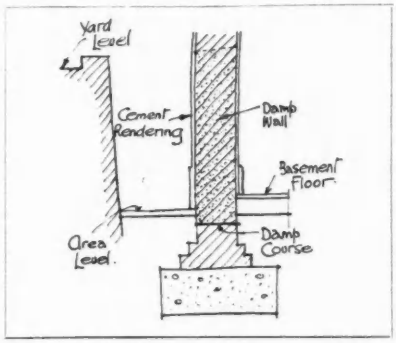
In the case of brass goods, it is most essential that a good coat of nickel be deposited before the article is chromium-plated. Three years ago this was not a recognized fact, and a great deal of trouble to purchasers of chromium-plated goods resulted. But in the light of present-day knowledge there is no excuse for any plater neglecting this important point, and it lies with the merchant to insist upon it. Apart from the matter of his own reputation, the inconsiderable extra charge may be more than outweighed by the putting right of goods complained of.

As an example, let us take the case of a lavatory waste flange, chromium-plated without a coat of nickel interposed. After a few months the chromium will begin to peel. The merchant will be put to the expense of having the flange removed and a new one fitted while the original one is replated—this time, it is to be hoped, by a reliable plater.

A little advice on the preservation of this beautiful finish will not be out of place. It must be borne in mind that, in comparison with nickel-plating, the initial cost is high. In fact, good chromium-plating cannot be produced at less than double the price of good nickel-plating, while inferior chromium-plating will cost much more than double the price of inferior nickel-plating. On the other hand, there is sound reason to believe that, given proper attention, chromium will last twice as long as its corresponding quality of nickel, thus halving installation charges over a period of years. Hence it is worth while to give it proper care.

Careless fitting may easily spoil a perfect article. We have all seen the results of plumber's grips used without due regard to the fine surface they come into contact with, or of a screwdriver allowed to slip across a finger-plate.

Again, when the fittings are finally installed, it does not do to neglect them. Chromium is certainly stainless. But dirt can settle upon it, and there are impurities in the air, such as acids, which will destroy chromium if allowed to remain upon it. The environs of a gasworks will almost certainly lead to the presence of sulphuric acid in the air. It is therefore incumbent upon the owner to see that the plating is kept clean. All that is necessary is to wipe the articles occasionally with a damp cloth, and particularly whenever any dullness is apparent. No metal-cleaning pastes or liquids should be used. They may contain acids deleterious to chromium. An abrasive powder or scourer will, of course, spoil the appearance of the plating. In this connection, it is noticeable that the plated fittings on cars give rise to no complaints, while door knockers, etc., are frequently complained of. The explanation is simple. In the one case, the owner sees that the parts are kept bright. In the other, months are allowed to elapse before attention.



To summarize, the essentials are : (1) a good base metal; (2) good workmanship in the preparation of the articles before plating; (3) the use of a technically sound and reliable job, as opposed to one apparently cheap but unreliable; (4) careful handling of the completed work; (5) precautions in preservation.

QUESTIONS THAT ARISE

Damp Wall

J. E. K. writes : "*It is proposed to make habitable an old house which has been empty for a considerable period. The lower story is a semi-basement, the floor of which is 5 ft. below the general ground level. An area, 15 ins. wide, with a total length of approximately 120 ft., surrounds the house. The floor of the area is covered with tiles 2 ins. thick, well pointed with cement, and the area is well drained. The whole of the walls are rendered externally in cement, painted.*

"*Internally the walls, which are papered, are damp for a height of about 4 ft. above the floor. The dampness extends round all external walls and is fairly regular. I had the tiling removed in several places, and the walling cut away, and found that there is a damp course, but this is 1 in. below the bottom of the tiling in the places I opened up, the earth below being very wet. My client wishes to put this work in order with the minimum of expense. I am suggesting cutting out the plaster to all external walls from the floor level to a height of 2 ft. above the dampness, and rendering with cement with the addition of a waterproofing powder. Do you think a satisfactory job will be made in this manner without disturbing any outside work? The accompanying sketch illustrates a section of the wall.*"

A section of a damp wall (see accompanying query by "J. E. K.")

If, as your correspondent says, he requires to make the house in question habitable, he will certainly have to spend more on this work than cutting out and rendering externally as he suggests.

If the dampness penetrates from the area, above the damp course, here is where the protection is needed. I suggest that he should take up the area tiling as required, hack away a portion of the external cement rendering to wall, and well rake out the brick joints. Cover the wall 6 ins. below the existing horizontal damp course and to, say, 9 ins. above, with two courses of slates in cement and sand of equal proportions. His client will probably not see any value for his money for at least twelve months, during which time the wall will be drying out. When the paper is stripped from the walls the plaster will in all probability be found in a very decayed state, and if he wishes to make the lower floor habitable it looks as if it will be necessary to cut out this defective work, and make good in waterproof cement.

W. A. D.

Aluminium Powder

P. A. writes : "*What is your expert's opinion on the following two questions :* (a) *What percentage of aluminium bronze powder should I add to white lead paint to increase its opacity for use as an undercoating?* (b) *Is it a fact that some remarkable interior decorative effects can be obtained by using aluminium bronze powder, in conjunction with ordinary paint pigments and the varnish vehicle used for making up the aluminium paint*"?

In reply to your correspondent's first query, the addition of 5 per cent. of aluminium bronze powder to white lead, zinc oxide, lithopone and similar white paints will materially increase the opacity of the latter for use as undercoatings, and will at the same time make them more durable in positions which are exposed to strong sunlight.

The last-named virtue is due to the fact that the aluminium flakes tend to protect a large proportion of the oil vehicle against the destructive influence of the sunlight. For this same reason, aluminium paint itself is claimed to have an extra long "life" when used in exposed positions.

Regarding the second query, your correspondent is quite correct, in that aluminium bronze powder can be used as he suggests. A mixture of ten parts of red oxide with twenty parts of aluminium bronze powder and seventy parts of vehicle, gives an attractive rose tint. Five parts of brown oxide, fifteen parts of chrome yellow or fifteen parts of chrome green, each with twenty parts of aluminium bronze powder and the balance made up with vehicle, will give other shades of a similar nature. These paints are unique in appearance, since they combine the metallic lustre of the aluminium with the particular colour of the actual pigment employed.

C. H. B.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Town Planning Schemes

DURING a recent debate on unemployment, Mr. Lloyd George called attention to town planning, and said that they had at present eighty regional committees, about thirty of which had devised schemes which they were prepared to put into operation. Surely this was the time to do it and to give the workers some opportunity of living under healthy conditions. Could not the Prime Minister consent to the preliminary suggestion that a committee of expert town planners with representatives of the municipalities and Government departments should consider these schemes and decide which of them should be put into operation? If that were done there would be work for a very considerable number of people.

At question-time Sir K. Wood asked for the number of town-planning schemes finally approved and put into force since the beginning of June, 1929, and the number of preliminary statements of town-planning proposals approved since that date.

Mr. Greenwood replied that the numbers were four and forty-four respectively.

Expenditure on Educational Buildings

Captain Waterhouse asked the President of the Board of Education if he would state the amount of capital expenditure on buildings for elementary and secondary schools, respectively, for 1913; for each of the years 1924 to 1929; and for the last twelve months for which figures are available.

Sir Charles Trevelyan said that the figures were as follows :

CAPITAL EXPENDITURE OF LOCAL EDUCATION AUTHORITIES.

Financial Year.	Elementary Schools.	Secondary Schools.
Actual expenditure—	£	£
1912-13	2,290,000	844,000 (see note)
Proposals approved by the Board—		
1923-24	1,094,000	688,000
1924-25	2,468,000	1,698,000
1925-26	3,477,000	2,016,000
1926-27	3,322,000	1,974,000
1927-28	3,860,000	1,914,000
1928-29	4,299,000	1,855,000
1929-30	5,510,000	2,292,000
1930-31 (six months)	4,495,000	1,270,000

Note.—The figures for 1912-13 related to higher education generally. Separate particulars for secondary schools were not available.

Progress of the Bridges Schemes

In reply to Major Nathan, who asked if he would state the present position with regard to the Waterloo and Charing Cross Bridge schemes, Mr. Morrison, the Minister of Transport,

said that the committee appointed by the L.C.C. to advise them on the subject of a Charing Cross Bridge had not yet reported, and he understood that the question of the reconstruction of Waterloo Bridge was, in the meantime, in abeyance.

British and Foreign Kerbs

Mr. L. Smith asked the Minister of Transport whether, in view of his note to divisional road engineers in favour of the use of British kerb in road-making, he could state whether imports of Norwegian granite kerb were still coming into this country.

Mr. Morrison said he believed that Norwegian granite kerb was still imported. He understood that, owing to the large programme of roadworks now in hand, there was such a wide demand for British granite kerb that highway authorities, much to his disappointment, experienced great difficulty in obtaining their requirements from British quarry-owners.

Housing Shortage

Mr. Ramsbotham asked the Minister of Health whether the housing shortage was definitely at an end.

Mr. Greenwood said it was common knowledge that there was still a widespread shortage of working-class houses. He would be better able to judge its local incidence in presence of the results of the survey prescribed by section 25 of the Act of 1930 to be made by local authorities.

Housing Subsidies

Mr. Greenwood informed Sir K. Wood that the total amount paid in housing subsidies in England and Wales since 1918 was £91,614,488, of which £15,608,326 had been paid since June 30, 1929. The amount estimated to be expended during the current financial year was £11,855,000.

Mr. Greenwood informed Mr. Day that the number of houses of a rateable value not exceeding £78 (£105 in the Metropolitan Police District) completed during the year ended March 31, 1930 in England and Wales was 202,060, of which 5,718 were completed in the County of London or on estates of the London County Council outside the county boundary.

Housing (Rural Workers) Act, 1926

Mr. Adamson, the Secretary of State for Scotland, informed Mr. Scott that as at September 30, 1930—the latest date for which information was available—grants had been promised by local authorities in Scotland under the provisions of the Housing (Rural Workers) Act, 1926, amounting to £530,264 16s. 8d. Of this sum £295,239 4s. 4d. had been paid at that date.

Slum Clearance

Mr. Albery asked the Minister of Health whether he could now report any accelerated progress in slum clearance.

Mr. Greenwood said he could not, since time must obviously be allowed to local authorities to formulate their proposals under an Act which became law as recently as August last.

Asked by Sir K. Wood if he would state the number of buildings acquired by local authorities in connection with approved slum clearance schemes, Mr. Greenwood said that the number in England and Wales between March 31, 1930, and June 30, 1930, the latest date to which complete figures were at present available, was 463.

The Architects (Registration) Bill

Somewhat to the general surprise of members, the House of Commons on Friday, November 7, gave a second reading without a division to the Architects (Registration) Bill, the debate on the Rabbits Bill, which was first on the Order Paper, having lasted only a couple of hours, instead of the whole day, as had been expected. The Architects Bill will now be the second on the list of Bills to go to a Standing Committee, and its future prospects are favourable.

The Bill this year was in the hands of Lt.-Col. Moore, the Unionist member for Ayr Burghs, who moved the second reading in an able and conciliatory speech. He disarmed much of the criticism that the Bill might have encountered by stating frankly that the promoters were not asking for anything unreasonable. They wanted to be assured that when a man was called an architect he had the qualifications necessary to give efficient and useful service to those who employed him. If the House allowed the Bill to go to a Standing Committee, the promoters would be ready to consider any reasonable suggestion for its improvement. Lt.-Col. Moore also traced the history of the Bill in some detail, and explained that the promoters were the R.I.B.A., which had a membership of about 8,000. The Bill provided for the establishment and maintenance of a Register of Architects, to which would be admitted without examination all persons practising as *bona-fide* architects, all those who were under instruction, and those engaged as architects' assistants. The Bill allowed these persons five years in which to apply for admission to the register. Persons desiring to join at a later date would have to pass an examination; and an Architectural Examination Board, consisting of men of high knowledge and wide experience, would be set up. Clause 7 established a Discipline Committee, on which representatives of the Law Society and of the Ministry of Health would be co-opted. This committee would have the power to remove names from the register, with a right of appeal to the Law Courts. The Bill would protect the public and make the architectural profession safe, secure and dignified.

Mr. Ben Tillett, one of the Labour leaders, who seconded, knew of no profession which called for more organization that that of the architect. The profession that was not organized stood to lose a great deal through chaos and uncertainty, and if architects could command an authoritative body of opinion, nationally expressed, they would do a great deal to abolish "jerry-building." The architects of the country had the power to reorganize our housing system in such a way as to make it worth handing down to posterity as a lesson and an example.

The approval of the architects of Northern Ireland was voiced by Col. Sinclair, who said that a system of registration would have a beneficial effect both morally and materially on the profession, and would benefit the public as well.

Mr. Mills, the Labour member for Dartford, was doubtful of the effect which the Bill would have on young men who, working as plasterers, joiners and bricklayers, were giving their spare time to improving their capacity to serve their crafts.

Mr. Geoffrey Shakespeare, from the Liberal benches, pointed out that, if ever a Bill had been subject to the scrutiny of Parliamentary procedure and debate, it was this Bill. The principles of the Bill, he declared, were in accordance with the tendencies of modern life, and the House ought not to deny to the oldest and most honourable profession the right to raise its status, as other professions had done.

Mr. March, however, the Labour member for Poplar, said that, unless assurances of reasonable consideration were given to other associations outside the R.I.B.A., he would oppose the Bill.

Sir Martin Conway made a powerful speech in favour of the Bill, and repeated the assurance that the R.I.B.A. was ready to meet objections with the utmost willingness to satisfy legitimate criticism.

Mr. Short, the Parliamentary Secretary to the Home Office, then put the Government view. He said that they must all recognize that there was a wide divergence of opinion among architects as to the merits of the Bill. There was a large body of opinion, including the Incorporated Association of Architects and Surveyors —the second largest association, he thought, of architects—who were very much averse to the provisions of the Bill. It would, therefore, be well, if the Bill reached the Committee stage, that these facts should not be ignored, and that a real attempt should be made to secure agreement. While not going into the merits or demerits of the Bill,

he said they could all agree with it so far as it sought to establish a higher educational standard. Many people feared that the Bill would create another very close corporation. They were entitled to regard the matter from a different point of view from the case of doctors, dentists, or lawyers. They were dealing with creative art, and it would be unfortunate if art should be robbed of great artists because they were not registered. The Government intended to leave the Bill to a free vote of the House.

After a strong speech in opposition to the Bill from another Labour member, Mr. Broad, who declared that it was unnecessary, that it would bring about a close corporation and would maintain the profession for a certain class only, the Bill was read a second time. It was referred to a Standing Committee.

SOCIETIES AND INSTITUTIONS

PROPOSED PALACE OF JUSTICE, ATHENS

THE following resolution has been passed by the Council of the R.I.B.A.: "The Council of the R.I.B.A. share the apprehension of the Académie des Beaux-Arts at the proposal of the Greek Government to erect a Palace of Justice near the Acropolis and close to the Theatre of Dionysos. They join with the Académie des Beaux-Arts in hoping that the Greek Government will consider the danger of interference with these great monuments by placing a modern building in juxtaposition with them."

HANTS AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION

The annual general meeting of the Hants and Isle of Wight Architectural Association was held at the Castle, Winchester, under the chairmanship of the President, Mr. J. Arthur Smith, F.R.I.B.A.

The Hon. Secretary presented the balance sheet for the session 1929–30, which was adopted on the motion of the chairman.

The President, in his annual address, traced the history of the Registration Bill and rejected the idea that the campaign for this had been quite unsuccessful. The contrary was the fact. It was recognized from the first that to get the Bill passed would be a long business requiring years of patient persistence. In a little more than three years of campaigning, the Bill had (1) been given a second reading in the House of Commons; (2) received a favourable verdict from a Select Committee; (3) passed through all its stages in the House of Lords; (4) received a certain amount of Government support; (5) the interest opposed to it in the House of Commons had greatly weakened. He went on to urge that to secure the passage of the Bill it was important that they should strengthen their membership by bringing every reputable and well-qualified architect into their ranks.

Mr. Smith pointed out that the proposal for reopening the Licentiateship of the R.I.B.A. offered an entry to its ranks to many established architects who were non-members, and they should have no hesitation in thus enrolling themselves. He urged all members to see that assistants, pupils, and students were attached to a society allied to the R.I.B.A.

In dealing with the affairs of his own Association, the President reviewed the activities of the past year, including lectures, addresses, excursions, and meetings of an educational and social character. He stated that forty new members had been enrolled during the past year, bringing the total membership up to 250.

A vote of thanks to the President was proposed by Colonel R. F. Gutteridge and seconded by Mr. H. S. Sawyer.

LIVERPOOL ARCHITECTURAL SOCIETY

Reference to Sir Edwin Lutyens's design for the proposed Roman Catholic Cathedral, and criticism of various building developments in Liverpool, was made by Professor L. Patrick Abercrombie in his inaugural address as president of the Liverpool Architectural Society.

Professor Abercrombie said the greatest architectural event in recent years had been the scheme to build a new cathedral in Liverpool to the design of Sir Edwin Lutyens, but he hoped that Sir Edwin's design might be amended before the cathedral was actually built, and that Dr. Downey would not tie Sir Edwin down too much to his first ideas.

Professor Abercrombie suggested the issuing of a "Cautionary Guide to Liverpool," which, he thought, might shame Liverpool into taking more care of the more ordinary type of building in its midst. Nevertheless, he acknowledged that in addition to Liverpool's fine collection of old buildings and the cathedral, a large volume of good things was growing in their midst—churches, banks, shops, schools, houses, etc.—from all of which much of the art and practice of architecture could be learned.

It was announced that the H. W. Williams Scholarship, valued at £50, had been awarded to Mr. R. P. S. Hubbard. Mr. Frank H. Nittler was honourably mentioned.

A LECTURE ON ST. PAUL'S

Under the auspices of the South Wales Institute of Architects (Central Branch) and the Institute of Builders (South Wales Branch), a lecture on "The Work at St. Paul's Cathedral" was given at the Engineers' Institute, Park Place, Cardiff, recently, by Mr. E. J. Bolwell, Clerk of Works, St. Paul's Cathedral. Mr. J. E. Turner, J.P., presided.

Mr. Bolwell, with the aid of an excellent collection of lantern slides, specially taken for the purpose, described in detail the great scheme of work which had been undertaken during recent years with the object of restoring Sir Christopher Wren's masterpiece. He made quite clear to his audience the nature of the work in strengthening the piers with bars of stainless steel and cement, and also the extremely complicated and difficult task of making secure the dome supports by means of great rods and chains of the same non-corrosive metal.

A vote of thanks to the lecturer was proposed by Mr. H. Norman Edwards, of the South Wales Institute of Architects (Central Branch), and seconded by Mr. T. E. Gough (South Wales Branch, Institute of Builders).

ARCHITECTURAL ASSOCIATION OF IRELAND

Mr. Alfred E. Jones, M.R.I.A.I., in his presidential address to the Architectural Association of Ireland, suggested that one of the best ways of studying the history of architecture in detail was the measuring and sketching of old buildings. He dealt with the best methods of making surveys, particularly surveys of buildings of an antiquarian nature, and spoke of what had been done in Ireland in compiling a record of the architectural and antiquarian remains by means of measured drawings in the past, and to suggest what could be done in the future.

Referring to the National Monuments Act, 1930, passed into law by the Free State Government, which made provision for the protection and preservation of national monuments and archæological objects, he said it might include any building of historical, architectural, traditional, artistic or archæological interest. He suggested that the time was opportune for the Advisory Council set up by the Government to recommend the publication from time to time of a complete history of the country's ancient buildings and antiquities.

Mr. J. V. Downes proposed a vote of thanks to the president, which was seconded by Mr. T. J. Cullen.

STYLES IN ARCHITECTURE

An address on the care and protection of ancient buildings was given by Mr. A. R. Powys, Secretary of the S.P.A.B., at a luncheon of the Dorking Rotary Club. Mr. Powys said that a style of architecture which was admired in a beautiful building represented a

response to the circumstances of the age in which the building was erected. It was a true response to the senses of the men working at that time. It was not a copy of a past style of architecture, but a work in the pure style of architecture of the day the building was erected.

GOTHIC ARCHITECTURE

Sir Banister Fletcher, P.R.I.B.A., lecturing at the Central School of Arts and Crafts on Wednesday last, gave an illustrated comparative analysis of the Gothic architecture of Italy, pointing out the many distinctive features and describing, in detail, many of the churches.

LAW REPORT

RE-ASSIGNMENT WITHOUT ASSENT — QUESTION OF WAIVER

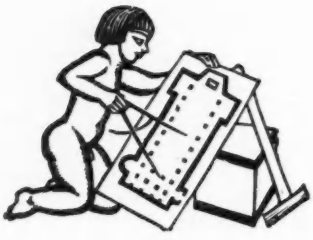
The Fulham and Hampstead Property Co., Ltd., v. *Pitt. King's Bench Divisional Court. Before Justices Swift and Acton*

THE point in this appeal was an award of £100 damages for breach of covenant not to assign the lease of a house at 99 Broadhurst Road, Hampstead.

The issue came before the Court on an appeal by the defendant, Mr. Percy Pitt, from a judgment of Judge Snagge, sitting at the Marylebone County Court, in favour of the plaintiffs in the action, the Fulham and Hampstead Property Co., Ltd., the owners of the house.

Mr. Hanbury Aggs, for the appellant, Mr. Pitt, said in 1925 the company assigned to his client a twenty-one years' lease of the premises at £160 per annum. In 1928 his client transferred the lease to a Mrs. Roberts, he having moved, and the company having refused its assent to the assignment. Mrs. Roberts, however, left the premises after six months' occupation, and the company then resumed possession and endeavoured to re-let at £225 per annum. Under the lease the company claimed from the appellant in respect of dilapidations. Ultimately, they sued for damages for breach of covenant on the assignment of the lease to Mrs. Roberts, and the jury awarded them £100 and judgment was entered against his client for the £100.

Counsel said his argument was that here the company had been guilty of waiver, both as regards re-entry and acceptance of rent from Mrs. Roberts, and that they were barred from maintaining their action.



The Court, after long arguments, dismissed the appeal with costs, holding that the county court judge arrived at a right decision and that the sum awarded was a proper amount, and further that the company had not been guilty of waiver of any right they had to claim for damages resulting from the breach of covenant not to re-assign.

COMPETITIONS OPEN

November 17.—The Scarborough Education Committee invites architects to submit competitive designs for the Seamer Road New School. Assessor: Morris Thompson, F.R.I.B.A. Premiums: £100, £60, and £40, for designs placed first, second and third, respectively. Applications for conditions of the competition should be made to R. Underwood, Director of Education, Education Offices, Huntriss Road, Scarborough, not later than November 17. Deposit £1 1s. Latest date for submission of designs: January 17.

November 30.—The Guildford Cathedral Committee invites any architect, who has been engaged in the design of cathedrals or churches, to submit for examination drawings and other illustrations of his works; or a design for a cathedral. Not more than three sets of drawings may be submitted, packed in one large portfolio. The Committee, with the assistance of Mr. Walter Tapper, A.R.A., will examine the portfolios, and select a limited number of architects for the Final Competition. Each architect selected for the final competition will receive 500 guineas, whether his design is accepted or not. Portfolios should be addressed to The Venerable the Archdeacon of Surrey, The Diocesan Office,

THE ARCHITECTS' JOURNAL

Lloyds Bank Chambers, Guildford, not later than November 30.

December 6.—The Bermondsey B.C. invites competitive designs for a proposed new medical clinic in Tower Bridge Road, S.E. The assessors will comprise representatives of the L.C.C., Ministry of Health and the Bermondsey B.C. Premiums: £250, £150 and £50 for first, second and third place, respectively. Applications for the conditions of the competition and site plan should be made to E. Goff Clark, Town Clerk, Town Hall, Spa Road, Bermondsey, S.E.16, by December 6. Deposit £2. Latest date for submission of designs: January 10, 1931.

December 31.—The Incorporated Association of Architects and Surveyors invites competitive designs for a Model Petrol Filling and Service Depot. The competition has the full support of the Automobile Association, the Scapa Society and other bodies which have at heart the preservation of the countryside, as well as the principal motor-trade journals. Assessors: Alfred Stephens Cross, M.A. (CANTAB.), V-P., I.A.A.S.; Edward H. Fryer, Deputy Secretary of the Automobile Association; and Walter Groves, Editor of *The Motor*. Prizes: 50 guineas, 20 guineas and 10 guineas for first, second and third places, respectively. Smaller awards may also be made on the advice of the assessors, and at the discretion of the Council of the Association. In addition a prize of 10 guineas and two prizes of 5 guineas each will be awarded to laymen for the best suggestions submitted with or without sketches. Full particulars, etc., are obtainable from the Secretary, the Incorporated Association of Architects and Surveyors, 1 Wilbraham Place, London, S.W.1. Latest date for submission of designs: December 31, 1930.

February 1.—The Norwich Corporation invites architects practising in Norwich and in the County of Norfolk to submit competitive designs for a proposed new fire station to be erected on a site in Bethel Street, Norwich. Conditions of the competition are obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. Deposit, £1 1s. Latest date for submission of designs: February 1, 1931.

No date.—The Committee of the Foundation Hospital and the Rectorate of the Royal Yugoslavian University of Zagreb invites competitive designs for the general rebuilding plans of the Foundation and Clinic Hospital of Zagreb. Assessors: 1. Dr. Srkulj Stjepan, Burgomaster and Chairman of the Foundation, as president of the jury. 2. Henauer, W., architect, of Zurich (or his representative, Ch. Thevenaz, architect, of Lausanne), for the Swiss Engineers' Association of Germany. 3. Dr. Ing. Kreis Wilhelm, of Dresden, for the Engineers' Association of France. 4. Arch. Expert H.R., of Paris, for the Engineers' and Architects' Association of France. 5. Dr. Culumovic Pavao, Primarius, for the Medical Association of Zagreb. 6. Ing. Gabric Franjo, for the Yugoslavian Association of Engineers and Architects, Zagreb section. 7. Dr. Rasuhin Josip, deputy for the Directors of the Institute of Hygiene Foundation Hospital of Zagreb. 8. Prof. Dr. Prasek Emil, for the medical faculty of Zagreb. 9. Dr. Durst Franjo, for the medical faculty of Zagreb. 10. Arch. Heinzel Vjekoslav, Alderman of the City of Zagreb. Committee representative of the jury: Ing. Jurkovic Mato, Stadtbaurat in Zagreb. Prizes: 1st, 20,000 Swiss francs; 2nd, 15,000 Swiss francs; 3rd, 10,000 Swiss francs. 15,000 Swiss francs have been set aside for any further work which may be required. Programme and particulars of the competition will be sent on or after August 15, 1930, on application to the Stadtvorstand of Zagreb (Mr. Matica, secretary), Room No. 70, 2nd floor, on payment of 200 dinar. Latest date for submission of designs: January 15, 1931.

THE ARCHITECTS' DIARY

WEDNESDAY, NOVEMBER 12

R.I.B.A., 9 Conduit Street, W.1. Exhibition of photographs of original drawings by Sir Christopher Wren. Until November 14.

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Exhibition of Members' Holiday Sketches. Until November 27.

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "The Royal Society of Arts Competition of Industrial Designs." By Professor A. E. Richardson, F.S.A., F.R.I.B.A. Chairman: The Rt. Hon. Lord Stanmore, C.V.O. **8 p.m.**

INSTITUTION OF WELDING ENGINEERS. At the Institution of Mechanical Engineers, Storey's Gate, St. James' Park, S.W.1. "Metal Surface Hardening." By A. E. Shorter, M.B.E., A.M.I.MECH.E. (Lantern Illustrations.) **7.45 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "A Comparison of English and Foreign Building Laws." By C. H. Cottew, M.INST.S E. **6.30 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Yates Lectures. Fifth of a course of eight public lectures on "Greek Myths and their Representation in Art." By Professor A. E. Gardner. (Lantern Illustrations.) 5 p.m. Third of five public lectures on "Re-planning of London, *c.* 1520–1920." By Miss E. Jeffries Davis. 5.30 p.m. **5 p.m.**

ROYAL ACADEMY, Burlington House, W.1. "Modern Pigments: Their Proper Selection and Use." By A. P. Laurie, D.SC. **4 p.m.**

VICTORIA AND ALBERT MUSEUM, Cromwell Road, South Kensington, S.W.7. Lecture Theatre, "English Mediæval Painting." By W. G. Constable, F.S.A. (Lantern Illustrations.) **5.30 p.m.**

Secretaries of architectural and allied societies are invited to forward particulars of their forthcoming meetings and visits for publication on this page. They should be addressed to the Editor at 9 Queen Anne's Gate, S.W.1.

FRIDAY, NOVEMBER 14

SOUTH-EASTERN SOCIETY OF ARCHITECTS. Brighton Chapter. Smoking Concert, to be held at Booth's Restaurant, East Street, Brighton. Chairman: John L. Denman, F.R.I.B.A.

TOWN PLANNING INSTITUTE, Caxton Hall, Caxton Street, Westminster, S.W.1. Presidential Address by F. W. Platt. **6 p.m.**

ILLUMINATING ENGINEERING SOCIETY. At the Royal Society of Arts, John Street, Adelphi, W.C.2. "Lighting of Offices and Public Buildings." By J. A. Macintyre. **6.30 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS. Midland Counties Branch. At the Chamber of Commerce Buildings, New Street, Birmingham. "Stresses in Angle Sections." By F. C. Bridge. **6.30 p.m.**

CHADWICK LECTURES. At the R.I.B.A., 9 Conduit Street, W.1. "The Object and Methods of Sewage Treatment, particularly in Relation to Inland Towns and Isolated Institutions." By J. H. Coste. Chairman: Sir George Humphreys, K.B.E., M.INST.C.E. **8.15 p.m.**

ROYAL ACADEMY, Burlington House, W.1. "Painting Media: Oils, Varnishes and Tempera." By A. P. Laurie, D.SC. **4 p.m.**

SATURDAY, NOVEMBER 15

Sunrise, 7.16 a.m. Sunset, 4.12 p.m.

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to the Church of St. Stephen, Walbrook, E.C.4. **2.30 p.m.**

HORNIMAN MUSEUM, Forest Hill, S.E.23. "The Lake Villages of Somerset." By H. St. George Gray, F.S.A. **3.30 p.m.**

MONDAY, NOVEMBER 17

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Executive Committee. 4 p.m. General Meeting. "Public Control of Buildings: The Position in 1930." By A. N. C. Shelley. 8 p.m. Also, Licentiates' Examination to qualify for Fellowship. Until November 21. **4 p.m.**

ROYAL ACADEMY, Burlington House, W.1. "Methods of Wall Painting." By A. P. Laurie, D.SC. **4 p.m.**

TUESDAY, NOVEMBER 18

ROYAL ACADEMY, Burlington House, W.1. "The Theory of Colour and its Application to Painting." By A. P. Laurie, D.SC. **4 p.m.**

INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Ordinary Meeting. "The Lockaber Water Power Scheme." By William T. Halcrow, M.INST.C.E. **6 p.m.**

WEDNESDAY, NOVEMBER 19

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "Persian Painting." By Laurence Binyon, LL.D. Chairman: Sir Arnold Wilson, K.C.I.E., etc. **8 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Italian Mediæval Architecture: Bridges, Castles, Palaces." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

ROYAL ACADEMY, Burlington House, W.1. "Early Methods of Oil Painting." By A. P. Laurie, D.SC. **4 p.m.**

INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Students' Meeting. Address by Arthur T. Black, STUD.INST.C.E. Chairman: Sir George W. Humphreys, K.B.E. **6.30 p.m.**

THURSDAY, NOVEMBER 20

GEFFRYE MUSEUM, Kingsland Road, Shoreditch, E.2. "The Progress of Furniture Craftsmanship from 1650 to 1700." By John C. Rogers, A.R.I.B.A. **7.30 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS. Yorkshire Branch. At the Metropole Hotel, Leeds. "Concrete and Critics." By A. W. Legat, M.INST.C.E. **7 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Yates Lectures. Sixth of eight public lectures on "Greek Myths and their Representation in Art." By Professor A. E. Gardner. (Lantern Illustrations.) 5 p.m. Fourth of a series of five public lectures on "Re-plannings of London, *c.* 1520–1920." By Miss E. Jeffries Davis. 5.30 p.m. **5 p.m.**

VICTORIA AND ALBERT MUSEUM, Cromwell Road, South Kensington, S.W.7. Lecture Theatre. "English Alabaster Carvings." By W. L. Hildburgh, F.S.A. (Lantern Illustrations.) **5.30 p.m.**

FRIDAY, NOVEMBER 21

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Finance and House Committee. Intermediate Examination. Until November 27.

LONDON SOCIETY. At the Royal Society of Arts, John Street, Adelphi, W.C.2. "More Light on London." By Dr. C. W. Saleeby. (Illustrated by a film entitled "A School in the Sun.") Chairman: Sir Leonard Hill, F.R.S. **5 p.m.**

NATIONAL HOUSING AND TOWN PLANNING CONFERENCE. At Blackpool. Until November 24, inclusive.

INSTITUTION OF STRUCTURAL ENGINEERS. Western Counties Branch. At the Merchant Venturer Technical College, Unity Street, Bristol. "The Erection of Steelwork." By G. F. C. Caswell. **7.30 p.m.**

SATURDAY, NOVEMBER 22

Sunrise, 7.28 a.m. Sunset, 4.3 p.m.

TRADE NOTES

Messrs. Electrolux, Ltd., have recently received an order from Messrs. J. Lyons & Co., Ltd., for the supply of 700 ice cream conservators (gas operated). This is the second large order given by this catering firm to Messrs. Electrolux, Ltd. The first was an order for 500 machines, bringing the total up to 1,200. Besides supplying these conservators, the firm has installed Electrolux refrigerators, some electric, others gas operated, in many large blocks of flats, including Melbury Court, Kensington, 40 flats; Grosvenor House, Park Lane, 13 for service purposes; Eyre Court, N.W.8, 125 flats; and Berkeley Court, N.W.1, 128 flats.

*

Often has a person's equanimity been disturbed as to why the mark "Sheralak finished" is bestowed upon certain conduits and fittings. There is a general consensus of opinion that the trade mark is used to denote a super rust-proof job, but it is not generally known that it is applied to a material which has been sherardized and afterwards doped with a special varnish. The dope is transparent, durable and elastic, and is said to prevent the sherardized surface from picking up foreign matter and becoming discoloured. This point obviously is of great importance to the ultimate user of the conduit because it enables the manufacturers and the distributors to carry large stocks and give quick delivery. The outside surfaces of the conduits can easily be painted or colour-washed after erection; and it is claimed that the inside is thoroughly protected and dead smooth, and that all machined surfaces are rust-proofed. This special varnish is also said to give added protection to buried work where traces of acid in concrete or plaster are liable to cause trouble. Sherardizing has, of course, been in use for many years for the protection of iron and steel. It is the name of a process of applying zinc to the surface of articles made of iron or steel in order that they may not rust. The graduation of iron-zinc alloys formed on the surface of sherardized articles is claimed to comprise some which are not only highly resistant to corrosion, but sufficiently hard and continuous enough with the base metal to show remarkable powers of endurance. Finally, it is claimed that sherardized articles can be buff-polished and made to exhibit a high and attractive lustre.

*

Much interesting information concerning Todd burners is given in the new "Land Section" catalogue issued by Todd Oil Burners, Ltd. The firm's patent air atomizing oil burner is claimed to be ideal for firing cast-iron boilers varying in size from the smallest to 650,000 B.T.U.'s capacity. The burner is designed to incorporate the advantages of a pressure atomizing burner for efficiency, and has a vortex chamber from which the oil emanates through a circular orifice to the furnace in the form of a fine spray. The construction of the vortex chamber in the burner is such that the oil fuel is supplied through a central valve. Air is also admitted to the vortex chamber through tangential channels in order to give the oil the necessary rotation for the purpose of atomizing. The air employed for atomizing the oil is supplied at low pressure from an electrically-driven rotary air compressor, which, it is claimed, simultaneously provides a corresponding pressure to the oil supply tank, ensuring at all times a constant and uniform flow of air and oil to the burner. A specially designed furnace front is supplied which admits natural draught air to the oil spray for combustion. To this front the burner is attached. It is easily removed without disconnecting pipes, and enables any cleaning to be done without the assistance of a mechanic. Many other different types of Todd burners are illustrated and described, each designed for service under specific conditions and covering practically every type of industrial oil-burning installation.

*

The advertisement of the Cement Marketing Co., Ltd., in THE ARCHITECTS' JOURNAL for October 15 last stated that all the concrete piles for the Ford factory at Dagenham are of "Ferrocrete," the rapid-hardening Portland cement. The company now state that piles made with Ciment Fondu are also being driven.

*

Messrs. W. H. Gaze and Sons Ltd., The Gazeway, Kingston-on-Thames, have received an order from Cannes for one of their permanent miniature golf courses. This is believed to be the first one to be put down in France. The firm have also received an order for one of their portable sets from the Malay States.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors, specialists, and some of the sub-contractors for the buildings illustrated in this issue:

The Phœnix Theatre, Charing Cross Road, W.C.2 (pages 719-721). General contractors, Bovis, Ltd. Plaster modelling, W. J. B. Clark (supervisor, W. Carter; craftsmen, William Fuller, Ivor Golkovitch, J. McLaren Morgan and Louis J. Alexandre); ventilating engineer, J. K. Cooling; electrical engineers, Donald G. Tyrie and W. M. Pope; steelwork engineer, G. M. Hall. Sub-contractors: St. Mary's Wharf Cartage, Ltd., demolition and excavations; Moreland Hayne & Co., Ltd., steelwork; Clark and Fenn, Ltd., fibrous plaster and decoration; J. Jeffreys & Co., Ltd., heating and ventilating; H. H. Martyn, Ltd., and J. P. White and Sons, Ltd., joinery; Kinematograph Equipment Co., Ltd., seating, furnishing, upholstery, etc.; Grierson, Ltd., electric lighting; Parker, Winder and Achurch, Ltd., ironmongery; Independent Sprinklers, Ltd., sprinkler installation; Frank Burkitt, fire curtain, fire appliances, bio. shutters, etc.; British Challenge Glazing Co., mirrors, laylights, etc.; Fenning & Co., Ltd., marble; Carter & Co., Ltd., tiling; The Morris Singer Co., architectural metal work, etc.; F. A. Norris & Co., Ltd., iron staircases, etc.; Shinkfields, Ltd., cat-ladder, ironwork, etc.; J. W. Gray and Son, Ltd., lightning conductor; Leeds Fireclay Co., Ltd., terracotta and sanitary fittings; S. W. Farmer and Son, Ltd., canopy, Phœnix Street; Comyn, Ching & Co., Ltd., canopy, Charing Cross Road; British Vacuum Cleaner and Engineering Co., Ltd., vacuum-cleaning installation; Hitchins Laminated Doors, Ltd., doors; Campbell Bros., paint; Lapidosus, Ltd., cast stonework; Lift and Engineering, Ltd., counter-weighting; Dennison, Kett and Co., Ltd., revolving shutters; Self-Sentering Expanded Metal Co., Ltd., bracketing for decoration; Caxton Floors, Ltd., patent floors; Mellowes & Co., Ltd., metal casements.

Isle of Thorns Summer Camp (pages 722-725). Consulting engineer, Du Platt Taylor, M.I.C.E. London Construction Co., bath and lake; H. and E. Waters, buildings; Chuter and Tyler, huts; Collier and Catley drainage; Dean & Co., electrical work; Thresh Disinfector Co., disinfector; Comyn Ching & Co., Ltd., weathercock.

Wolverton Rectory, Ewhurst, Hants (page 726). General contractors, Wait of Newbury. Sub-contractors: Crittall Manufacturing Co., Ltd., casements; Warner's "Star" Tiles, roofing.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATION

31662. Robinson, P. Building constructions. October 22.

SPECIFICATION PUBLISHED

336567. Jaklin, H., and Frostig, O. Steel framing for walls, ceilings, roofs and the like.

ANNOUNCEMENTS

Mr. Henry A. Mackmin, F.S.I., chartered quantity surveyor, has removed his offices to 23 Golden Square, Regent Street, London, W.1. Telephone: Gerrard 7208.

The Association of Special Libraries and Information Bureaux recently formed a Panel of Expert Translators, with the object of providing translators with the necessary linguistic qualification and a knowledge of special technical subjects. Particulars of the scheme may be obtained from the A.S.L.I.B., 26 Bedford Square, W.C.1.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The BERMONDSEY B.C. has in hand housing schemes costing £750,000.

The offices of *The Times* in Printing House Square, CITY, E.C., are to be rebuilt.

Plans passed by the HORNCHURCH U.D.C. : Twenty-six houses, Rockingham Avenue, for Messrs. Bellamy and Lemon; three houses, Hainault Road, for Mr. F. G. Smith; eighteen houses, St. George's Avenue, for Messrs. C. and G. Contractors, Ltd.; two houses, Haynes Road, for Messrs. E. A. Coryn and Son; nine houses, Park Lane, for the County of London Electrical Supply Co., Ltd.; forty-eight houses, Harwood Avenue, for Messrs. Wood and Wren; four houses, St. George's Avenue, for Mr. W. Jones; twenty houses, Boscombe Avenue, for Mr. S. J. Davies; fourteen houses, Cecil Avenue, for Messrs. Jay and Deverill; twelve houses, Victor Gardens, for Mr. G. Wood; four houses, Kinfauns Avenue, for Mr. E. A. Faux; twenty-five houses, Harwood Avenue, for Messrs. Smith and Sharpe; six houses, Whitehorn Gardens, and seventeen houses, Brookland Gardens, for Mr. B. G. Bratchell; two houses, New Road, South Hornchurch, for Messrs. Buckley and Son; eighteen houses, Maylands Way, for Mr. J. E. Neal; three houses, Bruce Avenue, for Mr. L. Lloyd; two houses, Hainault Road, for Mr. H. G. Mynott; ten houses, The Avenue, for Messrs. W. Belsher and Son; two houses, Hainault Road, for Messrs. A. E. Whichello and J. L. Bibby; four houses, Upminster Road, for Mr. A. E. Johnson.

Cadby Hall, KENSINGTON, W.14, the headquarters of Messrs. J. Lyons & Co., Ltd., is to be enlarged from plans prepared by Messrs. Holman and Goodrham.

The KINGSBURY R.D.C. has approved plans for the erection of eighteen houses at Oaktree Dell, subject to certain drainage alterations being carried out.

The Board of Education is to be asked to approve plans for alterations and additions at nine schools for the LEYTON Corporation, at a cost of £32,100, in connection with a reorganisation scheme.

The L.C.C. propose to purchase sites in London at a cost of £500,000 for new housing schemes which will provide accommodation for 50,000 people.

Plans passed by the STAINES U.D.C. : Six houses, Shepperton Road, Laleham, for Mr. F. J. Craswell; house, Bath Road, Colnbrook, for Mrs. Wyatt; house, Common Road, Laleham, for Mr. Dollery; two houses, Kingston Road, Staines, for Mr. A. W. Francis.

Twenty-two houses are to be erected on a site at Higham Hill, WALTHAMSTOW.

EASTERN COUNTIES

Plans passed by the CHELMSFORD T.C. : Rebuilding of house in Galleywood Road, for Mr. G. J. Bragg; two houses, Galleywood Road, for Mr. W. J. Wade; new shop-warehouse at the corner of Moulsham Street and Barrack Square, for the Chelmsford Co-operative Society; six pairs of houses, Longstomps Avenue, for Mr. R. H. Currie; house in Galleywood Road, for Mr. Robert Wenley.

SOUTHERN COUNTIES

Messrs. Seal and Hardy, L. & A.R.I.B.A., have prepared plans for a large garage, showrooms and offices on a site in Westover Road, BOURNEMOUTH.

The EASTBOURNE T.C. has decided to proceed with a motor-coach station scheme in the centre of the town, at a cost of £10,000.

The GUILDFORD Corporation is to buy, under compulsory powers, a farm, comprising fifty-nine acres of land, for housing purposes.

At a meeting of the PORTSMOUTH City Council, it was stated that the Health and Housing Committee was preparing schemes for the erection of 119 houses at Portsea, which will complete the Council's proposal to build 500 houses for the accommodation of persons removed from sanitary areas. The Housing Committee is also preparing a five-years' programme under the provisions of the 1930 Housing Act.

At a meeting of the TUNBRIDGE WELLS T.C. it was decided to support the recommendations of the General Purposes Committee for the erection of municipal buildings, at a cost of approximately £172,000. The buildings it has been decided to proceed with consist of : Municipal offices, £97,000; police station, clinics, etc., £31,550; fire station, £8,000; mortuary, weights and measures and yard block, including site work, etc., £15,630.

MIDLAND COUNTIES

At a meeting of the Governors of Derby School a proposal that the DERBY Education Committee be requested to take the necessary steps towards acquiring a new site and erecting entirely new buildings for the school was passed. The estimated cost of a new school for 450 pupils (apart from the cost of site and levelling of playing-fields, or of the provision of a school chapel) would be from £50,000 to £60,000.

The FINEDON U.D.C. has decided to apply to the Ministry of Health for sanction to erect fifty more houses on the Thrapston road site.

Plans passed by the HINCKLEY U.D.C. : Two houses, Edward Street, for Mr. W. Foxon; three houses, Forest Road, for Messrs. Greaves Bros. ; a layout of eleven houses, Strathmore Road, for Mr. R. H. Simmonds; additions to factory, Hawley Road, for Messrs. Huckerby and Growdridge; alterations and additions to factory, Druid Street, for W. Moore and Osborne, Ltd.

Plans are in hand for the erection of forty-eight more houses on the Shelthorpe Corporation Estate at LOUGHBOROUGH.

The NUNEATON T.C. has received from the Ministry of Health sanction to borrow £7,939 for the erection of a new school clinic and maternity and child-welfare centre in Colton Road, Nuneaton.

Plans are being prepared by Mr. Edward Heazell for the proposed St. Martin's Church, SHERWOOD. It will accommodate 700 persons, and the estimated cost is £21,000.

SOUTH-WESTERN COUNTIES

A church, with accommodation for 300 persons, is to be erected at Primrose Hill, LYDNEY, from the designs of Mr. Ellery Anderson.

NORTHERN COUNTIES

The Bakewell U.D.C. has received the sanction of the Ministry of Health for a loan of £5,000 for the erection of twelve houses in Field Road, BAKEWELL.

Plans passed by the BLACKPOOL T.C. : Two houses, Oregon Avenue, for Mr. R. Smith; house, Rawcliffe Street, for the St. Peter's Church Trustees; twelve houses, Antrim Road, for Messrs. C. and C. Hilton; house, St. Anne's Road, for Mr. J. Stanworth; four houses, Westmorland Avenue, for Mr. F. Francis; two houses, Dalewood Avenue, for Mr. T. Mercer; house, Park Drive, for Messrs. Staunton & Co.; two houses and two bungalows, Sandhurst Avenue, for Mr. J. Ridyard; eight houses, Orkney Road, for Messrs. J. and W. Ormerod; two houses, Harrington Avenue, for Mr. J. Midgeley; four houses, Sandhills Avenue, for Mr. G. Woodhead; four houses, Sunnybank Avenue, for Messrs. R. Brown and Sons; seven houses, Appleby Road, for Messrs. J. Fielding and Sons; two bungalows, Sandhurst Avenue, for Mr. J. Marsden; garage and flats, Springfield Road, for Mr. F. Lee; warehouse, Caunce Street (rear), for Messrs. J. and R. Fenton, Ltd.

The BLYTH T.C. is recommended by the Education Committee to forward to the Board of Education estimates, amounting to £42,780, for new schools and alterations to others.

The BURY T.C. General Purposes Committee has considered plans for proposed alterations to the town hall to accommodate the various departments of the Corporation. The committee has decided that the scheme of alteration be limited to the provision of a council chamber, mayor's parlour, committee rooms, and the housing of the town clerk's, borough treasurer's and borough engineer's departments, at an estimated cost of £24,000. The approximate cost of the larger scheme would have been £60,000.

Mr. S. W. B. Jack, architect, has prepared plans for a new church hall for Holy Trinity Church, CARLISLE.

Sanction has been received by CHESTER-LE-STREET U.D.C. to borrow £20,400 for the erection of fifty houses, and the Ministry of Health has recommended the Public Works Loan Board to advance the money.

The DONCASTER Corporation has decided to proceed with plans for a municipal aerodrome, at a cost of £120,000.

A scheme is on foot at HEYWOOD to construct a bridge over the River Roach and to continue William Street to Bury Road. The cost of the scheme is estimated at about £27,000.

Schemes, including the provision of new swimming baths, houses, and roads, to cost £400,000, have been submitted to the HULL Corporation Finance Committee.

At a meeting of the LINDSEY C.C. approval was given to financial proposals involving an expenditure of £420,000. This amount includes £200,000 on a programme of special works in substitution of £100,000 previously approved; £26,000 for the Ashby Senior Girls' School; £11,100 for a Council school at Scotter; £7,250 for a school at Bottesford; and various other amounts in connection with road widenings and bridges improvements.

The MANCHESTER T.C. has received sanction to borrow £7,750 for the provision of additional firemen's quarters at the Ash and New Streets Stations.

The ROTHERHAM R.D.C. is to apply to the Ministry of Health for sanction to build a further 200 houses.

The site of the SOUTHPORT Opera House has been purchased by Mr. George Rose, of Southport, and a new theatre is to be built on the site to accommodate 2,000 persons. The estimated cost is £150,000.

The Housing Committee of the SUNDERLAND Corporation are negotiating for the purchase of two areas of land at Southwick for building purposes, one of them large enough for the erection of eighty-five houses, and also of land in Silksworth Lane. At the meeting of the committee this month, plans will be submitted for 212 new houses to be built on the Ford estate.

SCOTLAND

The erection or reconstruction of twenty-six piers at an estimated cost of more than £117,800 has been recommended to the interdepartmental committee of the ARGYLL C.C.

The AYRSHIRE C.C. has approved a scheme for the erection of more than 300 houses under the Housing (Scotland) Act, 1930.

Approval has been obtained for the erection of a church at St. Ninian's, BOWHILL, Fife.

The local authorities of Fife, Stirling and Clackmannan, with the burghs of Alloa, Dunfermline and Falkirk, have agreed to proceed with the promotion of a Provisional Order for the construction of a road bridge over the Forth at KINCARDINE. The estimated cost is £400,000.

A housing scheme, involving the demolition of eighty-three houses and the building of sixty new ones, has been adopted by the PETERHEAD T.C.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour ;* NAVVY, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour ;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0 11 6
Thames ballast, per yd.	0 10 0
Pit gravel, per yd.	0 15 0
Pit sand, per yd.	0 12 6
Washed sand, per yd.	0 13 0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2 8 0
Lias lime, per ton	2 0 0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.
Transport hire per day :

Cart and horse	£1 3 0	*Trailer*	£0 15 0
3-ton motor lorry	3 15 0	*Steam roller*	4 5 0
Steam lorry, 5-ton	4 0 0	*Water cart*	1 5 0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.
RETURN, fill, and ram, ordinary earth, per yd. £0 1 6
SPREAD and level, including wheeling, per yd. 0 1 6

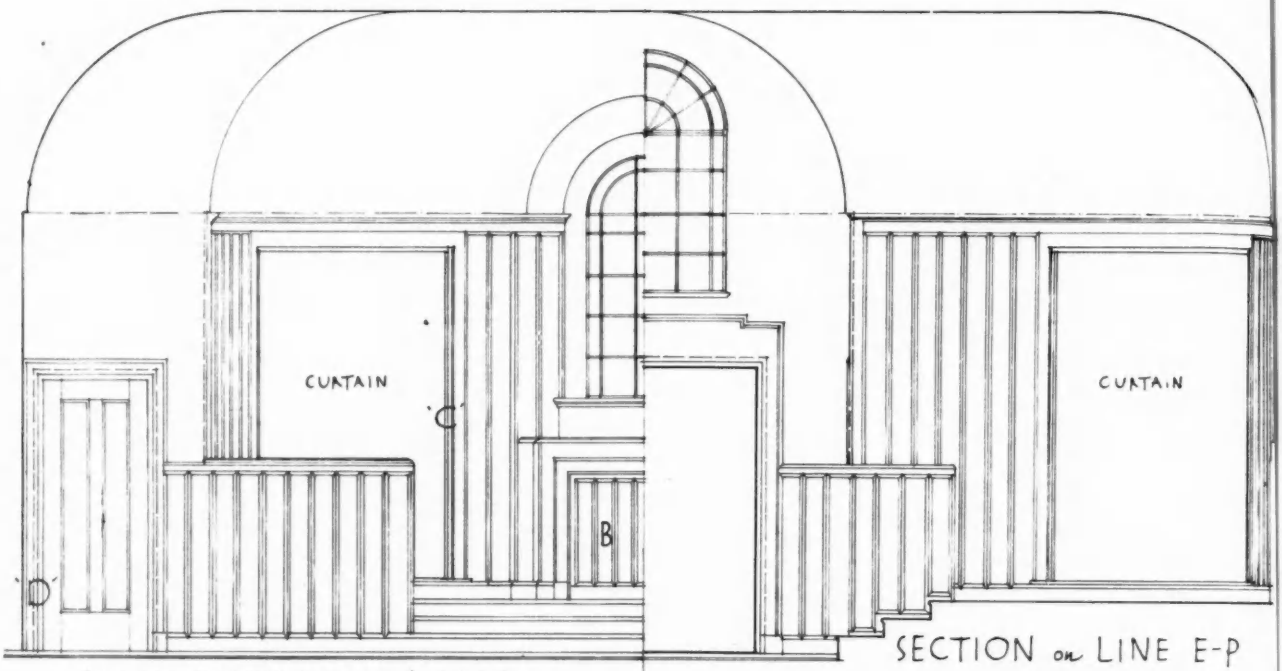
APSIDAL END TO ASSEMBLY HALL AT KINGSLEY HALL, BOW, E.3.
Designed by C. COWLES-VOYSEY

THE Assembly Hall at this social settlement at Bow is a room which of necessity has to serve many purposes, and the fact that on occasion it would be necessary to hold divine service in it led the architect to import traditional ecclesiastical elements into the design for the end of the room, and carry this feeling into the details. At the same time he was wishful to preserve, elsewhere, something of the secular atmosphere that would be appropriate when the room was put to other uses.

Thus, the grille under the central semi-circular-headed metal window masks a radiator and, with its shelf, forms a small Holy Table.

The whole of the ceiling of this apse is finished in acoustic plaster, and the panelling itself contributes to the acoustic properties of the hall as a whole.



Reference to the drawings reproduced on the next page will show that the right-hand of the pair of curtains conceals a shallow recess to balance the opening on the left. These drawings give details of the whole of the joinery except the reading-desks flanking the opening, and it is proposed to add these in a later issue.

General photographs and drawings, with a description of Kingsley Hall, appeared in THE ARCHITECTS' JOURNAL *dated July 16 last, while the issue for October 22 contained scale details of the external chimney-fountain on the roof*

The drawings overleaf may be read with architects' ordinary scales ($\frac{1}{4}$"; and 6" = 1 ft.

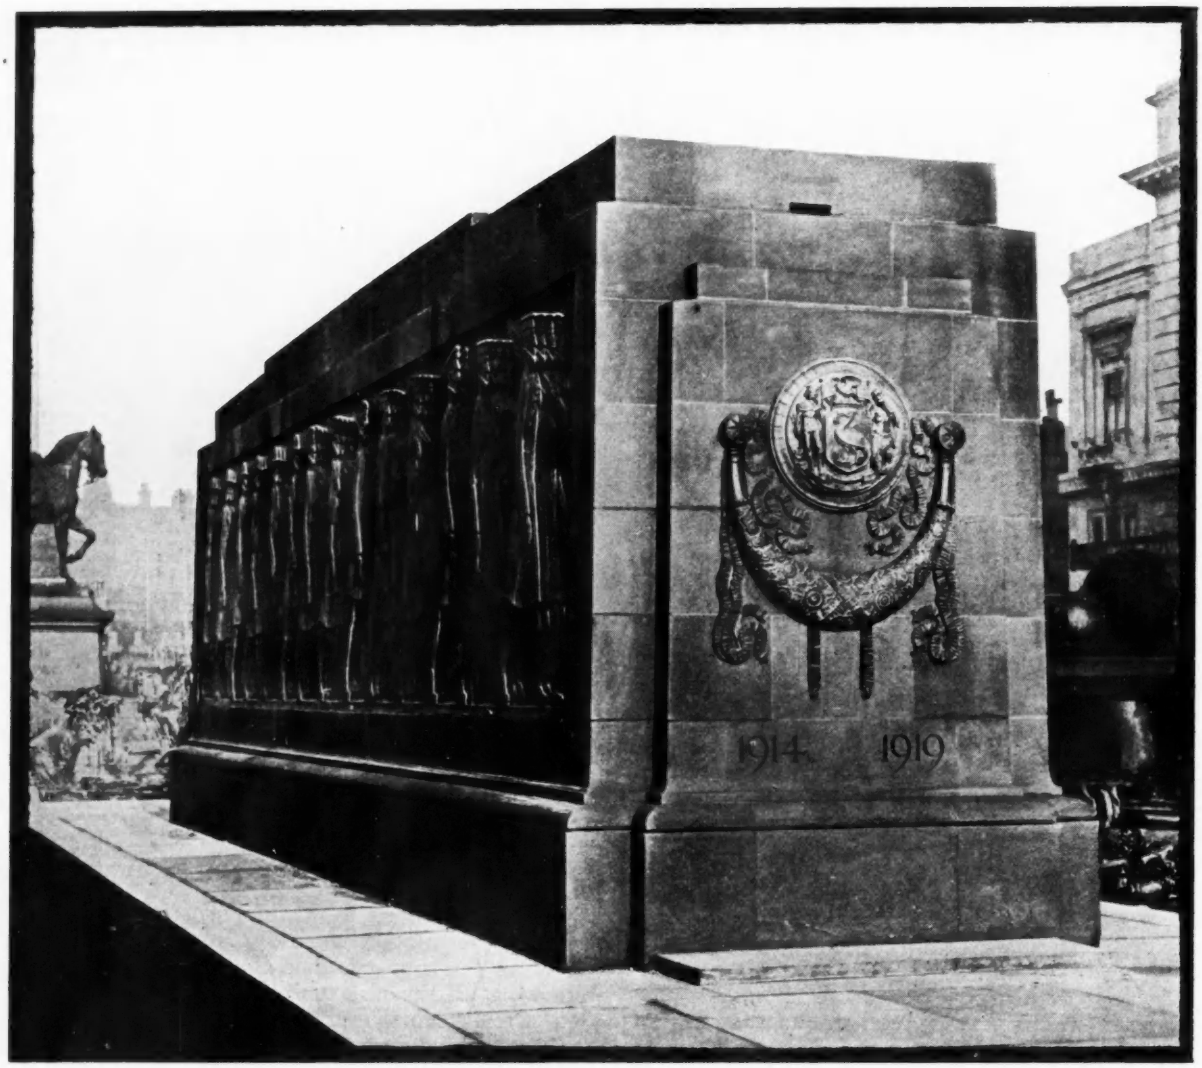
STATION—ARY

ONE of the certain effects of a new mode of transport has been the generation of trade, the acquisition of wealth. And from this accumulation, proceeding gradually but inevitably, comes congestion, stagnation, a crisis—and either a new lease of life or the end of that particular prosperity or civilization.

Thus with us in England came the stage-coach and Telford's roads, came railways, steamboats; now motor cars, soon aeroplanes: each bringing new forms of wealth, then new forms of vested interest; and, finally, the state wherein the vested interests have become too powerfully obstructive to allow of the expansion necessary to the continued existence of the first cause of wealth.

In these days of rapid change and ceaseless power, of fresh mechanical invention, one hesitates to prognosticate upon the future of the railway as a mode of transport. With England only as an example, it might possibly be thought that the railway had reached a stage of stagnation and obsolescence from which it might never again emerge; but looking elsewhere in the world, one sees the railway in another light. That light, revealing through architecture an entirely fresh attitude towards railway travel *and its place in the social fabric*, may yet serve to lead the English railway from its black tunnel of present-day depression.

It is always pointed out to the critic of English railways that they are paying the price of pioneership, and that foreigners, coming after, reaped the fruits of our experience and started from a higher level of development.



This is true in a limited sense, but it does not explain the one central fact through which our railways suffer in comparison with those of nearly every other country—we refer to the peculiar attitude of English railway directors towards the public they serve, as exemplified in the design and upkeep of stations great and small.

Once only, in Hardwick's Waiting Hall at Euston Station, the railway rose to a conception of its function in the social and civic fabric, and made expression in the grand manner. From that date, which saw other fine buildings erected, the spark died out; Hardwick's noble but forbidding gateway was blocked by the first railway hotel, and thereafter the portentous birthright of a form of transport, capable of evoking the highest architectural expression, was frittered away in a mass of fruitless building, which, far from evolving new types, merely added to and obstructed what was originally seemly and workable.

We feel it nearly beside the point to complain that Victoria Station is a muddle of advertisements, or that Euston Station is a ridiculous and wilful maze, if we are seeking only to clear up this physical mess, knowing all the time that nothing can be achieved on a scale commensurate with the grandeur of the colossal muddle until there is effected the entire reorientation of attitude which perhaps only the passing of the present boards of directors will bring about.

So long as directors regard railways as their own property, which for the public to interfere with by even the breath of suggestion is rank impertinence, then we can hope for nothing. We can expect a new Charing Cross Station to be only a replica of a hide-bound director's mind, designed by a *nobody* for a railway company, with no fine thought for its purpose, for the city it serves, or its high place in the architectural history of the age.

Oh, if for one moment it were thought possible to throw open the new Charing Cross Station to public competition instead of, or as well as, the new bridge, what new floods of imagination might there not sweep into the fusty warrens of degenerate railway officialdom! If we could only dissolve that monopoly of specialized wisdom, which supports the dying fires of directordom, what a fine station we could build to celebrate the second childhood of the English Railway!

THE LIVERPOOL CENOTAPH:
A STUDY FROM THE SOUTH-WEST

Unveiled by Lord Derby on Armistice Day, the Liverpool Cenotaph takes the form of a rectangular altar set upon an elevated stone platform, which enhances its dignity and incidentally provides a protected space for wreaths, immediately in front of St. George's Hall and facing Lime Street (to the right in the photograph).

The memorial has an overall length of 35 ft. and a height of 11 ft. A bronze plaque showing, in relief, the coat of arms of the City of Liverpool, and a swag, are affixed to each end, and rectangular bronze panels, 31 ft. by 6 ft., form the central features of the sides.

That shown represents men marching into action, and inscribed on the stone above and below it are two lines of lettering: AS UNKNOWN AND YET WELL KNOWN: AS DYING AND BEHOLD WE LIVE; *and:* OUT OF THE NORTH PARTS A GREAT COMPANY AND A MIGHTY ARMY. *The eastern panel, facing Lime Street, has a group of mourning figures, surrounding a Stone of Remembrance, in the act of commemorating Armistice Day, with, as background, the headstones of a great military cemetery. Here the inscriptions read:* TO THE MEN OF LIVERPOOL WHO FELL IN THE GREAT WAR; *and:* AND THE VICTORY THAT DAY WAS TURNED INTO MOURNING UNTO ALL PEOPLE.

The Cenotaph was designed by Lionel B. Budden, M.A., F.R.I.B.A., Associate Professor in Architecture at Liverpool University, and the sculptures are the work of G. H. Tyson Smith, A.R.B.S. Working drawings appear on pages 762–3.

NEWS & TOPICS

Sir Mervyn Macartney, F.R.I.B.A., surveyor of the fabric of St. Paul's Cathedral since 1906, who, it is announced, will relinquish his office on Lady Day next. Sir Mervyn's twenty-five years of office have witnessed the successful completion, after a mighty effort, extending over nearly two decades, of the measures to consolidate the Cathedral's structure. His knighthood was bestowed in recognition of the event.

NO WHITE ELEPHANT IN WHITEHALL

MR. LANSBURY may or may not have had in mind his recent experiences in connection with the Calton Jail site in Edinburgh when he stated in Parliament last week that the designs for the Whitehall rebuilding scheme would be entrusted to an architect in private practice. It is of considerable magnitude, for an expenditure of at least £2,000,000 is in contemplation, and on an island site on the eastern side of a widened Whitehall, extending from Gwydyr House to Richmond Terrace, with a corresponding Embankment frontage between Horse Guards Avenue and Scotland Yard, no fewer than six Ministries would be rehoused, while public gardens would be formed abreast of the Cenotaph. A Bill to sanction the widening of the road will have to be introduced; meanwhile, Mr. Lansbury says that the precise method of selection of the architect has not been settled. There is always the method of public competition: it would at least avoid a white elephant in Whitehall.

THE DISASTER AT LYONS

The tragic disaster at Lyons last week, when a number of houses collapsed on a hillside, has a moral for this country. I visited these streets at Lyons only a few months ago, and wondered at the way these high tenement houses, overcrowded to a degree fortunately unknown in Great Britain, clung to the steep hillside. In many rooms there can have been no through ventilation, and the conditions would undoubtedly have been condemned by any British Medical Officer of Health. The tragedy is a justification of our British policy of employing surveyors who, like the late Mr. Todd, will fearlessly declare even St. Paul's Cathedral to be a dangerous structure if they consider such action to be necessary.

★

The whole question is closely related to that of building bylaws discussed at the R.I.B.A. last Monday. Many will feel that Mr. A. N. C. Shelley, the speaker of the evening, was somewhat supercilious in his references to the architectural profession. I have had the opportunity of discussing various aspects of this question with representatives of practically every branch of the building industry, and also with M.P.s of all parties. There is a general feeling that to leave the central control of bylaws to officials in the Ministry of Health, whose knowledge of the law may be extensive, but whose practical experience of architecture and building is but slight, is unwise. Both Mr. J. H. Thomas and Mr. Greenwood during the past few months have been considering the setting up of an advisory council of men with personal knowledge who will guide such officials. From the elaborate apologia offered last Monday it might be assumed that our Central Department does not welcome too heartily any outside criticism. Sir Frank Baines, formerly Chief Architect at the Office of Works, was very downright in his recent comments on the present system.

HOUSING PROVIDED BY THE COMMUNITY

The figures for London housing, announced by Mr. Angus Scott, the Chairman of the Finance Committee, are a useful reminder of what is being done. £34,000,000 has been already spent, and the Council are committed to a further £20,000,000. But beyond that they have voted £500,000 for buying other sites, the ultimate development of which will cost some millions. Then the Borough Councils had spent £11,000,000; another £4,000,000 has been lent to owner-occupiers on easy terms, and the grand total of expenditure, as far as present commitments go, reaches £75,000,000. Of this, £65,000,000 comes directly from ratepayers, who will have spent £15 per head upon the housing of the working classes, so that one out of every ten of the population of London will be living in a house or flat built by the community and subsidized up to a third part of the economic rental. That is Socialism in our time.

THE CHURCH'S SLUMS

The Church of England is the owner of slum property as bad as may be found in London. This property is not under the direct control of the Church Assembly, nor even, since it has been allowed to become a tangle of leases and sub-leases, under the effective control of the Commissioners. But the property belongs to the Church, and the Church draws income from it: more income when it is slum property than when it is not.

★

The citizens of London, through the L.C.C., have spent £34,000,000 on the housing of the working classes and continue to spend money upon the provision of new houses and the reconstruction of insanitary areas. I know that the L.C.C. is not a landlord in the sense that the Church is a landlord, yet one cannot but compare the spirit which fired the L.C.C. to put their fine work in hand and to increase its scope year by year, with the unquestioning resignation of the Church Assembly in the face of similar facts and no worse difficulties.

The Church has been advised that its worst property was long ago leased and sub-leased, and that control over it was therefore lost—and the Church acquiesced and accepted, instead of taking action to see that control over its own evil were restored to it. At a time when campaigns are being launched against slums, it would be a fine thing if this great landlord, the Church, would see its work among these very slums and engage itself upon a mission of reconstruction as thorough as that of the L.C.C.

IN MAYFAIR—NOT AMERICA

Let me now transport you in fancy to Mayfair, to the new modernistic hotel which Mr. Maxwell Ayrton is to build on part of the site of Lansdowne House. Costing well over a million pounds, it will differ materially from any hotel yet seen—a great restaurant ballroom; and 350 bedrooms, each with its own bathroom, and each having embodied in its specially designed decorative scheme a picture by a contemporary British artist of note. For the selection of the artists a committee has been formed, consisting of, among others, Sir William Llewellyn, R.A.; Sir William Orpen, R.A.; Mr. Philip Connard, R.A.; Mr. Stanley Spencer; Mr. C. G. Holmes; and Mr. Maxwell Ayrton. Each artist will paint or choose his own picture to suit the decorative scheme. Sir Owen Williams is consulting engineer; and Mr. George Sheringham will act as art director, with Mr. Maxwell Ayrton, for the colour schemes, decorations and furnishings.

THE NEW R.I.B.A. LIBRARIAN

To succeed Mr. Rudolf Dircks, to whose retirement from the librarianship of the R.I.B.A. and editorship of the Institute's *Journal* I referred recently, Mr. Carter, elected an Associate last April, has been appointed. Edward Julian Carter, who is a B.A. of Cambridge University, was educated at Lancing and Magdalene College, taking an honours degree in history and carrying off the Donaldson Essay Prize with an essay on "The Renaissance." Entering, thereafter, the A.A. School of Architecture, where he gained the Second Year Travelling Studentship, he emerged from the five years' course with the School Diploma in 1928. With such an apprenticeship behind him, and much of the full vigour of life ahead—for he is yet in his twenty-ninth year—Mr. Carter embarks on onerous duties with the good will of all concerned.

THE RALPH KNOTT MEMORIAL TAKES SHAPE

Nothing is more pleasing, in looking over the list of donations to the Ralph Knott Memorial Fund, than the presence therein of many names of firms engaged in the building industry, side by side with those of the late architect's professional intimates. The respectable total of £1,040 has already been reached, and Mr. Yerbury intimates that contributions to the fund may still be sent to him at the A.A. The memorial is likely to take a form that would, I imagine, have been highly gratifying to Knott himself: a memorial plaque, to be made by Gilbert Bayes and affixed to the London County Hall; and the founding of a maintenance scholarship of some £50 per annum, tenable in the A.A. schools.

A CONVENIENT BURROW IN LONDON'S WARREN

Rather over a year ago attention was drawn in these notes to the fact that there was still no interchange station between the Piccadilly and Central London Tubes, and that transit from Holborn to British Museum stations involved nearly two hundred yards of crowded pavement, a perilous street crossing, and the use of two lifts. A scheme to abolish these inconveniences and amalgamate the two stations was embodied in the Underground Company's Bill, presented during the last session of Parliament and since passed into law. The contract for these works has just been placed; they comprise the reconstruction of the existing Holborn surface station, the closing down of British Museum, the building of new platform tunnels for the Central London line under those of the Piccadilly line, the installation of four escalators leading down to the first, and of three more leading down to the second, below. The total cost will be £170,000.

"WHEN LOVELY WOMAN STOOPS——"

Periodically, on the Woman's Page of one or other of the daily papers, there appears a column or so about the wonderful things to be done by women architects. Curiously enough these usually centre on sinks, though rounded corners, floods of light, and built-in fitments run them close. Thus in *The Morning Post* of late, after remarks as to correct backgrounds for different neurotic symptoms, we arrive at the sink in the following choice excerpt (let me break into parallel comment):

"Why do architects always put the kitchen sink so far from the stove?" I once asked a professional. "We do it on purpose, of course," he replied. "How else could the cook get the necessary exercise?"

This shows how dangerous it may be to "pull a woman's leg," for the grave comment follows:

I doubt if cooks appreciate this forethought. At all events, my psychological house is built to save as much exercise as possible. The larder shelves are of glass and the door fits flush to the wall so that the food-storing space is invisible. There are shelves all round the walls. Everything is to hand, and the whole effect is so pleasing that I find it difficult to coax my friends out into the lounge.

Shelves in a larder are of course quite a novelty, but why this shamefaced hiding of the "food-storing space"? I *like* food, and so do most of the sylph-like young things of my acquaintance.

We now arrive at the inevitable "dust-proof" phase, as follows:

Hard, sharp lines and corners that gather dust will be banished from the woman-built home of the future. All my ceilings merge into the walls and my skirting boards have curves instead of corners. The doors are flush to the walls and of beautifully grained wood.

Well, well!

After this the trustfulness of our lady architect has another spell:

All taps are washerless and cannot drip, and the pipes are of copper which does not burst in the hardest frost.

I have fitted a tap for which this claim was made: it lasted three weeks.

From thence to the end language grows lyrical—a dining-room mantelpiece with its alliterative "luminous lintel of satin-finished wood" being a charming touch:

Women who would build such homes for a nation must know every detail of the work from the laying of the foundations to the choosing of the window curtains.

Following these lines they will also do well to choose their clients from among the wealthy classes; or perhaps as these are to be "homes for a nation" it had better be some other nation than this.

ASTRAGAL

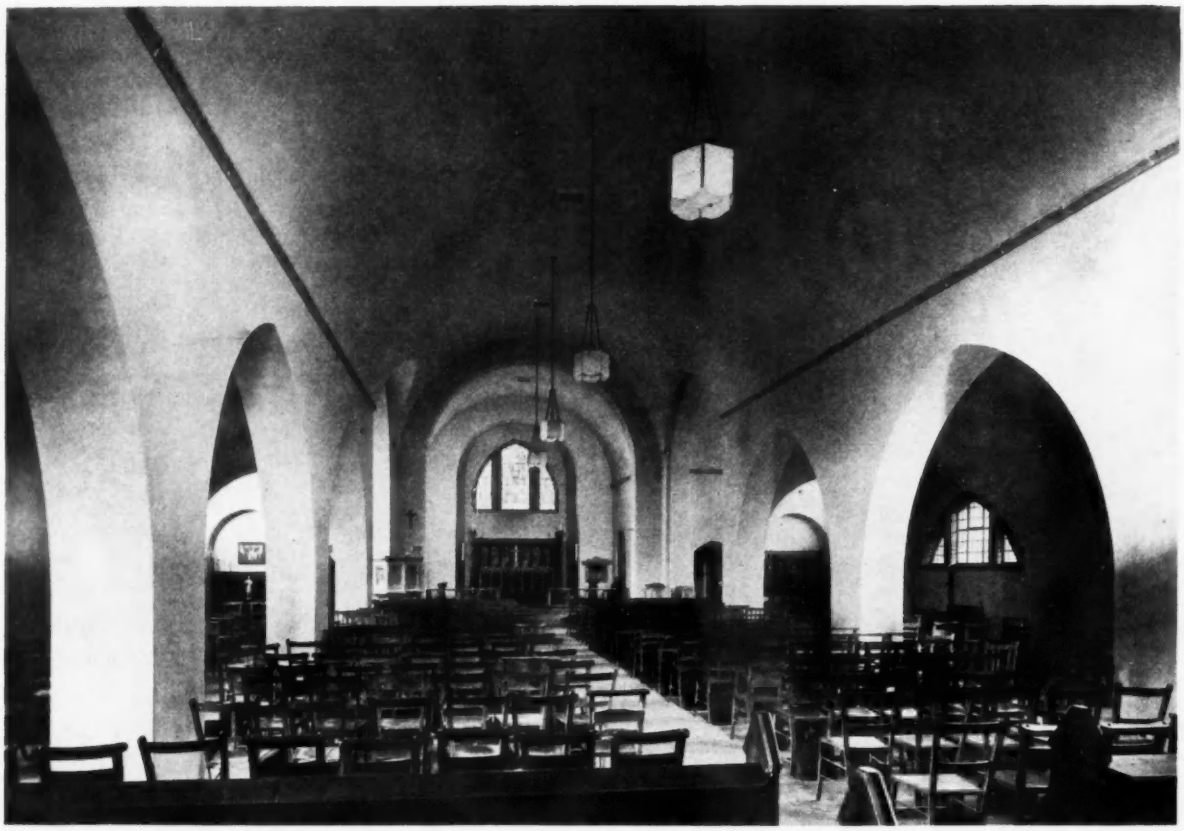
A general view of the church from the north-east, showing the campanile, and the windows of the sanctuary and transept, to left and right, respectively. The main entrance is seen on the extreme right.

ST. ALBAN'S CHURCH, BARRAS GREEN, COVENTRY

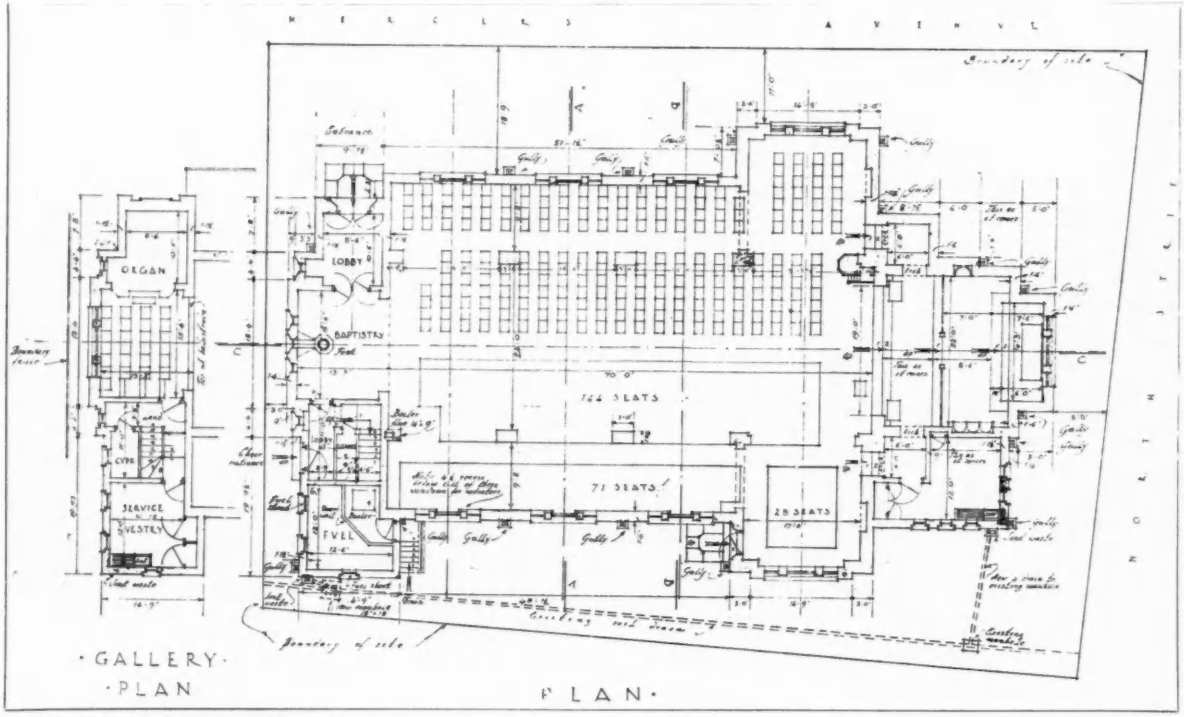
DESIGNED BY H. B. CRESWELL

ST. ALBAN'S, which has lately been completed, stands upon an open site facing north over Barras Green, Wyken, Coventry. The church belongs in a particular way to the parishioners; for the building fund was, in the main, collected in the parish, which is a poor one, over a period of several years by the Vicar, the Rev. Claud Phillips. Economy of construction was, accordingly, a condition of the design, but in securing this no element of cheapness has been allowed; the materials are all the best of their kinds and, as is appropriate to a place of worship, the whole is the work of men's hands and, so far as such a thing is now possible, the machine has had no part in the work.

As economical church building is a common need at this time, and to build a church well at a cost of £14 a sitting would by many architects be deemed impossible, exact particulars of St. Alban's are not without interest.



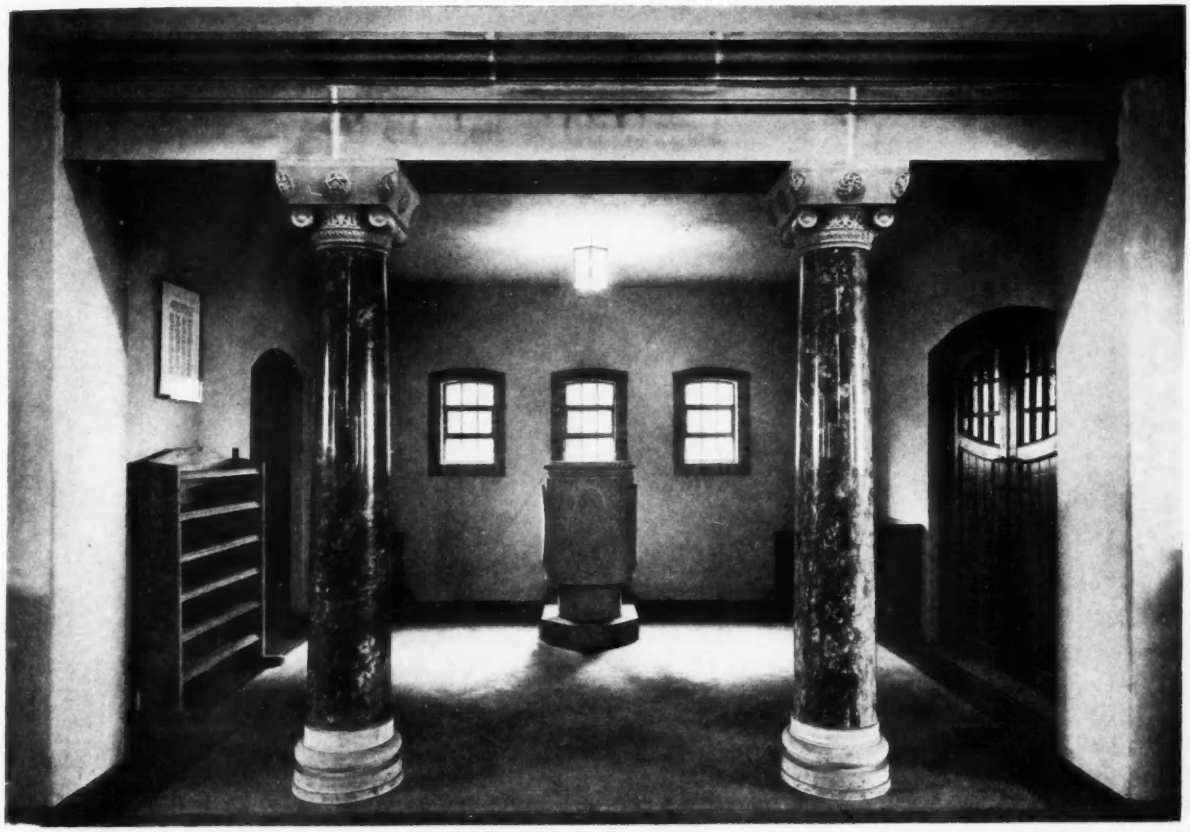
The church seats 520, allowing the full measure of 1 ft. 8 ins. by 2 ft. 10½ ins. to each sitting. There are a priest's vestry and a service vestry; a choir and organ gallery over a baptistry at the west end; a heating chamber; and ambulatories giving access to the chancel for communicants. The main walls are 1 ft. 10½ ins. thick, and there is a campanile. The materials are 2⅜-in. bricks and 10½-in. Lombardic tiles, hand-made and sand-faced;



The principal entrance doorway, at the north-west corner of the church, affords examples of fine craftsmanship in brick, stone, oak and wrought iron.

choice English oak wrought by hand, with smith-made ironmongery; blue Forest of Dean stone, Cork Red marble; and plaster. The whole, including all services and fittings, except pulpit, prayer-desk, font, and east window, was built by Messrs. H. Clarke and Sons, of Coventry, for £7,350, which is, as has been said, £14 a sitting. This low cost is in some part due to the design of the roof, which is constructed of trussed rafters so arranged as to form cradling for the plaster barrel, and to allow the ceiling to rise to within five or six feet of the ridge and the height of walls to be much reduced.

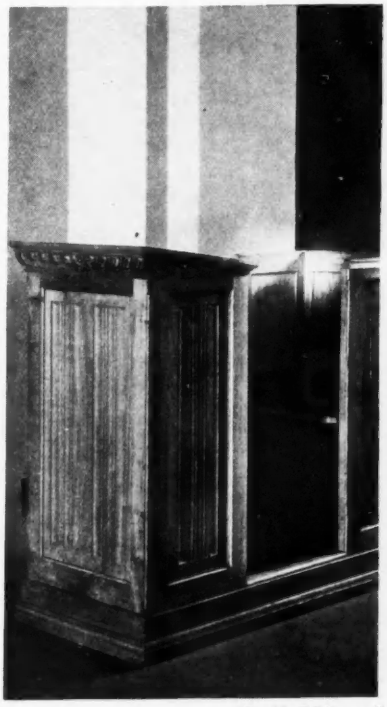
The design is an attempt to combine the traditional plan of the parish church with that of mediæval brick architecture. Attempts to render English Gothic in terms of brickwork commonly depress the beholder by reminding him of the absence of the stone which the bricks replace; and the more closely the brick design follows the stone tradition the more painful is the disparity. Any attempt, moreover, at such substitution, involves the brickwork tradition of eighteenth-century architecture which was itself a revolt against Gothic. Traditional Gothic brickwork has to be looked for in countries where stone was not readily available, as in Lombardy and Flanders; here is an attempt to combine the tradition of Gothic brickwork with the traditional form of the English parish church.



A general view of the nave, looking towards the altar. The roof is constructed of trussed rafters, forming a cradle for the plaster barrel. This form of design enabled the height of the walls to be kept relatively low.

St. Alban's Church, Barras Green, Coventry.]

Plans of the ground floor, and of the choir and organ gallery which spans the western end of the church. The building affords comfortable sittings for 520 persons, and, by economy of design, does so at a cost of £14 per sitting.



The baptistry at the western end of the church, showing the marble columns with carved capitals that support the choir gallery and organ loft. The doors on the right lead to the main entrance lobby; that on the left leads to the gallery stairs.

The pulpit is hand-carved in oak. The archway behind leads from the sanctuary.

The font, placed centrally against the west wall, is of Forest of Dean stone.

English oak, hand-carved, is also used for this prayer-desk in the sanctuary.

A London Flower Shop.] [*By J. Stanley Beard and Clare.*

The centre portion of the showroom, showing the laylight in the ceiling from which natural lighting is obtained. The wall treatment provides a quiet and dignified background for the flowers. A general view appears on page 761.

The shopfront faces Victoria Station, the gateway to the Continent. It is about 30 ft. wide. The surround is in blue pearl granite, and the ornamental architrave and the entrance doors are in burnished stainless steel.

A LONDON SHOP WHERE ROSES BLOW

DESIGNED BY J. STANLEY BEARD AND CLARE

FOR the contemplation of flowers solitude is, of course, the ideal condition. Those who know anything of the vicinity of Victoria Station, however, will recognize the extreme difficulty of finding seclusion unless they wander a considerable distance from its suburbs.

Such a thing as an unfrequented retreat in the neighbouring Royal parks cannot for one moment be imagined. The lover of Nature, imprisoned in the dust and din of this great metropolis, will hunt in vain for privacy amid the scenes of natural loveliness which surround him there. No observing person, however, will forget the sensations of awe and admiration with which he gazed at the flowers in their glimmering glades and bowers; the favourite haunts of the overseas and provincial sightseer.

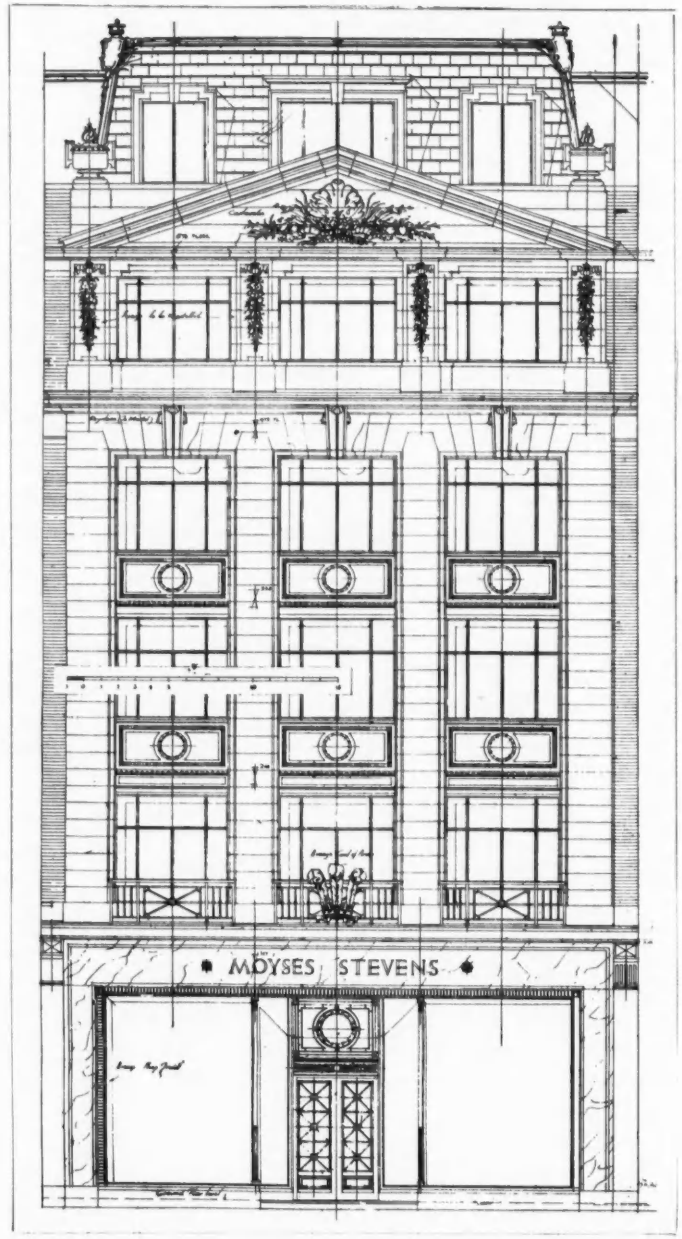
Flowers of even rarer beauty, gathered from beneath all heavens, each lovelier than the name it bears, shyly or proudly peep from the windows of Moyses Stevens, one of the most popular flower-shops in London, and a firm with Royal appointments, whose new building has been recently completed in Victoria Street on the site of the old one.

It was in 1926 that Allington House, at the corner of Victoria Street and Allington Street, was erected from the designs of Mr. J. Stanley Beard, F.R.I.B.A. In 1928 this building was extended farther westwards, Moyses Stevens having acquired Nos. 144–150 Victoria Street. Ebury House, that portion of the scheme in which the firm is housed, has just been completed, the architects now being Messrs. J. Stanley Beard and Clare.

The design of Ebury House carries on the architectural lines of the earlier building, but these are emphasized on the Victoria Street façade by a stone pavilion, which forms a prominent feature of the complete scheme.

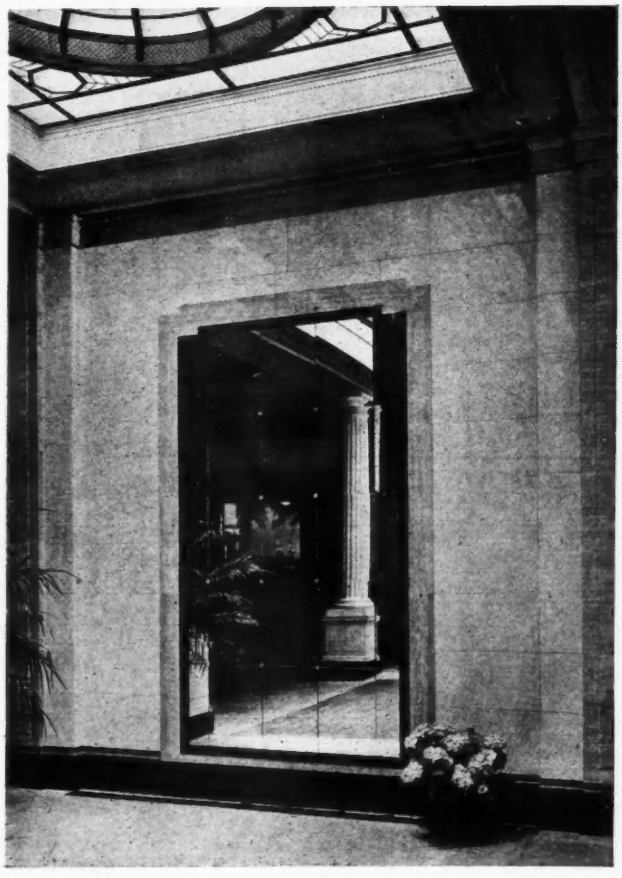
The Moyses Stevens shop occupies the central position on the ground floor, and the shop-front has been specially designed by the architects to provide the maximum amount of glass area and window space for the display of the flowers. It is carried out in blue pearl granite, with burnished stainless steel ornamental architrave and entrance doors. The architects were greatly assisted in their task by Mr. Harold Stevens, who supplied many original ideas, and whose unfailing colour sense contributed largely to the successful design of the showroom.

In the spacious main showroom, which is 95 ft. long by 30 ft. wide, particular attention has been paid to the wall treatment, the chief aim being to provide a quiet and dignified background for the tiers and banks of flowers exhibited. The walls are lined with Subiaco marble and have Travertine pilasters and a black marble skirting.



Mirrors have been introduced to break up the long length of walling. These have a Travertine marble band as an architrave to the moulded bronze frames around them. For ventilation purposes — highly necessary in the damp- and scent-laden atmosphere prevalent in florists' shops—specially designed bronze grilles are introduced into the corners of the mirrors. The floor is covered with Travertine marble, laid in large squares. The showroom obtains natural lighting by means of a laylight in the centre of its length.

Here, then, if the visitor has not the advantage of being sequestered with



A London Flower Shop. [By J. Stanley Beard and Clare.

The new block of buildings at the corner of Victoria Street and Allington Street. Moyses Stevens' flower-shop, the architects' elevational drawing of which is reproduced, occupies the centre of the Victoria Street façade. The entrance doors lead direct to the showroom.

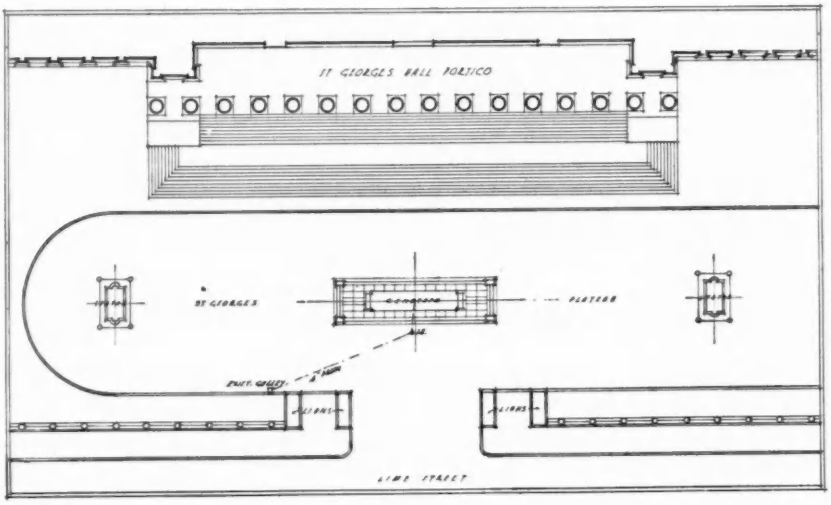
The showroom, looking from the main entrance doors in Victoria Street. The walls are lined with Subiaco marble and the skirting is in black marble.

One of the mirrors in the showroom. In the corners of each are bronze ventilation grilles to remove the scent- and damp-laden atmosphere created by the flowers.

the choice blooms, he can at least see and procure them in profusion and in all their natural beauty.

European Architecture

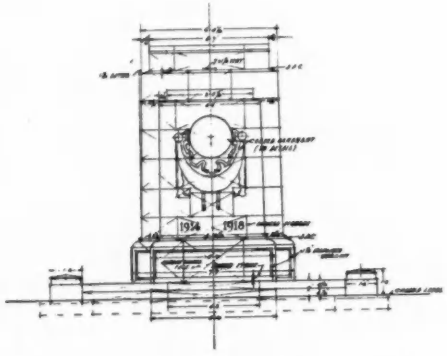
A lecture on the above subject was delivered by Mr. F. R. Yerbury, HON. A.R.I.B.A., at a meeting of the Brighton Chapter of the South-Eastern Society of Architects, held at the Municipal School of Art, Brighton.



The lecturer illustrated his remarks by means of a large number of slides of architectural work in most of the European countries, including Holland, Austria, Germany, Sweden, and Norway, all of which showed that the present tendency was to eliminate detail and ornamentation, and to give preference to light and colour.

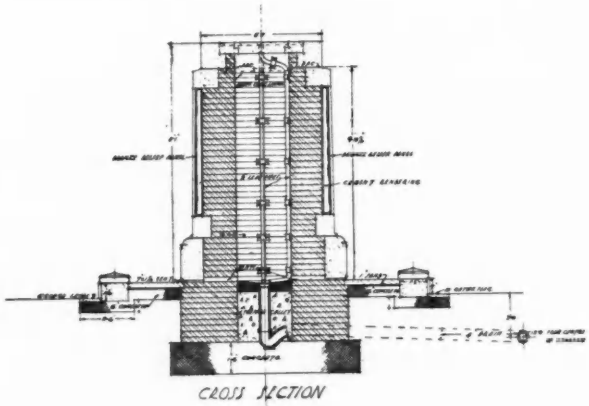
Generally speaking, he said, more attention was given to external appearances than to utilitarian advantages, and so far as housing schemes were concerned, the standard of accommodation was much lower than that adopted in this country. England had the best housing schemes of any country in the world, because we had adopted a type of house which accommodated a family, in preference to the tenement system, although in London, where land was extremely dear, the tenement system could not be avoided. With regard to factories and similar buildings, however, the Germans and the Dutch were far ahead of us.

CITY OF LIVERPOOL CENOTAPH

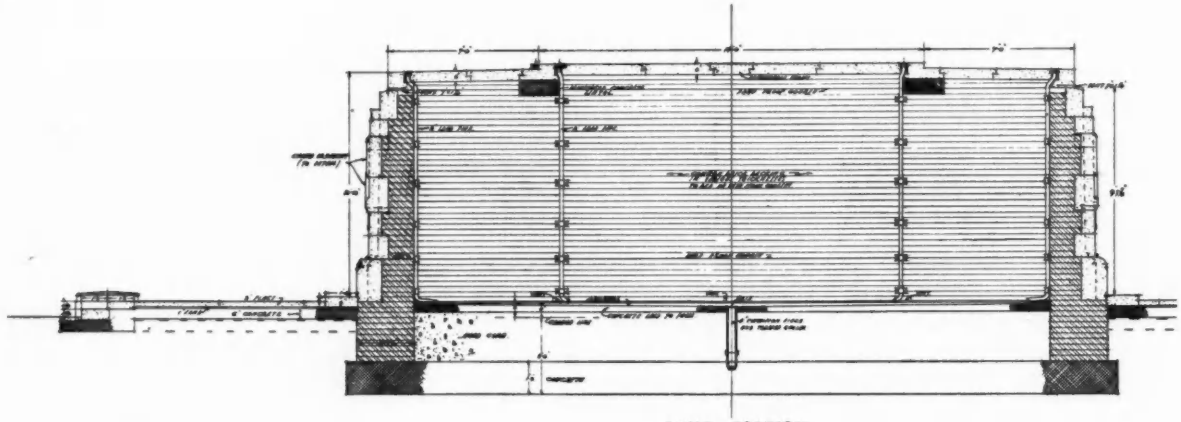


DESIGNED BY LIONEL B. BUDDEN

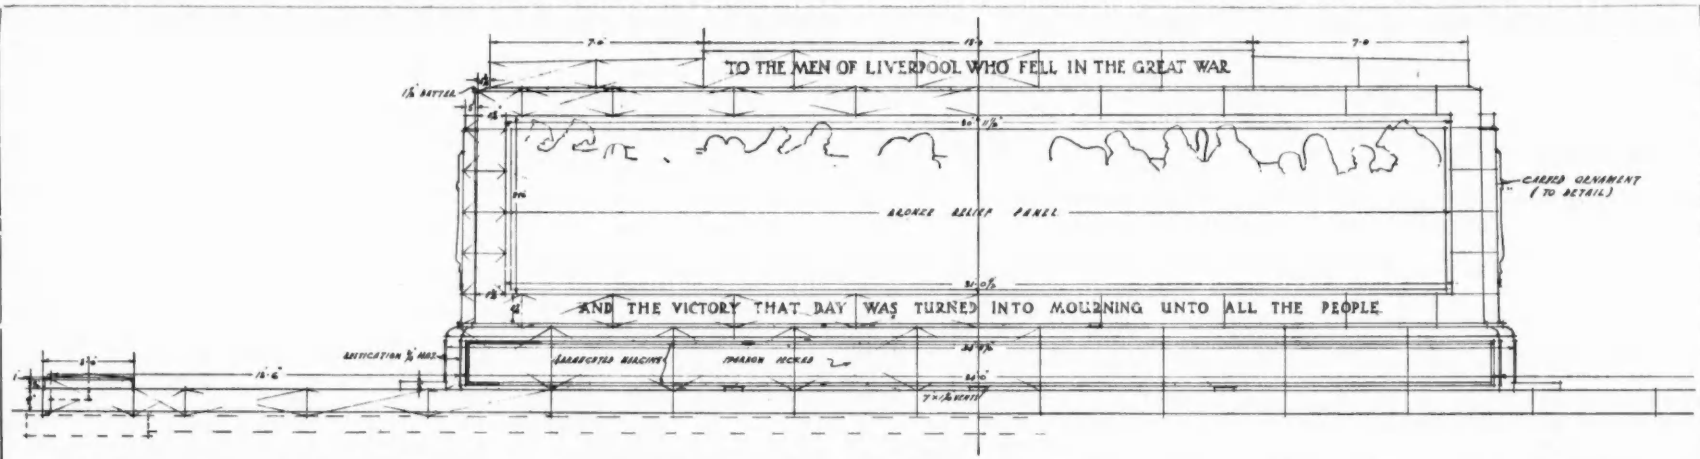
On this and the facing pages appear a series of reproductions selected from among the architect's drawings for the Liverpool Cenotaph. This was unveiled on Armistice Day and forms the subject of the frontispiece to the present issue. The drawings are to three scales. First comes the general site plan in miniature, to show the position of the cenotaph relative to St. George's Hall, with which it is designed to accord in form and fabric. The remainder of this page is devoted to longitudinal and cross sections, together with an end elevation, all to the same, and a somewhat larger, scale: a part only of the longitudinal section is included, the ends being identical. Part side elevation and plan drawings, still larger, are given opposite.



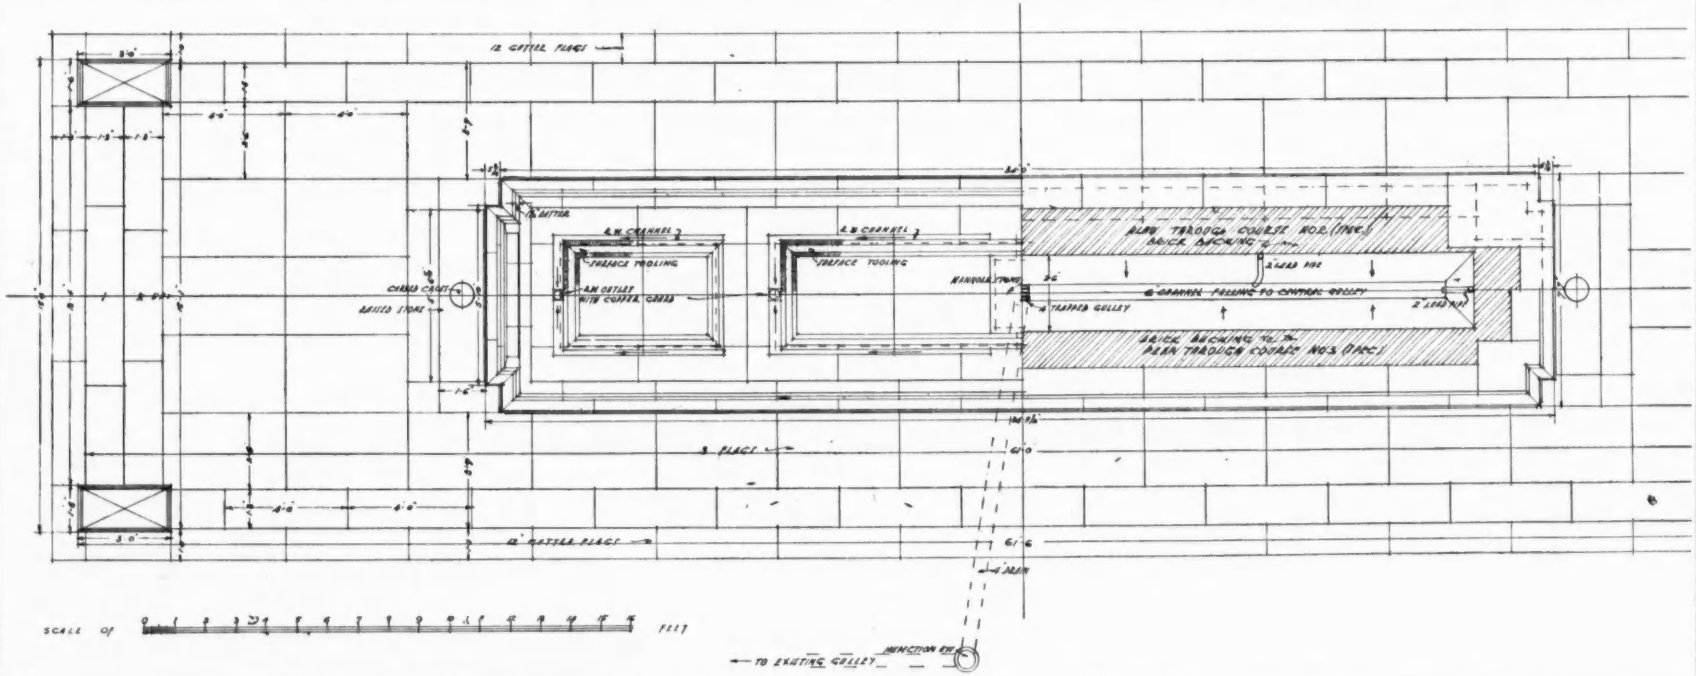
SITE PLAN



SCALE OF FEET



END ELEVATION



CROSS SECTION

LONG SECTION

The elevation of the Liverpool Cenotaph to Lime Street ; and half-roof and half-sectional plans (the parts omitted are similar to those shown). The bronze panel on this side shows a mourning group surrounding a stone of remembrance ; that facing towards St. George's Hall, fighting men marching into action. Above and below run inscriptions set in the stone. There are bronze plaques of the city arms on the two ends. The plan, when studied with the longitudinal and cross sections on the preceding page, shows the interesting arrangements for running off rain-water from the top of the monument. Mr. G. H. Tyson Smith was the sculptor associated with Professor Budden, the architect, for the lettering and ornamental work.

PUBLIC CONTROL OF BUILDING

The Position in 1930

FOLLOWING are printed as many extracts from the lengthy and important paper read by Mr. A. N. C. Shelley, M.A., B.C.L., at the R.I.B.A. last Monday as space will allow :

At the end of the paper which I read before the R.I.B.A. in 1922, I said : "We still get much less help than might be possible from the architectural profession . . . architects who find themselves in difficulties should not hesitate to make them known to us." In the eight years which have elapsed, the reasoned complaints against the present law or its operation received in the Ministry of Health from architects have been less than one a year.

The trend of legislation, and of governmental action, throughout the twenty-one years I have been in the service of the Crown, and the longer period during which I have been familiar with local government, has been steadily towards increasing the power of elected local authorities, and this trend has been markedly accelerated in the last ten years. The problem which we have to face is to ensure that local authorities . . . shall keep their local legislation and methods of administration up to date, and avoid needless restrictions upon building and development.

There are outside London 1,763 local authorities in England and Wales; of these, 1,122 are the councils of boroughs or urban districts. Many urban districts have no bylaws. There are 641 rural district councils. About one-third of the rural districts in the country have no bylaws. About one-third of the rural districts have bylaws based upon the rural model, which contains no provision restricting the materials of buildings and so contains no provisions restricting steelwork. The remaining one-third of the rural districts have bylaws which contain no requirements as to the structure of warehouse buildings, and as regards public buildings and domestic buildings simply require that steel construction shall be adequate to secure due stability. In the rest of the country, whether the districts be thickly populated industrial areas or residential areas, whatever bylaws exist allow steelwork for all classes of buildings —or (in some districts where revision took place some years ago) for all except domestic buildings —either without imposing any requirements or imposing only the requirement that it shall be adequate to secure due stability.

It will thus be seen that, unless under local Acts, there is no legal impediment anywhere in this country to the ordinary use of structural steelwork.

I have heard complaint made of a bylaw "that all sanitary work must be carried out to the satisfaction of the Council and its officials" —a bylaw which conceivably might have been enacted somewhere seventy or eighty years ago, but I have never seen it, and since 1875 it has been regarded as legally impossible.

One hears again that the architect finds his style cramped by the requirement in bylaws of 9 ft. or 8 ft. 6 ins. for the height of rooms. As I have said before, bylaws governing the height of rooms are almost dead. Of rural districts, concerning which the complaint has been most vocal, there is certainly not one in ten having any bylaw at all upon the subject. In urban districts and boroughs the bylaw is also very rare except in the industrial North and the suburban districts outside London, which are influenced by the existence of a statutory requirement of 8 ft. 6 ins. in the London Building Act. Where the bylaw exists, there are not more than three places in the country where 9 ft. is still required, and not a dozen where the height required is more than 8 ft.

The final clauses of the model series which deal with the giving of notices and the deposit of plans and sections, and generally with the enforcement of the bylaws, like the rest, have been recast in recent years, and we have no reason to think that architects find them oppressive or unsatisfactory. It is to be remembered that the duty of the local authority in considering the plans for ordinary buildings is to enforce the law. It cannot effectively reject plans which show compliance with the law, but, on the other hand, it is entitled to adequate information of what the builder or architect proposes. The other day I had to deal with solicitors who complained that a local authority had rejected plans by a "well-known architect" for laying out some land. On looking at the plans, we found that the proposed means of drainage of the buildings was not shown—and even a well-known architect is hardly an equivalent for drains. A good proportion of the correspondence and complaints which reach us in the Ministry would never have arisen if builders and architects had realized this elementary point—that to the extent required by the bylaws they must inform the local authority adequately what they are proposing. Quite commonly we find an architect (especially of "well-known" standing) does not consult the bylaws; an omission which is unfair to his client, as well as likely to cause needless labour to himself. He waits for the local authority to tell him what is in them. Once a plan is deposited with the local authority, the builder or architect is under no legal obligation, under the ordinary law, to await approval : he is entitled, by the express language of the Public Health Acts, to proceed—although obviously it is better to wait a reasonable time, to learn from the local authority whether they approve or not. In other words, the approval of plans is not a legal preliminary to the commencing of work, although the deposit of plans is—to the extent required by the bylaws. "To the extent required by the bylaws." I read somewhere the other day that "no building can be started in Great Britain without the drawings being approved by some authority. It may be the district surveyor; it may be the Ministry of Health, or the County Council, or the ground landlord." This is a grave exaggeration. There may be cases where the Minister must approve the plans of buildings, but, apart from some buildings erected by local authorities themselves, I cannot think of any. . . . A provincial local authority dealing with the plans of buildings is, by Act of Parliament, required to approve or disapprove within a month. On the Minister's behalf the opinion has been expressed in correspondence that even this time is too long, and there are plenty of local authorities who deal with plans more quickly. But if, in a particular case, you are sure that the plans you have put in are adequate to show compliance with the law, you can go ahead, and, if they are not dealt with within the statutory period, there is no reason why you should not bring the fact to the Minister's attention.

Do not over-estimate the effect or geographical extent of Parliament. Most of the local Acts passed in recent years are unlikely to have an adverse effect on building, and the areas where local Acts of an old and obstructive type exist, or indeed the areas where there are any local Acts at all, are few in number taking the country as a whole.

Inquiries into foreign building law and practice have not been restricted to America. We try to draw on the whole world, and at the present day there is no country where the system of control is comparable, where more has been done than in England to fit legal control to the use of modern building methods.

The control of building does not end with the approval of plans. If public control of building is to be preserved, the public supervision of the actual work must be upon the spot. At present it is an official of the local authority who does it (where it is done at all). The suggestion for national administration of the law of building means, therefore (if anything at all, which I doubt), not only that control would be extended to work which, without detriment to anyone, is now left alone; and that the officials, who must be stationed locally, would be controlled not by the elected local authority but by the national Government. It is difficult to see what public advantage would accrue. Greater uniformity in supervision, possibly, but supervision (so far as necessary at all) involves dealing from day to day with many details on which it is doubtful whether greater uniformity could be attained, unless by issuing voluminous rules or by constantly referring doubtful points to headquarters. Public complaint has (rightly or wrongly) recently been made that even in London, geographically small, the rules issued for the supervisory officials, and the delays caused by their references to the County Council, are vexatious ; and if central supervision of building throughout the country were introduced, similar, but intensified, complaints would be inevitable : supervision would be rendered slower, and more mechanical, and so no more acceptable to industry than it is at present.

The consolidation of the Public Health Acts when effected will be a great step in advance. And everybody who is affected hopes that it will be but the beginning of the consolidation of other branches of the law connected with public health, with building, and with local government.

We in the Ministry are committed to a programme, in which Poor Law, Housing and Town Planning have been already done, and I do not forget that the R.I.B.A. has urged us already to press on with the Public Health Acts. But even for consolidation there are competing claims on the time of Parliamentary Committees, and it is for those who want a particular subject dealt with to assert themselves. . . . In some respects the greatest of architects' needs, as I construe them, is speedy and inexpensive justice. Various suggestions have been made from time to time. The conferring of exclusive jurisdiction on the Minister and the setting up of special tribunals to deal locally with disputes on building, both suggestions involving elimination of the ordinary courts, were examined by the Departmental Committee and rejected. For parliamentary and practical reasons they are not worth pursuing. You are thus thrown back on three ideas—an obligation, imposed on a local authority which rejects a plan, to state its reasons (this lies at the root of everything); then a voluntary jurisdiction exercised by the Minister by agreement as at present ; and, where there is not agreement to lay the case before him, a speedy resort to the courts at the most convenient stage. These ideas involve no outrage on the constitution and no interference with the courts.

Four summarized aims : First, freedom from control where control is not essential.

Secondly, that control which is out of date in substance, as in the older local Acts, shall be brought into line with modern needs, and into a form susceptible, like bylaws, of speedy revision in the future.

Thirdly, that the statutes affecting building be consolidated for the sake of accessibility and comprehensibility.

Fourthly, that procedure be devised, consistent with settled English modes of thought, by which I mean the paramountcy of the ordinary courts, for settling disputed points.

ENGLISH PRECEDENT No. 142

GARDEN HOUSE, CHIPPING CAMPDEN, GLOUCESTERSHIRE

This elaborate garden-house is one of two, built opposite to one another. The fancifulness of its detail is characteristic of Late Elizabethan and Early Jacobean architecture.

The primary purpose of such a building was not so much for use as to make a picturesque object of interest in the layout of a gentleman's formal garden, and, as such, perhaps its exuberance is excusable.

The faulty jointing of the stone parapets is clearly shown in a measured drawing reproduced in Mr. Gotch's "Early Renaissance Architecture in England" (page 136).

—[BASIL OLIVER]

LETTERS FROM READERS

Bungalophobia

SIR,—I was delighted to see the letter from Mr. W. Harding Thompson in your last issue. Now he has seen the point or points of the controversy. In fact he has provided me with just the information which shows that architects can, if they choose, descend to such humdrum levels and solve problems so urgent as that of bungalow design. He assures me that 1 : bungalow designs, regionally classified, have been made accessible " with partial success " in America. 2 : that " standardized buildings properly grouped and sited " have been carried out by architects for local authorities at a cost of less than £350 per house.

In other words, my suggestions in regard to bungalows have been put into operation in America, but in England the same scheme is, at present, only applied to the houses of local authorities. What reason can there be for the same scheme not being made both accessible and attractive to the individual owner or the wholesale speculative builder? For, as the local authorities have seen, the best scheme is the cheapest in the long run.

What restrains architects from applying the same measures to bungalows is, quite simply, a curious feeling of superiority which finds expression in Mr. Harding Thompson's letter in phrases like " The architect's job is to find the best solution for each individual problem," or, far more crudely and naively, in the letter from Mr. William Davidson, as " No architect of repute wishes to compete with the trade article " !

Pocket your pride, Messieurs, and get down to business. Most professions have done so. Lawyers long ago (at least in England) drove away the unprofessional practician by proper organization : doctors are busy driving the quack off the market by providing a superior thing in medical attention. Only the Church suffers quack religions to compete with her and, apparently, only architects turn away in scorn from the " ready-made article." Mr. Davidson asks me whether I can expect to get a suit made to measure at the same price as a ready-made suit. To which I can only reply that I don't want a suit made to measure. I want simply an overcoat that will fit, a hat for my head and shoes for my feet : those I invariably do buy ready-made, as do most people of slender incomes. So with my bungalow. It is to be a residence that serves its purpose, not an ideal home. And the sooner it is dealt with as are the houses of local authorities the better. But if the architects are too proud, then they should give up jeering at what they cannot supersede.

But I am sure that Mr. Harding Thompson and Mr. Davidson are not as proud as they would seem !

STANLEY CASSON

Official Architecture

SIR,—Mr. Leathart is still in need of light. He is doubtless aware that a very large percentage of private practising architects are not of his calibre. I do not say this in any spirit of jest, as the works of his firm indicate a degree of ability which, as an architect, I am capable of appreciating; but, for the same reason, I also discern that private practice is concurrently responsible for a voluminous foul torrent of rubbish which detracts from the amenities of our cities and our countryside. Seaside balustrade and bandstand architecture is invariably the product of a borough engineer or surveyor, and so has no bearing upon official architecture.

Amongst the ranks of officials and private practitioners there are, and ever will be, architects of varying inherent ability.

The reason I referred to qualified architects functioning in official capacity is because I personally have knowledge of scores of them. In the organization in which I am the senior official architect there are fourteen members of the Institute, and I have little doubt that other official architects' offices are similarly situated in this respect. These members of the Institute very naturally resent the supercilious posture of any private practising architect who essays to assume an attitude of childish jest, derision, toadyism, snobbism, or even mere stupidity, in regard to the conditions under which they select to function, or in relation to their work.

Any continuance of this correspondence would appear to be futile.

[This correspondence is now closed.—ED. A.J.]

Canutism in Ireland

SIR,—I wish someone would dissuade you from your practice of publishing designs which have won public competitions. Do you realize how much you contribute to the unhappiness of the world by indulging in this unfortunate habit ?

Some person who has not yet reached the desirable state of cynicism enters for a competition, and uses up his spare time and his landlady's midnight oil in working out a careful scheme. He sends in his design. Weeks of waiting. Then, one morning, comes a letter naming the successful competitors, of whom he is not one. He is disappointed; but he is content to think that the best design has won. There is the end of the matter for him. He wants to forget about it.

But he is not allowed to forget. One Wednesday morning, a little while later, he opens THE ARCHITECTS' JOURNAL. There is the winning design. He examines it. Good God ! what is this ? He sees, say, as the writer recently saw in the winning design of a sea-front layout, that a promenade with a refreshment pavilion, kiosks, lavatories and shelters, is proposed at a level of 12 ft. above O.D. He refers to the original plan that the Corporation sent him. Yes ! High-water mark of *ordinary* tides, 14 ft. O.D. (spring tides will be several feet higher). So on an ordinary day of dead calm the refreshment pavilion and the rest are going to be 2 ft. under water at high tide ! Then he hesitates. Perhaps it is merely a small error that can be easily adjusted. He examines the winning design sympathetically. No; those levels are an essential and basic part of the scheme. There can be no adjustment. And so that costly winning design falls to the ground—or into the sea !

By publishing that design you have wrecked his happiness for a week. What can he do ? He tries hard to be a sportsman and takes refuge in cynicism. Or, being a fool and no sportsman, he writes a letter like this. Don't you see, Sir, the relation between ignorance and bliss in this connection ?

COMPETITOR

New Ways in Architecture

SIR,—In your issue for October 29 Mr. Hugh Macintosh supplies food for thought in the summary of his Croydon lecture ; decidedly, more interest in the subject is being manifested by the public.

One cannot say with conviction that the new ways and tendencies are, in many respects, leading to better architecture, or that they are enhancing the cause of architecture in the mind of the public.

The simile between architecture and music, as propounded by Mr. Macintosh, is a good one; it emphasizes a point of view which is otherwise obscured.

Several *soi-disant* musical composers feel impelled to express themselves in terms of macilent cacophony, for the edification of a coterie of cranks.

It is certainly regrettable, also, that a few otherwise brilliant architects essay to interpret in expensive building materials their own latent febrile imaginative aspirations, in order to create an illusion of slick versatility.

It must be admitted, however, that

what they achieve is like the mule—without pride of ancestry or hope of posterity.

Now, in the difference between architects and musicians lies the crux of the matter—for, whereas in the case of the musician the public need not listen—they can either stay away from recitals or switch off their wireless—in the case of the architect, his work must be seen every day in town and countryside.

There are many definitions of architecture and what it should be and express; all are variations of the general theme relating beauty to construction. It has been said that tradition in architecture has been destroyed, that modern mechanization of the building industry and fresh conquests of science are creating a " new architecture."

I am sufficiently old-fashioned to believe that tradition should be a fundamental element in an architectural composition, and should restrain the too impulsive recourse to the facile methods of modern construction and production.

This view is not to be taken for unintelligent conservatism, but rather as pointing to the *via media* between mere copyism of past styles on the one hand and meretricious " functionalism" on the other.

True architecture, after all, is not achieved in a battle of styles, but rather in quality of style.

HARRY HOLLAND

Modern Decoration

SIR,—May I make an observation on your review of *Modern French Decorative Art*? Mr. Leathart speaks bitterly of the client who " knows what he wants," and he would have the client's functions limited to paying for the job. Now, I am not quite certain about this. If only for the reason that I do not know what I want my heart goes out to the man who does; the pity is that what he wants is often so infernally bad. But cannot we, who presumably only know what we do not want, take him by the hand?

We need educated criticism badly, and when architects give a lead by frank criticism of architecture we shall begin to get a body of informed lay opinion comparable to that which existed in the eighteenth century.

The man who has spent years collecting cuttings of windows, doors, gables and other things in order to work them into his dream house is undoubtedly a nuisance, and wrecks many a promising set of drawings.

His architectural education has developed on wrong lines. But it *has* developed, and there was a time when help from the right quarter would have made him a valuable spur to the best architectural effort.

The man who writes a fat cheque for the privilege of saying that his house was built, or his room decorated, by So-and-so, is very often without any architectural education. His room may be faultless, but it often sets small store by that important item in the furnishing of any room—the owner!

GORDON RUSSELL

Daylight Illumination Data

SIR,—With reference to the articles in THE ARCHITECTS' JOURNAL of October 15 and 29 on the above subject, I am, of course, unable to add anything to Dr. Walsh's excellent description of the work in progress in his department at the National Physical Laboratory, Teddington.

I would, however, suggest that architects should realize the peculiar value to this country of a final Court of scientific appeal which is provided by the Department of Scientific and Industrial Research in its well-equipped and well-staffed laboratories at Teddington and at the Building Research Station, Watford.

Our knowledge of many subjects is overgrown with errors and prejudices, false but orthodox, which have taken such firm root in generations of textbooks that nothing less powerful than a Government department can uproot them. This is particularly true of daylight illumination.

For example, it is some five years since it was shown in a paper read before the R.I.B.A. that the value of white-glazed bricks as a panacea for the ills of overbuilding was absurdly over-estimated. Possibly very few people were impressed by that statement; some regarded it as rank heresy; others have openly derided it as mere theoretical nonsense, contrary to practical experience.

The results of the National Physical Laboratory's tests on the efficiency of light wells mentioned by Dr. Walsh were published in *Illumination Research, Technical Paper No. 11*. In this report the facts which were adduced in the R.I.B.A. paper are proved and substantiated by the most severe and comprehensive tests.

Similar corroboration of the heretical and often unpopular ideas of practitioners who think for themselves will doubtless appear in due course. I have had many opportunities of following the progress of researches at Teddington and Watford, and of studying the proofs of reports still in the Press. I can therefore without hesitation strongly advise architects to make a point of acquiring these technical papers both from Teddington and Watford immediately they are issued. They are models of terse, lucid explanation of technical details in the simplest of language, with a wealth of important and often vital information set forth in convenient and digestible form, and the price at which they are published by H.M. Stationery Office is ridiculously low.

In these hard and lean times it is not without importance that the cost of each publication is about the same as that of a packet of cheap cigarettes.

PERCY J. WALDRAM

Safeguarding Architectural Assistants

SIR,—I am desired by the Council of the Association of Architects, Surveyors and Technical Assistants to call the attention of your readers to the fact that an instance has come to light in which a large commercial firm has engaged architectural assistants on the express condition that no notice of termination of engagement is given, taken, or required.

While such a condition gives almost unlimited power or advantage to an employer, it places the employee at a grave disadvantage and is, in fact, degrading.

Those who are inclined to accept such engagements are strongly advised not to do so, as compliance with such conditions may cause subsequent regret to a bitter extent.

Assistants are invited to inform me of any attempt on the part of employers to impose such terms.

A. SEYMOUR REEVES
(SECRETARY, A.A.S.T.A.).

Spoiling the Green Park

SIR,—In his indefatigable efforts to create work Mr. Lansbury has removed a useful gate which gave access to the Green Park from the Mall, and has had it re-erected in immediate juxtaposition to the gilt-touched main entrance.

The end of the path which led to the useful gate having been obliterated, the continuation of the way is being destroyed, while a few yards distant a strenuous gang of men cuts up a wide stretch of greensward to form a straighter track to the new exit. One tree has been felled in record time. Are others to follow?

Might I suggest to Mr. Lansbury that he should seek a less disastrous field for his activities? If he set his men to cleaning the Serpentine and destroying some millions of microbes we should not grumble; but leave us our grass and trees!

E. THORNTON COOK

On Monday, December 15, in aid of the Lambeth Housing Movement, a grand " Foundation Stone " benefit performance will be given of *Paddy, the Next Best Thing*, at the New Scala Theatre, Charlotte Street, Tottenham Court Road, W.1. Tickets are obtainable, ranging from £1 1s. to 1s. 2d., from Miss L. A. Shaw, 63 Lincoln's Inn Fields, W.C.2.

IN THAT CONTINGENCY

The following abstracts of inquiries are representative of a number of those recently submitted to the Building Research Station, and their replies thereto.

Failure of Plaster Ceiling

A CONTRACTOR reports: A ceiling has fallen down, the plaster having broken away from the laths.

The materials used for "pricking" up and floating were grey hydrated lime and sand, and the finishing coat white hydrated lime, all used to maker's specification. A small sample of the broken ceiling was enclosed.

Reply: From a superficial examination, the material comprising the first coat appears to be rather weak and friable, the second and finishing are appreciably harder. The material contains a fair proportion of hair, although the quantities usually specified are too small to make this point significant.

It is to be regretted that it is not possible to obtain definite information as to the cause of failure, in cases of this kind, by chemical analysis of samples which have been exposed to the atmosphere for some time. At the best, analysis would only give a rough indication of the mix used and no definite information regarding the quality of the materials used could be obtained.

From a number of cases reported to us we conclude that manipulative errors are largely responsible for failure of this type of plasterwork. The most common faults are probably the use of air-slaked and partially carbonated lime, and the lack of thorough knocking up and subsequent trowelling, which are traditionally required for the best class of work, and which are as important with a hydrated lime as with lime putty.

Failures have been reported to us where sound materials appear to have been carefully applied by skilled operatives. It has to be borne in mind, however, that at the best, lime plaster has low strength at an early age, and the process of hardening is very slow; if the material is disturbed in any way by movements in the structure, such as warping or shrinking of the laths or joists, this, together with shrinkage of the plaster itself, may give rise to failure.

Heat Insulation

A manufacturer requires data regarding the insulating values of various types of bricks, including cement-sand bricks.

Reply: There are no figures for the thermal conductivity of individual bricks available in our records, but the following values may give some indication of the relative merits of clay, brick walling and cement products. It should be noted that variations in the properties of the materials such as density, porosity and moisture content will give different values from those quoted.

Material.	Thickness. Ins.	Thermal conductivity B.Th.U. per sq. ft. per hour for 1° F. difference in temperature between faces.
Walls.		
London stock bricks in cement mortar	9	0·68
Flettons in cement mortar	9	0·70
Sand lime bricks in cement mortar ..	9	1·03
Concrete.		
Granite (to pass ½-in. sieve) 4--cement 1	9	0·57
Sand 4--cement 1 ..	9	0·41

Wall Boards

A Government Department asks for general information on the use of wall boards as plaster substitutes.

Reply: In the light of our present knowledge, wall boards may be divided into three categories:

(1) Boards of fibrous composition: (*a*) Sold with special claims for heat insulating and sound absorbent properties; (*b*) Sold with the main object of lining in view. These have similar properties but are often thinner than type (*a*).

(2) Plaster boards intended for use under a finishing coat of plaster.

(3) Plaster boards jointed with plaster for use without plaster finishing or cover fillets for fixing.

Boards of type (1) are liable to moisture movements (i.e. shrinkage on drying and expansion on wetting) comparable with wood and, therefore, under ordinary circumstances the joints must be covered with wooden fillets in order to accommodate such movements. They vary in this respect, but there is not a great deal to choose between them. They require a system of battens for fixing and are unsuitable for use where damp conditions are likely to arise. They are liable to injury by rough usage, but possibly not more so than lime plaster. The manufacturers of certain boards of this kind claim that they may be used as a base for plaster with special precautions for jointing, such as the embedment of a strip of wire mesh along the joint. This would probably be satisfactory in the case of a studded internal partition, but we should be doubtful whether it would make a sound job where applied close up to a solid external wall, which might become damp by moisture transmitted by capillarity from the exterior.

Boards of type (2), being composed essentially of gypsum plaster, are not liable to moisture movements of magnitude comparable with those of the fibrous materials, and have been on the market for a sufficient length of time for a fair amount of experience to have been gained in their use. When finished with a good quality plaster, they make a satisfactory job.

Boards of type (3) consist of high grade gypsum plaster base material, between sheets of heavy felted paper. We have examined ceilings over periods up to three years, which have developed no cracks when fixed to ceiling joists, the joints being filled with the maker's special gypsum plaster.

Failure of Tiled Floor

School Authorities report the failure by buckling of the tiled floor in the entrance hall. They require an examination to be made and an explanation of the causes of failure.

Reply: An examination was made of the tiled floor of the entrance hall of the school, which had failed by loosening and buckling of the tiles.

Failures of this kind are not uncommon, and a number of similar cases have been brought to our notice.

The present appearance of the floor suggests that failure has been caused by shrinkage of the concrete filler-joist floor beneath. The shrinkage of the concrete floor has probably been increased by the heat derived from the heating plant in the basement directly below. The buckling is due to the fact that whereas concrete shrinks appreciably on drying out, a well-burnt clay tile does not exhibit any considerable movement.

It is not possible to state whether the full shrinkage of the floor has yet taken place, but, as the floor has been subjected to drying conditions for several seasons, it seems reasonable to suppose that it has. In these circumstances it would appear justifiable to relay the tiles.

The rather large variations of humidity and temperature between summer and winter to which a floor between an entrance hall and a basement in which heating apparatus is installed, must always militate against the soundness of tiling. The maximum length changes due to these variations, however, will be much less than the initial drying-shrinkage of the concrete, which appears to be complete or closely approaching a limit.

It has to be borne in mind that this floor is subdivided into a number of small units by shrinkage of the concrete, and there must be some possibility of cracking of the tiling by any subsequent movements.

THE SKETCH CLUB

SIXTEENTH SESSION

For the present session, another, and this time a final, selection has been made from among the hundreds of drawings sent in by entrants for the three recent Holiday Sketches Competitions. Indeed the hanging committee may now claim to have found space (however inadequate in some cases) for practically every subject deemed likely to be interesting and intelligible to others besides the individual sketcher. Readers who are also sketchers are invited to submit material for future reproduction.

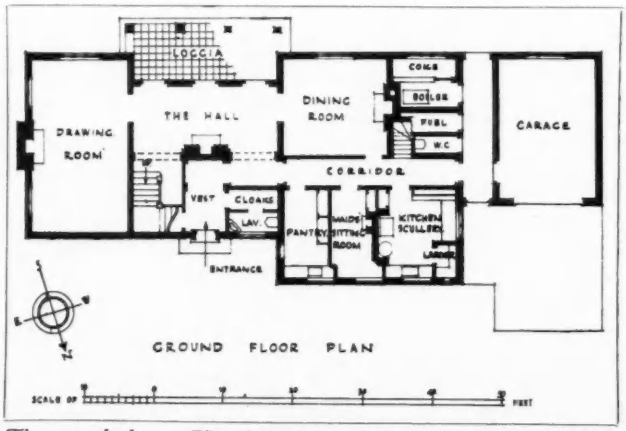
HOUSE AT TARRING

DESIGNED BY TATCHELL AND WILSON



The southerly front; a view from the garden, showing the loggia, with balcony over, facing the central garden pool and fountain.

MARLPOSTS, Tarring, near Worthing, is built on a site which in early times formed part of the Manor of Marlposts and Ferring, Sussex. Situated as the building is within a short distance of the sea, special care was taken in the construction of walls and roof. Daneshill facing bricks were used and a cavity (filled with hygeian rock composition) was formed in the thickness of the outer walls from foundations to roof plate. Tiles were used in roofing.

In the southerly or garden front a large loggia on the ground floor, with a wide balcony at first-floor level, makes an attractive central feature. This looks over the pool and fountain, with surrounding paved walks, at the focal point of the garden layout, which was also designed by the architects.

Inside the house, too, there is a centre of interest in the hall, planned *en suite* with dining- and drawing-rooms, and with two arched openings, one of which leads to the staircase. The service quarters are a compact and isolated unit, and a garage, facing onto a yard, is built into the fabric of the house.

The ground plan. The determining factor was the central hall, connecting on either hand with the dining- and drawing-rooms.

The stairs, with windows on half-landing, seen through one of the hall archways.

The hall. The windows overlook the loggia. A glimpse of the dining-room is seen through the open door. The stairs lead up beyond the right-hand archway.

LITERATURE

TWENTIETH-CENTURY SCULPTORS

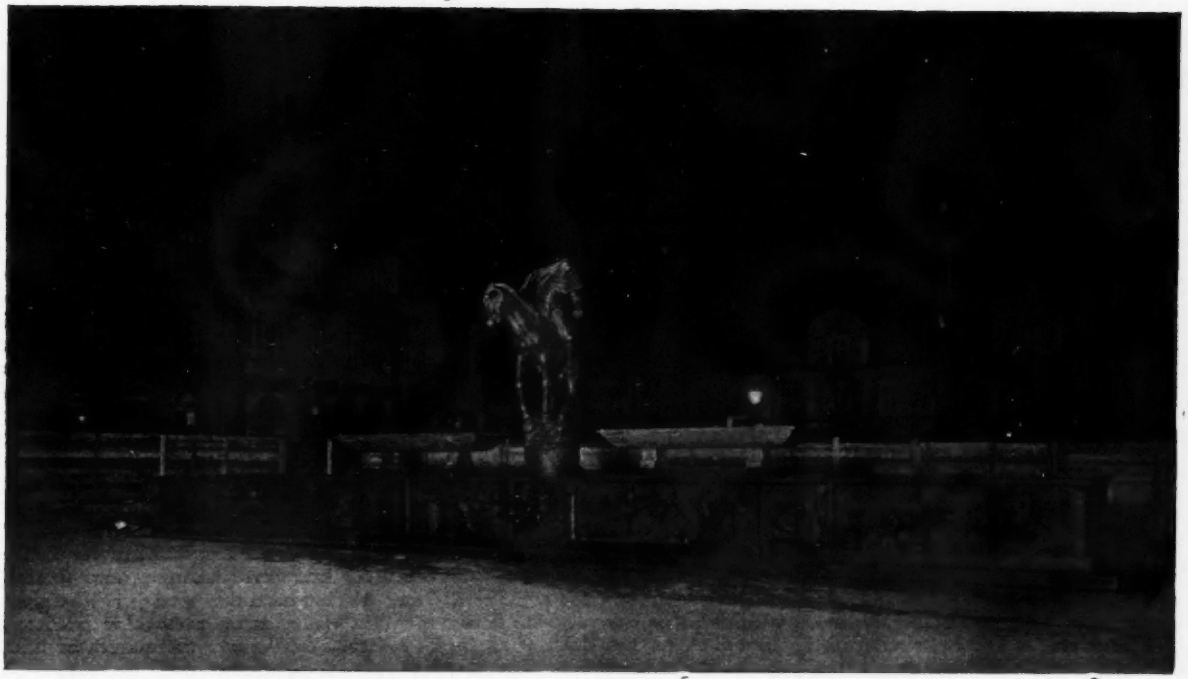
MR. CASSON deserves well of architects because he does what they should themselves do. Bearding the sculptors in their dens, and provoking them into speech, he has achieved at a total sacrifice of critical imperturbability, something of the sculptor's point of view.

There are two things today that should be giving architects a great deal of thought. One is the job of getting painting out of the frame and *into* the building; the other is the equally important job of getting sculpture out of the gallery and *onto* the building.

Neither of these will become possible until both painting and sculpture, and painters and sculptors, are understood. We have just emerged, as well we know, from a period of architecture in which sculpture, though treated according to the best canons of professional rectitude, has come to lose all significance. From this degeneration we have tended towards the opposite extreme that would eschew all sculpture. Thought clarifies but slowly; we are, it seems, still in the midst of what Geoffrey Scott called the mechanical fallacy; but when we have designed horizontally or vertically, according as we are told to look along girders or up stanchions, we will once again take control of the situation and become humanists. Then we shall need sculptors. In the meantime, there may be salvation to seek in the problems which sculptors themselves have solved or are solving.

Standing before a good work of sculpture there is not much one can say of it that is not three parts eyewash and of little use to the better understanding of it. On the other hand, there is a great deal that can be said both of the man that did it and of his methods of doing it. If Edwardian sculpture was in the main bad, that is the end of it so far as it affects us as we stand before it. But to know how it was made, and in what surroundings and circumstances, gives reasons for distaste, and the beginning of a critically selective taste.

In the same way taste will enable us to say with some certainty what is good, but only a knowledge of material and methods of working, and the circumstances of the work, will enable us to appraise it. And only the widespread acquisition of this knowledge will generate an atmosphere sympathetic to the production of good sculpture.



Mr. Casson holds sculpture to be pre-eminently the art of the open air, and at its best in association with the architecture of cities. When the work of Carl Milles is understood in relation to its setting who can disagree with him? The one barrier against the revival of sculpture for civic adornment is the badness of it in the past; the one hope for the future is the recognition of what constitutes its goodness. Here it is that I would make a very earnest recommendation to every architect who enjoys architecture to read Mr. Casson's book, for he has got nearer to the truth of the tremendously important matter of sculpture and architecture than any other writer on the same subject. One is reminded of Lessing, in content, if not in style. E. M. F.

XXth Century Sculptures. By Stanley Casson. London: Oxford University Press. Price 9s. net.

THE BIRMINGHAM CIVIC SOCIETY

IN the last annual report of the Birmingham Civic Society, just issued, it is stated that the gold medal of the Society has this year been presented to the Hon. Lady Anstruther-Gough-Calthorpe, D.B.E. The award has been made in recognition of the great æsthetic value to the city of the policy established and maintained in developing the Edgbaston estate, and also in appreciation of the generous gifts made by her from time to time towards the increase of amenity in Birmingham. Lady Calthorpe succeeded to the Calthorpe estate on the death of her father, the sixth Baron Calthorpe, in 1910, by whose family it has been owned for upwards of two hundred years. This is the tenth year in which the gold medal has been awarded, the past recipients including Sir Barry Jackson and the Rt. Hon. Arthur Neville Chamberlain, M.P.

Many matters have occupied the attention of the Society during the year :

From XXth Century Sculptures.] [*By Stanley Casson.*

Bronze fountain and water trough of Folke Filbyter Linkoping, by Carl Milles.

their special knowledge of printing and book production has been utilized by the Chamber of Commerce in the newly-published official Birmingham guide; they were of great assistance in obtaining a considerable modification of the original drastic proposals for the reduction in the musical staff of the Birmingham (5 GB) studio; they have collaborated from time to time with the City Parks Committee; prepared a garden scheme for the Douglas Haig Memorial Homes at Billesley Common; and have assisted in the formulation of a consultative committee to develop social facilities on the new housing estates. Action is also being taken in a great variety of other affairs, such as litter, road signs, and municipal recreation.

It can readily be seen that much of the best work of the Society must be of a strictly confidential nature, and that privacy must be a condition of its performance. However, the evidence submitted in the report of matters no longer confidential more than justifies the existence of this live Society.

ACOUSTIC CONSTRUCTION

BY C. W. GLOVER

The author, in a paper on "The Acoustics of the Sound Film Studio," read before a meeting of the Society of Motion Picture Engineers on Monday of last week, reviewed at large the problems confronting the acoustic engineer. Below are summarized points of particular interest regarding sound-proof floors, doors, and windows.

FLOORS

IN the case of floor construction, not only do we have to deal with airborne sounds, but contact noises produced by vibration communicated directly to the structure are introduced. It is quite certain that the important points for the prevention of sound transmission through floors are:

(1) A floating floor isolated from the walls.
(2) An isolating material of non-homogeneous nature between the floor covering and the floor proper.
(3) The floor proper; and
(4) A suspended ceiling.

These are required to prevent actual mechanical vibration, such as footsteps, from being transmitted from the room above to the room below.

DOORS

The illustration on the facing page shows typical details of sound-proof doors. The provision of elaborately padded and even expensively upholstered doors has not been uncommon in the past, it being generally assumed that the absorbent surface assists in the prevention of transmission of sound.

For certain reasons a highly reflecting surface is really preferable, provided the door itself is laminated in construction, with sound-absorbent materials embodied in the interior.

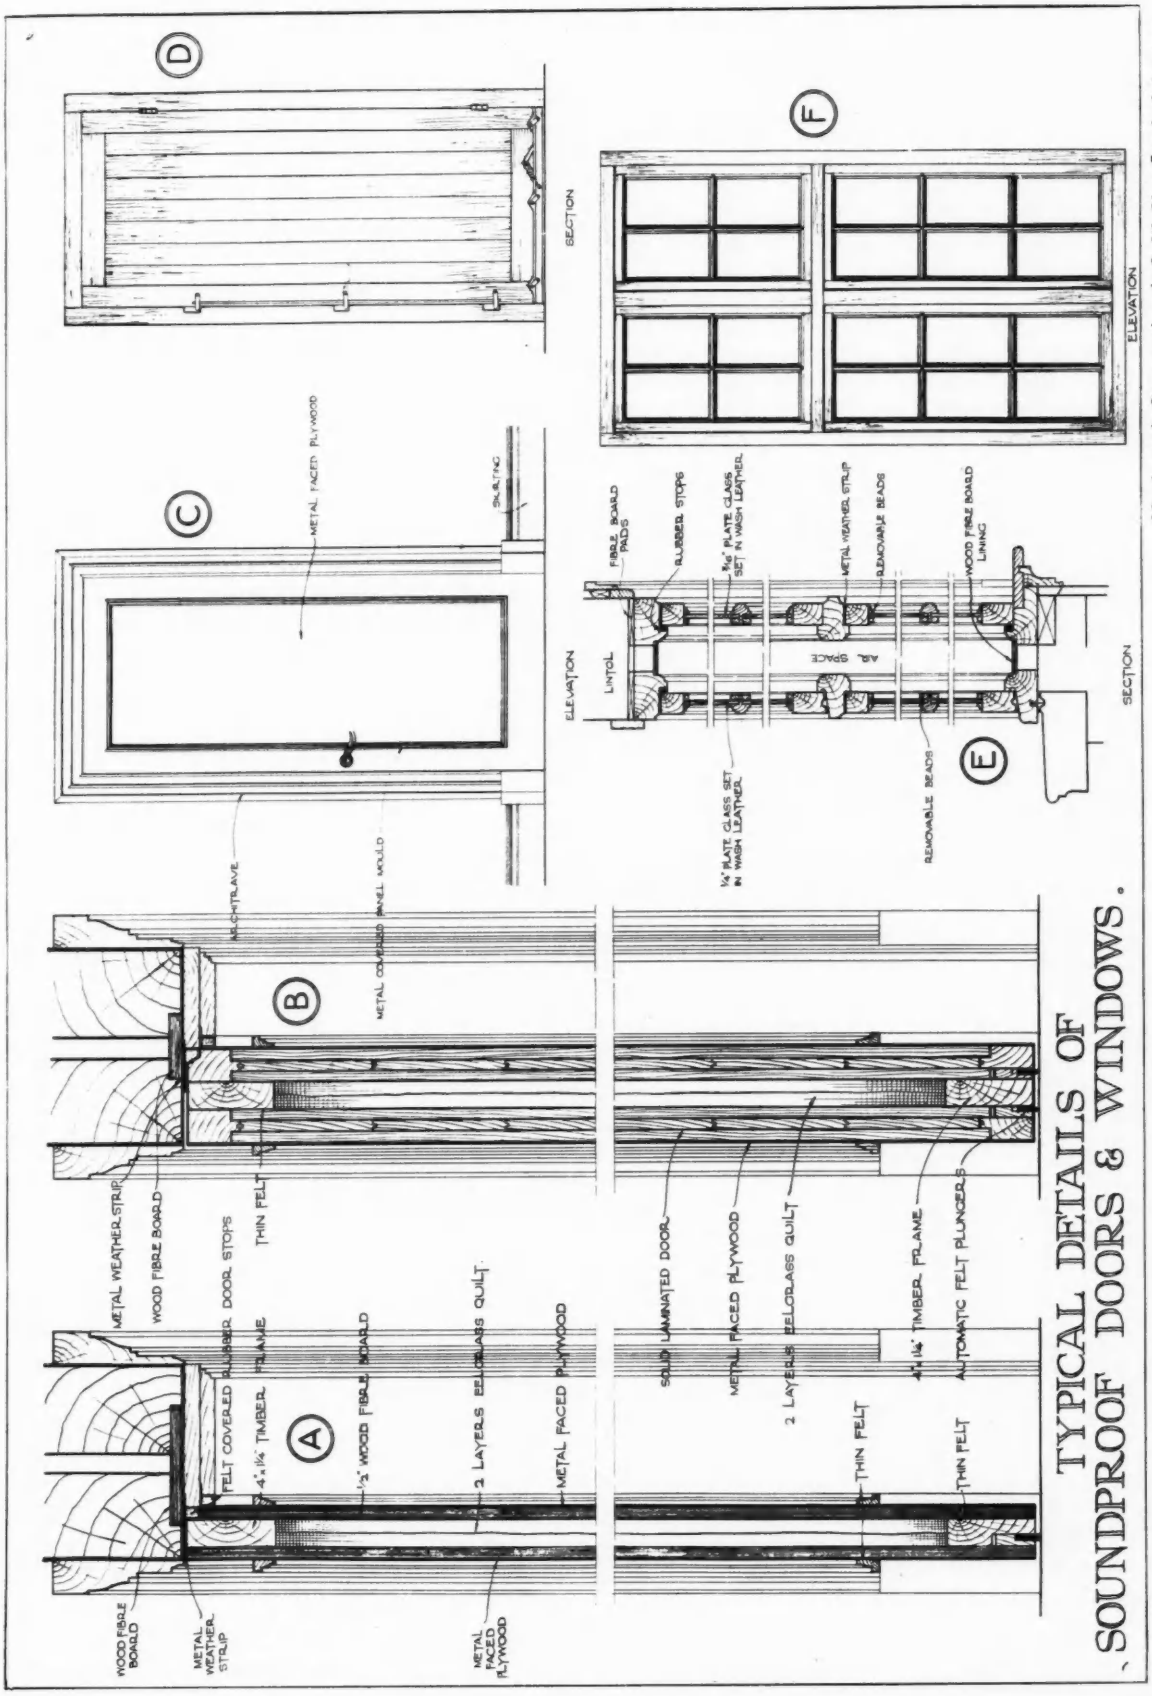
Experiments have proved that as much as 17 per cent. of sound transmitted through a closed door can be eliminated by the mere provision of caulking round the edge, and it will be readily appreciated that an expensive sound-proof door may be little short of useless if it is not made a good fit.

It may generally be taken that for adequate sound insulation a sound-proof door should be reasonably airtight when closed, and the details shown on the accompanying illustration indicate a means of effecting this.

Automatic felt plungers fixed to the bottom of the door seal the opening under the door when closed, though if conditions of the installation permit, it is better to provide a step at the doorway so as to get a more effective seal. Round the jambs rubber gaskets are fixed and the door, provided with a strong three-lever door handle, presses hard upon its seating and forms an effective seal.

It is, of course, not possible to provide the equivalent of thick, massive walls or a structure with isolated surfaces without physical contact between them and at the same time provide a door which will be easy of operation.

Detail A on the illustration shows a single sound-proof door which would be suitable for domestic or hotel work. This door is constructed of metal-faced plywood on both sides, screwed to wood fibre boards attached to a timber frame, the interior of which is loosely filled with two layers of eelgrass quilt. Between the plywood and the fibre board, and the fibre board and the frame, a layer of thin felt is used to break structural contact as much as possible. Metal-sheathed moulding planted on to the outside of the door can be used with advantage to form any panelled effect required.



If doors made to detail A are used in highly damped rooms, a curtain should be hung over the door opening on the inside of the room, otherwise the sound energy condition of the room is likely to be altered.

Detail B shows an improved construction of sound-proof door, which, under normal circumstances, may be considered to have a reduction factor of 35 sensation units. In this door a timber frame, filled loosely with two layers of eelgrass quilt, is covered both sides with solidly-built laminated doors. These latter are square framed, and filled with G. and T. boarding in three layers, laid cross-grain, with the object of obtaining maximum rigidity. To each outer face metal-covered plywood is applied, and felt is used as before to separate each unit of the construction. Flexible metal weather strips serve to improve the fit of the door, and should be installed when the highest efficiency is of importance.

The provision of glazed openings in these doors should be avoided as far as is possible, but, if required, these should be constructed on the lines laid down for sound-proof windows. When installing door frames in sound-proof walls and partitions, care should be taken to insert felt or the like insulator between the frame and the wall, and, in the case of linings to door openings, fibre boards or divided linings with felt strip should be used. Doors of this type also have very high heat insulation and fire-resisting qualities.

WINDOWS

Details E and F on the illustration show what is, in my opinion, the best type of sound-proof window. Two independent frames, set in the window opening with fibre-board pads, are connected only with a wood fibre board lining, so that the physical contact between the two sides of the window is made less rigid. Casement-type windows are indicated on the detail, each side opening outwards and provided with weather strips, rubber gaskets, etc., so as to provide facilities for occasional cleaning, and to render them reasonably airtight. The glazing is best fixed in removable beads; the glass on the one side should be thicker than on the other in order that both sides of the window will not tune in together.

[*See* Acoustic Construction, *by C. W. Glover, on the facing page.*

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Steel for building purposes

MORE use of steel for building purposes was advocated in a debate in the House of Commons by Miss Wilkinson, the Labour member for East Middlesbrough, who said that they needed to get rid of the antiquated building restrictions which were preventing the use of steel. There was a ridiculous case of a large building not far from that House, costing many thousands of pounds, where, because of the antiquated regulations of the London County Council, the top story could not be used. No one could suggest that it was not as safe as any other story, but it did not happen to fit in with the specific regulations which were framed with no idea of the use of steel in that building. If they had a national board, speaking on behalf of the whole industry, they could deal with public departments in a way that the individual steel manufacturers could not do. They must get rid of the system under which architects, decorators and furnishers clung to the idea that there was something sacred in the use of wood, and that steel was a thing with which only Bolshevists would have anything to do. Some new designs in steel furniture might well be considered by the steel trade. France was far in advance of this country in the use of steel for home and office furniture. The steel industry made a very great mistake when they linked up the idea of steel houses with the idea of a lower rate of wages for the workmen. People would not look at steel houses because they meant lower wages.

The Government spokesman, Mr. W. R. Smith, welcomed Miss Wilkinson's suggestions, which, he said, were very useful, and might be followed up as a means of bringing more men into the industry.

Private architect for Government buildings

Mr. Lansbury, the First Commissioner of Works, told Captain Balfour that, whilst it had been decided that the design for the proposed Government offices in Whitehall would be entrusted to an architect in private practice, the precise method of selection had not yet been settled.

Educational buildings

Sir C. Trevelyan, President of the Board of Education, informed Major Edmondson that the advice of the Board's architects' department and of His Majesty's inspectors was at the disposal of local education authorities which were contemplating the erection of new school buildings at all stages, from the inception of the project to the final approval of plans. It was the Board's practice to approve in principle the erection of a new school prior to the submission of finished plans, but their final sanction was dependent on their approval of such plans.

Cost of houses

Mr. Greenwood told Sir K. Wood that the average cost (excluding the cost of land, roads and sewers) during the period from January 1 to September 30, 1930, was for non-parlour houses £337, and for parlour houses £405.

Housing progress

At question time Sir K. Wood asked the Minister of Health if he would give the number of houses finished under the various Housing Acts each quarter since June, 1929; and the number of houses during the same period erected without State assistance.

Mr. Greenwood said that the following statement gave the desired particulars so far as State-assisted houses in England and Wales were concerned :

Quarter ended	Number of State-assisted houses completed during the quarter under the		
	Housing, Town Planning, etc., Act, 1919.	Housing, etc., Act, 1923.	Housing (Financial Provisions) Act, 1924.
Sept. 30, 1929	18	39,227	17,730
Dec. 31, 1929	14	—	14,507
Mar. 31, 1930	—	—	10,571
June 30, 1930	—	—	11,351
Sept. 30, 1930	—	—	14,881

Returns as to houses erected without State assistance were obtained half-yearly only, to the end of March and September respectively. The number of such houses of a rateable value not exceeding £78 (or £105 in the Metropolitan Police District) erected during the six months ended in September, 1929, was 38,298 and during the six months ended in March last 53,393. Complete figures for the six months ended in September last were not yet available.

In reply to a further question by Sir K. Wood, Mr. Greenwood said that during the period June to September, 1930, 1,204 houses were completed by the L.C.C., ninety-three by the Metropolitan Borough Council of Poplar, and eight by the Metropolitan Borough Council of Lambeth.

Sir K. Wood asked for the number of houses erected in each month during 1930 in agricultural parishes in England and Wales under the Housing (Financial Provisions) Act, 1924.

Mr. Greenwood said that the following statement gave the desired particulars :

Month.	Number of houses completed in agricultural parishes in England and Wales under the Housing (Financial Provisions) Act, 1924, during the month.
1930	
January	195
February ..	118
March	199
April	128
May	199
June	171
July	198
August	287
September ..	525

Mr. Greenwood informed Sir K. Wood that at June 30, 1930 (the latest date to which complete figures were at present available), seventy-one slum clearance schemes remained to be completed in England and Wales. Two such schemes were completed between March 31, 1930, and June 30, 1930, and none were confirmed during that period.

State-assisted dwellings

Mr. Wellock asked the number of dwellings completed with State assistance under the Housing Act of 1924 in England and Wales during each month from October, 1929, to September, 1930, inclusive, and the total number of dwellings now under construction under the same Act.

Mr. Greenwood replied that the following statement gave the information asked for in the first part of the question :

Month.	Number of houses completed during the month in England and Wales under the Housing (Financial Provisions) Act, 1924.
1929	
October ..	6,278
November ..	4,555
December ..	3,674
1930	
January ..	3,073
February ..	4,009
March	3,489
April	3,038
May	4,377
June	3,936
July	4,669
August	4,571
September ..	5,641

The total number of houses under construction in England and Wales under the Housing (Financial Provisions) Act, 1924, at September 30, 1930, was 37,359.

Mr. Greenwood informed Sir K. Wood that the number of State-assisted houses completed between January 1, 1921, and September 30, 1930, was 949,451.

Mr. Greenwood informed Sir K. Wood that up to the end of June last, the latest date to which complete information was at present available, assistance had been promised under the Housing (Rural Workers) Act, 1926, in respect of 3,308 dwellings in England and Wales, work had been finished on 2,206 dwellings, and was in progress at that date on a further 818 dwellings.

Direct labour schemes

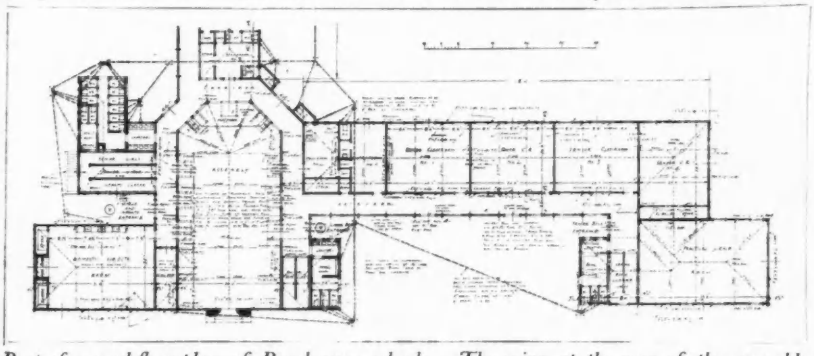
Sir K. Wood asked the Minister if he would state the average price of non-parlour and parlour houses, respectively, included in contracts let by or in direct labour schemes of local authorities in England and Wales during each month since May, 1930.

Mr. Greenwood said that the following statement gave the desired particulars (excluding the cost of lands, roads and sewers) for each month from June to September, 1930, inclusive :

Month.	Non-parlour Houses.	Parlour Houses.
	£	£
June, 1930 ..	339	403
July, 1930	333	392
August, 1930 ..	341	401
September, 1930 ..	347	410

Sir K. Wood asked the Minister if he would state the average superficial area of A-type non-parlour houses included in contracts let by or in direct labour schemes of local authorities in England and Wales during the years 1928, 1929, and 1930, respectively.

Mr. Greenwood said that the average superficial areas were, in 1928, 762 sq. ft.; in 1929, 766 sq. ft.; and during the nine months from January to September, 1930, inclusive, 763 sq. ft.



Town-planning schemes

Mr. D. G. Somerville asked the Minister of Health if, in the different town-planning schemes submitted to him, he was giving full consideration to the objections, properly formulated, of residents who considered that the proposals affected the amenities of the district in which they lived, and whether an inquiry was held in all such cases.

Mr. Greenwood said that the answer to both parts of the question was in the affirmative. The permission of development while a town-planning scheme was in course of preparation, however, rested with the local authority concerned, and there was no appeal to him against the granting of such permission. He had recommended local authorities to ascertain and consider the representations of persons likely to be seriously affected by any proposed development before granting permission for it, and he believed that local authorities generally observed the spirit of his recommendation.

A perspective sketch of the proposed Church of England Schools, Broxbourne, to be erected from designs by R. J. Hugh Minty. The building will comprise junior and senior departments. The funds have been raised entirely by local subscription.

Part of ground-floor plan of Broxbourne schools. The wing at the rear of the assembly hall continues for about 125 ft. and comprises, in addition to the staff room shown, four classrooms. The grounds, apart from the playground, are to be laid out for football, cricket, hockey and basketball pitches.

SOCIETIES AND INSTITUTIONS

MANCHESTER SOCIETY OF ARCHITECTS

THE profession of architecture was passing through a time which was critical but full of promise, said Mr. J. T. Halliday, F.R.I.B.A., in his presidential address to the Manchester Society of Architects, last Wednesday. He continued by saying that after nearly thirty years of controversy, the Bill for the registration of architects, which passed its second reading recently, would put the profession on a sound and reasonable basis. In future the public would be able to distinguish between incompetent and unqualified persons and those who had qualified to the extent required to earn a place on the register. It would then rest largely upon the intelligence of the general public whether they continued to employ men without taste or training.

In many directions, he pointed out, the R.I.B.A. and the allied societies were endeavouring to raise the standard of architecture. A scheme was being worked out by which speculative builders, who were at present building thousands of houses of a type which was apparently imagined to supply a long-felt want, but which were the butt of everyone's criticism, would be able to avail themselves of designs prepared by architects without the expense of employing an architect in his full professional capacity.

R.S.A. INDUSTRIAL DESIGNS COMPETITION

Some candid comments on the conditions of modern industrial production were made by Professor Richardson at the Royal Society of Arts, last Wednesday, in reviewing the designs submitted in the R.S.A. Industrial Designs Competition. Much of the work of art today, said he, such as toy sculpture, pretty painting, loose carving, odd stuffs and grotesque pottery, was due to lack of taking pains on the part of the artist, to the greed of manufacturers, to the apathy of the general public who followed fashion as sheep followed the butcher to the slaughterhouse, and to the general chaotic conditions.

Lord Stanmore, C.V.O., presided over a large audience, composed chiefly of students.

Professor Richardson, before commenting on the prize-winning designs, said that young craftsmen no less than manufacturers should learn that conscious art was not always desirable. There were times when the spirit of art should not be degraded—times when art was not required. Of late years we had come to recognize the fact that the products of the Middle Ages and the Renaissance possessed a quality which we admired and, at the same time, despaired of recovering. The quality would never be recovered until we tackled our problems anew. Modernism aimed at sweeping the past into the limbo of things to be forgotten. It was symptomatic of democracy and the triumph of the machine. If modernists could build up a new beauty, a new perception of rightness in all works of the mind and the imagination, they would be certain of success. But modernism, unfortunately, was another name for fashion.

The average modernist, he continued, seeking notoriety, was apt to disregard proven materials. He juggled with form and experimented with the abstract, hoping that something would arise; and something did arise, but not art. Modernism was not lightly to be disregarded; at present its tenets were half-truths, and that was where the danger lay.

In Germany, where much had been done to foster the new movement, a sort of formula had been evolved for dehumanized building in which direct expression of function was dominant. The factory or machine-shop style was one of the important contributions. In France the liner or the aeroplane style had been developed. America had made vertical advances in the ziggutrat style. Some adventurers in England compromised between all three.

His point in this particular regard was that the arts take their tone from architecture. Because a sort of cubism was the fashion in architecture, sculpture followed suit, and so on, and so forth. But such experiments did not deceive those thinkers who advocated grace in building. No doubt time would bring its compensations; bastard engineering would in turn give place to a revival of building in which materials would be treated logically and without affectation.

If ever the day came, he said, when architectonic qualities were ignored, useless as they might be from a practical standpoint, then architecture would cease to be a fine art. This was very nearly the case today. A work of art must be the product of a controlling mind.

By the aid of lantern illustrations of the prize-winning designs, Professor Richardson was able to offer constructive criticism of the work.

He hoped that when the terms of the 1931 competition were published the instructions to the competitors would be a little more explicit than in the past.

WEST YORKSHIRE ARCHITECTS

"The Englishman does not know what he wants, he does not know what he has lost; but in a confused sort of way he recognizes that he can never have wanted what he has got." The foregoing remarks from *The English Secret* formed the keynote of Mr. Norman Culley's presidential address to the West Yorkshire Society of Architects. Environment, he said, constituted the great ill or many of the ills under which present-day civilization suffered.

Referring to the Town Planning Act, he remarked that great roads had been constructed under the Act to take the heavy modern traffic. They might have been parkways had sufficient land been taken on either side. On these roads modern petrol buses run, and, as someone had said, make fortunes by taking people farther out, and who go farther out in the hope of escaping the noises which the very buses themselves make.

The people taken farther out, desirous of enjoying the amenities of the countryside, were assisted by the Government subsidy to the erection of a bungaloid or other jerry-designed growth, the work still of the speculative builder and the untrained, uncultured jerry draughtsman, under the benevolent auspices of municipal authority, thus spoiling the amenities of the countryside even for others who desired to do likewise.

One was prompted to the thought that with no radical difference in constitutions of local authority, English towns and cities could not be made beautiful by Act of Parliament alone, neither could Act of Parliament alone prevent the desecration of the countryside. There must be education, and there must be employment of architects and architectural control of architecture. Matters could be much improved if all plans submitted to local authorities had in all cases to be over the signature of a practising architect.

Mr. J. E. Stocks, proposing the vote of thanks, said that undoubtedly the exodus from the towns was destroying the amenities of the countryside.

In seconding the vote, Mr. J. F. Walsh considered that architects generally were far too modest in not putting forward their claims to execute departmental work; and to blame for not ensuring that, when such commissions did come their way, that their names were mentioned in press reports referring to such buildings.

THE RATING AND VALUATION ACT

The defects in the Rating and Valuation Acts of 1925 to 1928 were dealt with by Mr. Michael Faraday at a meeting of the Auctioneers' and Estate Agents' Institute held at the Society's headquarters, Lincoln's Inn Fields.

The lecturer said that an amazing anomaly arose out of the fact that, in the erection of a house, clay was converted into bricks and the brick kilns were rateable, while the process plant or machinery in connection with the conversion of wood into joists, beams, doors, and window frames was exempted.

He thought that it might have been in the minds of the compilers of the Act that all types of buildings should be assessed, and therefore the words "in the nature of a structure" found their way into the Act, but if process plant was to be exempt, it should be the process plant of all trades and not the process plant of some only.

GOTHIC ARCHITECTURE

Sir Banister Fletcher, P.R.I.B.A., lecturing at the Central School of Arts and Crafts on Wednesday last, continued from his previous lecture the study of Gothic architecture in Italy.

He pointed out that throughout the independent cities of Central Italy in the thirteenth century the unfamiliar Gothic style from the north was accepted in a half-hearted manner. The restlessness of this northern art did not appeal to Italians, who loved repose in line and design, and during the whole mediæval period it failed to capture the true spirit of northern Gothic.

AUSTRALIAN STUDENTS' CLUB

A club for Australian architectural students has been formed in London for the purpose of facilitating study both in England and on the Continent. The Club meets at intervals, when matters of interest are discussed for the mutual benefit of the members. All Australians are invited to join, and further particulars can be obtained from Mr. Eric Garthside, Hon. Secretary of the Club, 6 Alberos Gardens, Golders Green, London, W.N.11.

RALPH KNOTT MEMORIAL FUND

As a result of the appeal for the above fund, donations amounting to just over £1,040 were received, and the Council of the Architectural Association appointed the following committee to deal with the matter: Messrs. Robert Atkinson, F.R.I.B.A., W. Fraser Grainger, F.R.I.B.A., Maurice E. Webb, F.R.I.B.A., and F. R. Yerbury, HON. A.R.I.B.A.

The L.C.C., having contributed a sum of £250 to the fund, have appointed Mr. Ronald P. Jones, F.R.I.B.A., to serve

as its representative on the committee.

Following is a list of donations which have been given; as the fund is still open, further donations may be sent to Mr. F. Yerbury, Hon. Secretary of the Fund, Architectural Association, 36 Bedford Square, W.C.1. :

[For list of Competitions Open see last issue.—ED. A.J.]

THE ARCHITECTS' DIARY

WEDNESDAY, NOVEMBER 19

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Exhibition of Members' Holiday Sketches. Until November 27.

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "Persian Painting." By Laurence Binyon, LL.D. Chairman: Sir Arnold Wilson, K.C.I.E., etc. **8 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Italian Mediæval Architecture: Venice, and the Doges Palace." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

ROYAL ACADEMY, Burlington House, W.1. "Early Methods of Oil Painting." By A. P. Laurie, D.SC. **4 p.m.**

INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Students' Meeting. Address by Arthur T. Black, STUD.INST.C.E. Chairman: Sir George W. Humphreys, K.B.E. **6.30 p.m.**

PUBLIC HEALTH CONGRESS AND EXHIBITION. At the Royal Agricultural Hall, N. Until November 22. 10 a.m. to 7 p.m. **10 a.m.**

SOANE MUSEUM, 13 Lincoln's Inn Fields, W.C.2. Art and House Collection. Open Thursdays and Fridays in November. 10.30 a.m. to 4 p.m. **10.30 a.m.**

EXHIBITION OF MODELS OF OLD LONDON. At the Golden Cross Hotel, Strand, W.C.2. The models are the work of John B. Thorpe. **2.30 p.m.**

THURSDAY, NOVEMBER 20

WEST YORKSHIRE SOCIETY OF ARCHITECTS. At the College of Art, Leeds. General Meeting. "Where Are We Going?" By H. S. Goodhart-Rendel, F.R.I.B.A. **7 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, Victoria Embankment, W.C.2. Ordinary Meeting. "Some Data Concerning Railway Electrification in Italy." By G. Bianchi. (Light Refreshments, 5.30 p.m.). **6 p.m.**

INSTITUTE OF METALS, 36 Victoria Street, S.W.1. "Some Non-Ferrous Metals in Chemical Engineering." By Richard Seligman.

GEFFRYE MUSEUM, Kingsland Road, Shoreditch, E.2. "The Progress of Furniture Craftsmanship from 1650 to 1700." By John C. Rogers, A.R.I.B.A. **7.30 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS. Yorkshire Branch. At the Metropole Hotel, Leeds. "Concrete and Critics." By A. W. Legat, M.INST.C.E. **7 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Yates Lectures. Sixth of eight public lectures on "Greek Myths and their Representation in Art." By Professor A. E. Gardner. (Lantern Illustrations.) 5 p.m. Fourth of a series of five public lectures on "Re-plannings of London, *c.* 1520–1920." By Miss E. Jeffries Davis. 5.30 p.m. **5 p.m.**

VICTORIA AND ALBERT MUSEUM, Cromwell Road, South Kensington, S.W.7. Lecture Theatre: "English Alabaster Carvings." By W. L. Hildburgh, F.S.A. (Lantern Illustrations.) **5.30 p.m.**

FRIDAY, NOVEMBER 21

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Finance and House Committee. Intermediate Examination. Until November 27.

LONDON SOCIETY. At the Royal Society of Arts, John Street, Adelphi, W.C.2. "More Light on London." By Dr. C. W. Saleeby. (Illustrated by a film entitled "A School in the Sun.") Chairman: Sir Leonard Hill, F.R.S. **5 p.m.**

NATIONAL HOUSING AND TOWN PLANNING CONFERENCE. At the Imperial Hydro Hotel, Blackpool. "Future Town Planning Legislation." By Dr. Raymond Unwin, F.R.I.B.A. 5.30 to 7.15 p.m. "Machinery for the Building and Controlling of New Towns." By Sir Theodore Chambers, K.B.E., F.S.I. 8.30 to 10.15 p.m. **5.30 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS. Western Counties Branch. At the Merchant Venturers' Technical College, Unity Street, Bristol. "The Erection of Steelwork." By G. F. C. Caswell. **7.30 p.m.**

SATURDAY, NOVEMBER 22

Sunrise, 7.28 a.m. Sunset, 4.3 p.m.

NATIONAL HOUSING AND TOWN PLANNING CONFERENCE. At the Co-operative Congress Hall, Albert Road, Blackpool. Morning Session: 10 a.m. to 1 p.m. Afternoon Session: 2.30 to 5 p.m. Subject: "The Administration of the Housing Act, 1930." Papers will be submitted by Sir William E. Whyte, John G. Martin and E. D. Simon, M.P. Joint Meeting at the Imperial Hydro Hotel of the Executive and General Committees of the National Council. 5.45 p.m. **10 a.m.**

SUNDAY, NOVEMBER 23

NATIONAL HOUSING AND TOWN PLANNING CONFERENCE. At Blackpool. Circular coach tour, 2 to 4 p.m. At the Imperial Hydro Hotel. "The Preservation of Lakeland." By Kenneth Spence. 5 to 6.30 p.m. Concert, 8.15 p.m. **2 p.m.**

MONDAY, NOVEMBER 24

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. "The A.A. Excursion to Sweden and Denmark, 1930." By H. Austen Hall, F.R.I.B.A. Exhibition of photographs of buildings visited on the A.A. Excursion to Sweden and Denmark. Until 1 December 20. **8 p.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Cantor Lecture I. "Modern Domestic Scientific Appliances: Lighting of Rooms." By Professor Charles R. Dowling, F.I.C., F.INST.P. **8 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. South Midland Centre. At the University, Edmund Street, Birmingham. "Some Data Concerning Railway Electrification in Italy." By G. Bianchi. **7 p.m.**

TUESDAY, NOVEMBER 25

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, W.1. "The Construction of a Great Exhibition." By W. T. Bowman, O.B.E., F.I.A.A., M.I.STRUCT.E. Chairman: Sir William Crawford, K.B.E. **7 p.m.**

LONDON SOCIETY. At the Gas Light and Coke Company's Offices, Church Street, Kensington, W.8. "Gas as a Public Servant." By Sir Francis Goodenough, C.B.E. **4 p.m.**

WEDNESDAY, NOVEMBER 26

ARCHITECTURE CLUB. Eighteenth Annual Dinner, to be held at the Savoy Hotel, Strand, W.C.2. Topic: "London of the Future." R. Holland-Martin will preside. 7.15 for 7.30 p.m. **7.15 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "French Mediæval Architecture: The Romanesque Period." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. First of three public lectures on "Stockholm and Its Environs." By A. M. Wijk. (Lantern Illustrations.) **5.30 p.m.**

ST. PAUL'S ECCLESIOLOGICAL SOCIETY. At the R.I.B.A., 9 Conduit Street, W. "Conway Castle and Town: Its Creation, Early History and Present Condition." By Arthur E. Henderson, F.S.A., F.R.I.B.A. (Illustrated by slides and drawings). **8 p.m.**

THURSDAY, NOVEMBER 27

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Literature Standing Committee.

WEST YORKSHIRE SOCIETY OF ARCHITECTS, 62 Woodhouse Lane, Leeds. Students' Debate. "That 'Esquisse Design' in Schools of Architecture is not essential to the furtherance of good Architectural Design." Affirmative: P. J. N. Penlington. Negative: D. Steel. **7 p.m.**

INTERNATIONAL CONGRESS OF MODERN ARCHITECTURE. At Brussels. Until November 29. Subjects for discussion: "Rational Ground Layout for Minimum Size Dwellings" and "Horizontal Sliding Windows."

GEFFRYE MUSEUM, Kingsland Road, Shoreditch, E.2. "The Influence of the Architect on Modern Furnishing." By John Gloag. **7.30 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "The Structural Engineer's Relation to Building Construction and Transportation." By Alfred Bossom, F.R.I.B.A. **6.30 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Yates Lectures. Seventh of eight public lectures on "Greek Myths and their Representation in Art." By Professor A. E. Gardner. (Lantern Illustrations.) 5 p.m. Last of five public lectures on "Re-plannings of London, *c.* 1520–1920." By Miss E. Jeffries Davis. 5.30 p.m. **5 p.m.**

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. At the Showroom of W. T. Lamb and Sons, 43 Shoe Lane, E.C.4. "Bricks and Tiles." By E. Valser. **7 p.m.**

VICTORIA AND ALBERT MUSEUM, Cromwell Road, South Kensington, S.W.7. Lecture Theatre. "English Mediæval Sculpture." By Arthur Gardner. (Lantern Illustrations.) **5.30 p.m.**

FRIDAY, NOVEMBER 28

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, W.1. Fifth Annual Banquet to be held at the Stationers' Hall, City, E.C.

INSTITUTION OF STRUCTURAL ENGINEERS. Midland Counties Branch. At the Chamber of Commerce Buildings, New Street, Birmingham. Paper on "Steelwork in Cinema Construction." By S. Willis. With an Introduction by William T. Benslyn, F.R.I.B.A. **6.30 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. South Midland Centre. Annual Dinner, to be held at the Grand Hotel, Birmingham.

SATURDAY, NOVEMBER 29

Sunrise, 7.40 a.m. Sunset, 3.56 p.m.

L.C.C. SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Visit to the Works of Messrs. W. T. Lamb and Sons, Worcester Park. **2 p.m.**

INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Students' Afternoon Visit to the reconstruction works in progress at the L.C.C. Kingsway Subway.

MONDAY, DECEMBER 1

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Cantor Lecture II. "Modern Domestic Scientific Appliances: Heating of Rooms." By Professor Charles R. Dowling, F.I.C., F.INST.P. **8 p.m.**

WEDNESDAY, DECEMBER 3

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "The Building of the Mansion House." By Sydney Perks, F.S.A., F.R.I.B.A., F.S.I. **8 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "French Mediæval Architecture: The Gothic Period—The Cathedrals." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

TRADE NOTES

Messrs. J. W. Benson, Ltd., have just issued a booklet describing and illustrating their new turret clocks, bells and carillons, etc. A typical example of the firm's work is the clock installed on the sports pavilion at the Isle of Thorns Summer Camp for Boys, illustrated in the last issue of THE ARCHITECTS' JOURNAL. They were also responsible for the manufacture of the new clock on the Portsmouth Town Hall, which, it is claimed, is the largest and most powerful in the South of England. The latter shows the time on four illuminated dials of 11 ft. diameter; it strikes the hours on a bell of four tons and chimes the Cambridge quarters on four smaller bells of proportionate size, making a total weight of nearly seven tons. The firm's other work includes a large clock for the Post Office, Geelong, Australia (as a memorial to the late King Edward VII); the clock for the International Exhibition, 1862; the clock and carillon for St. Patrick's Cathedral, Dublin; the clocks at Welbeck (for the late Duke of Portland); St. James's Cathedral, Toronto; New College, Oxford, and the Hoseinabad Tower Lucknow. The large extent of the firm's premises, which are equipped with the latest labour-saving tools and machinery, gives immense facilities for the manufacture of work of this type. Messrs. Benson invite persons to visit their workshops, which are at the rear of their showrooms, 62–64 Ludgate Hill, E.C.4, and view the progress of orders during manufacture.

*

Much interesting information is given with regard to the manufacture of clay goods for building purposes in the new advertising literature, just published by Messrs. Wheatly & Co. In "Fireplaces in North Staffordshire Briquettes" the firm point out that when it is desired to construct or use an old-world fireplace without disturbing the mental tranquility of lovers or owners of modern furniture, the 6 in. by 2 in. by 1 in. Triton hand-made sand-faced briquettes are eminently suitable. These briquettes are purpose-made of North Staffordshire clays and stocked in this old size, giving 2 in. and 1 in. faces at will, in red, and in light, medium and dark brindled colours. All the colours are natural, and are obtained by a judicious mixing of the different seams of clay, coupled with special methods of firing. It is claimed that no fear of unsightly scumming need be entertained, provided Portland cement and sand are used for erection, as Triton briquettes are treated against soluble salts in the clays. Among "Eleven good reasons why architects specify the goods of Wheatly & Co.," another leaflet, the firm state that all goods are made by hand; tiles, ridges, roof fittings, flooring quarries and fittings, fireplace briquettes and all other goods are made from thoroughly weathered and tempered clay; the special process of double weathering in operation at the Springfield tileries being the architect's guarantee against lamination. In "Five tests of a good flooring quarry," the company give the results obtained with Triton flooring quarries by independent firms. "The good old way" is a little book about the Springfield Tileries, Newcastle-under-Lyme, showing that in tile-making the good old way is still the best. In it is reproduced a series of advertisements which have appeared in THE ARCHITECTS' JOURNAL. The advertisements deal briefly with the principal stages in the preparation and production of goods made from North Staffordshire clays, at the same time explaining how the finished article benefits by the particular method employed and the great care given to detail. The story is simply and interestingly told, but despite its brevity, it is impossible not to appreciate the value of the firm's experience, over sixty years, in the making of clay goods for building purposes.

*

The Ragusa Asphalte Paving Co., Ltd., of 25–27 Oxford Street, London, W.1, have opened another new branch, in Canterbury, in order to be in a position to cope with the increased business which has developed in Kent. The address is Sun Buildings, St. Georges Street, Canterbury. The resident manager, Mr. H. T. Skelcher, has a fully-equipped depot, and is in a position to give effect to customers' requirements at short notice.

*

The recent motor-cycle world's speed record of 150·75 miles an hour for a flying kilometre was set up on a stretch of concrete-surfaced road on the Cork City boundary. The road was laid in 1927 for the late County Surveyor of Cork, Mr. J. T. Murphey. The concrete section, two miles long, was the work of the South of Ireland Asphalt Co., Ferrocrete cement being used. The motor-cyclist was Mr. J. S. Wright; the designer of the engine, Mr. T. R. Temple.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, London, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATIONS

32268. Eddy, G. W., and Acton's Stoveware, Ltd. Manufacture of building-composition for flooring, etc. October 27.

32725. Aierey, Sir E. Concrete construction for floors. October 31.

SPECIFICATION PUBLISHED

337111. Roos, H. W. Apparatus for constructing concrete floors.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors, specialists, and some of the sub-contractors for the buildings illustrated in this issue:

Church at Barras Green, Coventry (pages 755–757). General contractors, H. Clarke and Sons. Reginald Hallward, stained glass east window; Alfred Miller, carving; Mr. Pyment, pulpit and prayer-desk; Ames and Finnis, facing bricks and tiling.

Moyses Stevens Flower Shop, Victoria Street, S.W. (pages 758–761). General contractors, Bovis (1928), Ltd. General foreman, F. Vosper. Sub-contractors: F. Lawford & Co., asphalt; London Brick Co. and Forders, Ltd., bricks; South-Western Stone Co., Ltd., stone; F. Bradford and Son, artificial stone, fireproof construction and stairtreads; Dorman Long & Co., Ltd., structural steel; Acme Flooring and Paving Co. (1904), Ltd., wood-block flooring; Art Pavements and Decorations, Ltd., patent flooring; G. N. Haden and Sons, Ltd., central heating, boilers, and ventilation; John Richards, Ltd., electric wiring and electric heating; Matthew Hall & Co., plumbing and sanitary fittings; Yannedis & Co., door furniture; Crittall Manufacturing Co., Ltd., casements and window furniture; A. L. Gibson & Co., Ltd., rolling shutters; Haywards, Ltd., iron staircases; E. Pollard & Co., Ltd., sunblinds and shop front; Arthur Searle & Co., decorative plaster; Birmingham Guild, Ltd., Starkie Gardner & Co., and Cashmore Art Workers, metalwork; A. Broadbent and Son, stone carving; J. Whitehead and Sons, Ltd., marble; Waygood-Otis, Ltd., lifts; Birmingham Guild, Ltd., signs.

House at Tarring (page 772). General contractors, Frank Sandell and Sons. C. Allaway, F.R.H.S., horticultural work. Sub-contractors: Durbin and Sons, drainage, plumbing, domestic and central heating; Jacob, White & Co., Ltd., electric light, power and bell installations; G. Matthews, Ltd., fireplaces; C. E. Welstead, Ltd., casements and lead lights; United Water Softeners, Ltd., Permutit water softeners; Martin van Straaten, floor and wall tiling; John Bolding & Sons, Ltd., sanitary fittings; J. W. Gray and Son, Ltd., lightning conductors; Daneshill Brick and Tile Co., facing bricks; Collier's, tiles.

ARCHITECTS' WILLS

Sir Aston Webb, P.P.R.I.B.A., of Hanover Terrace, Ladbroke Square, W., left £96,421 (net personalty £90,001). Among his bequests was £100 to the Architects' Benevolent Society. Sir Aston's share and interest in his business and business premises were bequeathed to his son Maurice, to whom, with his daughter, Dorothy Marion Webb, he left the ultimate residue of the property.

Mr. Albert Saville Buckley, of Chorley, Lancs., architect and surveyor, left £8,790 (net personalty, £7,486).

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Plans passed by the CATERHAM and WALLINGHAM U.D.C. : Two houses, Essendene Estate, for Mr. P. Surridge; ten houses, Sunny Rise, for Mr. W. Butler; additions to lodge, Whyteleafe, for Mr. R. S. Bradshaw; house, Croydon Road, for Mr. C. Dean; sixteen houses, Godstone Road, for Mr. W. T. Stutchberry; bank premises, High Street, for Lloyds Bank, Ltd.; outbuildings, The Meadows, Warlingham, for Miss Case; garage, Gordon Road, for Mr. C. L. Davies; temporary Church Institute, Whyteleafe.

The CHESHUNT U.D.C. has made application to the Ministry of Health for sanction to borrow £21,200 for the erection of the first instalment of the Cromwell Avenue housing scheme, providing for sixty-six houses. The complete scheme will comprise 136 houses.

The L.C.C., in conjunction with the Lewisham B.C., propose to erect a building in Churchdown, DOWNHAM, for use as a school treatment centre and as a maternity and child welfare centre. The estimated cost is £8,135.

The Hendon Council has received sanction for a loan of £14,240 for the erection of forty cottages on the Berridge Estate, EDGWARE.

The Canadian Pacific Railway Co., Ltd., is to erect a large hotel on land in Berkeley Square and Bruton Street, PICCADILLY, W.1. The building will contain 700 bedrooms and a number of restaurants, and the ground-floor frontage will consist partly of showrooms. It has been announced that the preparation of plans is to begin at once. The negotiations which have resulted in the acquisition of the site involved a sum of over £1,000,000.

The SUNBURY U.D.C. has instructed the surveyor to prepare plans and estimates and submit an application to the Ministry of Health for sanction to borrow £15,000 for the erection of thirty houses at Shepperton Green.

Plans passed by the SUNBURY U.D.C. : Twenty-six houses, Green Lane, Sunbury, for Mr. A. E. Beckley; house, Charlton Road, Shepperton, for Mr. Oliver Love; house, The Avenue, Sunbury, for Mr. J. Farmer; three houses, Squires Road, Shepperton Green, for Mr. A. W. Shepherd; eight houses, Manor Lane, Sunbury, for Mr. W. Myring; two bungalows, Scott's Avenue, Ashford Common, for Mr. F. Edwards.

Plans passed by the TWICKENHAM T.C. : Two houses and one bungalow, Wellesley Crescent and Upper Grotto Road, for Mr. H. L. Moyle; house, Cross Deep, for Messrs. Partridge and Daniel; shop, with flats over, Percy Road and Bridge Way, for Messrs. H. M. Grellier and Son; house, Nelson Road, for Mr. H. B. Phillips; extensions of wards, St. John's Hospital, for Messrs. Brewer, Smith and Brewer.

In a report of the Town Hall Committee of the WEMBLEY Council, it is recommended that the Council shall appoint an architect, who shall prepare a scheme for (*a*) town hall for municipal business only, (*b*) town hall and library, and (*c*) town hall, library and public hall to seat 1,500. The County Council is to be asked to bear the cost of the erection of the library. The cost of the building is estimated at £75,000.

EASTERN COUNTIES

Provisional plans for the new cinema to be erected on the old Beccles College site in Ballyate, have been approved by the BECCLES T.C. Another cinema is contemplated on the site of the old Lecture Hall, Fair Close, Beccles.

SOUTHERN COUNTIES

Plans passed by the CHATHAM T.C. : Twelve bungalows, Beaconsfield Road, for Mr. C. J. Howard; six houses, Park Crescent, for Mr. H. P. Hughes; two houses, Palmerston Road, for Mr. L. Shave; twelve houses, Magpie Hall Road, for Messrs. W. T. Davis and Son.

Plans have been passed for a new cinema to be erected at CROWBOROUGH for Messrs. Shipman and King.

Mr. Walter R. Hamblyn, architect and surveyor, has prepared plans for the erection of private residences on a site in Northiam Road, EASTBOURNE.

New shop premises are to be erected at the junction of Church Lane and Church Street, EASTBOURNE, for Messrs. Alfred I. Fear. Plans have been prepared by Mr. John C. Bowley, architect.

Mr. W. J. King, architect and surveyor, has received instructions to design a new cinema to be erected at the top of Mount Pleasant, TUNBRIDGE WELLS.

SOUTH-WESTERN COUNTIES

The BASINGSTOKE Council has passed plans for the reconstruction of the Pavilion Theatre, for Mr. E. G. Casey.

An appeal has been launched by the BRISTOL Hospital Council for £250,000 for increasing the hospital accommodation, and installing up-to-date equipment.

The Ministry of Health has forwarded formal sanction to the GOSPORT U.D.C. for the borrowing of £37,872 for the erection of 100 houses on the Kenton Road site and £2,978 for the purchase of 8,508 acres of land at Kenton Road North.

The Board of Trade has authorized the Poole Harbour Commissioners to proceed with work in connection with the proposed extension and development of the HAMWORTHY quays.

A scheme is in preparation for the erection of a cinema at HANHAM, Bristol. The local council has intimated that provided suitable plans are placed before them they are prepared to give the scheme favourable consideration.

The TORQUAY Corporation has decided to erect 188 more houses at Barton.

MIDLAND COUNTIES

At a meeting to be held shortly the Blore Heath (Staffs.) R.D.C. is to consider the question of building houses at BLORE.

The KIDDERMINSTER T.C. has decided that the site for the proposed new baths should be adjoining Caldwall Hall.

At a meeting of the LONG EATON U.D.C. the council resolved to invite architects to submit designs for a scheme for converting the Palace Theatre into an arcade and providing a covered-in market on land at the rear.

Messrs. Albert E. King & Co., architects, are preparing plans for a new cinema on the site of the Premier Dance Hall, LOUGHBOROUGH, for the Universal Car Co., Ltd.

The Southwell Diocesan Conference has approved a proposal to erect a church house on the site of St. Thomas's Church, Park Row, NOTTINGHAM. The estimated cost of the new building is £10,000.

The Staffordshire C.C. has agreed to provide an isolation hospital for patients in SOUTH STAFFORDSHIRE, at an estimated cost of £129,777.

Plans for fifty houses in Willowbridge Lane, Sutton-in-Ashfield, were passed at a meeting of the SUTTON-IN-ASHFIELD U.D.C.

The Staffordshire Education Committee has approved sketch plans for a senior girls' and a junior school at TAMWORTH for the accommodation of 480 and 350 scholars respectively.

At a meeting of the WALSALL R.D.C. the town clerk reported that sanction had been obtained for the erection of thirty-two houses.

NORTHERN COUNTIES

Provision has been made for the erection of more than 100 houses in the Cowpen Quay area of BLYTH borough.

Plans passed by the BRIDLINGTON T.C. : House, St. Andrew's Road, for Mr. H. F. Wood; house, St. Andrew's Road, for Mr. E. Thorpe and Mrs. K. Sharpe; twelve houses, St. Andrew's Road, and two houses, East Road, for Mr. A. L. Bacon; two houses, Sixth Avenue, for Messrs. W. and R. Barron; four houses, Kingsgate, for Mr. E. Gray; four bungalows, St. Oswald Road, for Mr. C. L. Waite.

The CASTLE WARD R.D.C. has confirmed the Housing Committee's decision to proceed with the erection of forty-six houses under the Hazlerigg housing scheme.

Plans passed by the DEWSBURY T.C. : Alterations, "Perseverance" Inn, Thornhill, for Messrs. S. Webster and Sons; houses, Spen Valley, Ravensthorpe, for Mr. N. Rayner; houses, Ossett Lane, Chickenley, for Mr. T. E. Gill; three houses, Fall Lane, for Mr. Beaumont, Senior.

The DURHAM City Council has approved plans for the provision of new baths and washhouses, estimated to cost £25,000. Plans are also almost complete for the proposed construction of new bridges and a through road, estimated to cost £100,000.

Plans for a new super cinema, prepared by Mr. Frank Verity, F.R.I.B.A., to be erected in the Headrow and Briggate, LEEDS, have been passed by the local Watch Committee. The theatre will have a seating capacity of 2,500, and is expected to cost about £150,000 to build.

The Ministry of Health has given sanction to the borrowing of £50,743 for the acquisition of land and the erection of 120 houses at an estimated cost of £350 per house, by direct labour on the Wigan Road (No. 2) housing site at LEIGH.

The LUNESDALE (LANCS.) R.D.C. has approved the purchase of a housing site adjoining Copy Lane, Caton.

At a meeting of the MANCHESTER Corporation Baths and Washhouses Committee it was announced that the Ministry of Health had approved of five of the nine schemes contained in the committee's new programme of development, recently authorized by the City Council. The approved schemes comprise the erection of public washhouses at Longsight, Moss Side, Clayton, and Newton Heath, and swimming baths at New Moston. The total estimated cost is £74,000. The Government is not prepared to consider a grant towards the cost of the remaining four schemes in the programme, which were all washhouses, until the sites have been acquired.

Plans for the proposed extension of NEWCASTLE Corporation Quay have been approved by the Tyne Improvement Commissioners.

The NEWCASTLE-UNDER-LYME T.C. has approved a scheme for the erection of new municipal offices, estimated to cost £40,000.

The SHEFFIELD city architect has been authorized to proceed with the erection of fifty-four houses on the Greenhill estate, at an estimated cost of £20,790.

Work has begun on the demolition of the Kursaal at WHITLEY BAY, in preparation for the building of a new theatre.

SCOTLAND

Improvements and alterations are to be carried out to branch banking premises of the Bank of Scotland, Union Street, ABERDEEN. Plans have been prepared by Mr. George Watt, F.R.I.B.A.

The DUNDEE Town Council housing committee has decided to apply closing orders to seventeen houses, on the site of which the west wing of the new city square is to be built.

The FAULDHOUSE (West Lothian) County Council is to erect new baths.

The Public Health Committee of the Fife C.C. recommends the erection of fifty houses at ST. MONANCE.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1*s.* 3½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour;* NAVVY, 1*s.* 3½*d. per hour;* TIMBERMAN, 1*s.* 5*d. per hour;* SCAFFOLDER, 1*s.* 4½*d. per hour;* WATCHMAN, 7*s.* 6*d. per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.

Transport hire per day:							
Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.
RETURN, fill, and ram, ordinary earth, per yd. £0 1 6
SPREAD and level, including wheeling, per yd. 0 1 6
FILLING into carts and carting away to a shoot or deposit, per yd. cube . 0 10 6
TRIMMING earth to slopes, per yd. sup. 0 0 6
HACKING up old grano. or similar paving, per yd. sup. . . . 0 1 3
PLANKING to excavations, per ft. sup. 0 0 5
DO. over 10 ft. deep, add, for each 5 ft. in depth, 30 per cent.
IF left in, add to above prices, per ft. cube 0 2 0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup. . 0 2 1
DO. 6 in. thick, per yd. sup. . . 0 2 10
PUDDLING, per yd. cube 1 10 0
CEMENT CONCRETE, 4-2-1, per yd. cube 1 17 6
DO. 6-2-1, per yd. cube 1 12 6
DO. in upper floors, add 15 per cent.
DO. in reinforced-concrete work, add 20 per cent.
DO. in underpinning, add 60 per cent.
LIAS-LIME CONCRETE, per yd. cube . £1 14 0
BREEZE CONCRETE, per yd. cube . 1 7 0
DO. in lintels, etc., per ft. cube . 0 1 6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube 0 3 9
FINE concrete benching to bottom of manholes, per ft. cube . . . 0 3 0
FINISHING surface of concrete spade face, per yd. sup. 0 0 9

DRAINER

LABOURER, 1*s.* 3½*d. per hour;* TIMBERMAN, 1*s.* 5*d. per hour;* BRICKLAYER, 1*s.* 8½*d. per hour;* PLUMBER, 1*s.* 8½*d. per hour;* WATCHMAN, 7*s.* 6*d. per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. *6 in., per ft.*	0	1	3
DO. *9 in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. *6 in., per yd.*	0	8	0
Portland cement and sand, see "Excavator" above.			
Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft. . . 0 4 3
DO. 6 in., per ft. 0 5 0
DO. 9 in., per ft. 0 7 9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft. 0 8 3
DO. 6 in., per ft. 0 10 3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1*s.* 8½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour;* SCAFFOLDER, 1*s.* 4½*d. per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
Midhurst white facing bricks, per M.	5	0	0
Multi-coloured facings, per M.	7	7	9
Best red facings, per M.	7	7	9
Rubbers, 9¼ in., per M.	12	0	6
Staffordshire blue, per M.	9	5	0
Firebricks, 2½ in., per M.	9	5	0
Glazed salt, white, and ivory stretchers, per M.	21	10	0
DO. *headers, per M.*	20	10	0
Colours, extra, per M.	5	10	0
Seconds, less, per M.	1	0	0

Cement and sand, see "Excavator" above.

Lime, grey stone, per ton	£2	11	6
Mixed lime mortar, per yd.	1	6	0
Dampcourse, in rolls of 4½ in., per roll	0	2	6
DO. *9 in., per roll*	0	4	9
DO. *14 in., per roll*	0	7	6
DO. *18 in., per roll*	0	9	6
BRICKWORK in stone lime mortar, Flettons, or equal, per rod	30	0	0
DO. in cement do., per rod	32	10	0

DO. in stocks, add 25 per cent. per rod.
DO. in blues, add 100 per cent. per rod.
DO. circular on plan, add 12½ per cent. per rod.
DO. in backing to masonry, add 12½ per cent. per rod.
DO. in raising on old walls, etc., add 12½ per cent. per rod.
DO. in underpinning, add 20 per cent. per rod.

HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS, fair, per ft. sup. extra	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra . .	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra	0	0	10
WEATHER pointing, do. do.	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup. . . .	0	6	0
DO. 2 in., per yd. sup. . . .	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities, in finishing to steps, etc., per ft. sup. . . .	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each . .	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup. . .	0	11	0
SLATE DAMP COURSE, per ft. sup. .	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ¾ in., per yd. . .	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup. . .	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each .	0	0	3

MASON

MASON, 1*s.* 8½*d. per hour;* DO. *fixer,* 1*s.* 9½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour;* SCAFFOLDER, 1*s.* 4½*d. per hour.*

Portland Stone:			
Whitbed, per ft. cube	£0	4	6
Basebed, per ft. cube	0	4	9
Bath stone, per ft. cube	0	3	0
Usual trade extras for large blocks.			
York paving, av. 2½ in., per yd. super	0	11	0
York templates, sawn, per ft. cube	0	7	6
Slate shelves, rubbed, 1 in., per ft. sup.	0	2	6

Cement and sand, see "Excavator," etc., above.

HOISTING and setting stone, per ft. cube	£0	2	2

DO. for every 10 ft. above 30 ft. add 15 per cent.

PLAIN face Portland basis, per ft. sup.	£0	2	8
DO. circular, per ft. sup. . . .	0	4	0
SUNK FACE, per ft. sup. . . .	0	3	9
DO. circular, per ft. sup. . .	0	4	10
JOINTS, arch, per ft. sup. . . .	0	2	6
DO. sunk, per ft. sup. . . .	0	2	7
DO. DO. circular, per ft. sup. .	0	4	6
CIRCULAR-CIRCULAR work, per ft. sup.	1	2	0
PLAIN MOULDING, straight, per inch of girth, per ft. run . . .	0	1	1
DO. circular, do., per ft. run .	0	1	4
HALF SAWING, per ft. sup. . .	0	1	0

Add to the foregoing prices, if in York stone, 35 per cent.
DO. Mansfield, 12½ per cent.
Deduct for Bath, 33⅓ per cent.
DO. for Chilmark, 5 per cent.

SETTING 1 in. slate shelving in cement, per ft. sup.	£0	0	6
RUBBED round nosing to do., per ft. lin.	£0	0	6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1	7	6
YORK SILLS, W. & T., ft. cub. fixed .	1	10	0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0	1	3
DO. 2½ in. thick, per ft. sup. . .	0	1	6

SLATER AND TILER

SLATER 1*s.* 8½*d. per hour;* TILER, 1*s.* 8½*d. per hour;* SCAFFOLDER, 1*s.* 4½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour.*
N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200:

Portmadoc Ladies				£14	0	0
Countess				23	0	0
Duchess				32	10	0
Old Delabole	*Med. Grey*			*Med. Green*		
24 in. × 12 in.	£42	11	3	£45	1	0
20 in. × 10 in.	31	4	3	33	0	6
16 in. × 10 in.	20	18	0	22	4	9
14 in. × 8 in.	12	1	0	12	16	3
Green Randoms, per ton				8	3	9
Grey-green do., per ton				7	3	9
Green peggies, 12 in. to 8 in. long, per ton				5	13	9

In 4-ton truck loads, delivered Nine Elms station.

Clips, lead, per lb.	£0	0	6
Clips, copper, per lb.	0	2	0
Nails, compo, per cwt.	1	6	0
Nails, copper, per lb.	0	2	2

Cement and sand, see "Excavator," etc., above.

Hand-made tiles, per M.	£5	18	0
Machine-made tiles, per M.	5	8	0
Westmorland slates, large, per ton	9	0	0
DO. *Peggies, per ton*	7	5	0

SLATING, 3 in. lap, compo nails, Portmadoc or equal:

Ladies, per square	£4	0	0
Countess, per square	4	5	0
Duchess, per square	4	10	0
WESTMORLAND, in diminishing courses, per square	6	5	0
CORNISH DO., per square	6	3	0
Add, if vertical, per square approx.	0	13	0
Add, if with copper nails, per square approx.	0	2	6
Double course at eaves, per ft. approx.	0	1	0

SLATING with Old Delabole slates to a 3 in. lap with copper nails, at per square.

	Med. Grey			Med. Green		
24 in. × 12 in.	£5	0	0	£5	2	0
20 in. × 10 in.	5	5	0	5	10	0
16 in. × 10 in.	4	15	0	5	1	0
14 in. × 8 in.	4	10	0	4	15	0
Green randoms				6	7	0
Grey-green do.				5	9	0
Green peggies, 12 in. to 8 in. long				4	13	6

TILING, 4 in. gauge, every 4th course nailed, in hand-made tiles, average per square	3	17	6
DO., machine-made do., per square	3	7	6
Vertical Tiling, including pointing, add 18*s.* 0*d.* per square.			
FIXING lead soakers, per dozen .	£0	0	10
STRIPPING old slates and stacking for re-use, and clearing away surplus and rubbish, per square . .	0	10	0
LABOUR only in laying slates, but including nails, per square . .	1	0	0

See "Sundries" for Asbestos Tiling.

CARPENTER AND JOINER

CARPENTER, 1*s.* 8½*d. per hour;* JOINER, 1*s.* 8½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour.*

Timber, average prices at Docks, London Standard, Scandinavian, etc. (equal to 2nds):

7 × 3, per std.	£22	0	0
11 × 4, per std.	30	0	0
Memel or Equal. Slightly less than foregoing.			
Flooring, P.E., 1 in., per sq.	£1	4	6
DO., *T. and G., 1 in., per sq.*	1	4	6
Planed boards, 1 in. × 11 in., per std.	30	0	0
Wainscot oak, per ft. sup. of 1 in.	0	1	6
Mahogany, Honduras, per ft. sup. of 1in.	0	1	4
DO., *Cuba, per ft. sup. of 1 in.*	0	2	6
DO., *African, per ft. sup.*	0	1	3
Teak, per ft. sup. of 1 in.	0	1	2
DO., *ft. cube*	0	14	0

FIR fixed in wall plates, lintels, sleepers, etc., per ft. cube . .	0	4	6
DO. framed in floors, roofs, etc., per ft. cube	0	4	6
DO. framed in trusses, etc., including ironwork, per ft. cube . .	0	8	6

PITCH PINE, add 33⅓ per cent.

FIXING only boarding in floors, roofs, etc., per sq.	0	13	6
SARKING FELT laid, 1-ply, per yd.	0	1	6
DO., 3-ply, per yd.	0	1	9
CENTERING for concrete, etc., including horsing and striking, per sq.	2	0	0
TURNING pieces to flat or segmental soffits, 4½ in. wide, per ft. run	0	0	4½
DO. 9 in. wide and over, per ft. sup.	0	1	2

[continued overleaf

CARPENTER AND JOINER: *continued*

SHUTTERING to face of concrete, per square	£1	10	0
DO. in narrow widths to beams, etc., per ft. sup.	0	0	6
USE and waste of timbers, allow 25 per cent. of above prices.			
SLATE BATTENING, per sq.	£0	12	6
DEAL boarding to flats, 1 in. thick and firrings to falls, per square	2	10	0
STOUT feather-edged tilting fillet to eaves, per ft. run	0	0	6
FEATHER-edged springer to trimmer arches, per ft. run	0	0	4
STOUT herringbone strutting (joists measured in), per ft. run	0	0	6
SOUND boarding, ⅞ in. thick and fillets nailed to sides of joists (joists measured over), per square	2	0	0
RUBEROID or similar quality roofing, one-ply, per yd. sup.	0	2	3
DO., two-ply, per yd. sup.	0	2	6
DO., three-ply, per yd. sup.	0	3	0
TONGUED and grooved flooring, 1¼ in. thick, laid complete with splayed headings, per square	2	5	0
DEAL skirting torus, moulded, 1¼ in. thick, including grounds and backings, per ft. sup.	0	1	0
TONGUED and mitred angles to do.	0	0	6
WOOD block flooring, standard blocks laid herringbone in mastic:			
Deal 1 in. thick, per yd. sup.	0	10	0
DO. 1¼ in. thick, per yd. sup.	0	12	0
Maple 1¼ in. thick, per yd. sup.	0	15	0
DEAL moulded sashes, 1¼ in., with moulded bars in small squares, per ft. sup.	0	2	6
DO. 2 in. do., per ft. sup.	0	2	9
DEAL cased frames, oak sills and 2 in. moulded sashes, brass-faced pulleys and iron weights, per ft. sup.	0	4	6
MOULDED horns, extra, each	0	0	3
DOORS, 4-panel square both sides, 1¼ in. thick, per ft. sup.	0	2	6
DO. moulded both sides, per ft. sup.	0	2	9
DO. 2 in. thick, square both sides, per ft. sup.	0	2	9
DO. moulded both sides, per ft. sup.	0	3	0
DO. in 3 panels, moulded both sides, upper panel with diminished stiles with moulded bars for glass, per ft. sup.	0	3	6
If in oak, mahogany, or teak, multiply 3 times.			
DEAL frames, 4 in. × 3 in., rebated and beaded, per ft. cube	£0	15	0
Add for extra labour, per ft. run	0	0	1
STAIRCASE work:			
DEAL treads 1¼ in. and risers 1 in., tongued and grooved, including fir carriages, per ft. sup.	0	2	6
DEAL wall strings, 1¼ in. thick, moulded, per ft. run	0	2	0
If ramped, per ft. run	0	4	6
SHORT ramps, extra, each	0	7	6
ENDS of treads and risers housed to strings, each	0	1	0
2 in. deal mopstick handrail fixed to brackets, per ft. run	0	1	6
4½ in. × 3 in. oak fully moulded handrail, per ft. run	0	5	6
1½ in. square deal bar balusters, framed in, per ft. run	0	0	6
FITTINGS:			
SHELVES and bearers, 1 in., cross-tongued, per ft. sup.	0	1	6
1¼ in. beaded cupboard fronts, moulded and square, per ft. sup.	0	2	9
TEAK grooved draining boards 1¼ in. thick, and bedding, per ft. sup.	0	4	6
IRONMONGERY:

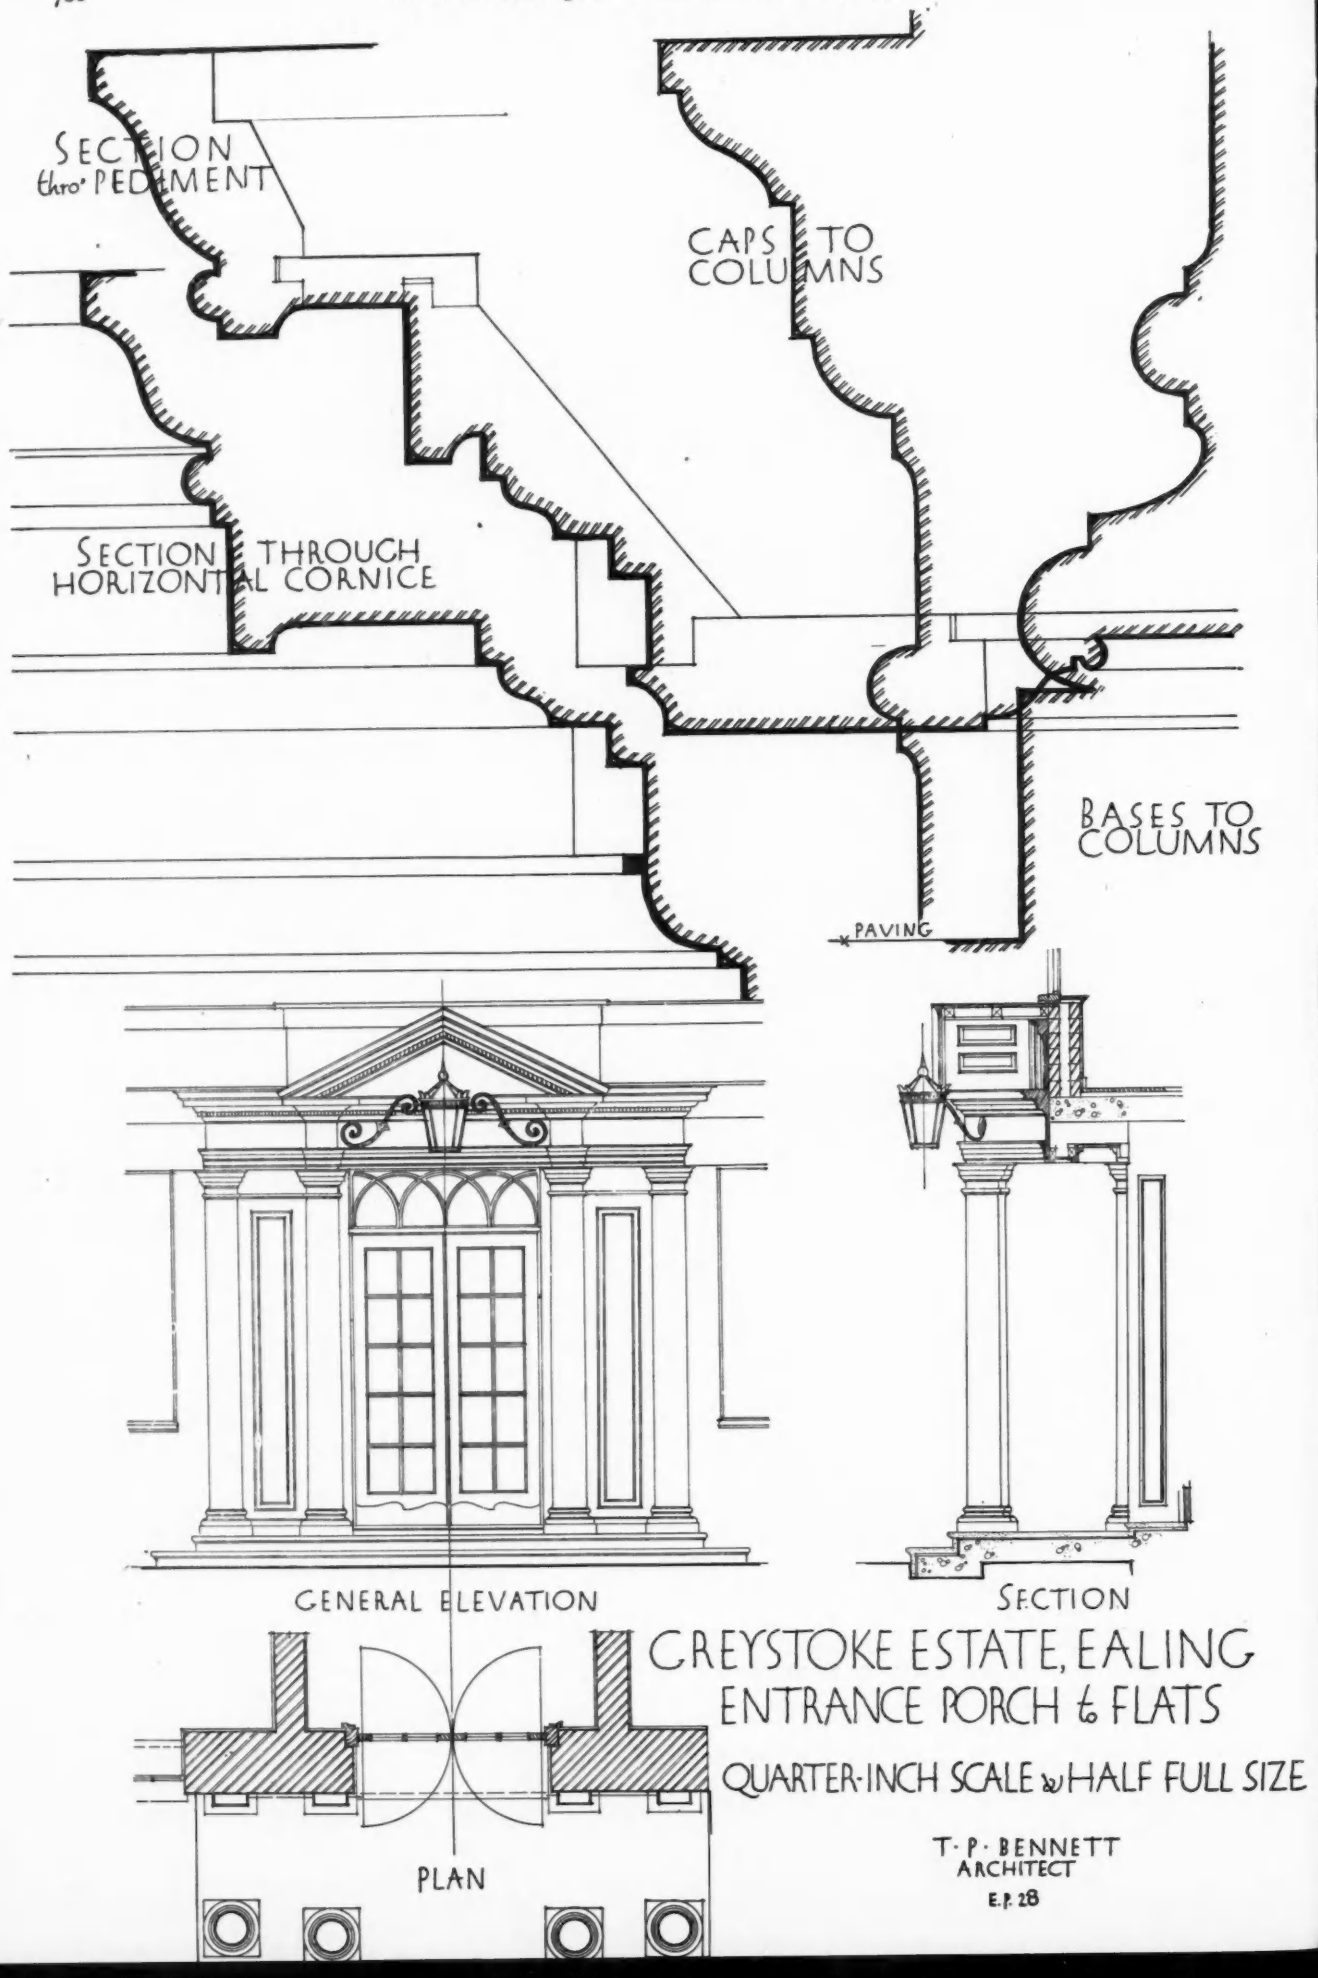
SCALE DETAILS:
A WEEKLY SERIES

ENTRANCE PORCH TO FLATS
ON THE GREYSTOKE ESTATE, EALING, W.5
Designed by T. P. BENNETT & SON



THE Porch shown in the above photograph and in the quarter-inch scale and half full-size detail drawings overleaf gives on to an entrance hall, serving a block of flats recently built on the Greystoke Estate at Hanger Hill, Ealing.

Comprising a screen of four columns and responding pilasters, and carrying a frieze, architrave, cornice and pediment, it is carried out in pine, painted a broken white, and is a good example of the use of the Roman Doric order.

The projection of the pair of columns which flank the glazed, double-hung entrance doors themselves should be noticed, as giving emphasis to the centre of the entablature from which, on wrought-iron brackets, is carried the lamp. The design of the fanlight is completely in harmony with the remainder of the composition.

The building as a whole was illustrated in THE ARCHITECTS' JOURNAL *for December 11, 1929.*

The drawings overleaf may be read with architects' ordinary scales (¼"; and 6" = 1 ft.)

WEDNESDAY, NOVEMBER 26, 1930

SOOT-BOUND

NOW abideth November, fog and smoke, and the greatest of these is smoke. For the Londoner or other town-dweller, such is the horrid triune burden of his thoughts.

For him, indeed, it is no delight on a foggy night at this season of the year to reflect that November is inevitable; nor that, in England, mere mist is by no means to be abolished lightly, as, for example, by Act of Parliament. But the greatest of these is smoke. And the rumination may well rankle within his fume-congested bosom that it is this very evil that demonstrably should lie within man's own power largely to alleviate if not definitely to cure. What, he may well ask, is being done about it ?

Little enough, in all conscience. Perhaps, of late years, the London fog has lost some of its particularity and become more general in character. But however it may be with this, in common with other enormous residential centres where the spread in use of central heating gas or electricity, for domestic purposes, has been slow but sure, it is well to remember that the visitation that mercifully afflicts them but occasionally is a permanent condition of existence in the industrial strongholds of the Midlands and the North. Let the town-dweller only make the voyage to Scotland, east about, and see the pall blowing miles out to sea from the plumed furnaces of the Yorkshire, Durham and Northumberland coast, or, adventuring by air to the Continent, mark how the London haze spreads far out over the Channel.

Such was the state of affairs admitted at the National Smoke Abatement Society's conference a few weeks ago. It was added that smoke was causing a wastage of £150 per minute in material values. There is not only the loss of some three million tons of potential fuel—say, £6,000,000—per annum to take into consideration, but the deterioration of the actual fabric of buildings, as well as of their decorations, fittings, and appointments, and of art treasures generally. Upon these there is no setting a price—much less upon the ruin to health.

The reader with a long memory will not need to be reminded how often we have returned to the charge. Figures have been quoted. History has been ransacked back to the time of Edward I, when coal first arrived upon the scene, and a proclamation was issued banning its use in London while Parliament was sitting. The damage to structures has been recounted in general and in detail. The bill prepared by Evelyn, the diarist, has been cited; the agitation of 1819, followed by a century or so of pleasant committee meeting and a desultory Act or so, nibbling at the problem; the Smoke Abatement Exhibition of 1909, an invitation to participate in which was declined by the Local Government Board; the private Bill of 1913, which never became law; the House of Lords Bill of the following year, withdrawn on the promise of an official committee, whose activities were suspended by the war. It is a sad tale.

What, then, is the position today ? Investigations are, we are told for the hundredth time, in progress " in connection with various classes of fuels, both for industrial and domestic purposes." Research, " the importance of which it is impossible to exaggerate, has shown that one way to economy and reform is the substitution of some form of solid smokeless fuel for raw coal," an opinion that we seem to have heard before. And, on top of that, the Smoke Abatement Society actually dares, in conference, to voice the pious hope of " an England with pure, clean air and a real warm sun."

And that will be about all, for the present. In other words, though, in theory, a revolution could be worked tomorrow, or at most within a year, no such consummation is even remotely within view. It would be too costly. In fact, the smoke problem would seem to fall in that class of issues susceptible of resolution rather by the slower processes of evolution. And in that economic field if the scientist, we may be sure, will have his moves to make, the architect has his. Let him design, as he has begun to do, gas-fire settings, radiator treatments, fitments for electric stoves (many more will be in demand when the Electric Grid is an accomplished fact), yea, the very anthracite stove itself.

But meanwhile let us—yes, do let's toast our toes at the open fire !

AN EIGHTY-YEAR-OLD CHALLENGE TO "THE NEW ARCHITECTURE": JOSEPH PAXTON'S CRYSTAL PALACE

> *"It was just about eighty years ago that Joseph Paxton designed the immense building of the Crystal Palace, all in glass and iron, and there were sanguine persons at the time who regarded it as a symbol of the peace that was to replace all wars, though within twenty years Germany was to defeat Austria and do her best to annihilate France.*
>
> *"If you compare that building with the steel and glass buildings erected in Germany in the last few years, you will find that the Crystal Palace, designed by a gardener and ridiculed for generations, holds its own with the work of the latest scientific German architects, and is very much better than the attempts at design in glass and steel by that enterprising person, M. le Corbusier, which you will find illustrated in the multitudinous publications of 'the new architecture.'"*

—SIR REGINALD BLOMFIELD, *addressing the Royal Academy on "The New Architecture."*

NEWS & TOPICS

STATION-ARY

LAST week's leading article on railway stations calls attention to Mr. Michael Sadleir's more thorough diagnosis of this " blind-spot in English civilization," which appeared in the November issue of *The Nineteenth Century*. Mr. Sadleir asks, as people are increasingly asking, why we should allow our railway companies to perform their public functions in surroundings of disorder, discomfort and unimaginative dirt.

★

" Authority, apparently, has not troubled to realize that the visitor comes to see (say) Oxford or Cambridge; he is not primarily interested in the programme of the Theatre Royal or the latest cereal . . . or that the cheapest boots or raincoats are available at this shop or that. Not only is he uninterested : he definitely resents having this irrelevant information thrust on his helpless notice. And he goes away with a queer reservation in his enthusiasm for these beautiful and historic cities, asking himself how it may be that the English, with such a past, should be blandly capable of such a present. He may well ask; no Englishman can give him a convincing answer."

MR. HICKS AND HOUSES

Mr. George Hicks, the Secretary of the Amalgamated Union of Building Trades Workers, recently described the type of house that is sold by easy instalments as one of the worst swindles of our time. He is right. Anyone can see, if he will examine the facts, that these houses are speculations. They are built to sell, quickly. Their design is based upon a supposed idea of what the public wants. They have large halls and small rooms. Their construction is a sham, obvious to the experienced eye, but sufficiently covered with paint and plaster to deceive the unwary.

★

And the pity of it is that we have heard a great deal about the deficiencies of Council houses, because presumably Councils, being public bodies, are there to be grumbled at. On the other hand, the occupants of the bad instalment house, having brought their troubles on themselves, being in process of paying for them, and indisposed to call themselves fools, keep silent.

SIR REGINALD BLOMFIELD AT THE R.A.

Sir Reginald Blomfield's address to the Royal Academy, last week, was, in effect, a plea for sanity in architecture. He was careful to say that by " The New Architecture " of his title he intended to define the movement now widely recognized on the Continent as such, that movement in which fulfilment of purpose was held to be a cardinal point. And though he had some caustic comments to pass upon it—" crude and unabashed brutality " ; " pyramids and parallelopipeds " ; and so forth—he emphasized the wisdom of watching all tendencies in modern architecture, and endeavouring to disentangle what was good in any of them. That architecture is a serious art, and not merely the plaything of the amateur is a maxim that cannot be too often repeated. " The New Architecture," he considered, was based on a confusion of the functions of the architect and engineer. " For myself," ran his peroration, " I cannot conceive of anything more dull and uninteresting than a dead level of standardized architecture, and a culture organized on strictly scientific lines. I prefer the hill on which I was born ; England for the English, France for the French, Germany for the Germans. This does not mean international hostility ; on the contrary, it means that regard and admiration which we feel for those who preserve their individual self-respect."

THE A.A. SCANDINAVIAN TOUR

Mr. Austen Hall, in the course of his paper on the A.A. Excursion to Sweden and Denmark, told of the surprise it was to " our functional faculties " to explore a building—the Art Gallery at Gothenburg, a portion of the 1923 Exhibition—of which the section bears no relation to the elevation; and to see the upper part of the interior walling of Ericson's church in the same town, finished in logs—" you might say whole timbers "—to correspond with the roof. Actually the walls are of brick and the roof is of concrete. He also remarked that the interiors of a good many of the new buildings in Sweden were inclined to be dark, a great deal being sacrificed to the elevations.

★

Of Carl Milles, Mr. Austen Hall gave the following pen-portrait : " He received us in his lovely garden on a cliff overlooking the waters around Stockholm—a man with quiet grey eyes, very refined features, a large head, wonderful hands, very slow speech, the embodiment of serenity. A man, I think, who builds around himself a defence against the disturbances and worries of life so that nothing shall interfere with the dreams of divinely beautiful things which he is able to express in material forms. The power of Milles's work is that he sees in nature a subtlety and humour that need no added artistic conventions to explain them or embellish them. He puts into the work something that he sees, something that is life, inapprehensible to most of us until the genius of a Milles makes it plain."

AN ATELIER OF ARCHITECTURE

It has been suggested by a few enthusiasts that an atelier on the lines of the old first atelier of architecture, so successfully run under the patronage of Mr. Arthur Davis, should be started. Mr. Davis himself has been approached and is perfectly willing once more to act as patron and critic. It is, however, necessary to be assured in advance of adequate support.

★

For the benefit of those readers who do not remember the old atelier, it may be helpful to outline the working of such an institution. Subjects are set by the month, and each member is expected to come in on the Saturday allotted for the sketch design and make his study of the problem. Copies of these are given in to the committee, and for the rest of the month when the member feels inclined he can work up his sketch to any degree of elaboration. A day is appointed for the criticism, and the schemes are hung and judged by a jury, and publicly criticized by the patron. Short subjects are also set during the month and criticized at the same time.

★

The system is of great benefit to men of some experience, who are keen to improve their powers of design and draughtsmanship, and is in no way intended to compete

with the existing excellent schools. Any of my readers who are interested may have full particulars from Mr. G. G. Clark, c/o Mewès and Davis, 22 Conduit Street, W. Until the necessary support is forthcoming nothing can be done.

HITCH YOUR WAGON TO A—BALLOON

I should have loved to see the balloon go up at Southampton last week. What balloon, you ask; anything special about it? Well, there was, rather. You see, hitched to it was a framework 15 ft. across, from the perimeter of which ropes hung down to the ground. It is this you are to visualize, rather than the gas bag. For to the councillors of Southampton in solemn conclave assembled near by (all save one, and he an alderman), they said, after the manner of the Pyramus and Thisbe play: "Let this present tower." Now, this was done on the site of the proposed civic centre, and the arrangement of spars and rigging, though swaying gently to the breeze, did, I make no doubt, give a very good idea of the shape and effect of Mr. Berry Webber's design. And the alderman? Oh, he drove to a point of vantage well removed from the scene of action, to judge of the effect from the outskirts of the town. Where are your mere scale models, now? A merry conceit, truly.

CATHEDRAL RESTORATION

The Bishops who were gathered together in London last week for the autumn session of the Church Assembly discussed in several cases the difficulties which they are now experiencing in maintaining the structure of their cathedrals. The actual responsibility falls upon the Dean and Chapter, but at Salisbury, Durham and elsewhere, the need of raising funds for preservation purposes is giving a good deal of anxiety to the Bishops as well. In Queen Victoria's day much was spent upon ill-advised restoration. Among the cathedrals supposedly restored at a cost of over a million pounds between 1837 and 1887 were Hereford, Chichester, St. Davids, Ripon, Chester, Lichfield, Manchester, Peterborough, York, Rochester, Southwell, Gloucester, Carlisle and Wells. Some of the horrors perpetrated may be seen at Salisbury, where in 1856 damaged portions of sculptures were "restored" in Caen stone and gilding and colours applied. Even roof paintings were "effectively reproduced." Fortunately the ecclesiastics of 1930 have more appreciation of the need to carry out any preservation work with the greatest care for treasures inherited from the past.

Old London Bridge, 1630, showing the Traitor's Gate at the Southwark end, with their heads impaled on spikes above it. One of a series of models, by John B. Thorp, now on exhibition at the Golden Cross Hotel, Charing Cross, S.W.

PAINTING IN THE WINTER

Not enough people realize the advantages of having painting and interior decoration work done during winter months. That there is a surprising difference between estimates in winter and in summer I can testify from personal experience. Under normal conditions this is true, but the present acute unemployment among painters adds further point. One of the advantages, of course, is the better choice of good workmen and the closer supervision possible when work is scarce: the reason why so many people leave it to the spring is because they leave everything to do with the house until spring stirs them to action, and the strengthening light shows up the bad bits in their true light.

AN HISTORIC MANSION

What and where is Earnscliffe? I take leave to doubt whether many readers could say, off-hand. Nor could I, were it not for the arrival of dispatches from Canada describing the renovation of the interior of this mansion in Ottawa, for many years the residence of Sir John Macdonald, first Prime Minister of Canada, and henceforth to be the permanent home of the High Commissioner for His Majesty's Government of Great Britain and Northern Ireland. In preparation for occupation by Sir William Clark, appointed first holder of that office two years ago, extensive remodelling and redecoration have been carried out to the designs of Mr. J. Albert Ewart, an architect well known in Ottawa.

★

On the main floor no structural changes have been made, so my information runs, but the rather dark, heavily oak-panelled dining-room has been greatly brightened through the employment of light-green colouring on the walls. And the worn-out tapestries have gone. What was Sir John's workroom has become a boudoir for Lady Clark, and the famed ante-room, served by a convenient door by which Sir John had been known to escape from unwelcome visitors, has been made into a small private sitting-room. The large reception room and the library remain much as they were. Above, the bedroom accommodation has been nearly doubled by partitioning, while new heating and electric systems, including two refrigerators, all of Canadian manufacture, have brought the house into conformity with modern standards. The Right Hon. R. B. Bennett is to write an inscription for the bronze tablet already designed to be placed on a corner stone to mark the historic site. ASTRAGAL

NEW CINEMA AT SMETHWICK, STAFFS.

DESIGNED BY W. T. BENSLYN

THE Rink Cinema, Windmill Lane, Smethwick, Staffs., is built on the site of the old Rink, and its completion under seven months is believed to be a record for a building of its size in the Midlands. Demolition began in November, 1929; possession of the site was obtained by the general contractor on December 15; six weeks later the 200 tons of steelwork involved had been erected in position, having been made and fabricated at West Bromwich beforehand.

As far as possible local materials and workmanship were utilized, and the building is cited as proof of the unsurpassed skill in craftsmanship of the British workman under adequate direction. The full effect of the main frontage, for example, could not have been realized had the brickwork been less perfect than it can be seen to be in the photographs reproduced herewith.

Some statistics may be of interest. Two-and-a-half tons of red oxide paint were required to protect the steel framework; 360,000 local sand-faced bricks, 1,300 tons of sand, 400 of cement and 900 of aggregate were used, while over 1,200 ft. of sound-deadening material were incorporated in the interior; and the average number of men employed, mainly

The front, apart from its segmental outline, on plan, relies mainly for impression in mass and in detail upon design and craftsmanship in brickwork, e.g. the diaper pattern in the architrave to the name panel is repeated above the exit doors on the right in compensation for the slight fall in the site.

A near view of the entrance front to show the design of the Portland stone window-surrounds, with crown and peacock.

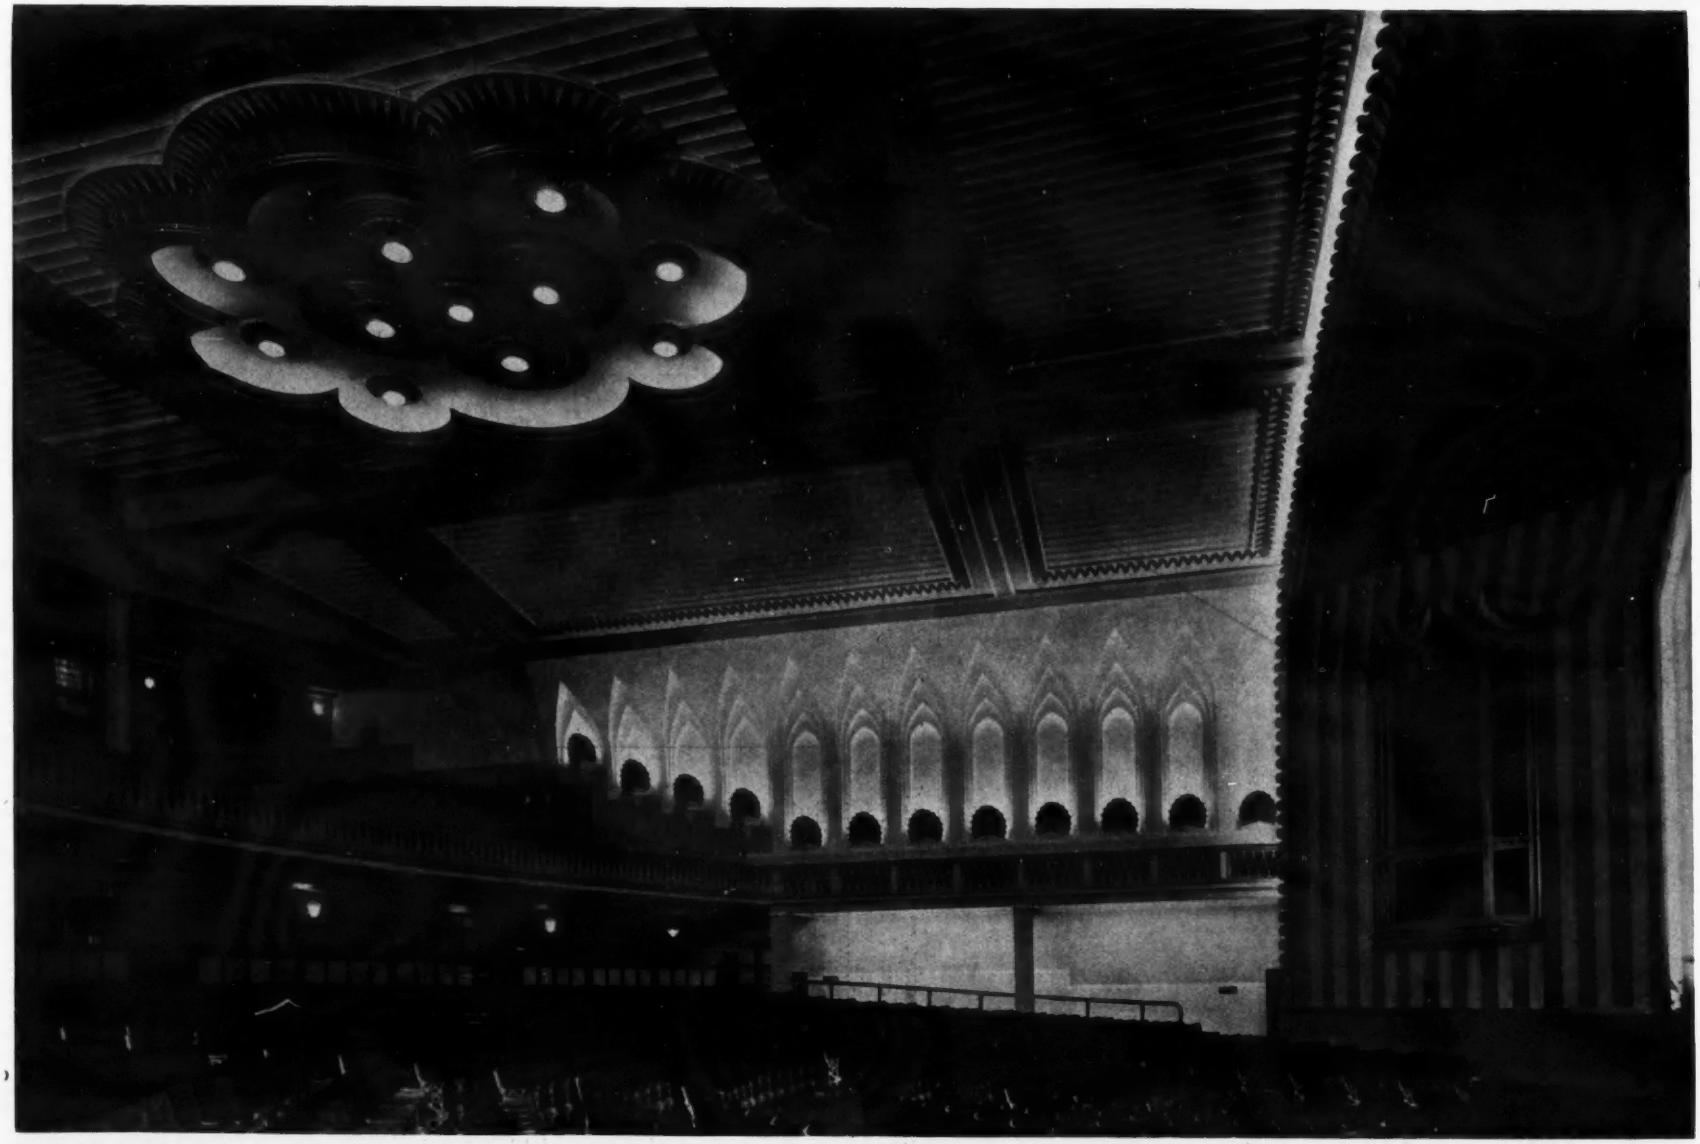
drawn from the locality, was eighty, in addition to sub-contractors' staffs.

The site in Windmill Lane is one of the most important in Smethwick, and in order to obtain adequate means of access to all parts of the house, two 10-ft. open-air passages have been left running the full depth of the building on either side. Externally, the front elevation is a frank expression of the houses, or, perhaps more accurately, of harbour lights. A bold canopy over 40 ft. long shields the main entrance from the weather, and exit passages from each part of the house discharge directly on the front elevation.

Full advantage has been taken of the frontage of 120 ft., the central portion being occupied by three large openings, forming an outer vestibule, from which with the architect. The vaulting of the staircases and the foyer is reminiscent of Italian Renaissance architecture.

From the entrance hall four pairs of doors lead into a large crush hall, from which access to all parts of the auditorium is obtained. This crush hall will, it is hoped, avoid the necessity of patrons waiting in queues outside the building until such time as they

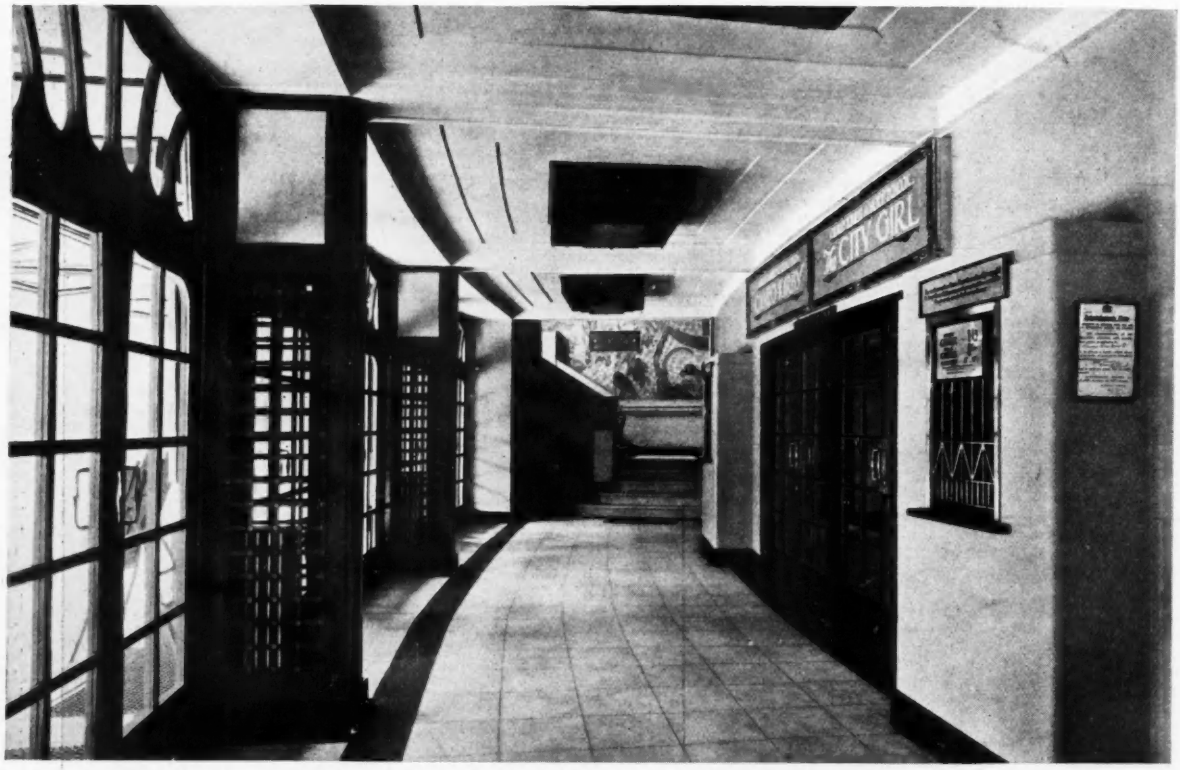
The Rink Cinema, Smethwick.] [*By W. T. Benslyn.*



The proscenium, viewed from the balcony; the screen will show pictures up to 40 ft. by 28 ft. The central group of lights is expressly designed for a lighting colour scheme ranging through rainbow hues from orange to blue.

nature of the building, carried out in special sand-faced bricks. Emphasis has been given to the windows of the foyer and staircases by carved decoration in Portland stone. Two towers run from top to bottom of the building for means of access to the operating box; the tops are crowned with glazed cupolas, reminiscent of light-

six pairs of double doors give access to the main entrance hall. At either end of this hall is an ample staircase leading to the balcony foyer, from which the balcony is reached by a broad staircase. Here a striking scheme of colour decoration has been painted *in situ* by Mr. Frank Barnes, the clients' scenic artist, working in close co-operation



can be seated. In addition to this means of entering the auditorium, there is a special side entrance, with a canopy over, for queueing in one of the side passages. In fact, it has been the aim of the clients and their architect to provide the public with every comfort possible at a minimum price.

The accommodation of the building

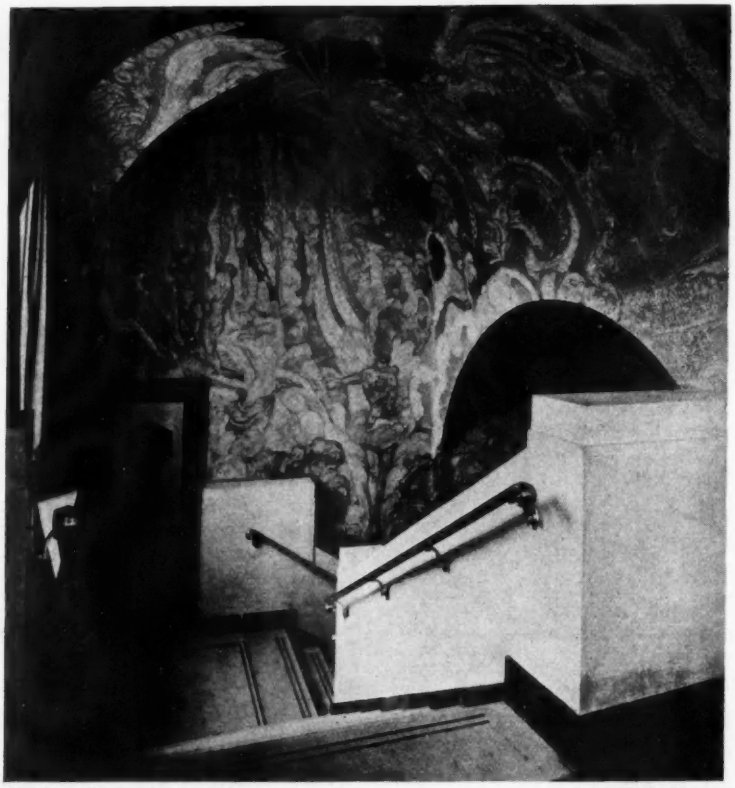
A side view of the house, showing the concealed lighting of the walls, the recess of the proscenium, ribbed like the ceiling, and the organ grille, of conventionalized sunflower design.



The entrance hall, showing, on the left, the three pairs of street doors, and, on the right, flanked by pay-boxes, doors leading to the crush hall ; at either end there are balcony stairs, a detail of one of which appears below.

is designed for slightly over 2,000, there being approximately 650 seats in the balcony and 1,300 on the ground floor, in addition to a limited amount of standing room.

Internally, the proscenium opening is more than 45 ft. wide and 30 ft. high, making it possible to show pictures up to a size of 40 ft. by 28 ft. The organ grille design is based on conventionalized plant-like forms, reaching their expression at the top in bold sunflower rosettes. The scheme of internal decoration has been carefully studied in relation to the lighting effects. The main feature of the ceiling is capable of being lighted in colours ranging through a scheme of orange, yellow, green, red and blue, according to the lighting treatment. Heating and ventilation are on the semi-plenum system, by which it is possible to introduce air at exactly the right temperature, whatever the weather may be outside.

All in all, the building is a testimony to the virtues of co-operation. It has been erected at high speed; the design has arisen directly out of an attempt to provide for all practical needs in the most simple and direct manner possible; and in the interior the artistic craftsmanship of the plasterwork and the effective colour decoration show the advantages to be derived from the architect designing these things, and choosing, in relation thereto, the curtains and fittings. Unity is thus secured.

A MODERN LONDON HAIRDRESSING SALOON

DESIGNED BY P. J. WESTWOOD

THIS new hairdressing saloon is situated in the basement of Austin Reed's premises in Regent Street, W. It is reached through a spacious waiting lobby, containing a cloakroom, where the patron may leave his coat and hat before entering the saloon, various kiosks for the sale of tobacco, toilet requisites and theatre tickets, also a telephone booth. Here in the lobby, during the rush hours, a person may sit in comfort and await his turn for the barber's chair.

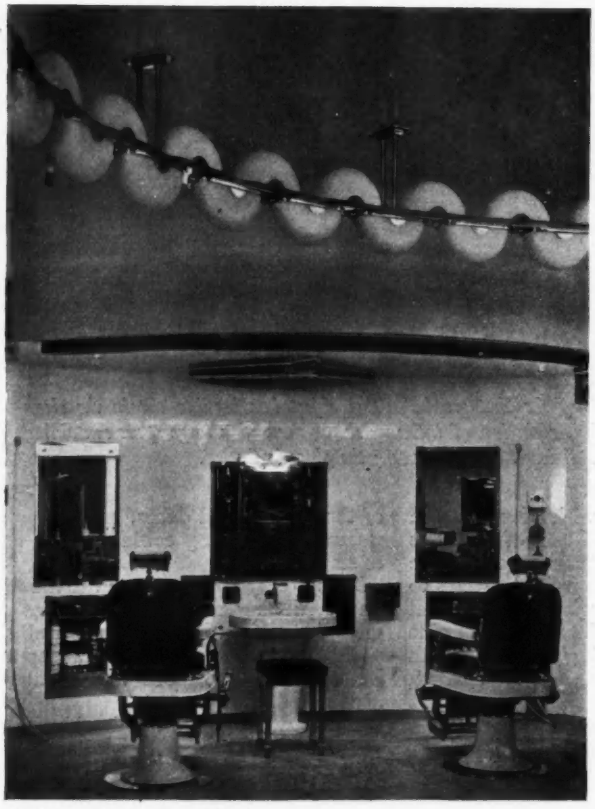
On entering the saloon one is immediately arrested by the unusual decorative treatment, its enamelled walls and its cream-coloured ceiling. The impression given is that the work in the saloon is carried on with the clean severity of an operating theatre.

Every part of the room receives the maximum amount of light by means of a large circular electrical fitment of stainless steel framework and frosted glass, projecting from the ceiling and closely resembling a huge caterpillar. This has been devised to give what is said to be the perfect light for barbers, and at the same time a decorative effect.

The unusual plan, which is similar in outline to the sole and heel of a boot, is partly the result of the shape of the site and the necessity of obtaining access to the plumbing throughout. The wall surface is broken up into a series of nine alcoves, each containing two chairs, with complete services to each bay, which contrast vividly with the usual barber's shop. In the centre of the saloon is a table, around which are placed six chairs. Thus, twenty-four persons can receive attention at the same time.

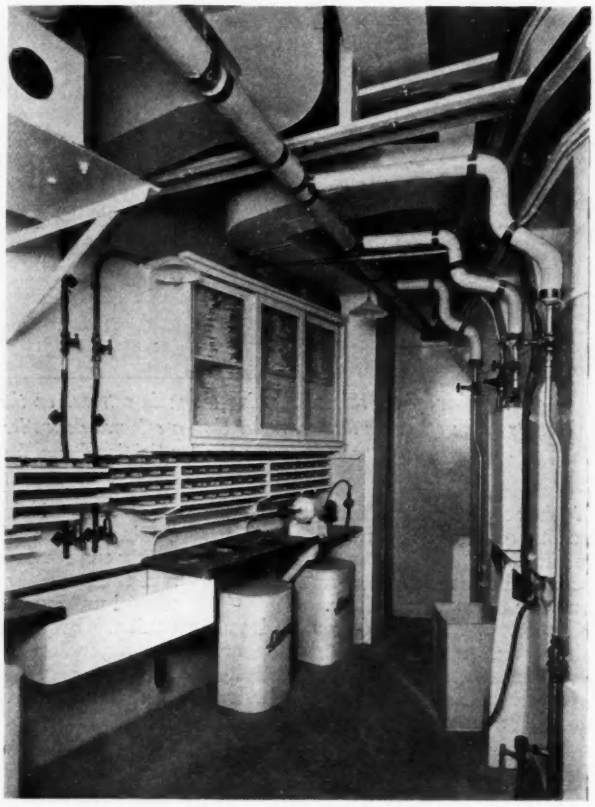
The surrounds to the entrance doors have been carried out in picked green Cippolino marble, and the floor is of Travertine marble, made to a special design. The double roller shutters, like a fire curtain at a theatre, are worked by means of a wheel on the marble surround, and are lowered and raised by a turn of the wheel. All doors, grilles, towel steamers, sterilizing cabinets, etc., are of stainless steel.

Giving off from the saloon are mixing and sterilizing rooms, and a series of changing-rooms, panelled in walnut with cork floors, with ordinary spray baths, batman's room and lavatory accommodation.

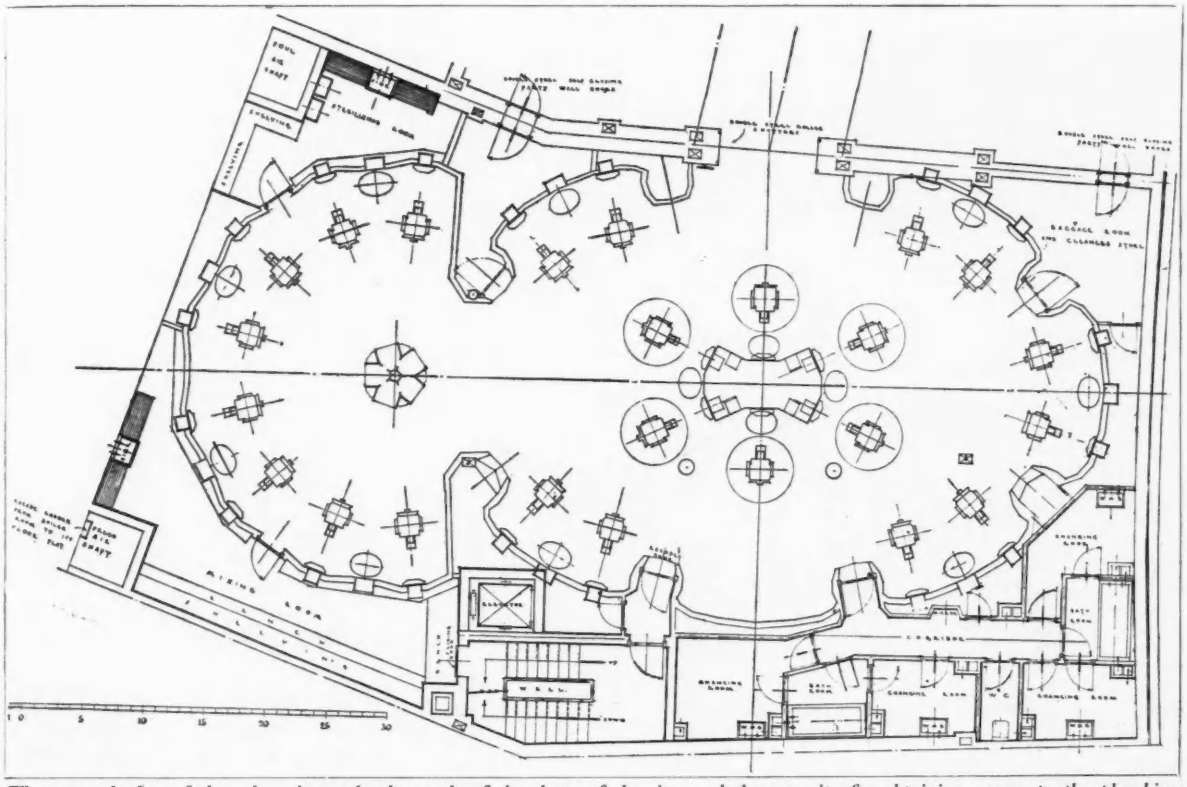


The plant for the hot and cold water, ventilation vacuum, steam and air compressors, etc., is situated in the sub-basement.

A general view of the saloon, showing the main entrance on the left of the photograph. The object has been to obtain the clean severity of an operating theatre, rather than a coloured decorative effect, a feeling of intimacy rather than of a large space containing barbers' chairs. The circular lighting fitment has a stainless steel framework; the glass is frosted.



A side view of the smaller segment of the saloon. The walls are of white ceramic, the floor is of Travertine marble, and the ceiling is covered with a glossy paint. The door shown, of stainless steel, gives on to the sterilizing room, illustrated below.



A Modern Hairdressing Saloon.]

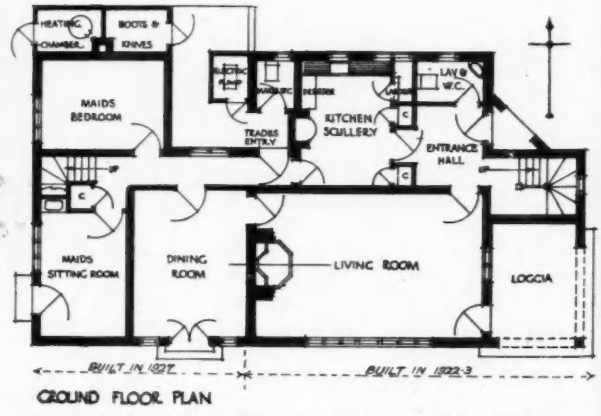
A near view of one of the alcoves; each contains two chairs, with complete services to each bay. The sterilizing cabinets, towel steamers, etc., are of white ceramic.

In the sterilizing room: the walls and ceiling are cream coloured. Here the utensils and even the brushes in current use are sterilized, on the average, once a day.

The unusual plan of the saloon is partly the result of the shape of the site, and the necessity for obtaining access to the plumbing throughout. Outside the saloon is an ample waiting lobby (not shown on plan) containing a cloakroom, telephone booth, and kiosks.

[*By P. J. Westwood.*

The cloakroom, reception desk and telephone booth are situated on the right-hand side of the waiting lobby. On the left of the illustration is seen a part of the surround to the saloon entrance, on which is mounted the wheel operating the raising and lowering mechanism of the double steel roller shutters.



This view of the S.W. corner of the house as it was built in 1922-3 should be compared with the similar photograph of original and 1927 extension at the top of the facing page. The layout was expressly planned for building in two halves : for example, the archway here seen on the extreme left marks the termination of a corridor now prolonged into the new part.

A HOUSE DESIGNED

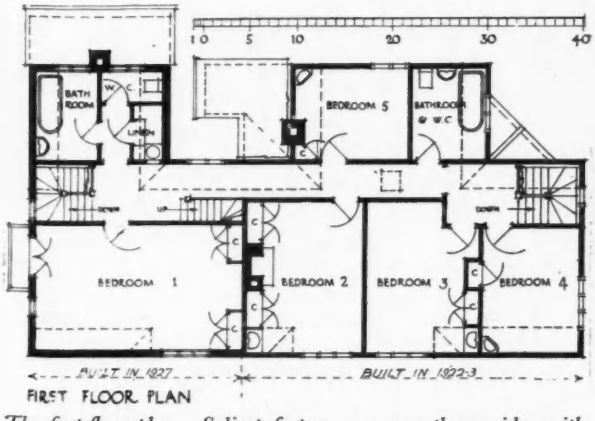
DEVISED BY

The views above give prominence to the second, westerly instalment, being taken from the N.W. and S.W. respectively. In the

PRENTICE WOOD, Farnham Common, Buckinghamshire, solves very prettily a problem with which most architects of public buildings are familiar enough, and even those engaged in the design of private houses may be occasionally confronted by their clients : building in instalments. The first idea was a modest week-end and summer cottage in the beechwood country. It was stipulated that this was to be complete and seemly in itself, but at the same time readily susceptible of expansion, if and when

GROUND FLOOR PLAN

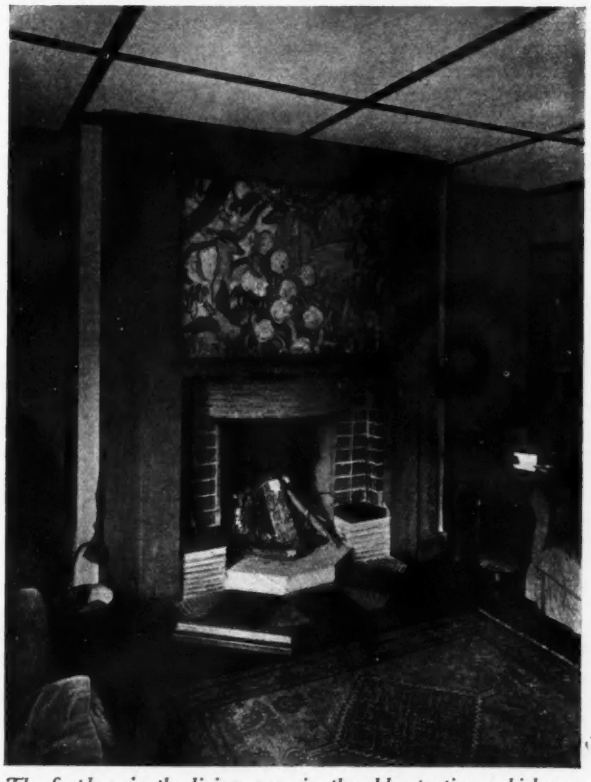
The ground-floor plan. The newer portion provides a dining-room, maids' sitting- and bedrooms, heating chamber, etc.



IN TWO INSTALMENTS

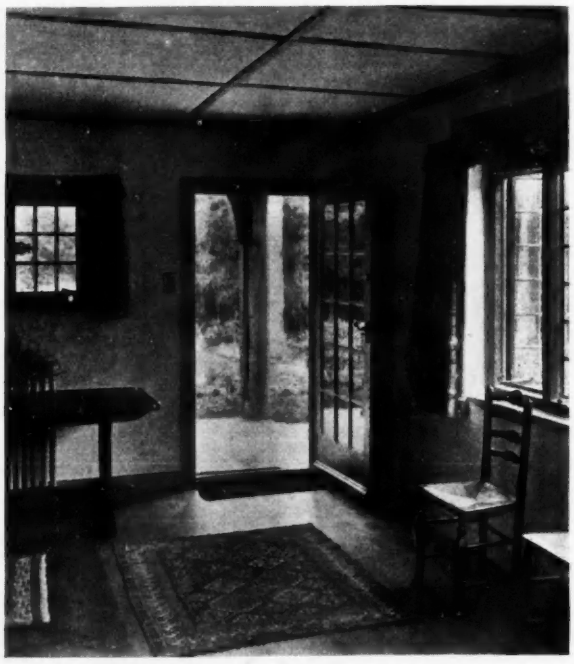
BASIL OLIVER

expediency permitted, to proportions suitable for permanent residence.



Forewarned is forearmed is never more aptly applicable than to a building adventure of this kind: fortunately the ultimate requirements were in view from the outset, and it is easy to see that Mr. Basil Oliver entered upon it with the greater relish for its inherent difficulties.

Almost invariably where unforeseen extensions are concerned it is the provision of access to the added rooms that is the stumbling-block. Hence a



The first-floor plan. Salient features now are the corridor with stairs at either end, and the extra (principal) bedroom.

former may be seen the balcony to the principal bedroom. Most of the external woodwork is oak untouched; upper walls are tile-hung.

The fireplace in the living-room in the older portion, which now assumes the uses of a drawing-room. The woodwork is in oak, like the floor; roofing tiles and dull purple bricks are used for the fireplace; the walls are beeswaxed plaster, parchment-colour. The decorative panel was painted, in tones intentionally rather low, for the sake of harmony, by Hugh de Poix.

The loggia from without and within. This feature, being at the south-east corner of the original plan, remains unaffected by the extension. The room with which it is in communication is the original single living-room.

central corridor, both upstairs and down, was a key to the present situation. Moreover, the ground-floor corridor was made to terminate in an archway that gave definition to the earlier end elevation concerned. Hence, too, the placing of the main chimney-stack at this end, where the extension was designed to come. Externally this expedient worked very well: what was the dominant feature in the first edition takes its place very happily as a point of punctuation in the whole. The full stop becomes a colon.

The house, which is built of bricks and tiles, the upper part of the walls being also tile-hung, has woodwork mainly of oak, left untouched. Steel casement windows are fitted into the oak frames. One or two deal doors in the newer part that are exceptions to the general rule of oak have been painted a very bright green, contrasting very effectively with the oak lintels, etc. The balcony provided to the new principal bedroom, which takes up much of the space added on the first floor, is an attractive feature. A loggia was already built at the south-easterly corner of the house that remains untouched.

Within, besides the bedroom already mentioned, the extensions have given, upstairs, an additional bath, w.c., and linen cupboard, and, last but not least, for it adds materially both to the symmetry and convenience of the plan, another staircase. Below there are provided a dining-room, to take over part of the uses of the former single living-room, and a sitting-room and bedroom for maids.

Prentice Wood, Farnham Common, Bucks.

By Basil Oliver.

ENGLISH PRECEDENT No. 143

SHOP FRONT, STAMFORD, LINCS.

Old work of the nature of this shop has essential qualities which have power to charm us in an extraordinary degree. But it can never be too much insisted upon that such examples should not be so much studied from the point of view of fitting them into our present scheme of things, as to discover what made them in their own day practical and useful, and has yet survived the passage of a hundred years of change. —[E. MAXWELL FRY]

LETTERS FROM READERS

Bungalophobia

SIR,—In connection with the controversy in your columns on the subject of Mr. Stanley Casson's bungalow in Cornwall, the following experience of a similar type of structure in which I am at present living may be of interest.

It is a district of Cotswold character, and the local authority is endeavouring by peaceful persuasion to improve the general character of building in the neighbourhood. They are doing this by means of an advisory architectural panel, appointed according to the advice contained in the Minister of Health's circular relating to housing and town planning. Making use of the gratuitous advice offered by this panel, the local authority were able to approach a speculator—who desired to erect an appallingly ugly sheet asbestos structure—with an entirely fresh proposition, costing not a penny more (if the two were put out to public tender), containing exactly the same accommodation equally conveniently disposed, and comprising quite a seemly structure of its kind. In spite of this entirely voluntary and generous service on the part of the panel architect concerned, the man refused the seemly and built the chaotic. The only ounce he would concede from his pound of flesh was a consent to use grey instead of pink asbestos slates.

Here is a potent illustration of how a modern speculator works havoc on misguided persons like, as far as his Cornish bungalow is concerned, Mr. Casson must have been : a man who inquired the price of this structure when it was completed was told that it could be had for a modest £650 on its site (valued at about £40). This, let Mr. Casson mark, was for a structure of a purely temporary character, having a useful life of not longer than twenty-five years at the outside, with no main drainage, company's water, electric light or gas, its only amenities those of adjoining premises of like character. To my own personal knowledge the materials for this building cost our speculator friend a little over £100; to this may be added the cost of ground above stated, his own time and that of a labourer for six months as his entire labour costs, plus the substantial profit necessary to make up the respectable figure of £650.

I suggest to Mr. Casson that architects could not compete with this even if they desired or tried. Is it not too serious a matter, in this time of national stress and the need for economy and wise spending, to sport with ? Any body of men seeking powers to deal adequately with these speculators is worthy of the widest support and sympathy, and let us not hinder the movement with idle talk.

And what of the manufactured article? What country builder is there that would not be glad of the job of putting up a well-designed and purpose-made article at two-thirds of the cost of manufacture, carriage, and foundations, chimneys and fixing ? I venture to put it to Mr. Casson that the case for the manufactured article cannot be substantiated today. It is uneconomic and in every way unsatisfactory as compared with the purpose- and local-made job. The war-time hut may have been different, but I rather think that it is an anachronism today; who would have one's residence designed by a Royal Engineer and be proud of it ?

Then comes the railway carriage and its more modern counterpart, the disused omnibus body. But may not these even, when dire necessity dictates their use, be made to look respectable? The accompanying illustration shows that where there is a will there is a way. This transformation was carried out by the owner who, although he may have been poor, was at least useful, for it cost him precious little.

It is the kind of public of which Mr. Casson is unquestionably a member, that requires to readjust itself. The architects are all right and are doing admirably the very things Mr. Casson demands, if only he will allow them to continue the good work in peace.

THOMAS THOMSON

SIR,—Mr. Stanley Casson accuses me of expressing myself crudely, and in the last sentence of his latest letter throws doubts on my sincerity. I hesitate to occupy further valuable space in refuting the statements of one who buys bungalows and clothes ready made, the more so as Mr. Casson's transparent honesty makes it unlikely that he will be led to see the errors of his point of view.

Any architect of experience knows that the first considerations in designing a house are the questions of aspect, outlook, environment and contours of the ground. (We are, of course, assuming that the foundations are reliable.) This being so, it is absurd to talk of the possible success of standardization.

It is impossible to compare architecture with law, medicine and the Church, as Mr. Casson does.

Architecture deals with things seen. The other three deal with things more or less unseen. Did the medical profession drive the quack off the field by descending to the quacks' level? This is what Mr. Casson asks the architect to do. Did lawyers drive the unprofessional practitioner off the field by descending to his methods of doing business? This, again, is what Mr. Casson asks the architect to do.

Before and after. The transformation of an old railway carriage into a modern bungalow (with grey asbestos slates) is described by a correspondent in a letter on this page.

The Church suffers quack religions because it knows that they will pass away, as all freak things die and perish. In architecture, the traditionalist will ultimately triumph for the same reason that the whole teaching of history proves that every department of human industry is founded on evolution and continuance by selection of the finest elements from passing phases.

If Mr. Casson's policy ever comes to be universally adopted (" ready-made articles "), then true art and craft will die. No real craftsmanship could ever be found in a house of £350. Such a house might with difficulty be made water- and weather-tight for five years.

If there is any question of pride, it is pride in the long and honourable traditions built up by many generations of worthy and noble ancestors, who placed sound workmanship and beauty before all else; it is nonsense to state that there is not sufficient money in the country to do the right thing. The Irish sweepstake proves that.

Mr. Casson admits that he does not wish an ideal home. No architect of repute wishes to work for such a client.

WILLIAM DAVIDSON

Preservation of Old Buildings

SIR,—Lest it should be thought that the Society for the Preservation of Ancient Buildings is always ready to criticize the way old buildings have been restored and never to praise, may I, on behalf of my members, make public the Society's gratitude to the Anglo-American Oil Company for the care they have taken in their treatment of 25 Queen Anne's Gate, the corner house in the most perfect of London's few remaining early-eighteenth-century streets?

It is not too much to say that the preservation of Queen Anne's Gate depended on the action of this company in allowing their architects, after consultation with this Society, to strengthen the foundations and walls and rebuild the upper part of the building in such a way that the original front remains unspoiled.

This building had been condemned by the L.C.C., who served a " dangerous structure " notice on the owners. The urgent need of additional office room could have been met by pulling it down and rebuilding, or the old building could have been marred in the reconditioning. In either case a precedent would have been created for similar methods as other houses in the street became due to repair.

The precedent which has now been created is a formidable one with which to confront the potential spoiler of noble work, whether in London or in the country, especially as the interior office arrangements are such as to silence those who believe efficiency is incompatible with the use of an old building.

A. R. POWYS
(SECRETARY, S.P.A.B.)

Modern Architecture

SIR,—The article by Sir William Crawford, in a recent issue of THE ARCHITECTS' JOURNAL on " My New Building," is as forthright and vigorous as his personality.

His boldness is invariably admirable, and his new building is typical of the man. He is a pioneer and always will be. For that reason I admire his latest effort.

But it does not exactly suit my own taste. Quite frankly I do not feel a hundred-per-cent. appreciation of the extreme and ultra-modern ideas in building construction: they are hard and result in rooms being box-like.

Many of the rooms of extreme modernistic design look more like prisons than liveable rooms. I cannot hope that the modernist will agree with me in this respect, but we must realize that very nearly a third of our life is spent in our offices, and the more pleasurable they can be made, the better.

I do agree, however, with Sir William's idea of getting the maximum amount of light. Some architects forget that the human being loves daylight. It is all very well to get beauty in design and a delightful expanse of brickwork, but to get this artistic effect at the expense of perfectly light rooms is, in my opinion, a great mistake.

A. J. GREENLY

The Control of Building

SIR,—May I correct one sentence which seems accidentally to have gone wrong in the extracts you printed in your last issue, from my long paper delivered at the R.I.B.A. on November 17?

Near the bottom of the middle column on page 764 I am made to say " do not over-estimate the effect or geographical extent of Parliament." This should be " do not over-estimate the effect or geographical extent of local Acts of Parliament."

A. N. C. SHELLEY

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Plight of the British Granite Industry

THE plight of the British granite industry was discussed in the House of Lords last week, when Viscount Mersey asked the Government whether any development could be made in the employment of British labour and material in the quarrying industry, more particularly as regarded road construction. He said that the owners of the granite quarries in Cornwall, the Midlands and Scotland, could not or did not meet the requirements of the highway authorities for granite kerbs for road construction. Nearly all our granite kerbs at present came from Norway. Apparently our quarry owners were unable to produce the kerbs in anything like sufficient time, and they were unable to produce them of the required length. The owners said that there was not sufficient skilled labour available. In Norway, semi-skilled labour was employed to produce the kerbs, which were machine-cut. Another answer of British quarry owners was that the road authorities should use a different sort of material. The Unemployment Grants Committee were very much exercised over the position, and the Chairman, Lord St. Davids, had stated that it might be well for the Government to consider opening a quarry of their own. While he (Lord Mersey) did not advocate that, he asked the Government if they could throw any light on the incapacity of the British quarry owners to deal with a matter which required very different treatment with a little more vision and a little more activity.

Lord Cushendun, however, declared that Lord Mersey had been unfair to the quarry owners. Our persistent free trade policy had killed the granite industry in this country.

Lord Ponsonby, the Parliamentary Secretary to the Ministry of Transport, said that the present state of affairs was very disappointing. There had been an enormous increase in road construction in recent years. The present Government had approved the expenditure of £50,000,000 during the last year for the construction and widening of classified roads. Although a gigantic amount of broken stone was required—12,000,000 tons a year for 40,000 miles of classified roads—only 172,000 tons had been imported in the last nine months, so that no particular problem arose with regard to broken stone. But the question of granite kerbs was different. British granite was undoubtedly superior to concrete kerb, which was being manufactured now under the orders of some local authorities in their anxiety not to import foreign granite. The granite kerbs, however, were far more durable and more satisfactory. Hundreds of thousands of feet of granite kerb were required. In Leicestershire very satisfactory progress had been made in the production of granite kerbs. In the past three months 4,000 tons had been produced, compared with 3,500 tons last year. The owners were

making every effort to get their organization into a more efficient state, and were succeeding. No blame could be attached to local authorities, which were hampered by the question of price. It was cheaper to send granite kerbs from Norway to the East Coast of England than from the West of England. It would be most unfair not to realize that the quarry owners were up against difficulties. The owners might consider the question of coastwise steamers for carrying this stone. The Minister of Transport had recommended that they should set up within their industry an organization devised to secure efficient propaganda in favour of British quarry products, and that they should adopt a policy of standardization and secure co-operation between the industry and various transport agencies for prompt and reliable deliveries, if need be by seaborne transport. There were indications that steps were being taken to improve matters, but a great deal remained to be done. There was no question of a subsidy, nor of protection, but simply of a lack of efficiency and a failure to realize the great opportunity that was within the reach of the industry. He felt that they could put their house in order and meet the demand that existed for their material.

Regional Planning Committees

At question time in the House of Commons Sir K. Wood asked the Minister of Health whether he proposed to appoint an advisory committee consisting of experts in town-planning, representatives of the local authorities, and civil servants, to consider the present schemes of the regional town-planning committees and select those which could be put into immediate operation.

Mr. Greenwood said that many reports had been issued by Advisory Regional Committees, but these were far from being approved schemes. No regional schemes had been approved, though many proposals of a regional character were embodied in approved town plans or preliminary statements and several had been or were being carried out by local authorities. He was not satisfied that any useful purpose would be served by such a committee as that suggested, but the matter was being further considered.

Prices of Building Materials

Mr. Raynes asked the Minister of Health whether, in view of the probable increased activity in the building industry consequent upon the five years' building programme, he would say what steps he proposed to take in order to prevent unwarranted increases taking place in the prices of building materials.

Miss Lawrence, who replied, said that with the help of the Inter-Departmental Committee on the Prices of Building Materials, the Minister would, of course, continue to watch very carefully any variation in the prices of building materials. He did not think it would be desirable at the present stage to anticipate the action which he might have to propose if unwarranted increases in those prices did take place.

Lead Poisoning

Mr. Grahame-White asked the Secretary of State for the Home Department if he could state the number of cases of lead poisoning notified, and the number of deaths which had occurred since the imposition of the new regulations dealing with the use of white lead.

Mr. Short, who replied, said that the regulations under the Lead Paint Act came into force on October 1, 1927. During 1928 eighty-seven cases were reported, including twenty deaths. During 1929 there were seventy-five cases, including ten deaths; and during the nine months ending September 30 last there were forty-three cases, including nine deaths.

QUESTIONS THAT ARISE

Damp Wall

J. J. E. writes: "*I am tempted to reply to W. A. D. regarding his views on curing the dampness to some basement walling, on page 739 of your issue dated November 12. No doubt his suggestions are sound, but they cannot be regarded as inexpensive, and your correspondent's client appears to require the work to be carried out at the minimum of expense. Taking up so much of the area paving and forming a vertical dampcourse, as well as cutting out plasterwork internally, will leave very little change out of £75.*

"*To my mind, the dampness in the house, which is described as an old building, has probably reached its height. If the plaster were cut away to the external walls of all the rooms affected, and the walls rendered with a waterproofed cement, from the floor to two feet above the present dampness, as suggested by J. E. K., I feel that this would effect a cure.*

"*By carrying out the work in this manner, the considerable expense in cutting away externally for a vertical dampcourse would be saved. I do not wish in any way to belittle W. A. D.'s ideas, but I have found that so many clients in these days ask for cheapness in their architect's solutions.*"

[We have submitted the above letter to our expert, who has sent us the following reply:—]

I am interested to read J. J. E.'s views in opposition to mine on the question of a cure to a damp basement wall, and I take a further opportunity through your columns of expressing my opinions.

J. J. E.'s chief weapon appears to be cheapness, and I realize the necessity of studying a client's pocket. It is, however, no use spending money in making the upper rooms habitable, and leaving the lower, possibly servants' quarters, to take care of themselves.

J. J. E. also feels confident that his method in cutting out the plasterwork internally, and rendering from the floor to a height of 2 ft. above the dampness, will provide a cure. I doubt it. In fact, I have seen walls, which are not rendered externally as these, treated in this manner, and in due course the dampness has risen above the new work.

In this case the dampness enters the wall above the dampcourse, and the walls being rendered externally provide no escape for the moisture except through the plasterwork.

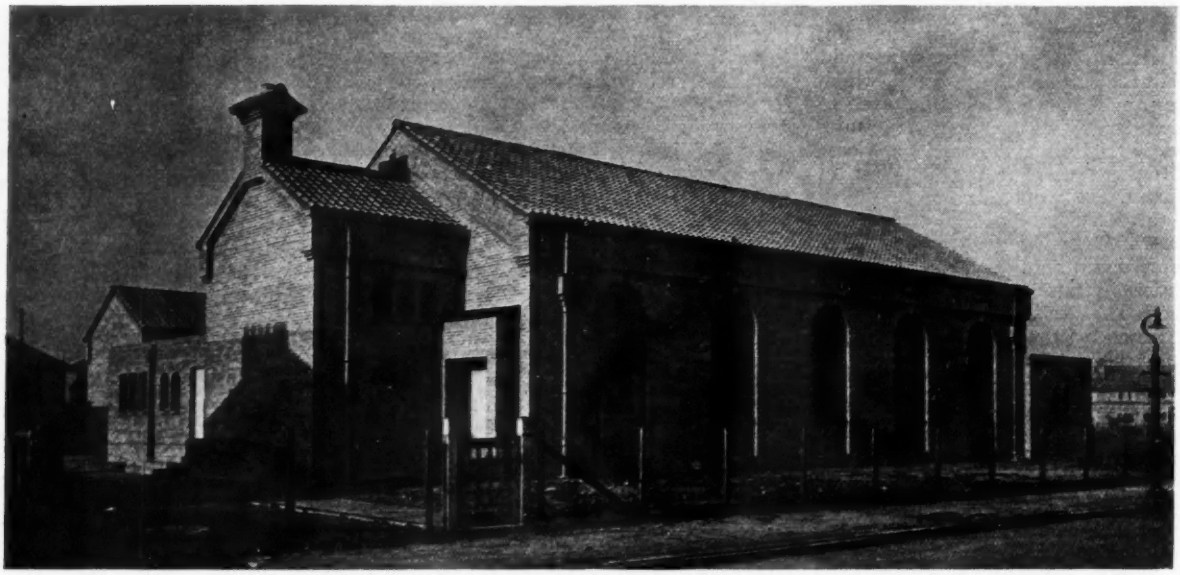
J. J. E. is simply covering up the damp walling and hoping for the best. The obvious necessity is to keep further dampness from penetrating, and with this end in view I consider that the provision of a new vertical dampcourse is a necessity. W. A. D.

Drainage

M. J. writes: "*There is a 12-inch surface-water drain running 3 ft. inside my fence on my property for a distance of 25 ft. I understand that the drain has been there for twenty years, before my house was built and the ground fenced round. Have I any claim on the U.D.C. for using my land to run their drain through?*"

It is unnecessary, in my opinion, to consider the numerous points that would arise if the interval of time were less than the period stated in the question before me, as they do not arise.

In my view, no action will now lie against the U.D.C. for trespass owing to the lapse of time.



It may be that you would have an action for damages against the vendor of the property if he did not disclose in the contract to yourself the existence of the drains, unless the contract contained a condition to the effect that the property was sold subject to all rights of drainage.

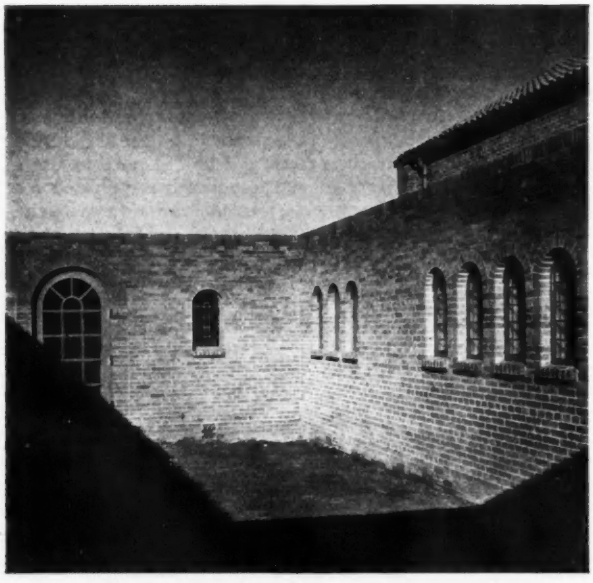
I have not got this document before me, and in the circumstances I am unable to express a final opinion on the matter.

In my view the title to the property ought to be investigated, in order to see whether the existence of the drain appears in the deeds.

An investigation of the title deeds and the contract for sale to yourself should be made by your solicitor, who can then advise you fully on the facts before him, as owing to the absence of these documents the answer is too problematical to venture an opinion.

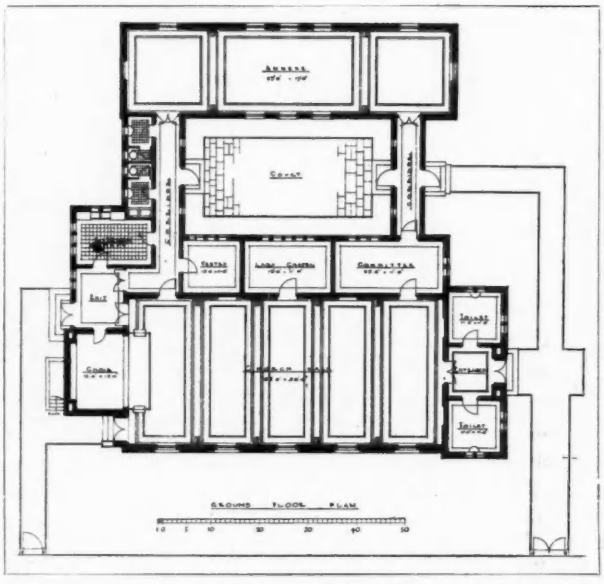
E. F. I.

A view from Sedgemoor Road. The entrance shown gives direct access to the main hall, which is lighted by the five large semi-circular-headed windows. The walls are constructed of hand-made sand-faced bricks, and the roof is of red and brown tiles.



THE CHAVASSE MEMORIAL HALL, LIVERPOOL

DESIGNED BY QUIGGIN AND GEE



THE Bishop Chavasse Memorial Hall, Sedgemoor Road, Norris Green, is situated in one of the new Liverpool housing areas, and is the first of a group of church buildings.

The problem that faced the architects was that of designing a building, low enough not to compete with the church, to be erected at a later date, and, at the same time, to give it the necessary architectural treatment to stand out from the surrounding houses, although not much higher or larger in bulk. In its solution the roof plays a significant part. The small tiles, rich red in colour, intermixed with brown, form a pleasing contrast with the multi-coloured hand-made sand-faced bricks below.

The interior of the building comprises two halls, the larger of the two functioning as a chapel pending the completion of the church, a vestry, Lady chapel, committee room, toilet rooms, and kitchen quarters. An interesting experiment was carried out with the plasterwork in the main hall; this was coloured in mixing, thus avoiding further decorations. The treatment appears to be very satisfactory.

A corner of the courtyard. The door gives on to the corridor connecting the small hall and committee room; the windows of the latter, together with those of the chapel, are seen on the right.

The central feature of the ground-floor plan is the main hall, measuring 65 ft. by 30 ft. The small hall, although 2 ft. longer, is only 17 ft. wide. There are five separate entrances to the former.

THE SPECIFICATION WRITER

Specifying for Demolitions

THE disappearance of the Hotel Cecil and of Lever House (formerly De Keyser's Hotel, of which progress photographs appear overleaf), is yet another reminder that permanence is not an asset in modern civilization. These buildings, which would have been capable of withstanding natural decay for at least a century, have been pulled down to give place to more revenue-producing structures.

Whether the American idea that anything from a Ford car to a skyscraper has only a comparatively short economic life be the right one is a question for the political economist rather than the architect. But the latter has in these days to supervise the destruction as well as the erection of large buildings, and to do so he must be able to specify what is required for the housebreaking.

In preparing a specification for demolition of other than derelict structures the architect is confronted by a totally different set of conditions from those of a new building. He is not out to spend but to save money, and in competitive tenders the contractor who offers to give the most credit will get the job.

Therefore the specification writer will begin with the various fittings, fireplaces, overmantels, lavatory basins, sinks, w.c.s, etc., which he thinks it will be more economical for his client to store for re-use. Here he must exercise judgment, for probably these fittings are somewhat out of date, and it will depend upon the class of building that is to be subsequently erected whether it is better policy to allow the housebreaking contractor to give credit for them and for the client to pay the difference between the credit and the cost of the most modern style of article.

Generally it will be found advisable to retain the best of the existing fittings for use in the second-rate parts of the new building, and to accept credit for all others. It is seldom worth while to specify for the retention and re-use of hot water boilers, cooking appliances, or parts of heating systems, but it is well to see that proper credits are given. To break up and remove a large boiler from a basement may barely cover its value as old iron, but there will be gunmetal valves and taps that are easy to unscrew, and which can be sold for a fair sum. This applies to all bib valves and taps in radiators and sanitary work generally.

The next item will be the doors and windows and any panelling in the rooms; if the building is comparatively modern these should represent a substantial credit. Flooring, especially if grooved and tongued boarding or wood blocks, is probably worth nothing, but sound joists and roof timbers should show a credit, as also should the lead and other roof coverings. But here the architect must be somewhat generous, remembering that the work of removing these is considerable, and also that the percentage of breakages is great. Genuine old tiles will, of course, fetch money, but old slating is probably only useful for dampcourse work, or pinning up underpinning.

Lastly comes the question of walling, and here the optimistic architect may receive a surprise and find the contractor's credit very much below his estimate. Although pulling down is a more rapid proceeding than building, and necessitates less scaffolding, still there will be hoardings and fans to protect the public if the building is in a town, and these should be specified.

Then again in large towns the work may have to be done at night or between certain hours, and with the precautions taken against raising dust, all this will cost money.

Finally, the adjoining building, or buildings, may require shoring or protecting from weather on any exposed party walls; the contractor should find this work specified in detail, as he will set the cost of it against his credits. But even if these costs are not excessive, it still has to be remembered that the bricks will need cleaning and the stonework re-working, so that in the end the sale price of the materials will only about pay for the labour and cartage, and if the bricks are to be stacked for re-use then the cost will be charged to the building-owner, and this should be clearly specified.

If there is an existing basement to be filled in, this should be specified, as it may save the cost of removing brick and stone rubbish, but it should be made clear that only this material, and not broken laths and plaster, is to be used. This is a point to be carefully watched, as it is a tempting dump, and may cause trouble when it begins to settle later; and the building contractor has no means of knowing what has been used for making up.

Old drains should be specified to be grubbed up, and all cesspools emptied and cleaned with lime before being filled in. Old wells may prove a difficulty, but if these cannot be filled in, the best way is to cover them in with a thick slab of concrete.

In any large job it is always wise to make a separate pulling-down contract and to stipulate that the contractor shall leave the site with a proper hoarding and gates. The building-owner will buy these from the housebreaker, and the architect should include in the building specification that the building contractor shall give credit for them in his estimate for new work.

Where the final credit due to the owner is likely to be small, it is sometimes the practice to specify a sum which the contractor is to deposit with the architect before signing the contract. This sum is to be returned to him upon the satisfactory completion of the work, the object being to ensure that the contract will be completed, as the latter part of a demolition contract is for the housebreaker the least remunerative. LL. E. W.

Electric Storage Heating

EXCEPT for intermittent local heating on a small scale, electricity has not come very prominently into vogue, due almost entirely to the high cost of current. With a view to increasing the consumption of electricity during off-load periods, many supply companies are prepared to deliver current at ¼d. per unit during specified hours. General electric heating on this basis, however, involves some system of storage of the heat, if it is to be applied throughout the whole of the day; hence the various systems of water and oil storage in which heat is accumulated by immersing the electric heating element, the heat being then utilized, when required, by use of the calorifier for transferring it to a water-circulating system.

When properly installed and insulated against radiation losses, these storage systems can show a fairly high efficiency, ranging up to 90 per cent. of the heat stored. Direct electrical radiation, being 100 per cent. efficient, can be considered on the basis of the heat delivered per electric unit supplied, and a similar figure for electric heat-storage systems can be arrived at by deducting the loss in storage. When, however, cost comparisons come to be made with other systems, it is obviously imperative that the figures be taken on the same basis in both cases. A useful guide is that a modern, coke-fired central-heating plant has an average efficiency of about 50 per cent. Comparisons that assume a lower figure are not only misleading, but directly detrimental to the development of electrical power for heating.

Electricity, however, has advantages peculiar to itself, and, despite the fact that a direct comparison of costs of electricity and fuel may show the former to be very high, the low cost of the plant involved, the small space occupied, the absence of a central

heat-generating plant demanding attention, together with the convenience and cleanliness of electric heating, are factors which in many cases are sufficient to discount the difference in price.

The cost of any system must include not only that of the plant to be installed, maintenance and fuel costs, and rental of space occupied, but must also have regard to the labour and attention involved in operation, personal convenience and, above all, the absence of destructive effects on the rooms which are heated. On these lines electricity can certainly present a very strong case to many users.

A. H. H.

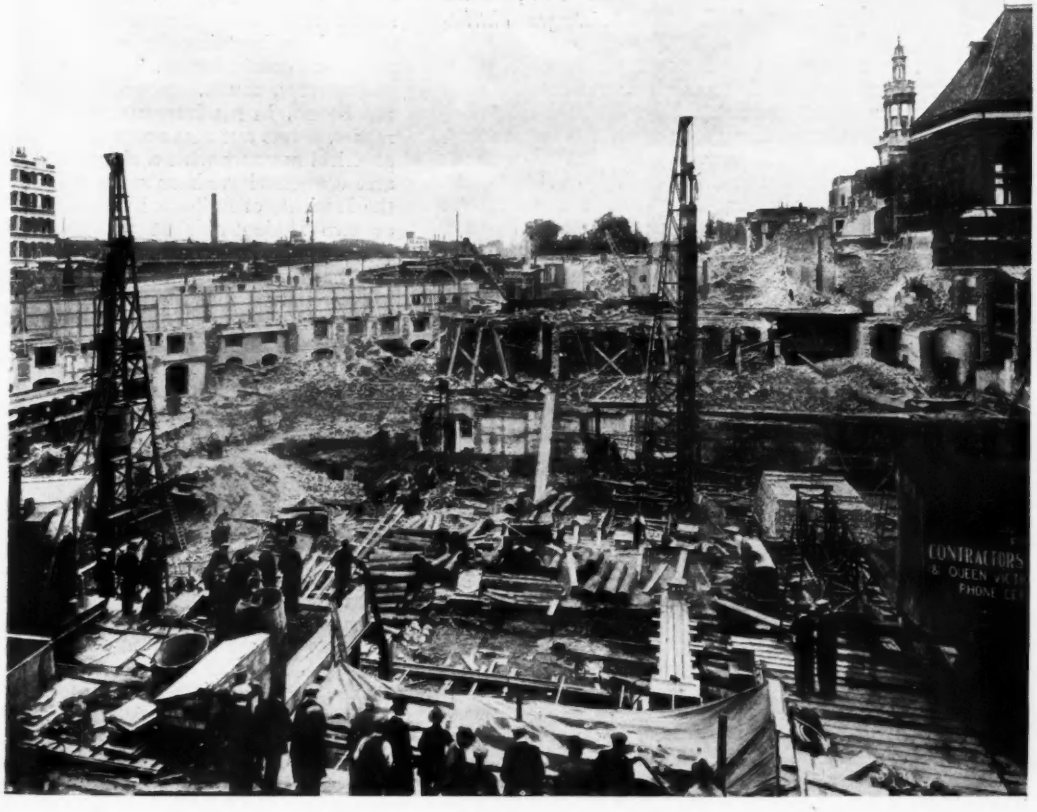
On this and the facing page are reproduced three progress photographs of the demolition of Lever House, formerly De Keyser's Hotel, London. It was six stories high, with two basements, and covered a site roughly two-and-a-half acres in extent, bounded on three sides by the Victoria Embankment, New Bridge Street, and William Street respectively. The principal façade faced the Embankment and Blackfriars Bridge. The photograph shows the progress made with the demolition work after four weeks.

Repairing Roof Coverings

LEAD

OLD lead roofs are often found laid on oak boarding, but in re-laying deal boarding should be specified, as lead laid on new oak rapidly decays. When it is impracticable to re-use the old cast lead sheets, milled lead at 6 or 7 lb. weight should be substituted, and will be as lasting, although the colour is always harsher owing to its greater purity. Sheets should not be larger than 8 ft. by 2 ft. 6 ins., and if they are laid to a steeper pitch than 20 degrees the joints should be diagonal to the slope to avoid the tendency to creep. Lead tingles are best specified 9 ins. long by 3 ins. wide, nailed to boarding and bent over edge of undersheet with the outer sheet closely dressed over. The lap should be wide, and an added safeguard against capillary attraction is sometimes provided by bending up the lap edge of the under sheet and dressing it down over the nail heads. Old nails were of wrought iron with flat heads, but similar shaped nails, which are now made in copper, should be specified, as they do not rust. Old lead gutters behind parapets have sometimes insufficient drips, and the lead is often cracked and thin; many of these cracks may have been repaired with solder, which results in bumps and weals on the surface, seriously impeding the flow of water. Such old gutters are best taken out and relaid, but when cracks are slight they should be repaired by burning rather than solder. Many old lead roofs are entirely hidden, and owing to their weight the woodwork of the roof shows signs of failure. In such cases there is no reason why they should not be renewed in copper.

SHINGLES



Except for church spires, wood shingles are not often met with in this country, although in Scandinavia and parts of America they are common. The most frequent defect is for the lower edge to turn up and split. This usually occurs on the south and west faces, and in laddering a spire for inspection the south face should be chosen; if the shingling is here found to be sound, it may be taken to be so on the other faces.

The shingles in England are usually of oak, 15 ins. by 5 ins. by $\frac{1}{2}$ in., and laid in the manner of slates. To make a good job the shingle should only be exposed for one-third of its length, and it should be specified to be split, not sawn. Ventilation is an important point, and one American method for ensuring it is to cover the rafters with 1 in. by 3 in. laths laid at $5\frac{1}{2}$ in. centres, so as to admit air to the back of the shingle. Each shingle should be nailed with zinc or galvanized iron nails, placed about $\frac{3}{4}$ in. from the outer edges.

[*Previous notes on this subject appeared in the issue for October 29 last.*]

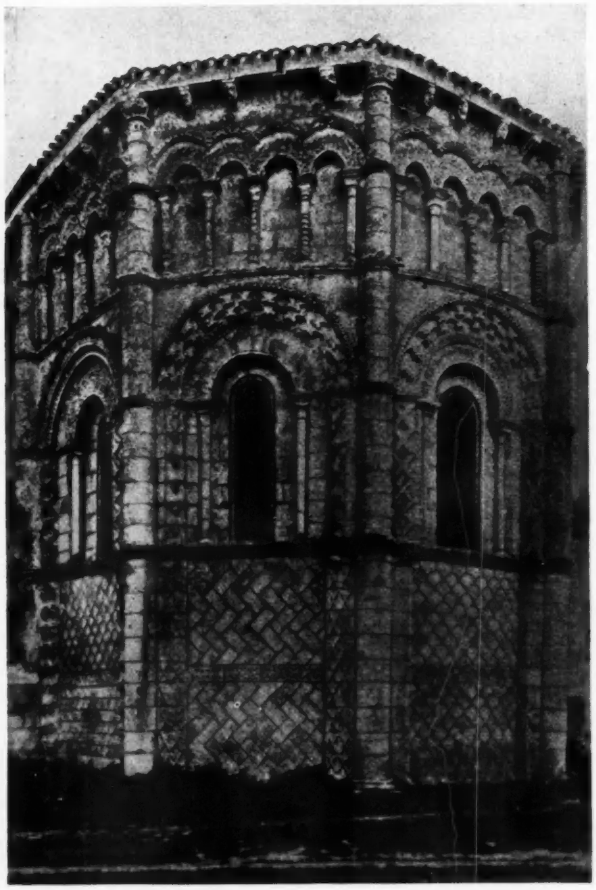
After seven weeks. All the photographs are taken from the same view point in William Street, which runs parallel to the Embankment and at the back of the building. All the material was carted away from this street to avoid further congesting the other two thoroughfares which are heavily-laden with traffic. After four weeks, while demolition work was still in progress, excavating and building work commenced for the new Unilever House, which is to be erected on the site. One of the pile drivers is seen in the photograph.

After eleven weeks. Blackfriars Bridge is seen in the background. The material from the building was disposed of at the rate of 600 tons a day. The broken stone from demolished buildings is used for the making of roads; sound bricks are utilized for foundations; the white rubbish from the ceilings and the mortar from the brickwork are made into mortar; and the steelwork is cut, with oxy-acetylene, into suitable lengths, transported to steelworks and there re-smelted.

LITERATURE

LITTLE CHURCHES OF FRANCE

BECAUSE the little church of France is a cathedral in miniature and " in the little churches are to be found the experiments that were adopted or discarded by the cathedral-builders," the foreword, comprising twenty-five folio pages, largely concerned with cathedrals and churches of cathedral size, is not irrelevant to the subject from which a delightful portfolio of photographs is named. Indeed, as the author indicates, the illustrations of the *Little Churches of France* are, to a great extent, self-explanatory, particularly against a background of the general history of French ecclesiastical architecture.



Unlike the cathedrals, the little churches were seldom built alike even in the type of plan, and Mr. Albert Chadwick has gathered from many parts of France a diversity of examples. He distinguishes, however, three definite areas, each illustrating a particular phase, as influenced by local circumstances, " where in nearly every village is a church that is a gem of its kind." Many of these date from within a century and a half of the building of Saint-Denis, a period when there occurred what the author describes as an " epidemic of church-building."

Scarcely a church was built in France during the wars with England, but another group dates from the time of recovery in the fifteenth century. The Renaissance " never achieved a worthy ecclesiastical expression in France," but the particular version of Renaissance expressed in some of the Brittany churches has a character of its own, " a mixture of the grim and the fanciful that is truly Celtic." In Plate CI, illustrating one of these, a letter " n " appears to have taken the place of " u," and one or two similarly small errors have no doubt been noted for correction—the spelling of " *trumeau*," with a superfluous second " m," is one of the most conspicuous. The use of the words " fourpartite," " eight-partite," etc., is a trifle irritating, when " sexpartite " has evidently presented no difficulty. The whole foreword would have lost nothing by the omission of its final sentence—an ugly and aggressive appendage to an otherwise well-knit résumé.

The contrasts in the illustrations are strongly marked, as, for instance, between the quiet, sweet solemnity of the portals at Béron, and the Oriental lavishness of the Saintonges district. The simple, direct Italianate church at Albi is very different from the strangely contrived bell-cupolas, beacon-turrets and spires of Finistère. But every one of these little churches offers something for enjoyment, study and reference.

THE CREATIVE AND THE RESOLVENT

AFTER dwelling meditatively upon the last report of the Building Research Board one is forced to admit that there is a vital need for a better training in science for entrants into the building industry. As science develops, says Dr. R. E. Stradling, the Director, so the urgency of this need becomes increasingly evident. For example, however much specification is facilitated by the availability of reliable standards for materials, the necessity remains unabated for scientific training such as will enable makers and users to apply the standards with the fullest benefit in building operations. It is, however, believed that the movement towards the endowment of a Chair of Building is taking definite shape and that one of the older universities is giving the matter sympathetic consideration. Sir George Humphreys, K.B.E., the chairman of the Board, in his introduction to the report, points out that as an immediate practical measure with a similar object arrangements have been made whereby the Institute of Builders maintains one or two studentships at the Building Research Station. The first studentship has already been awarded.

It is reported that the progress made in the general and special researches in hand at the Building Research Station, and the increase in the volume of special investigation and inquiry work, has been maintained during the year. Particular mention is made of the investigations into the flow of concrete under load, and into the corrosion of steel embedded in breeze and clinker concrete. The growth in intelligence work has been no less noticeable; the number of inquiries dealt with, apart from those of a minor character, has risen by slightly over 50 per cent., reaching a total of 632.

All the acoustics experimental work of the Department will in future be concentrated at the National Physical Laboratory. The Building Research Station will, however, remain responsible for the architectural application

of results and for general contact with the building industry. Another new arrangement is the proposal that the Station, in conjunction with the Geological Survey and Museum, should undertake a survey of natural building stones. The survey will include a study not only of the geological, petrological, physical and chemical properties of the stones, but also of their general economic importance.

Certain sections of the work undertaken by the Station, in conjunction with the Committees of the British Engineering Standards Association engaged in the preparation of standard specifications for building materials, have reached a stage when publication of specifications may shortly be expected. This applies, for instance, to the specification relating to quicklime for plastering purposes and clay roofing tiles.

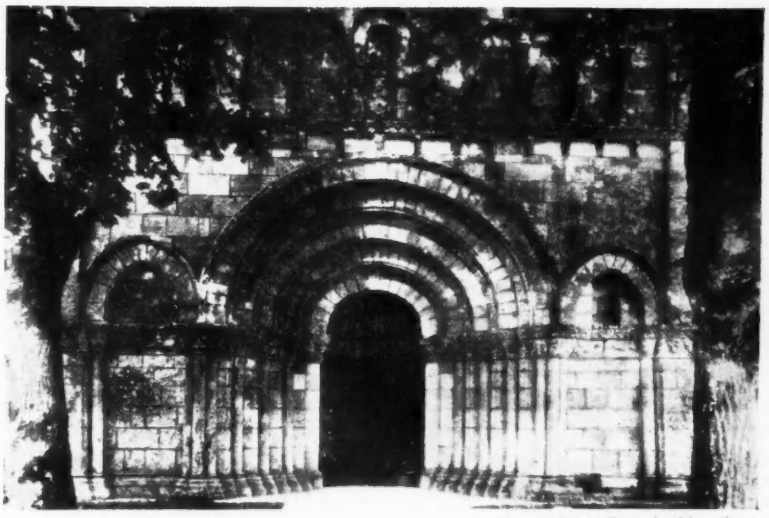
ARCHITECTS' ANNUAL REPORT

THE forty-second *Annual Report of the Sheffield, South Yorkshire and District Society of Architects and Surveyors* has recently been issued.

In addition to the Council's report for the year ending April, 1930, the report contains the statement of accounts, list of members, rules and synopses of lectures delivered during the past session. The total membership of the Society now stands as follows: 9 Honorary Members; 67 Fellows; 55 Associates; 4 Students and 3 Laymen, amounting in all to 138, as against 135 of last year. It is estimated that 44 new members have been obtained by the canvassing of districts in the Society's area which are out of touch with Sheffield.

Business dealt with by the Society during the year included such matters as architectural competitions, regulations governing the transfer of allied societies' members, the Registration Bill, trade discounts to builders, the Fitzalan Market Scheme; and questions with reference to salaried members of the profession, and the employment of other than official architects to design some of the poor law buildings and new Council schools.



The frontispiece is a portrait of Mr. W. G. Buck, F.R.I.B.A., the president.

PUNCH'S ALMANACK FOR 1931

MR. PUNCH in his Almanack for 1931, upon the cover of which he is depicted (with every justification) by Frank Reynolds in the guise of an Old Master, brews again that flowing bowl incredibly compounded of sheer elegance and gentle raillery of which he alone, it seems, possesses the masterly recipe. Every architect should be a connoisseur in diverse ways of living: such will quaff it with avidity. At the risk of being invidious, shall we confess that we like best, among the many excellent coloured pages, the fantasy of Arthur Watts, "Homesickness; or, the Call of the Jungle"? Here the pathetic monkey of the organ-grinder, his red coat the one spot of colour in a quiet scheme of blues and greens, is making tracks across what might be Queen Anne's Gate, did we tolerate organs there, irresistibly drawn by the piled exotic greenery on a florist's cart. Fougasse and Gilchik, Bateman, Ernest H. Shepard and G. L. Stampa take off aspects of the human comedy in serial sketches. A. P. H. graces the literary pages with a condensed musical comedy, in which the device of ellipsis is pricelessly exploited; and so does Evoe, with a fairy tale about a match played for the hand of the Princess Fifi upon "the Royal and Awful Golf-Course of Gamboogia." In fact, the mixture as before, but, so it seems, more ambrosial than ever. H. F.

SOCIETIES AND INSTITUTIONS

ACOUSTIC PROBLEMS

"The Influence of Acoustics on Architectural Design" was the title of a lecture delivered by Mr. Hope Bagenal at the Welsh School of Architecture on Wednesday last. Mr. W. S. Purchon, M.A., A.R.I.B.A., presided.

The lecturer dealt in a very illuminating manner with a variety of acoustical problems showing not only the very special need for care to be taken in the planning and arrangement of rooms used for acoustical purposes in the original design of the plans, but also laying stress on the great importance of careful consideration of the materials used, and emphasizing some of the difficulties which had arisen through the abandonment of traditional materials.

A design subject involving special acoustical requirements had previously been set to the students of the Welsh School of Architecture, and after the lecture Mr. Bagenal discussed each of the sketch designs submitted in detail with the students. On the following morning he gave a second lecture in which he dealt more particularly with the actual calculations.

TOWN PLANNING

An informal dinner of the Guildford Chapter of the South-Eastern Society of Architects was held recently at the Lion Hotel, Guildford. After the dinner a lecture was given by Mr. H. V. Lanchester, on "Town Planning."

The lecturer dealt with the various historical stages of town planning, laying special stress upon the importance of zoning, under which system districts could be expressly reserved for definite purposes. He pointed out how many of the muddles under which our towns now suffered had come about through residential districts being converted for business use without any forethought as to the consequent developments.

R.I.B.A. LONDON ARCHITECTURE MEDAL

The Council of the R.I.B.A. announce that the latest date for submission of forms for the London Street Architecture Medal is February 28, 1931. The award is made for a building completed during the three years ending December 31, 1930. The architect of the selected building will receive a bronze medal.

D

presented by the R.I.B.A., together with a diploma signed by the jury of assessors. A suitable tablet will be fixed to the chosen building. Forms of nomination are issued with the first two numbers of the *R.I.B.A. Journal* in each session.

R.I.B.A. ELECTION OF MEMBERS

At a recent meeting of the R.I.B.A., the following members were elected :

As Hon. Fellows (2).

Derby, The Rt. Hon. the Earl of, K.G., G.C.B., G.C.V.O.
MacDonald, The Rt. Hon. J. Ramsay, M.P.

As Hon. Associates (2).

Orpen, Major Sir W., R.A., R.I., R.O.I., LL.D.
Partridge, Sir B.

As Hon. Corresponding Member (1).

Kohn, R. D.

As Fellows (45).

Allison, W. B.
Archer, H. H.
Ballantyne, C. H.
Banks, P. H.
Berry, A. G.

EXHIBITION OF PRIZE DRAWINGS AT CARDIFF

The South Wales Institute of Architects, in conjunction with the Welsh School of Architecture, recently arranged an interesting series of exhibitions of architectural drawings at the Technical College, Cardiff.

The exhibition was divided into four sections, as follows :

1 : R.I.B.A. prize drawings, including the Tite prize, Soane medallion, measured drawings, Hunt bursary (one set) and the set of drawings with which Mr. J. B. Wride of the Welsh School of Architecture won the Rome scholarship, 1929.

2 : R.I.B.A. Testimonies of Study for the Intermediate Examination (three sets), and Final Examination (two sets).

3 : R.I.B.A. Exhibition of Working Drawings.

4 : South Wales Institute of Architects (Central Branch). Exhibition of members' working drawings.

TOWN-PLANNING INSTITUTE

Mr. F. W. Platt, in his presidential address at a meeting of the Town Planning Institute, held at Caxton Hall recently, said that they were now on the threshold of great activity under the Housing Act, 1930, and many local authorities had already taken action in the preparation of their work. The call for schemes for the re-development of both towns and villages, and indeed of many parts of the countryside, would become very insistent as lands now covered by houses and other buildings became cleared by operations under that Act.

Local authorities should seize the present as a valuable opportunity of considering their districts as a whole in consultation with parties interested, noting the potentialities, possibilities, and even the handicaps, and taking into account problems of vital importance to a district.

Consideration would be needed of the question of centralization as against decentralization, both in relation to its bearing on the prosperous town and the decaying town.

ARCHITECTS' AND BUILDERS' LUNCHEON

Under the auspices of the South-Eastern Society of Architects, in alliance with the R.I.B.A., Tunbridge Wells Chapter, and in conjunction with the Southern Counties Federation of Building Trades Employers, a luncheon was held at the Rose and Crown Hotel, Tonbridge.

Mr. J. E. Thom , who presided, said that that was the first occasion that he could recall in which they had joined in a gathering o that sort. The idea first of all came from Mr. Lovell.

Mr. Larkin (on behalf of the builders) said he was pleased that such a gathering had been possible, because if they took architects, builders and operatives, they were all one gr body working with the same idea. T y did not want confusion in their in stry, and the architect and the bui' ler had really much in common. On could not very well go on without the other. He thought that the better the architect, the better the builder. Speaking of the federated and unfederated builder, he thought that not all architects did all in their power to discriminate between the two. The unfederated builder was a source of trouble. The Federation spent a great amount of time in trying to stabilize the thing as much as was practicable. Against this, the unfederated builder said he was not going to have anything to do with it. He thought that the Federation would very much like it if architects would bear in mind that the federated builders were the people who had to bear the heat and the burden of the day. They had also had a good deal.

Mr. E. J. Strange proposed "The South-Eastern Society of Architects." He said that such gatherings were likely to be of advantage to them in material understanding. He thought that as the architects got to know the builders and *vice versa* it would tend to

make for better understanding of their duties and the possibilities in their business lives.

After Mr. Goulburn Lovell had spoken, an address was given by Mr. W. E. Watson on the report of the Building Industries Review.

TOWN PLANNING IN SCOTLAND

At the first meeting of the session of the Scottish branch of the Town Planning Institute, held in the Royal Technical College, Glasgow, a paper on "Town Planning of Built Areas: Twenty Years' Practical Experience," was delivered by Dr. W. H. McLean.

Sir William E. Whyte, O.B.E., who presided, remarked that it was his hope that the Scottish branch, as in England, would serve as the common meeting-ground between the technical and legal, official and unofficial, interests in this town planning.

Dr. McLean pointed out that owing to the lack of legislation it had not been possible to deal adequately with the built areas of towns, but it was understood that the demand for special legislation would soon be met, as all political parties appeared to be convinced of its necessity for public health and other reasons.

SECULAR ARCHITECTURE

A description of the secular architecture of Mediæval Italy was given by Sir Banister Fletcher, P.R.I.B.A., at the Central School of Arts and Crafts, London, on Wednesday last. He pointed out that the most interesting aspect of secular building activities was the picture it gave of the rise and growth of m ...ipalities, and the development of the communal idea.

MODERN DECORATION

Lecturing on "Modern Tendencies in Decoration," at a meeting of the Incorporated Institute of British Decorators, held in Manchester, Mr. Henry G. Dowling, F.I.B.D., said that there was a definite relationship between simplicity and good taste; simplicity was one of the great secrets of successful interior work, particularly as it applied to domestic decoration.

ARCHITECTURAL LIGHTING

The relationship of light to decoration was the subject of an address by Mr. R. Waldo Maitland, A.R.I.B.A., at a meeting of the South-Eastern Society of Architects, held at the School of Art, Maidstone.

The lecturer stated that in the movement towards architectural lighting we had something with great possibilities, and the fundamental idea of making lighting appliances an integral part of the architectural scheme was sound. In the many installations which conformed to the architectural lighting principle, we had already evidence that artificial lighting was attaining its true status as an art.

In architectural lighting, he said, we had a logical way of introducing artificial light, and although there were many people who were sceptical about this new outlook, he was convinced that, even with its limitations, it was a step in the right direction. Many critics of architectural lighting confined their criticism to the materials employed, but he felt that criticisms of this character did not in any way nullify the value of the principles involved.

The whole movement of architectural lighting was in its infancy, and its successful application was contingent upon the closest collaboration between the architect and the engineer.

ETCHING

At a recent meeting of the Birmingham Architectural Association, Mr. Harold H. Holden, Director of Art Education in Birmingham, delivered a lecture on etching. He demonstrated the various processes that were covered by the terms—dry-point, etching proper, aquatint and mezzotint—and by a series of slides showed the works of the great master etchers.

LAW REPORT

COST OF A HOUSE—DISPUTED AGREEMENT —OFFICIAL REFEREE AND COSTS

Lloyd v. *Oliver. Official Referee's Court. Before Sir Francis Newbolt, K.C.*

THIS was an action by Mr. Henry John Lloyd, of Bramshott Avenue, Charlton, against Mr. Geo. Oliver, of Brook Ambulance Station, Shooters Hill, to recover the sum of £1,000, being the balance alleged to be payable by the defendant for work done and materials supplied by the plaintiff in the course of the erection of a new house for the defendant at Shooters Hill Road, at 1s. 3½d. per cubic foot. Plaintiff's case was that he supplied 32,528 cubic feet, which amounted to £2,100. He had received £1,100 on account, and now sued for the remaining £1,000. Defendant by his defence alleged that the plaintiff agreed to erect the house and garage for a sum not to exceed £1,200. Defendant alleged breach of contract by plaintiff, and set up a counter-claim for damages. Plaintiff, in reply, denied that he ever agreed to build the house and garage for the sum alleged, and denied that he had committed any breach of the contract.

JUDGMENT

Sir Francis Newbolt, in delivering judgment, said in this case he did not intend to deliver more than a formal judgment, as the parties were satisfied with his decision on the preliminary point to the effect that, in a contract for building the house, no price had been agreed upon by the parties, and at the adjourned hearing the only question to be decided was a valuation of the building, but as the costs involved were large, and at the present moment, when economy in litigation was being much discussed, the facts and the procedure were of public interest, he thought he ought to draw attention to them. The Counsel in the case were concise and business-like men, even beyond the ordinary, and very helpful. Briefly, this was a dispute between two business men about a balance due, and had lasted for a year and involved the parties in expense exceeding in costs the sum due, when the case ought to have been disposed of in a few weeks for less than a quarter of this sum.

The plaintiff offered to build a house upon the defendant's plan with a small garage, and this was accepted. The plaintiff stated in evidence that his offer was to do the work at 1s. 3½d. per cubic foot. The defendant asserted that he did not agree to this, but stipulated that the price (based upon the plan and alleged specification) was not in any event to exceed £1,200. It appeared to Sir Francis to be clear that the price was not agreed, and he so decided. Both parties were wrong and must pay their own costs of that hearing. The plaintiff was therefore now entitled to be paid a reasonable price for his work, £1,100 having been paid on account. It was agreed between the parties that only one expert witness should be called on each side for valuation, and this, of course, saved a large sum in costs.

The plaintiff had issued a specially endorsed writ a year ago, and the matter was promptly and properly referred to the Official Referee. Two surveyors were employed to decide the cubic measurement, and that they agreed at 24,500 cubic feet. But the parties failed to instruct the surveyors to agree upon the *per se* price per cubic foot, or to refer the matter to an umpire in case of dispute. But in Sir Francis's opinion, the cheaper and better course would have been to have appointed the Official Referee to be arbitrator, and the decision would obviously have been the same as now reached ten months later, with a clear saving in costs of £300 or £400. The case, however, dragged on. Finally, the adjourned trial, to decide the valuation, took place on October 30, and raised two very important questions. The first was

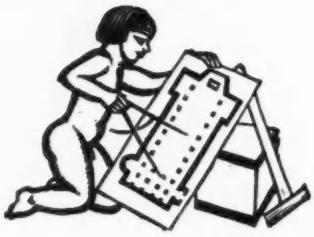
this : A judge or legal arbitrator could and must decide upon a disputed value on evidence, whether expert or otherwise, and where there was a conflict he must, as a rule, prefer one witness to another, but where two experts appeared to be equally competent and careful and yet diverged so greatly that one or both of them must be extravagantly wrong, it was extremely difficult for the Court to arrive at a figure which was even approximately right. Avoiding all detail, the plaintiff's surveyor said that the total value was £1,811. The defendant's surveyor put the figure at £1,108. He had to decide between these two.

The second point was little known to the public and generally misunderstood by parties who came before him in building cases, viz., the question of payment into Court. The defendant who owed something less than the claim was generally advised to pay money into Court. If he paid into Court sufficient, he escaped all the costs of the trial, which the plaintiff then had to pay. The amount he paid in depended in many cases upon the advice of his surveyor. In his (Sir Francis) ten years' experience, the amount advised was an insufficient payment. Here the defendant had paid £1,100 on account and had paid into Court a further payment of £150, with his defence and counter-claim.

After careful consideration and perusal of the evidence, and bearing in mind all the defendant's complaints and particulars and the plaintiff's claim for extras, Sir Francis put the valuation at £1,500, of which £1,100 had been paid. There would be judgment for the plaintiff on the claim and counter-claim for £400. The plaintiff's costs must be taxed and the defendant must pay three-quarters of the amount allowed on taxation, but the costs for the preliminary issue and trial were to be excluded as already stated.

The £150 in Court was to be paid out to the plaintiff on account of the £400 mentioned.

COMPETITIONS OPEN



November 30.—The Guildford Cathedral Committee invite any architect, who has been engaged in the design of cathedrals or churches, to submit for examination drawings and other illustrations of his works; or a design for a cathedral. Not more than three sets of drawings may be submitted, packed in one large portfolio. Portfolios should be addressed to The Venerable the Archdeacon of Surrey, The Diocesan Office, Lloyds Bank Chambers, Guildford, not later than November 30.

November 30.—The Burton-on-Trent Local Education Authority invite architects to submit competitive designs for a proposed new Council school to be erected on a site in Clarence Street. Applications for the conditions of the competition and site plan should have been made before September 8 to L. E. Burgess, Secretary and Director of Education, Education Offices, Guild Street, Burton-on-Trent. Latest date for submission of designs : November 30.

December 6.—The Bermondsey B.C. invites competitive designs for a proposed new medical clinic in Tower Bridge Road, S.E. The assessors will comprise representatives of the L.C.C., Ministry of Health and the Bermondsey B.C. Premiums : £250, £150 and £50 for first, second and third place, respectively. Applications for the conditions of the competition and site plan should be made to E. Goff Clark, Town Clerk, Town Hall, Spa Road, Bermondsey, S.E.16, by December 6. Deposit £2. Latest date for submission of designs : January 10, 1931.

December 25.—A prospectus giving full particulars of the international competition for the Ukrainian State Theatre, organized by the Kharkov Town Council, Russia, has recently been issued. The theatre is to be erected in the centre of Kharkov, on the site of the present Comsomolskv Square (Young Communist Square), and will contain a mas musical stage, and seating capacity for 4,000 persons. The competition will be assessed by a jury comprising a president, vice-president and fifty-six members. Prizes : 1st, 10,000 rub.; 2nd, 8,000 rub.; 3rd, 6,000 rub.; 4th, 5,000 rub.; 5th, 4,000 rub.; 6th, 3,000 rub.; 7th, 8th and 9th, 2,000 rub.; 10th, 11th, 12th, 1,500 rub. Drawings should be sent to the Kharkov Town Council on or before December 25. Copies of the prospectus are obtainable from the Embassy of the Union of Soviet Socialist Republics, Harrington House, 13 Kensington Palace Gardens, London, W.8.

SUBSCRIPTION FORM

Please send me "The Architects' Journal" each week for twelve months for £1 3s. 10d. beginning

or

Please continue to send me "The Architects' Journal" for a further period of twelve months

THE ARCHITECTS' JOURNAL

December 31.—The Incorporated Association of Architects and Surveyors invites competitive designs for a Model Petrol Filling and Service Depot. Assessors: Alfred Stephens Cross, M.A. (CANTAB.), V-P., I.A.A.S.; Edward H. Fryer, Deputy Secretary of the Automobile Association; and Walter Groves, Editor of *The Motor*. Prizes: 50 guineas, 20 guineas and 10 guineas for first, second and third places, respectively. Smaller awards may also be made on the advice of the assessors, and at the discretion of the Council of the Association. In addition a prize of 10 guineas and two prizes of 5 guineas each will be awarded to laymen for the best suggestions submitted with or without sketches. Full particulars, etc., are obtainable from the Secretary, the Incorporated Association of Architects and Surveyors, 1 Wilbraham Place, London, S.W.1. Latest date for submission of designs: December 31, 1930.

February 1.—The Norwich Corporation invites architects practising in the County of Norfolk to submit competitive designs for a proposed new fire station to be erected on a site in Bethel Street, Norwich. Conditions of the competition are obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. Deposit, £1 1s. Latest date for submission of designs: February 1, 1931.

No date.—The Committee of the Foundation Hospital and the Rectorate of the Royal Yugoslavian University of Zagreb invites competitive designs for the general rebuilding plans of the Foundation and Clinic Hospital of Zagreb. Assessors: 1. Dr. Srkulj Stjepan, Burgomaster and Chairman of the Foundation, as president of the jury. 2. Henauer, W., architect, of Zurich (or his representative, Ch. Thevenaz, architect, of Lausanne), for the Swiss Engineers' Association of Germany. 3. Dr. Ing. Kreis Wilhelm, of Dresden, for the Engineers' Association of France. 4. Arch. Expert H.R., of Paris, for the Engineers' and Architects' Association of France. 5. Dr. Culumovic Pavao, Primarius, for the Medical Association of Zagreb. 6. Ing. Gabric Franjo, for the Yugoslavian Association of Engineers and Architects, Zagreb section. 7. Dr. Rasuhin Josip, deputy for the Directors of the Institute of Hygiene Foundation Hospital of Zagreb. 8. Prof. Dr. Prasek Emil, for the medical faculty of Zagreb. 9. Dr. Durst Franjo, for the medical faculty of Zagreb. 10. Arch. Heinzel Vjekoslav, Alderman of the City of Zagreb. Committee representative of the jury: Ing. Jurkovic Mato, Stadtbaurat in Zagreb. Prizes: 1st, 20,000 Swiss francs; 2nd, 15,000 Swiss francs; 3rd, 10,000 Swiss francs. 15,000 Swiss francs have been set aside for any further work which may be required. Programme and particulars of the competition will be sent on or after August 15, 1930, on application to the Stadtvorstand of Zagreb (Mr. Matica, secretary), Room No. 70, 2nd floor, on payment of 200 dinar. Latest date for submission of designs: January 15, 1931.

No date.—An international competition for the development of the uses of aluminium and its alloys, open to inventors of any nationality, is to be held annually by the International Aluminium Bureau. The competition will be divided into two sections. All proposals will be allocated to the appropriate section by an adjudicating committee comprised of five members. The prizes to be awarded are 25,000 French francs for the entries under Sections A (methods of working or using the metal) and B (manufacture of articles therefrom) respectively, and 50,000 French francs to the author of a suggestion which has exceptional interest or value under either section. Entries may be submitted between January 1 and April 1, 1931. Further particulars are obtainable from the British Aluminium Co., Ltd., Adelaide House, London, E.C.4.

THE ARCHITECTS' DIARY

WEDNESDAY, NOVEMBER 26

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Finance and House Committee. Intermediate Examination. Until November 27.

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Exhibition of Members' Holiday Sketches. Until November 27. Exhibition of photographs of buildings visited on the A.A. Excursion to Sweden and Denmark. Until December 20.

ARCHITECTURE CLUB. Eighteenth Annual Dinner, to be held at the Savoy Hotel, Strand, W.C.2. Topic: "London of the Future." R. Holland-Martin will preside. 7.15 for 7.30 p.m. **7.15 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "French Mediæval Architecture: The Romanesque Period." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

SHEFFIELD, SOUTH YORKSHIRE AND DISTRICT SOCIETY OF ARCHITECTS AND SURVEYORS. At the University, Sheffield. "Maltese Architecture." By Professor L. P. Abercrombie, M.A., F.R.I.B.A. (Tea, 5.30 p.m.) **6.15 p.m.**

GEFFRYE MUSEUM, Kingsland Road, Shoreditch, E.2. "Old English Furniture and the Men Who Made It." By Ingleson C. Goodison. **7.30 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "The Æsthetic Side of Structural and Constructional Engineering." By Howard Robertson, F.R.I.B.A. South Wales and Monmouthshire Branch. Visit to works of Braithwaite & Co. (Engineers), Ltd., Newport. **6.30 p.m.**

OBITUARY

TAYLOR SCOTT : 1860–1930

BY the sudden death of Mr. Taylor Scott, F.R.I.B.A., of Carlisle, Cumberland has lost one of its oldest and best-known architects.

He was articled to the late Mr. Crosby Hetherington, of Carlisle, and thereafter had valuable experience in London, particularly in respect of light, air, and party-wall cases, but he was chiefly interested in Gothic work. He was a recipient, in 1882, of the R.I.B.A. Silver Medal and prize for measured drawings.

Mr. Crosby was elected an Associate of the R.I.B.A. in 1882, and commenced private practice in 1883.

He was one of the founders of the Cumberland branch of the Northern Architectural Association and took great interest in the work of the branch, serving as chairman, 1927–29, and acting continuously as a member of the Council of the Northern Architectural Association.

His work, as is so often the case with provincial architects, was of a most varied character, and included church buildings, schools, factories, business premises, mills and houses.

At one time he interested himself in the breeding of hunters, which he exhibited with success at shows held in different parts of the country. He was a life member of the Royal Agricultural Society.

[*We have received the following appreciation from Mr. C. McArthur Butler.*]

I am sorry to hear of the death of T. Taylor Scott. I was a junior assistant in his office forty years ago and I owe a great deal to his example, as it was there I learnt to work hard, and I never lost the habit.

I am glad to say that we kept up in personal friendship to the end, and on our too rare meetings in Carlisle and London he was always so pleased to see me and talk over matters of mutual interest.

Pardon my troubling you, but I would like to associate myself with any expression of appreciation and sympathy put forward by his professional brethren in the district.

C. MCARTHUR BUTLER,
Sec. R.I.B.A. Reg. Committee

THOMAS MALVERN : 1863–1930

The death has occurred, after a short illness, of Mr. Thomas Malvern, L.R.I.B.A., of Cheltenham. He was a son of the late Mr. Charles Malvern, and was educated privately. Mr. Malvern practised for more than thirty years as an architect in Cheltenham. He was architect to the Board of Guardians, for whom he carried out much work; and in recent years he had been engaged on several of the Cheltenham Corporation's big housing schemes, and responsible for quite a number of large houses and shops in the Cheltenham district. Mr. Malvern was a Fellow of the Gloucestershire Architectural Association and the Wessex Society of Artists.

A. E. LLOYD-OSWELL : 1850–1930

We regret to record the death of Mr. Arthur Edward Lloyd-Oswell, a well-known Shropshire architect and diocesan surveyor for the dioceses of Lichfield and Hereford.

Mr. Lloyd-Oswell, who was in his eighty-first year, was responsible for the building of several churches and public buildings in Shrewsbury and Shropshire.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Plans passed by the BEXLEY U.D.C.: Two houses, Menin Road, Welling, for Derrick Construction Co.; four houses, Broomfield Road, for Messrs. James and Norman; house, Danson Road, for Mr. A. D. Beaven; two houses, Westwood Lane, Welling, for Messrs. Strickland and Lyons; house, Danson Road, Bexley Heath, for Mr. B. Mitchell; four houses, Bethel Road, Welling, for Mr. C. H. Evans; house, Dartford Road, Bexley, for Mr. K. Dalgleish; four houses, Church Road, Bexley Heath, for Mr E. A. Davey; new road and sixteen houses off Honiton Road, Welling, for Mr. W. Norman; house, Upton Road, Bexley Heath, for Messrs. Connell and Seeley; four houses, Queen's Road, Welling, for Messrs. Peck and Flowers; ten shops, Upper Wickham Lane, Welling, for Mrs. Lewis; thirty-six bungalows, Pickford Lane, Long Lane and New Road, for Mr. D. C. Bowyer; club premises, Bank's Lane, Bexley Heath, for the Bexley Heath branch of the British Legion.

The General Purposes Committee, at a recent meeting of the CARSHALTON U.D.C., reported that they had considered the question of the layout of the Avenue Road improvement, especially regarding the land to be included in the scheme for re-housing, and had directed the surveyor to prepare a revised layout.

Plans have been approved for alterations at the "Victoria" public-house, 757 Woolwich Road, CHARLTON.

Plans have been submitted for alterations to the Palace, Broadway, CRICKLEWOOD, N.W.2.

Tenders are to be invited immediately for the rebuilding of the GREENWICH Hippodrome as a super-kinema. The architect is George Coles, F.R.I.B.A., and the scheme will cost about £30,000.

Plans have been approved for alterations at the "Ironfounders' Arms" public-house, Norman Road, and at the "Rose and Crown" public-house, Crooms Hill, GREENWICH.

At a special meeting of the HACKNEY B.C. it was resolved to apply in the present session of Parliament for a Bill *a*: To empower the Council to extend the Town Hall and, on lands to be acquired compulsorily for the purpose, to erect a town hall, council chamber, municipal offices, public halls and other buildings and premises for carrying on the business and the several undertakings of the Council; *b*: to empower the Council to execute street works on lands to be acquired compulsorily, including the widening of Reading Lane and the diversion of part of Hackney Grove; *c*: to empower the Council to borrow moneys for and in connection with the foregoing and other purposes of the intended Act; *d*: to amend the provisions relating to the granting of superannuation allowances to the officers and servants of the Council; and *e*: to provide for the transfer to and maintenance by the Council of the Hackney Old Church Tower as an ancient monument.

The London Education Committee is recommended to carry out extensions and improvements at the London School of Printing and Allied Trades, LAMBETH, at an estimated cost of £33,250.

The Imperial War Museum is to be removed from its present quarters at the Imperial Institute to the old buildings of the Royal Hospital of Bethlem, LAMBETH. The idea is to demolish the wings and to house the Museum in a portion of the central block.

The London Chamber of Commerce has asked the Ministry of Transport, the Port of London Authority, and the L.C.C. to co-operate in reconstructing the swing bridge over the MILLWALL Dock entrance.

Alterations are to be carried out to the "Amersham Arms" public-house, New Cross Road, NEW CROSS.

Plans have been submitted by a firm of architects for the erection of the British Studio, claimed to be the biggest in the world, within thirty-five minutes from Piccadilly Circus. The studio is planned to be built on a site of 160 acres of land, which has already been acquired and is being cleared. It is to cost £150,000.

Plans are being prepared by Cecil Masey, F.R.I.B.A., for a new theatre to be erected on the site of the PLUMSTEAD Cinema. Accommodation will be provided for 2,500 persons.

The WILLESDEN Education Committee is to provide accommodation for about 400 children on a site adjoining Braincroft Council school.

MIDLAND COUNTIES

The BAKEWELL (Derbyshire) R.D.C. has instructed the engineers to negotiate for land for a reservoir to augment the Stoke Flat water-supply scheme. The estimated cost is £18,000.

The DERBY Town Council is to be asked to agree to part of Markeaton Hall being converted into flats.

The DERBY Education Committee is to submit plans to the Board of Education for a new secondary school at Normanton. The school will accommodate 600 girls.

Plans passed by the NORTHAMPTON R.D.C.: Two houses, Weston Way, Weston Favell, for Mr. H. P. Cross; two houses, Park Way, Weston Favell, for Messrs. Stafford and Agutter; two houses, Weston Way, Weston Favell, for Mr. H. W. Richardson; house, Mill Lane, Kislingbury, for Messrs. S. G. Sale & Co.; house, Millway, Duston, for Mr. H. Stanford; house, Overstone Road, for Mrs. J. G. Shipman.

Notice has been given by the NOTTINGHAM Education Committee of the decision to build a new central school to accommodate 520 girls, on the Rosehill Farm site.

EASTERN COUNTIES

At a recent parish meeting at BLACK NOTLEY, it was decided to ask the Rural Council to provide twenty-five houses in the parish.

The SPALDING U.D.C. has sold four acres of land off the West Marsh Road, on the outskirts of the town, for the purpose of a canning factory, which is to be erected by the Wisbech Produce Canners, Ltd.

NORTHERN COUNTIES

At a meeting of the BRADFORD Street Improvement and Buildings Committee a number of proposals to purchase land for the making of the new inner ring road were approved. About ninety plans for new buildings contained instances of proposed extensions to mills.

The Marquis of Crewe, on learning that the CHESHIRE County Council is considering the provision of central buildings and offices for all the officials of the county, at an estimated cost of £160,000, has intimated his willingness to present Crewe Hall for the purpose. The value of the gift is estimated at over £250,000.

The COLWYN BAY Council is to consider the purchase of Bryn Euryn Hill, a quarry, twenty acres of woodland, and the ruins of a mediæval palace, for £5,000.

The Ministry of Labour has prepared plans for a suite of offices to be erected at CREWE. A site has been purchased from the L.M.S. at a cost of £3,000, and the building will involve over £8,000.

A Bill for the construction of a new dock and other extensive improvements at FLEETWOOD is to be promoted in the present Parliamentary session by the L. M. and S. Railway Company. The plans represent gigantic extensions to the Lancashire port which will involve an expenditure of approximately £750,000.

Tenders are invited for the erection of the superstructure of the new Langham Theatre to be built in Hessle Road, HULL, for Picture Playhouses, Ltd. The theatre will accommodate 2,697 persons.

The Dearne Valley Water Board has decided to construct, at Roebuck Hill, JUMP, a new service reservoir, with a holding capacity of 1,000,000 gallons, subject to the approval of the Ministry of Health. The scheme is estimated to cost £7,732.

Included in the building programme of the LANCASHIRE Higher Education Sub-committee for next year is a new training college at Ormskirk, extensions to Eccles Secondary School, Farnworth Grammar School, Radcliffe Technical School. Plans and estimates have also been approved for the following new senior elementary schools at: Westhoughton, £37,045; Little Lever, £13,010; and Ormskirk, £30,053.

The MYTHOLMROYD U.D.C. has rejected a proposal that they should oppose the building of a £30,000 new middle school in that district.

The SOUTHPORT T.C. has approved schemes for the remodelling of the North Marine Gardens and the building of a floral hall there, at an estimated cost of £20,000, and for an ornamental bridge over the Marine Lake leading to Princes Park, also at an estimated cost of £20,000.

The WELLINGTON R.D.C. has decided to erect fifty additional houses in various parts of the district. Thirty houses are to be erected at Hadley, at a cost of £10,470; eight houses at Rodington, at a cost of £3,032; four at Longdon, at £1,500; four at High Ercall, at £1,506; and a similar number at Sherlowe, at £1,500.

A new factory is to be erected at WEST HARTLEPOOL for the manufacture of barium products.

SCOTLAND

A large site has been acquired in High Street, FORT WILLIAM, for the erection of a super-talkie theatre.

Plans for the erection of four new schools for GLASGOW, estimated to cost together almost a quarter of a million pounds, have been passed by the Dean of Guild Court. The situation of the four schools and their estimated cost is as follows: Buckley Street, Parkhouse, Possill, £23,000; Balmore Road, Lambhill, £66,000; Pollokshaws Road, £80,000; Knightswood Road, £60,000. Other plans passed include: Cinema, Warriston Street and Cumbernauld Road, for Mr. William H. Martin; cinema, Cumbernauld Road, for Mr. George V. Scott; seventy-two houses of two apartments and seventy-eight houses of three apartments, Whitelaw Street scheme; 138 houses of three apartments; forty-four houses of four apartments, and two houses of five apartments, Knightswood; eight houses of four apartments, Moss Road, Drumoyne; alterations, Knightswood Hospital.

The KIRKINTILLOCH T.C. has passed plans for the erection of forty-four houses on the Woodhead estate, recently purchased by them. Of these, twenty-eight are to be of three apartments and sixteen of four apartments. The cost is estimated at £18,800.

The MIDLOTHIAN County Council has agreed to spend approximately £11,000 on the widening of the Telford Bridge, on the main road to Peebles.

A meeting to arouse local interest in the proposed Forth Road bridge was held in Bo'ness Town Hall recently. Councillor A. Gilzean said that he believed the £2,000,000 spent on the new Edinburgh-Glasgow road would be wasted money unless the proposed road bridge across the Forth at SOUTH QUEENSFERRY became a reality. At the conclusion a resolution in favour of the proposed new bridge was passed.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

• In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given

The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour ;* NAVVY, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour ;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0

Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.
Transport hire per day :

Cart and horse	£1	3	0	*Trailer*	£0	15	0
3-ton motor lorry	3	15	0	*Steam roller*	4	5	0
Steam lorry, 5-ton	4	0	0	*Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0	1	6
SPREAD and level, including wheeling, per yd.	0	1	6
FILLING into carts and carting away to a shoot or deposit, per yd. cube	0	10	6
TRIMMING earth to slopes, per yd. sup.	0	0	6
HACKING up old grano. or similar paving, per yd. sup.	0	1	3
PLANKING to excavations, per ft. sup.	0	0	5
DO. over 10 ft. deep, add, for each 5 ft. in depth, 30 per cent.			
IF left in, add to above prices, per ft. cube	0	2	0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup.	0	2	1
DO. 6 in. thick, per yd. sup.	0	2	10
PUDDLING, per yd. cube	1	10	0
CEMENT CONCRETE, 4-2-1, per yd. cube	1	17	6
DO. 6-2-1, per yd. cube	1	12	6
DO. in upper floors, add 15 per cent.			
DO. in reinforced-concrete work, add 20 per cent.			
DO. in underpinning, add 60 per cent.			
LIAS-LIME CONCRETE, per yd. cube	£1	14	0
BREEZE CONCRETE, per yd. cube	1	7	0
DO. in lintels, etc., per ft. cube	0	1	6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube	0	3	9
FINE concrete benching to bottom of manholes, per ft. cube	0	3	0
FINISHING surface of concrete spade face, per yd. sup.	0	0	9

DRAINER

LABOURER, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* BRICKLAYER, 1s. 8½d. *per hour ;* PLUMBER, 1s. 8½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. *6 in., per ft.*	0	1	3
DO. *9 in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. *6 in., per yd.*	0	8	0
Portland cement and sand, see " Excavator " above.			
Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft. 0 4 3
DO. 6 in., per ft. 0 5 0
DO. 9 in., per ft. 0 7 9

CAST-IRON DRAINS, jointed in lead, 4 in., per ft.	0	8	3
DO. 6 in., per ft.	0	10	3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1s. 8½d. *per hour ;* LABOURER, 1s. 3½d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
Midhurst white facing bricks, per M.	5	0	0
Multi-coloured facings, per M.	7	7	9
Best red facings, per M.	7	7	9
Rubbers, 9½ in., per M.	12	0	6
Staffordshire blue, per M.	9	5	0
Firebricks, 2½ in., per M.	9	5	0
Glazed salt, white, and ivory stretchers, per M.	21	10	0
DO. *headers, per M.*	20	10	0
Colours, extra, per M.	5	10	0
Seconds, less, per M.	1	0	0
Cement and sand, see " Excavator " above.			
Lime, grey stone, per ton	£2	11	6
Mixed lime mortar, per yd.	1	6	0
Dampcourse, in rolls of 4½ in., per roll	0	2	6
DO. *9 in., per roll*	0	4	9
DO. *14 in., per roll*	0	7	6
DO. *18 in., per roll*	0	9	6
BRICKWORK in stone lime mortar, Flettons, or equal, per rod	30	0	0
DO. in cement do., per rod	32	10	0
DO. in stocks, add 25 per cent. per rod.			
DO. in blues, add 100 per cent. per rod.			
DO. circular on plan, add 12½ per cent. per rod.			
DO. in backing to masonry, add 12½ per cent. per rod.			
DO. in raising on old walls, etc., add 12½ per cent. per rod.			
DO. in underpinning, add 20 per cent. per rod.			
HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS, fair, per ft. sup. extra	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra	0	0	10
WEATHER pointing, do. do.	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup.	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities, in finishing to steps, etc., per ft. sup.	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup.	0	11	0
SLATE DAMP COURSE, per ft. sup.	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ⅜ in., per yd.	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup.	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each	0	0	3

MASON

MASON, 1s. 8½d. *per hour ;* DO. *fixer,* 1s. 9½d. *per hour ;* LABOURER, 1s. 3½d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour.*

Portland Stone :			
Whitbed, per ft. cube	£0	4	6
Basebed, per ft. cube	0	4	9
Bath stone, per ft. cube	0	3	0
Usual trade extras for large blocks.			
York paving, av. 2½ in., per yd. super	0	11	0
York templates, sawn, per ft. cube	0	7	6
Slate shelves, rubbed, 1 in., per ft. sup.	0	2	6
Cement and sand, see " Excavator," etc., above.			
HOISTING and setting stone, per ft. cube	£0	2	2
DO. for every 10 ft. above 30 ft. add 15 per cent.			
PLAIN face Portland basis, per ft. sup.	£0	2	8
DO. circular, per ft. sup.	0	4	0
SUNK FACE, per ft. sup.	0	3	9
DO. circular, per ft. sup.	0	4	10
JOINTS, arch, per ft. sup.	0	2	6
DO. sunk, per ft. sup.	0	2	7
DO. DO. circular, per ft. sup.	0	4	6
CIRCULAR-CIRCULAR work, per ft. sup.	1	2	0
PLAIN MOULDING, straight, per inch of girth, per ft. run	0	1	1
DO. circular, do., per ft. run	0	1	4
HALF SAWING, per ft. sup.	0	1	0
Add to the foregoing prices, if in York stone 35 per cent.			
DO. Mansfield, 12½ per cent.			
Deduct for Bath, 33⅓ per cent.			
DO. for Chilmark, 5 per cent.			
SETTING 1 in. slate shelving in cement, per ft. sup.	£0	0	6
RUBBED round nosing to do., per ft. lin.	£0	0	6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1	7	6
YORK SILLS, W. & T., ft. cub. fixed	1	10	0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0	1	3
DO. 2½ in. thick, per ft. sup.	0	1	6

SLATER AND TILER

SLATER 1s. 8½d. *per hour ;* TILER, 1s. 8½d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour ;* LABOURER, 1s. 3½d. *per hour.*
N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200 :

	Med. Grey	*Med. Green*
Portmadoc Ladies		£14 0 0
Countess		23 0 0
Duchess		32 10 0
Old Delabole	*Med. Grey*	*Med. Green*
24 in. × 12 in.	£42 11 3	£45 1 0
20 in. × 10 in.	31 4 3	33 0 6
16 in. × 10 in.	20 18 0	22 4 9
14 in. × 8 in.	12 1 0	12 16 3

Green Randoms, per ton	8	3	9
Grey-green do., per ton	7	3	9
Green peggies, 12 in. to 8 in. long, per ton	5	13	9

In 4-ton truck loads, delivered Nine Elms station.

Clips, lead, per lb.	£0	0	6
Clips, copper, per lb.	0	2	0
Nails, compo, per cwt.	1	6	0
Nails, copper, per lb.	0	2	2
Cement and sand, see " Excavator," etc., above.			
Hand-made tiles, per M.	£5	18	0
Machine-made tiles, per M.	5	8	0
Westmorland slates, large, per ton	9	0	0
DO. *Peggies, per ton*	7	5	0

SLATING, 3 in. lap, compo nails, Portmadoc or equal :

Ladies, per square	£4	0	0
Countess, per square	4	5	0
Duchess, per square	4	10	0
WESTMORLAND, in diminishing courses, per square	6	5	0
CORNISH DO., per square	6	3	0
Add, if vertical, per square approx.	0	13	0
Add, if with copper nails, per square approx.	0	2	6
Double course at eaves, per ft. approx.	0	1	0

SLATING with Old Delabole slates to a 3 in. lap with copper nails, at per square.

	Med. Grey	*Med. Green*
24 in. × 12 in.	£5 0 0	£5 2 0
20 in. × 10 in.	5 5 0	5 10 0
16 in. × 10 in.	4 15 0	5 1 0
14 in. × 8 in.	4 10 0	4 15 0
Green randoms	6	7 0
Grey-green do.	5	9 0
Green peggies, 12 in. to 8 in. long	4	13 6

TILING, 4 in. gauge, every 4th course nailed, in hand-made tiles, average per square	3	17	6
DO., machine-made do., per square	3	7	6
Vertical Tiling, including pointing, add 18s. 0d. per square.			
FIXING lead soakers, per dozen	£0	0	10
STRIPPING old slates and stacking for re-use, and clearing away surplus and rubbish, per square	0	10	0
LABOUR only in laying slates, but including nails, per square	1	0	0

See " Sundries " for Asbestos Tiling.

CARPENTER AND JOINER

CARPENTER, 1s. 8½d. *per hour ;* JOINER, 1s. 8½d. *per hour ;* LABOURER, 1s. 3½d. *per hour.*

Timber, average prices at Docks, London Standard, Scandinavian, etc. (equal to 2nds) :

7 × 3, per std.	£22	0	0
11 × 4, per std.	30	0	0
Memel or Equal. Slightly less than foregoing.			
Flooring, P.E., 1 in., per sq.	£1	4	6
DO., *T. and G., 1 in., per sq.*	1	4	6
Planed boards, 1 in. × 11 in., per std.	30	0	0

Mahogany, Honduras, per ft. sup. of 1in.	0	1	4
DO., *Cuba, per ft. sup. of 1 in.*	0	2	6
DO., *African, per ft. sup.*	0	1	3
Teak, per ft. sup. of 1 in.	0	1	2
DO., *ft. cube*	0	14	0
FIR fixed in wall plates, lintels, sleepers, etc., per ft. cube	0	4	6
DO. framed in floors, roofs, etc., per ft. cube	0	4	6
DO. framed in trusses, etc., including ironwork, per ft. cube	0	8	6
PITCH PINE, add 33⅓ per cent.			
FIXING only boarding in floors, roofs, etc., per sq.	0	13	6
SARKING FELT laid, 1-ply, per yd.	0	1	6
DO., 3-ply, per yd.	0	1	9
CENTERING for concrete, etc., including horsing and striking, per sq.	2	0	0
TURNING pieces to flat or segmental soffits, 4½ in. wide, per ft. run	0	0	4½
DO. 9 in. wide and over, per ft. sup.	0	1	2

[continued overleaf

CARPENTER AND JOINER: *continued*

SHUTTERING to face of concrete, per square	£1	10	0
DO. in narrow widths to beams, etc., per ft. sup.	0	0	6
USE and waste of timbers, allow 25 per cent. of above prices.			
SLATE BATTENING, per sq.	£0	12	6
DEAL boarding to flats, 1 in. thick and firrings to falls, per square	2	10	0
STOUT feather-edged tilting fillet to eaves, per ft. run	0	0	6
FEATHER-edged springer to trimmer arches, per ft. run	0	0	4
STOUT herringbone strutting (joists measured in), per ft. run	0	0	6
SOUND boarding, ⅞ in. thick and fillets nailed to sides of joists (joists measured over), per square	2	0	0
RUBEROID or similar quality roofing, one-ply, per yd. sup.	0	2	3
DO., two-ply, per yd. sup.	0	2	6
DO., three-ply, per yd. sup.	0	3	0
TONGUED and grooved flooring, 1½ in. thick, laid complete with splayed headings, per square	2	5	0
DEAL skirting torus, moulded, 1½ in. thick, including grounds and backings, per ft. sup.	0	1	0
TONGUED and mitred angles to do.	0	0	6
WOOD block flooring, standard blocks laid herringbone in mastic:			
Deal 1 in. thick, per yd. sup.	0	10	0
DO. 1¼ in. thick, per yd. sup.	0	12	0
Maple 1¼ in. thick, per yd. sup.	0	15	0
DEAL moulded sashes, 1¼ in., with moulded bars in small squares, per ft. sup.	0	2	6
DO. 2 in. do., per ft. sup.	0	2	9
DEAL cased frames, oak sills and 2 in. moulded sashes, brass-faced pulleys and iron weights, per ft. sup.	0	4	6
MOULDED horns, extra, each	0	0	3
DOORS, 4-panel square both sides, 1¼ in. thick, per ft. sup.	0	2	6
DO. moulded both sides, per ft. sup.	0	2	9
DO. 2 in. thick, square both sides, per ft. sup.	0	2	9
DO. moulded both sides, per ft. sup.	0	3	0
DO. in 3 panels, moulded both sides, upper panel with diminished stiles with moulded bars for glass, per ft. sup.	0	3	6
If in oak, mahogany, or teak, multiply 3 times.			
DEAL frames, 4 in. × 3 in., rebated and beaded, per ft. cube	£0	15	0
Add for extra labour, per ft. run	0	0	1
STAIRCASE work:			
DEAL treads 1¼ in. and risers 1 in., tongued and grooved, including fir carriages, per ft. sup.	0	2	6
DEAL wall strings, 1¼ in. thick, moulded, per ft. run	0	2	0
If ramped, per ft. run	0	4	6
SHORT ramps, extra, each	0	7	6
ENDS of treads and risers housed to strings, each	0	1	0
2 in. deal mopstick handrail fixed to brackets, per ft. run	0	1	6
4½ in. × 3 in. oak fully moulded handrail, per ft. run	0	5	6
1½ in. square deal bar balusters, framed in, per ft. run	0	0	6
FITTINGS:			
SHELVES and bearers, 1 in., cross-tongued, per ft. sup.	0	1	6
1¼ in. beaded cupboard fronts, moulded and square, per ft. sup.	0	2	9
TEAK grooved draining boards 1¼ in. thick, and bedding, per ft. sup.	0	4	6
IRONMONGERY:			
Fixing only (including providing screws):			
TO DEAL—			
Hinges to sashes, per pair	0	1	2
Do. to doors, per pair	0	1	7
Barrel bolts, 9 in., iron, each	0	1	0
Sash fasteners, each	0	1	0
Rim locks, each	0	1	9
Mortice locks, each	0	4	0

SMITH

SMITH, *weekly rate equals* 1*s.* 8½*d. per hour*; MATE, *do.*, 1*s.* 3½*d. per hour*; ERECTOR, 1*s.* 8½*d. per hour*; FITTER, 1*s.* 8½*d. per hour*; LABOURER, 1*s.* 3½*d. per hour.*

Mild Steel in British standard sections, per ton	£12	10	0
Sheet Steel:			
Flat sheets, black, per ton	17	0	0
DO., *galvd., per ton*	18	0	0
Corrugated sheets, galvd., per ton	17	10	0
Driving screws, galvd., per grs.	0	1	10
Washers, galvd., per grs.	0	1	1
Bolts and nuts per cwt. and up	1	18	0
MILD STEEL in trusses, etc., erected, per ton	25	0	0
DO., in small sections as reinforcement, per ton	16	0	0
DO., in compounds, per ton	17	0	0
DO., in bar or rod reinforcement, per ton	22	10	0
WROT-IRON in chimney bars, etc., including building in, per cwt.	2	0	0
DO., in light railings and balusters, per cwt.	2	5	0
FIXING only corrugated sheeting, including washers and driving screws, per yd.	0	2	0

PLUMBER

PLUMBER, 1*s.* 9*d. per hour*; MATE OR LABOURER, 1*s.* 4*d. per hour.*

Lead, milled sheet, per cwt.	£1	5	0
DO. *drawn pipes, per cwt.*	1	5	6
DO. *soil pipe, per cwt.*	1	8	6
DO. *scrap, per cwt.*	0	14	0
Copper, sheet, per lb.	0	1	0
Solder, plumber's, per lb.	0	1	0
DO *fine, per lb.*	0	1	6
Cast-iron pipes, etc.:			
L.C.C. soil, 3 in. per yd.	0	3	0
DO. *4 in., per yd.*	0	3	8
R.W.P., 2½ in., per yd.	0	1	5
DO. *3 in., per yd.*	0	1	8
DO. *4 in., per yd.*	0	2	5
Gutter, 4 in. H.R., per yd.	0	0	11
DO. *4 in. O.G., per yd.*	0	1	2½
MILLED LEAD and labour in gutters, flashings, etc., per cwt.	2	6	0
LEAD PIPE, fixed, including running joints, bends, and tacks, ½ in., per ft.	0	1	8
DO. ⅝ in., per ft.	0	1	10
DO. 1 in., per ft.	0	2	6
DO. 1¼ in., per ft.	0	3	3
LEAD WASTE or soil, fixed as above, complete, 2½ in., per ft.	0	6	6
DO. 3 in., per ft.	0	7	9
DO. 4 in., per ft.	0	10	6
WIPED soldered joint, ½ in., each	0	2	6
DO. ⅝ in., each	0	3	2
DO. 1 in., each	0	3	8
BRASS screw-down stop cock and two soldered joints, ½ in., each	0	11	0
DO., ⅝ in., each	0	13	6
CAST-IRON rainwater pipe, jointed in red lead, 2½ in., per ft. run	0	1	4
DO. 3 in., per ft. run	0	1	8
DO. 4 in., per ft. run	0	2	0
CAST-IRON H.R. GUTTER, fixed, with all clips, etc., 4 in., per ft.	0	1	6
DO. O.G., 4 in., per ft.	0	1	9
CAST-IRON SOIL PIPE, fixed with caulked joints and all ears, etc., 4 in., per ft.	0	3	0
DO. 3 in., per ft.	0	2	0
Fixing only:			
W.C. PANS and all joints, P. or S., and including joint to water waste preventers, each	2	5	0
BATHS, with all joints	1	3	6
LAVATORY BASINS only, with all joints, on brackets, each	1	10	0

PLASTERER

PLASTERER, 1*s.* 11½*d. per hour*; LABOURER, 1*s.* 3½*d. per hour.*

Chalk lime, per ton	£2	17	0
Hair, per cwt.	2	5	0
Sand and cement, see "Excavator," etc., above.

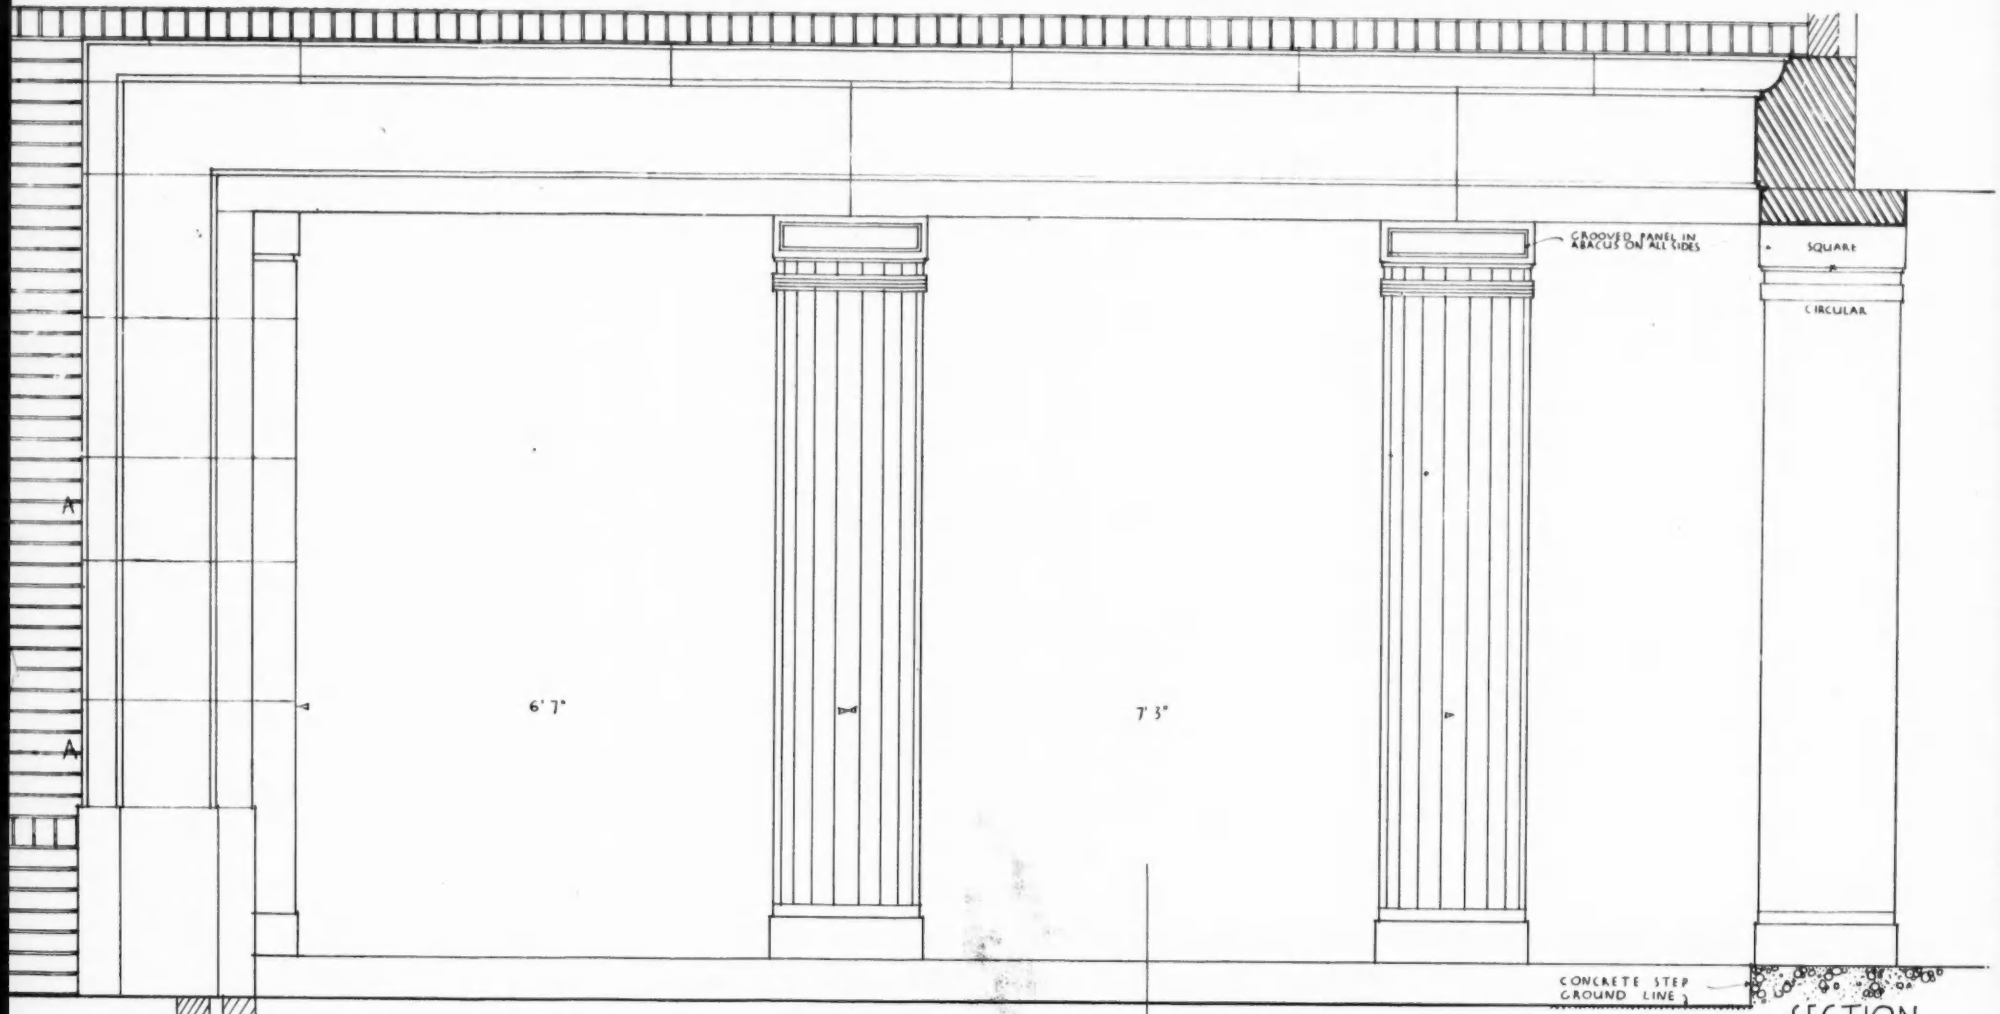
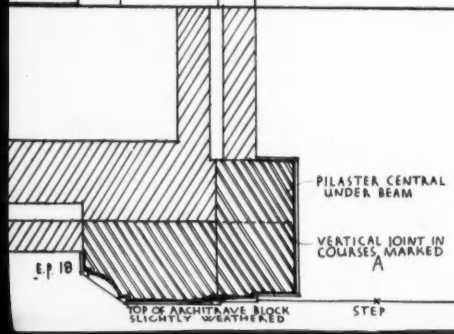
SCALE DETAILS:
A WEEKLY SERIES



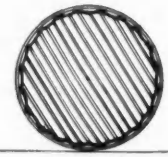
ENTRANCE TO FESTIVAL HALL AT ALDERLEY EDGE
Designed by HALLIDAY & AGATE

A STRONG and clean treatment of a stone-framed series of openings in a brick façade is shown in the photograph above.

It will be noticed from the scale drawings reproduced overleaf that certain liberties have been taken with the Orders as generally understood, i.e. the columns have been given no entasis, and a deep square abacus, with sunk and channelled panels on all four sides, takes the place of the usual capital. The bases, too, have been shorn of all projecting members, and are inflected at their junction with the ground merely by a cessation of the fluting and with one small offset moulding. The result, though unorthodox, has the merit of directness, and the columns well express their function.



The jointing of the surround should also be studied: it will be seen that at the junctions of the lintols over the columns a short length of lintol has been used, thus reducing the actual spans, but at the same time showing two joints over the columns instead of the customary one. For other views of the hall see pages 831–6.



The drawings may be read with an architect's scale (6″ = 1 ft.).

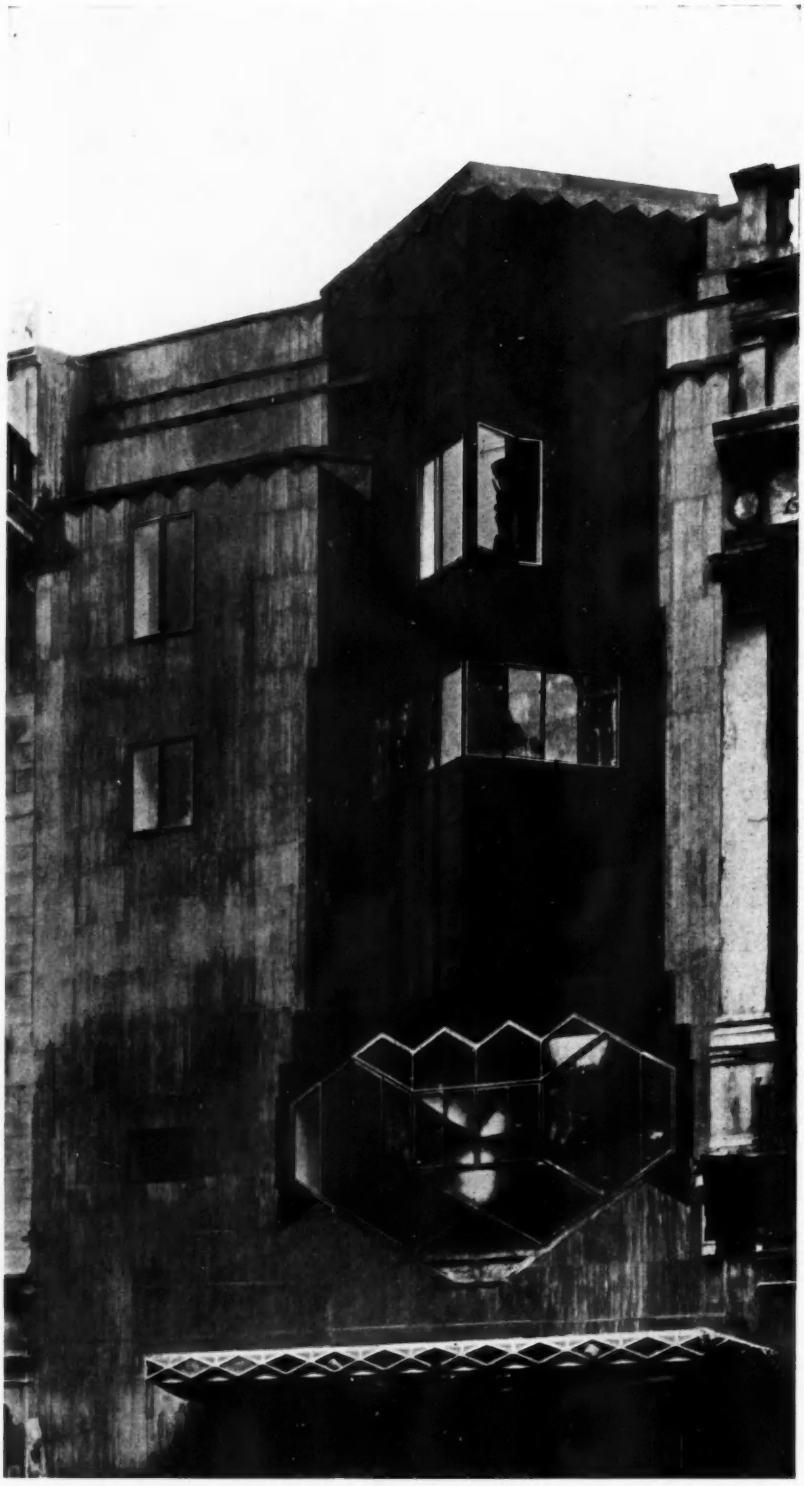
NEW BUILDING LAWS

" That machinery be created for giving national application to new methods and materials of construction."



—RECOMMENDATION BY LORD EBURY'S COMMITTEE.

THE movement for the revision of the building laws in this country is at last taking definite shape. An all-party meeting of M.P.'s was held in July last under the chairmanship of Sir Robert Horne, and as a result of this meeting a representative committee was received by the Minister of Health. The deputation urged that " the control of building has become a serious menace to enterprise and employment, not only in the building trades, but in the vast number of ancillary trades whose welfare is vitally dependent upon the building industry." We now have the views of the deputation available in print, and to-morrow—Thursday—a technical and economic Advisory Council is to be inaugurated at the R.I.B.A. Architects may take heart, for things are indeed moving.

What is it the committee is really trying to achieve? First of all, of course, it is out to simplify and modernize the whole intricate system of town-planning schemes, national Acts, local Acts, bylaws, regulations and the rest. The system works, like all our English systems that appear to have grown rather than to have been made, but it works, at this present moment, with a slowness, awkwardness and uncertainty of motion that have become so irksome as to be wellnigh intolerable. To ease the working of this machine is, we say, the committee's first aim. But the plight of Britain's trade to-day is such as to compel everyone striving after a private object to look about and take a wider national view also : to ask himself, that is, what benefit the country in general may gain from the success of his endeavour. In this case we are assured on every side that a genuine victory on the part of architects and builders would confer enormous advantages upon the nation's trade. In a letter to *The Times* the Director of the Federation of British Industries lays great stress on the possibilities of standardization in expanding " a live, world-wide demand for British products." The great enemy of a sane standardization—a reform which has been urged time and again in the pages of this JOURNAL—is, we learn, " the diversity of requirements from town to town and from borough to borough in the United Kingdom." Against the maintenance of this diversity Lord Ebury's Committee has resolutely set its face, and the Advisory Council will deserve well of the country if it can bring it down within the limits of reason and necessity.

Architecturally, the evil most in need of reform may be summed up in the one word, *London*. Outside the London area one can point to this or to that measure and say that it is out of date; in London everything is out of date. The dual control by L.C.C. and local and district officials is a complication whose effects can be incredibly hampering. The legislative enactments under which London building is controlled make it impossible to keep in touch with modern structural methods without Parliamentary sanction at every point. The Committee drily states, without comment, that " no L.C.C. housing scheme could have been carried out under the existing Building Act." Could any bald statement of fact be more damning ? The slack and objectionable system of " discretionary powers " under Acts and bylaws to which " waivers " may (or may not) be applied is seen at its worst in London, though this is, indeed, a matter for national reform. The result of this system as it now stands is that no one knows until a decision has been given what is and what is not permissible. Building under such conditions becomes a gamble against unknown odds. No wonder the heads of commercial firms are reluctant to embark on building and rebuilding schemes. Business building is now, as this report reminds us, a far smaller fraction of the national total than it was before the war, the percentages being 6·5 and 10 respectively. It is safe to

[*Continued on page 825.*

A V-FRONT IN THE STRAND

The upper portion of the main façade of the reconstructed Adelphi Theatre. It is in black and grey marble with cappings of copper, and a metal canopy with a black and white glass front. The new theatre is designed by E. Schaufelberg, and is announced to open tonight with "Ever Green," a musical play staged by Charles B. Cochran. Further views appear on pages 828–830.

prophesy that this figure will be substantially increased when the Advisory Council has got really busy.

There are two things we very much miss in this report; we hope the Council will not omit to consider them. The first is what we may briefly call the æsthetic consequences of building laws. Building Acts and bylaws, as this JOURNAL has often had occasion to point out, may interfere with sound design in more ways than is generally realized. Mr. Maurice Webb, the R.I.B.A. representative, is the only architect among the builders and business men who make up the bulk of Lord Ebury's Committee, and could hardly be expected to establish the full claims of design at the present stage. The Advisory Council, however, must do better. The other omission, which was also conspicuous in Mr. Shelley's recent paper on the subject at the R.I.B.A., is that of any reference to the Home Office, a national building authority, whose work has been quietly going on for a much longer time than that of most other authorities. We are assured by Mr. Shelley that a centralization of authority must inevitably mean more restrictions. To discuss national building legislation without reference to the Home Office is about as useful as to discuss local legislation without reference to the Ministry of Health. A survey of the work of this department has been prepared for this JOURNAL, where it will shortly appear. A careful study of the working of the Factory Acts is essential to any discussion on the public control of building.

NEWS & TOPICS

THE LONDON WE DREAM OF—

THE four speakers at the Architecture Club's eighteenth dinner last Wednesday did nothing to dissipate the profound pessimism which the subject of London's civic future must inevitably inspire. Even the dexterity with which the poets—for that is what literary gents like to call themselves after dining well—scratched each other's backs only momentarily relieved the all-pervading gloom. The architects caught it pretty hot. Mr. Priestley began by disdainfully assuring them that probably no man living had missed more "architectural sights" than himself. Never had he been wittingly guilty of such a criminal waste of time as to contemplate a west front. In a brilliant pastiche of Mr. Wells's previsionary style, he introduced us to a London in which the business and shopping areas were roofed over with glass and exclusively reserved for pedestrians. The housing problem had been solved by the simple expedient of blowing up the eastern and north-eastern districts, and transforming these brick rabbit-warrens into satellite towns of Corbusier tower-tenements with all the usual conveniences and garden-suburb amenities laid on—or rather up.

★

Mr. Squire, the other good companion, dismissed London as hopeless, preferring the C.P.R.E.'s campaign for rescuing what is left of the countryside to any League for Saving London from Itself. Were not two deplorable new buildings put up there for one that was seemly (an unduly clement judgment), and three good old buildings torn down for one that left no regrets? One thing, and one thing only, he knew about the architecture of our London of the Future: "My God, it *will* be bad!" Why it should, or how it could, be worse than that of London of the Present, he gave no inkling. Shaking a head prematurely silvering with forebodings, he prayed earnestly for a new Plague to decimate—or was it exterminate?—the besotted, supine and shiftless citizens of this increasingly mean city; followed by a second Fire of London to incinerate their degraded homes and monuments.

—AND THE LONDON WE DESERVE—

It was the commercialism of the City, Alderman Culpin insisted dolorously, which killed Wren's great plan for reshaping London as a coherent entity of parts standing in proper relation to the whole. The infinitely more complacent Micawberism of the L.C.C. had just refused to authorize a ten years' comprehensive programme of correlated improvements and replanning on the pietistic pretext that it was impossible to foresee the inscrutable needs of the future. The unforeseen is only unforeseen because, throughout the 2,000 square miles of Greater London, in which 280 different local authorities jealously tend their several parish pumps with complete indifference for their neighbours' needs, there is neither a co-ordinating policy, a settled plan of development, nor a schedule for reconstruction. The greatest city in the world is mistress neither in her own house, nor of her own destiny. He pleaded for "the big view, the big area, the big result," and the big stick of some Mussolini. It was positively humiliating to hear a lifelong Liberal unblushingly avow the impotence of democracy to clear up the mess.

—AND GET

From Captain Swinton came the wholesome, and very necessary, reminder that London traffic is infinitely more important than London architecture—a statement he might have elucidated by explaining that the sorry medley of the latter was the faithful reflection of the chaos of the former. Of seventy plans for the new Charing Cross Bridge examined by him, sixty could be summarily dismissed as "rotten." The only ray of hope was the imminent perfection of the helicopter type of aeroplane. And so to bed in much dread of gunpowder plots, and the coming great pestilence and conflagration, whereof both my priest and my squire do warn me; though Beadle Bumble bids me sleep sound and take no heed, saying "everything be right and well in the ordering of this most excellent city."

POSTERS AND NIGHT SIGNS

Some of Mr. Leathart's shrewdest blows, at the R.I.B.A. on Monday, were aimed at the outrageous abuse of perfectly good architecture by way of posters, signs and all the horrid American insignia of advertising on the part of certain cinema managements. It is not enough for the architect to incorporate in his design spaces for 6-sheet posters: the entire façade must disappear behind the bulwarks of big business. The searing neon light, too, is capable, every night, of new frightfulness. So that it is not without uneasiness that I read of fresh advances in electrical practice.

Plaster cast of a chimpanzee, by Henri Gaudier, one of the exhibits by four contemporary sculptors, at the Zwemmer Gallery. It is approximately 2 ft. 6 ins. wide and 2 ft. high.

There are other gases than neon. Hot and cold cathode tubes, charged with various vapours, can, as we remember from our dabblings in the science laboratory at school, be made to emit lights of extraordinary monochromatic and polychromatic intensity, some few captivating, a good many very much the reverse. Such effects are likely to be exploited commercially in the near future. "Not much imagination is needed," says *The Electrician*, "to visualize a world of the future in which the fall of darkness will open the doors of a fairyland of luminous colour." But when it voices, editorially, in the very same sentence, the hope "that it will not be allowed to become a nightmare," while uttering "Amen to that," I feel that things are likely to be worse before they are better.

THE ARCHITECT'S INFLUENCE ON FURNITURE DESIGN

The influence of the architect on modern furniture design was the subject of a lecture by Mr. John Gloag at the Geffrye Museum last Thursday evening. Incidentally, this was the only lecture of the series of six given as the first part of the winter session at this Museum that dealt with a contemporary problem; all the other lectures are concerned either with the antiquarian aspects of furnishing or with tradition in furniture design. Mr. Gloag's suggestion that the architect is returning gradually to that position of complete dominance in design that it held in the eighteenth century may or may not have caused his hearers to speculate on the future of the furniture trade under such circumstances. He made it clear that the architect approaches the solution of furnishing problems with a directness and a simplicity that the commercial furniture designer, especially if he is an emotional traditionalist, somehow manages to avoid.

★

The architect is using new materials for furniture making: he is encouraging the use of chromium-plated steel, of glass, of rubber, of plywood, and the results are efficient, although, as Mr. Gloag pointed out: "they are as yet a little inhuman, owing, perhaps, to an uncritical preoccupation with M. le Corbusier's edict that 'the house is a machine for living in.'" The slides that accompanied the lecture at least indicated the beginnings of a humanizing movement in the making of modern steel furniture, which, so far as chairs are concerned, is tending to become a metallic clasp for vividly decorative and extremely luxurious upholstery.

★

It is significant that a new point of view about furniture design should be imposed upon the furniture industry from without, and that the intelligent employment of new and promising materials should develop under the patronage and direct inspiration of architectural designers. The furniture industry as a whole has only stirred from its traditional slumbers once since the days when "new art" was discredited, and that fit of muddled wakefulness was unpleasantly employed in importing a spurious "modernism" after the noise of the 1925 Paris Exhibition had convinced the sluggard that something was going on somewhere, somehow.

SCULPTURES BY GAUDIER

Most of the drawings and sculpture by Henri Gaudier, the sculptor who, at the age of twenty-four, was killed in France in 1915, thus dealing a severe blow to his profession, form the major part of the exhibition of some work of four contemporary sculptors, now on view at the Zwemmer Gallery. It was a happy thought of Mr. Zwemmer's, says Mr. Wilenski in a foreword to the exhibition catalogue, to contrast the calligraphic drawings by Gaudier with the brilliant romantic drawings by Jacob Epstein, now at the height of his astonishing powers and supremely master of the vision of sentient life; to contrast Epstein's drawings with those of Frank Dobson, who is concerned with the plastic interplay of subtly defined masses, and to complete the exhibition with examples of the monumental vision of Henry Moore. The forty-one drawings comprise studies of figures and animals. The six pieces of sculpture—four by Gaudier and two by Dobson—are of high standard. I admired chiefly Dobson's bronze head of a girl, not hitherto exhibited, and a plaster cast of a chimpanzee by Gaudier; a photograph of the latter is reproduced on this page.

RE-HOUSING IN ST. PANCRAS

There was opened last week a block of forty flats for poor working people in an overcrowded area in Somers Town (known as the Sidney Street Estate), being the first part of a housing scheme designed by Mr. Ian Hamilton, A.R.I.B.A., for the St. Pancras House Improvement Society. They have done much already to clear away the slums, and this is the latest of their activities. An overcrowded area was bought, and street by street the dilapidated houses are being demolished and the people re-housed in well-planned and well-decorated homes, containing a sufficient number of rooms, and fitted with the very latest conveniences, at an extraordinarily small rental. The scheme itself is finely conceived and designed, and it has a pleasantly human feeling about it, which is of special value in this type of building. When completed, it will consist of a series of five-story blocks, so disposed on the site as to get the maximum of light, air and sun, and having a central garden space which will be planted and kept in order. There will be a roof nursery-school.

★

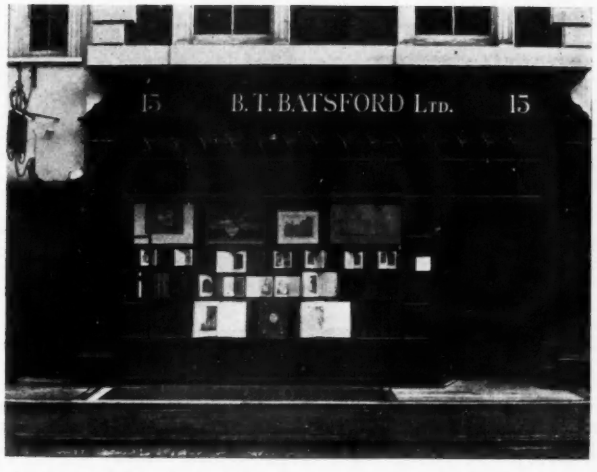
The Society is re-housing here only tenants who belong to the site already, and will ask such rents as poor families can afford in general, a feat which even many local authorities have not been able to achieve. Following the example of an L.C.C. scheme near by, the flats have been made all-electric, including cooking stoves, coppers, kettles, irons, fires, etc., at a very small cost for upkeep

and use. The people themselves are keenly appreciative as their own new homes rise up before their eyes, as fast as funds allow. This is certainly an object-lesson in housing.

A MAYFAIR MIGRATION

After Mudie's, Batsford's ! The "*Drang nach Westen*" of business continues, and Holborn is the poorer for two landmarks which were oases to the book-lover in the featureless prolongation of Oxford Street's mile of millinery. The associations of this part of London with architectural bookselling reach as far back as 1611, in which year Sir Robert Peake's black-letter translation of Serlio's *Architecture*—the second illustrated book on the subject to be printed in English—issued from a Holborn press. The next notable names are those of Piers and Partner, and Henry Webley, booksellers at "The Bible and Crown." They were succeeded by Isaac Taylor about 1767 at "The Rose and Crown," opposite the Great Turnstile, near Chancery Lane. In 1786 Isaac was joined by his son Josiah, and the business was transferred first to 56, and then to 59, on the "high" of old Holborn Hill—which was steep enough not to belie its name—at which address it remained till 1825.

★



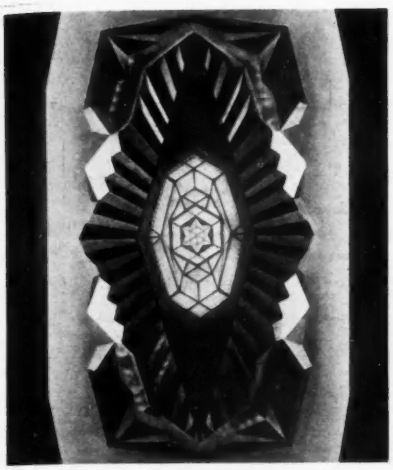
The premises and stock of this interesting and not undistinguished family was taken over by Priestley and Weale, when the Taylors moved to Wellington Street. In 1843 the first Batsford, Bradley Thomas of that name, who had been apprenticed in 1837 to "the art and mystery of bookselling" with Mr. Bickers, of the firm so long established in Leicester Square, set up as a second-hand bookseller in High Street, Bloomsbury. He soon moved to 52 High Holborn, whence his business was later transferred to the shop at No. 94, the book-crowded window and dusty, folio-filled shelves of which have been familiar to generations of architects and draughtsmen. Bradley Thomas Batsford, who died in 1904, was followed by his sons Bradley and Herbert. The firm of B. T. Batsford, Ltd., which will celebrate its centenary thirteen years hence, has for some years past been carried on as a private company under the management of Mr. Harry Batsford, HON. A.R.I.B.A., the great-nephew of its founder.

Batsford's new branch at 15 North Audley Street, which was inaugurated on Monday, occupies a Georgian house, built about 1790, that still retains some very prepossessing Regency details. The necessary transformation of what was a beauty parlour, decorated with fulsome Edwardian festoons, has been skilfully carried out by Professor A. E. Richardson so as to perpetuate something of the peculiar, almost Dickensian, atmosphere of the old premises in Holborn. The outside window, painted green, has interlacing ogival panes. On the ground floor are three very spacious showrooms panelled to the ceiling with old mahogany bookshelves as in a private library. In the second of these hangs Zoffany's fine Blairadam portrait of Robert Adam, the only authentic painting of him known, with James Gibbs by Andrea Soldi on its left. Upstairs is a small, but well-lit, gallery, intended for exhibitions; with a couple of editorial offices adjoining. The Mayfair Batsford's certainly supplies a long-felt London want: an art bookshop of the type which exists in all large foreign cities where architects, antiquarians, students, connoisseurs, and mere inquisitive bibliophiles can find everything they could possibly want, from curiously tooled folios of Stowe's *Survey* to the latest instalment of the functionalist creed according to St. Corbusier.

"ET TU, E. V.?"

This is what I read, put into the mouth of Richard, in *Down the Sky*, by E. V. Lucas: "Why don't women more often become architects? The designing of a home is surely their natural work. They know better than any man where the kitchen ought to be and the pantry, and how to save labour. They would enjoy ordering the builders about and wrangling with their clients over details and expense. It's amazing to me that women have let male architects do the house-planning all these centuries, more especially as houses are constructed far more for women to live in than men. Men go out, often slamming the door; women stay in. To design the houses they are to spend so much time in would be an ideal occupation for them. At any rate, they couldn't design them worse than men do."

ASTRAGAL



Another bookshop for the West End: exterior and interior views of the premises reconstructed for Messrs. B. T. Batsford, Ltd., in North Audley Street, W. Professor A. E. Richardson designed the new shopfront, and his renderings of the rooms perpetuate, as Astragal finds, the almost Dickensian atmosphere of the firm's old premises in High Holborn, as may be judged from this aspect of three on the ground floor, which form a suite.

TRIGONOMETRY IN THE THEATRE:

THE ADELPHI, LONDON.

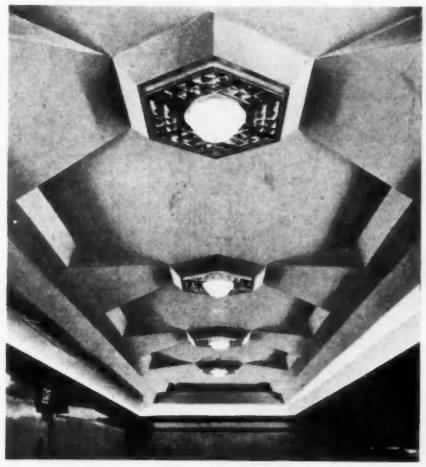
DESIGNED BY E. SCHAUFELBERG

In the auditorium, looking from the dress circle. Seating accommodation is for 1,500 persons. The lower half of the walls, and the fronts of the dress and upper circles, are lined with plain sheets of sycamore of amber colour, polished. The general colour scheme is green and gold, with a drop curtain, and hangings to the boxes and exits in red picked out in gold and green. Seats are of rainbow colour. The carpet is fawn. Near views of the ceiling lights appear on the facing page. At the sides of the boxes are amber lights; above them are special boxes containing spotting arcs. The balustrade of the orchestra pit, ash trays, etc., are chromium plated.

The panel in the ceiling of the auditorium has a silver and glass centrepiece designed to give different lighting effects, and is decorated in colours from green to gold.

TRIGONOMETRY IN THE THEATRE:

The Adelphi, London

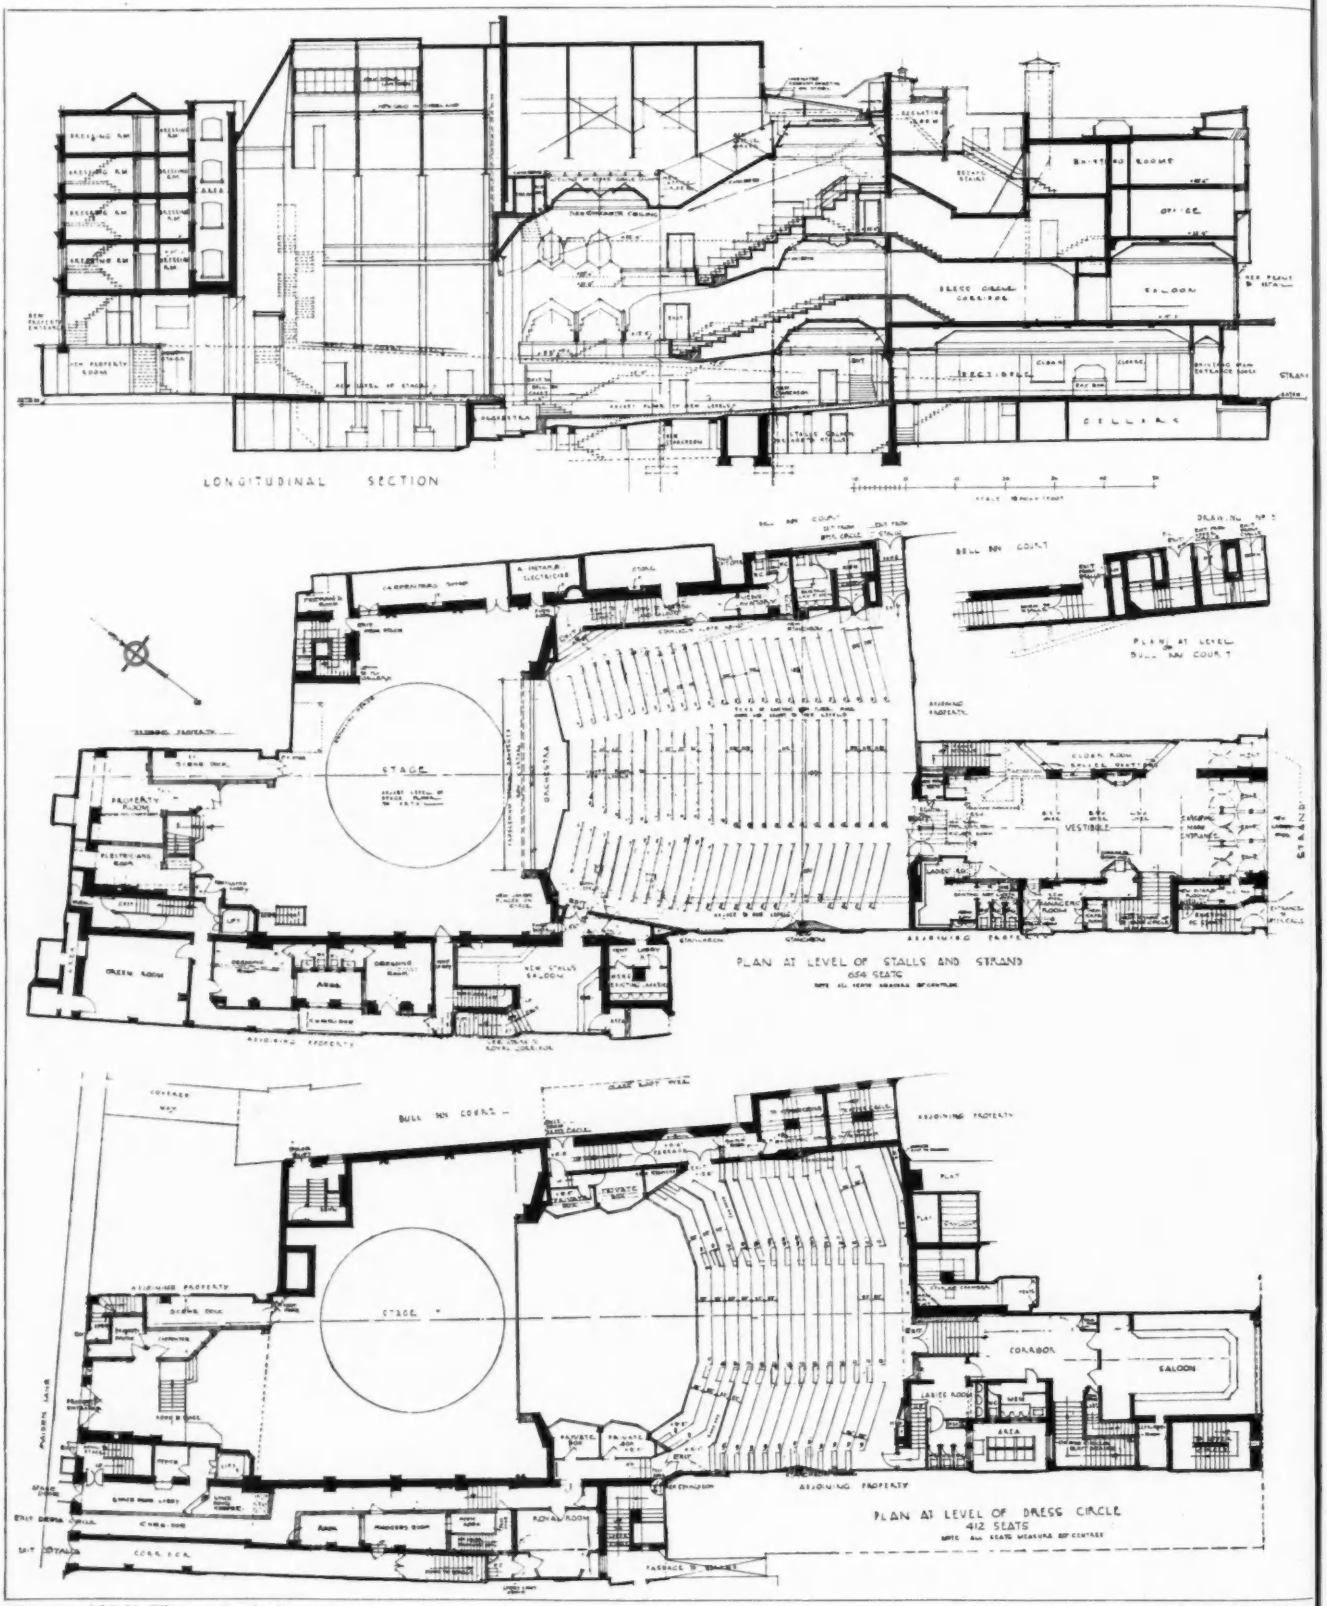


DESIGNED BY ERNEST SCHAUFELBERG

THE reconstructed Adelphi Theatre is designed with a complete absence of curves. Externally and internally the entire conception is carried out in straight lines and angles, the angle of 32 degrees being used as the master note.

It is built for Musical Plays, Ltd., and is intended for use as a legitimate theatre, although a projection room has been incorporated in the plans. In the stalls and two circles seating is provided for 1,500 persons. The proscenium opening is practically square, and has a width of 38 ft. and a stage depth of 40 ft.

The stage embodies many new innovations, not only in the lighting but in the method of handling the scenery. An electrically-driven revolving stage has been installed, so that changes of scenes can be made on the back half whilst the front scene is being played. This has necessitated the provision of a cyclorama cloth and the absence of sky borders, somewhat on the system now in vogue on the Continent.



Considerable public attention was riveted on the work during its final stages owing to the big hustle performed by the builders to keep to the schedule. It is understood that the theatre was to open on November 24, and that the owners were to pay Mr. Cochran a penalty of £450 for every day they were late in handing over the theatre.

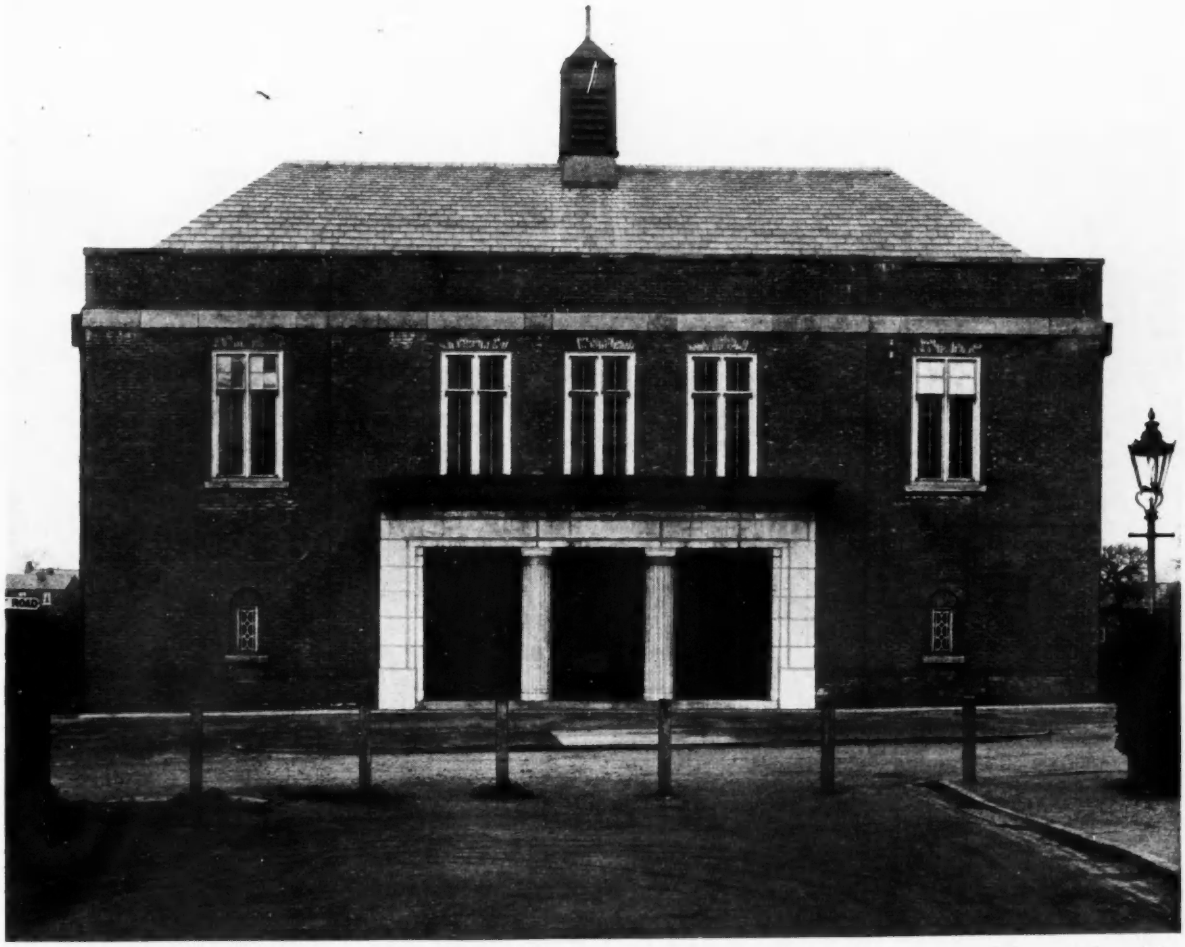
The ceiling of the dress circle is also boldly decorated in green and gold. It extends the full width of the theatre, over the gangway, behind the back row of seats.

The entrance vestibule. On the left is seen the staircase leading up to the dress circle, and one of the two box offices. On the extreme right are the doors to the stalls. The walls are lined with black marble. Both box offices have chromium-plated grilles and red curtains. The ceiling is treated in colours of gold, green amber, black and red. The interior doors generally are red, with black surrounds and chromium-plated handles.

The new Adelphi Theatre, London.] [*By E. Schaufelberg.*

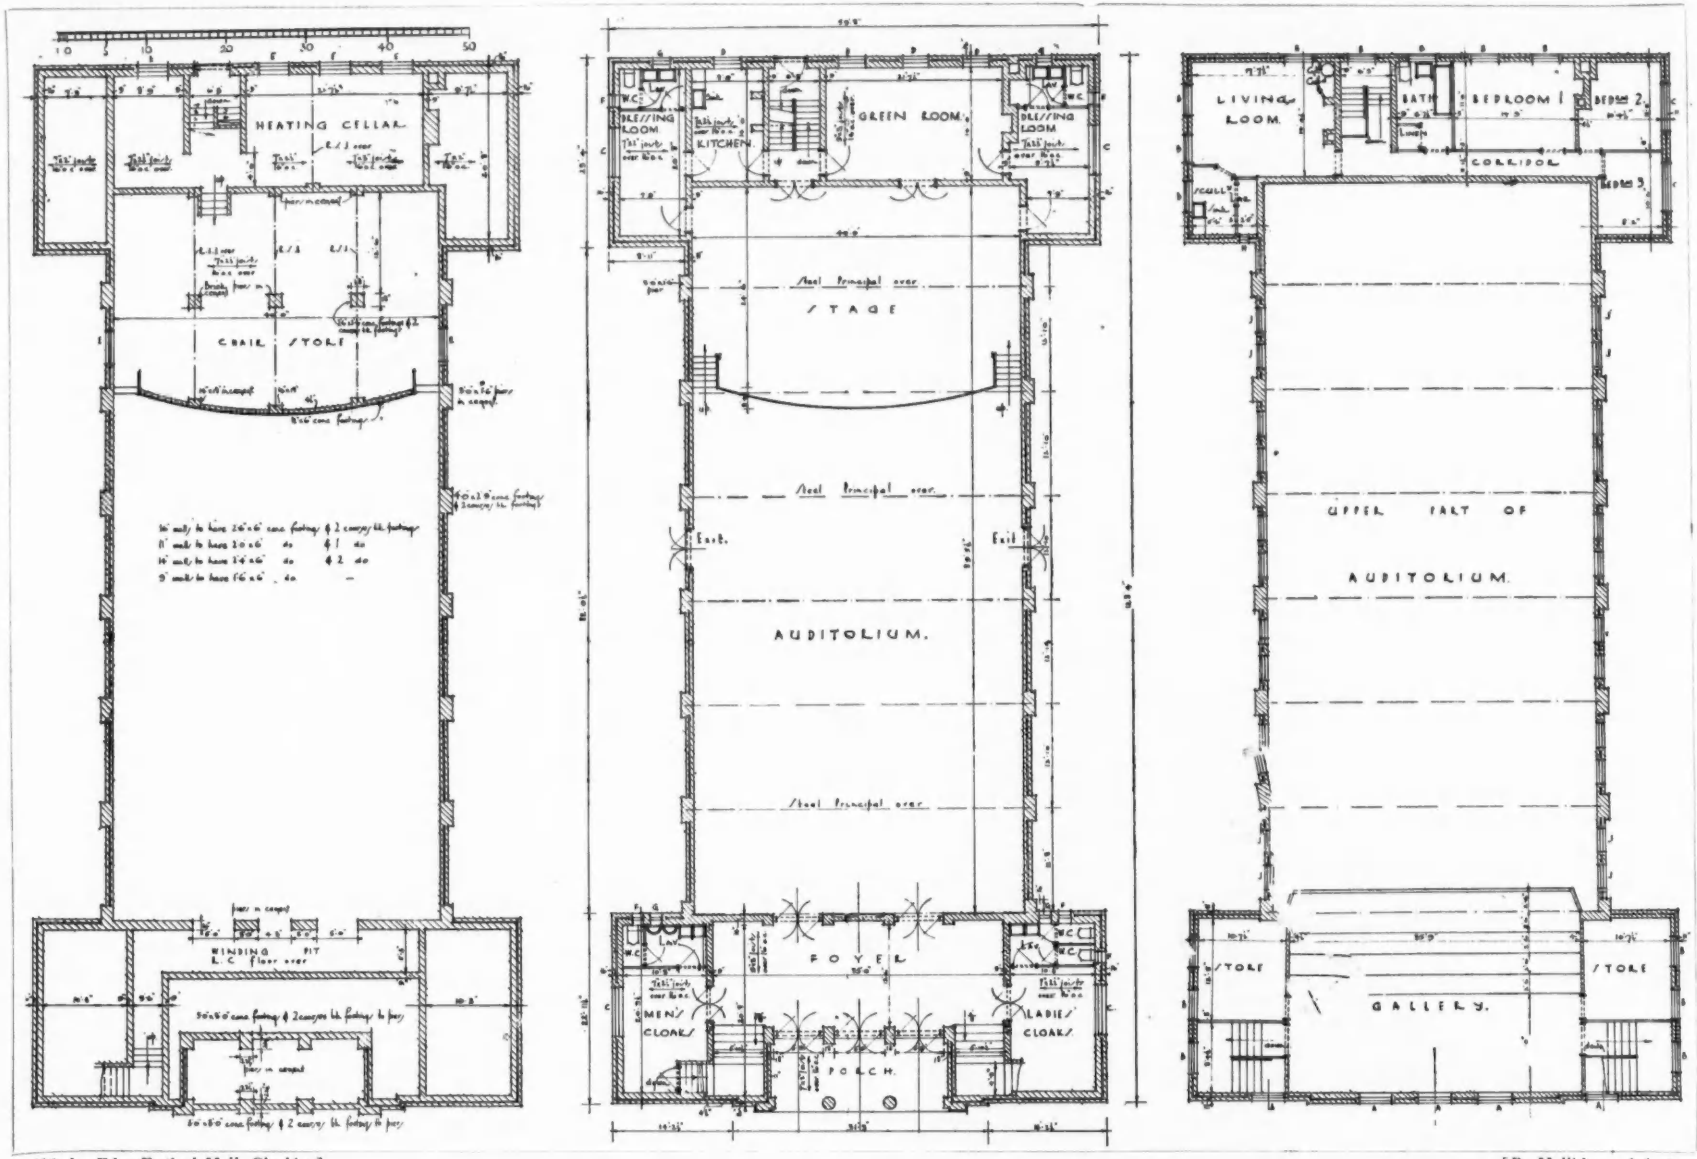
The architect's drawings of the longitudinal section and of plans. The stalls and dress circle are entered from the Strand through three pairs of swing doors, to the left of which a separate and independent entrance is planned to the upper circle. A revolving stage is provided.

A HALL WITH ADJUSTABLE FLOOR



DESIGNED BY HALLIDAY AND AGATE

ALDERLEY EDGE Festival Hall is an attempt to combine in one and the same auditorium the somewhat varied functions of a concert hall, theatre and ballroom. It was erected primarily as a building in which to hold the Alderley Edge Annual Musical Festival, and for this purpose a large platform for the choir or orchestra is required, with an auditorium floor sufficiently sloping to give a clear view of this platform.



When used for dramatic performances, raked seating is equally desirable, but the proscenium opening requires to be reduced, and this is done by the employment of side curtains, in conjunction with the usual moving drop curtain. Battens, footlights and provision for drop scenes are also needed, and all these are so disposed as to be out of the way when the platform is in use for concert performances.

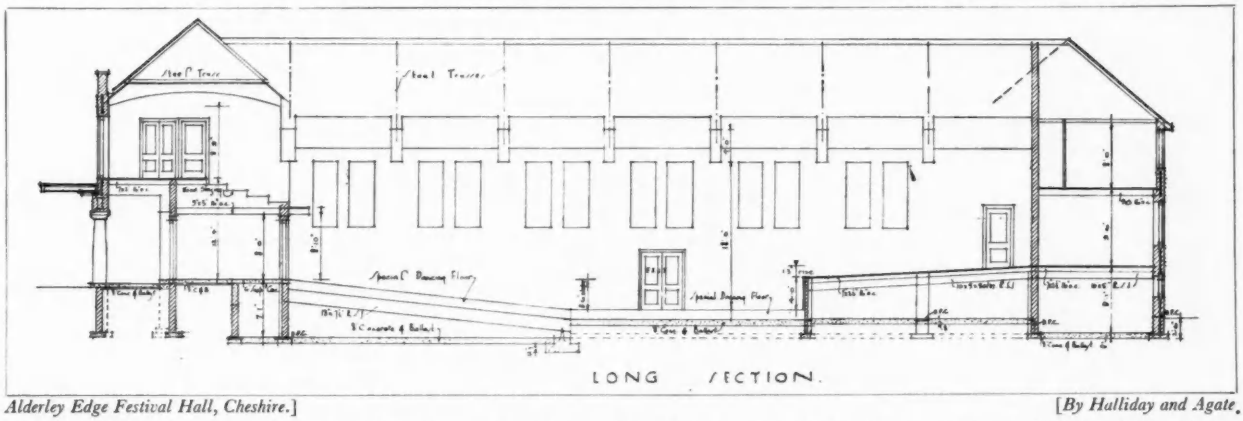
But for dancing an inclined plane is useless. To meet the conflicting demands, a workable compromise has been devised. The front part of the floor, which measures, in all, 62 ft. long and 40 ft. wide, is permanently level, but the rear 34 ft. is adjustable. This whole area is constructed upon a steel framework of which the forward end is attached to heavy pivots set in a concrete bed, while the rear end can be raised or lowered by a system of jacks, which are connected to a winch operated by hand. This is geared down so that it can if necessary be worked by one person. When the movable floor is lowered there is a gap of about four inches between the two halves; this is filled with an oak strip kept in position by thumbscrews. The floor is also built upon steel springs to give the necessary resilience for dancing.

Certain arrangements contingent upon the two-level floor had to be provided. Thus, the hall is entered through a vestibule and foyer which is level with the auditorium when the floor is in the raised position. When it is lowered a flight of steps is put in place to give access to the hall. Again, half of the

A general view of the entrance front of the hall, which has an extensive marquise, and is surmounted by a flèche. The building is faced with 2-inch local bricks, and has architraves and columns of artificial Hopton Wood stone.

Alderley Edge Festival Hall, Cheshire.] [*By Halliday and Agate.*

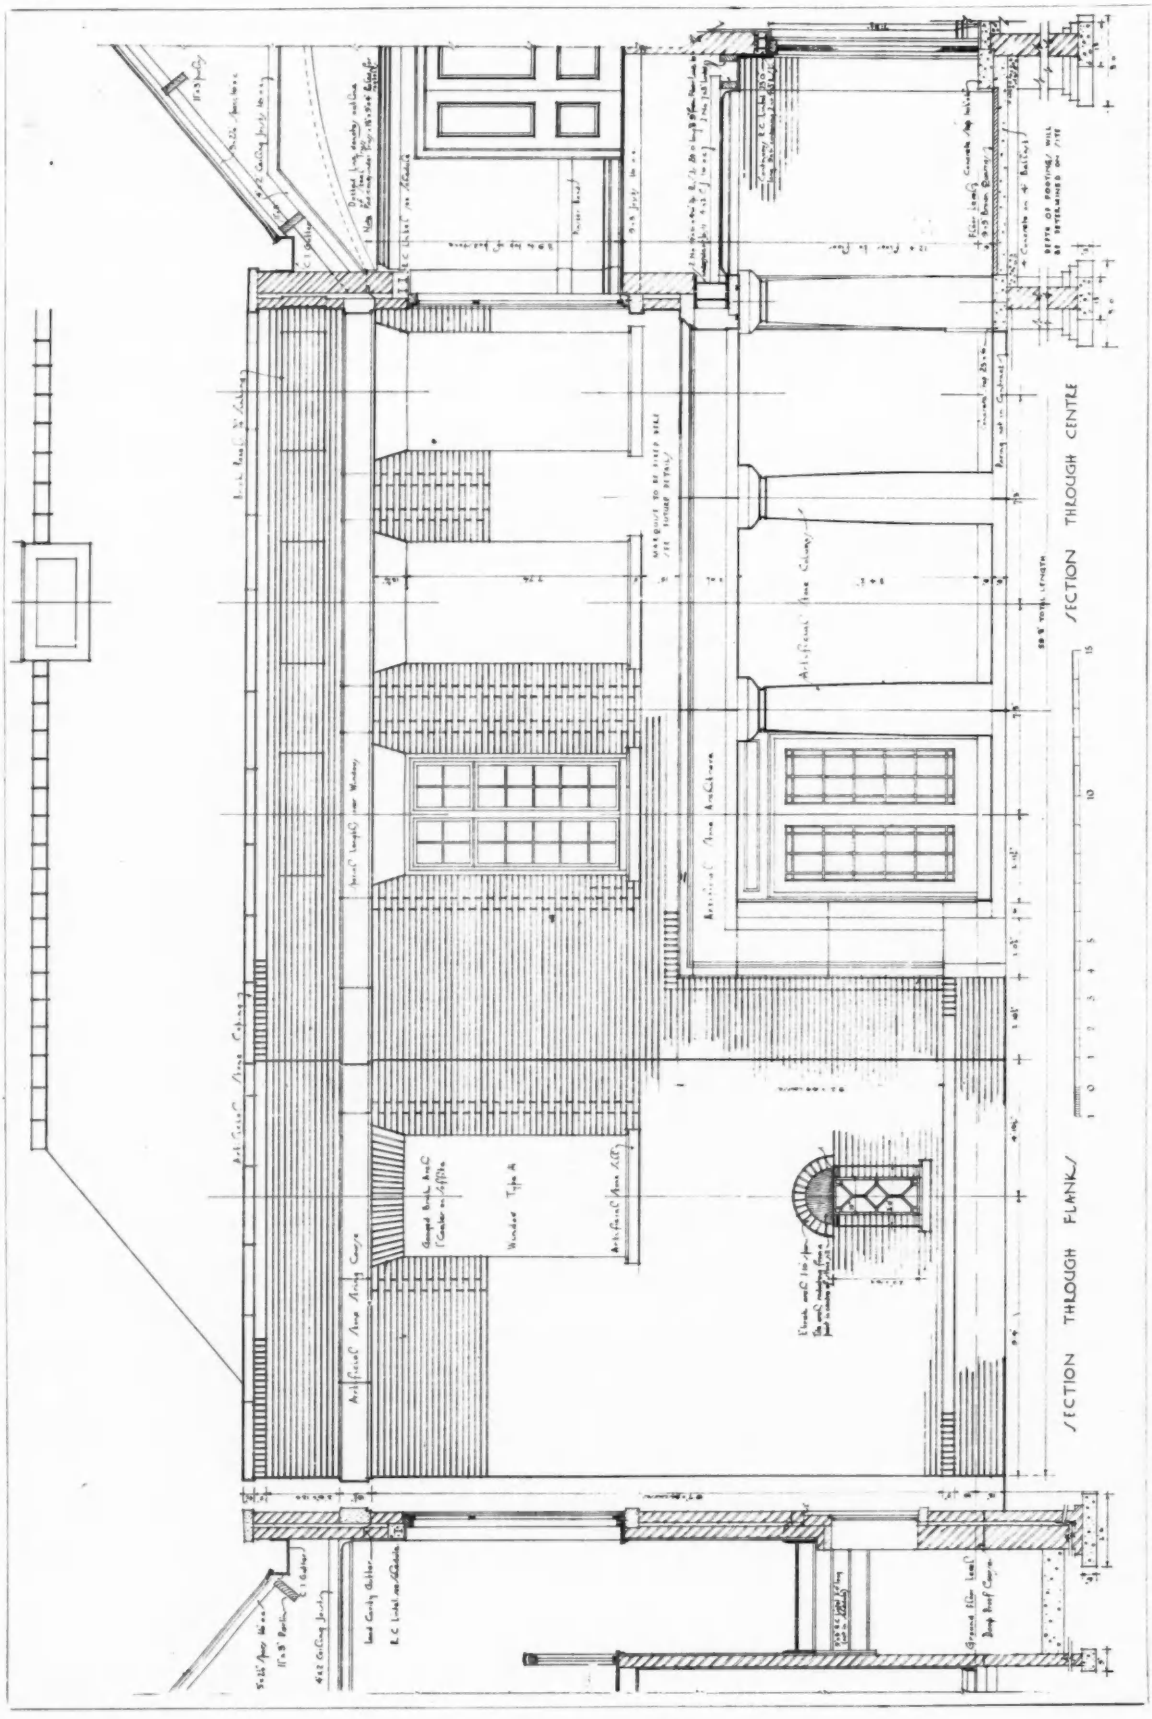
Plans of the basement, ground floor and first floor. A chamber is formed below floor level to accommodate the jacks and winch for winding the adjustable floor up and down. The large area of the platform necessary to the prime object of the hall—to house an annual musical festival—should be noted. A caretaker's flat occupies part of the topmost floor



This view gives some idea of the side elevation, which, owing to surrounding obstructions, is not very amenable to photographing. The actual proportions are revealed in the sectional drawing reproduced below.

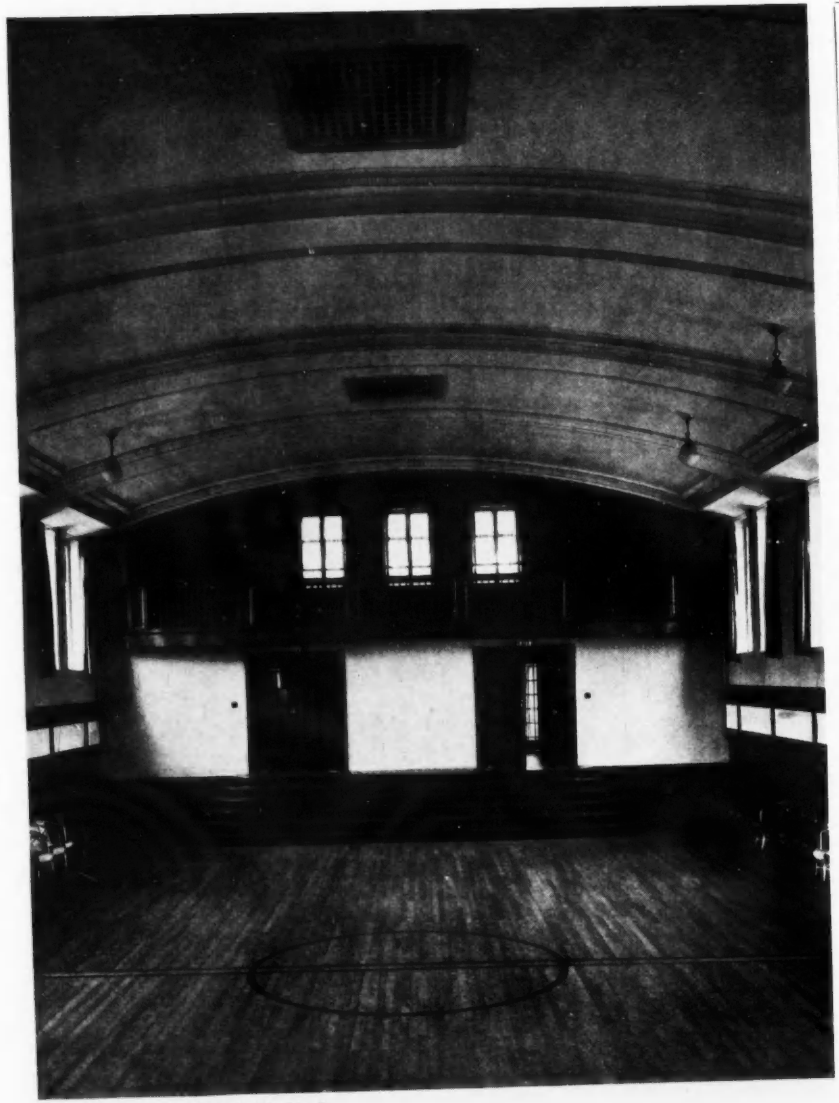
seats have the back legs shortened so that they stand firmly on the sloping floor. When the floor is lowered they are packed away in a store under the stage.

On either side of the foyer are cloak-rooms and lavatories, and staircases up to the gallery, which is over this part of the building. There is also access to the winding pit below, from which is operated the winch which moves the floor.



Behind the platform are dressing-rooms, a green room, and a kitchen for the use of caterers. Below these are heating cellar and stores, while upon the first floor is a caretaker's flat of living room, three bedrooms and bathroom.

The building is faced with 2-inch local bricks, with artificial stone string course and coping. The architraves and columns of the main entrance are of artificial Hopton Wood stone. The roof is of grey slates. The windows of the main hall are of wood, the remainder being steel casements in wood frames. The floor of the hall is of oak boards.



Alderley Edge Festival Hall, Cheshire.] [*By Halliday and Agate.*

This longitudinal section, being reduced to the same scale as the plans on the facing page, may be studied in relation thereto. It shows clearly the large and deep platform, and, at the other end of the hall, the portion of the floor made adjustable—level for dancing, raked for concert and dramatic performances.

A general view of the auditorium, looking towards the platform, the rake of which is perceptible, here seen arranged as a theatrical stage : side curtains and the drop curtain fixture form a restricted opening by way of proscenium. When a clear floor is required, the chairs are stored under the stage.

IN PARLIAMENT

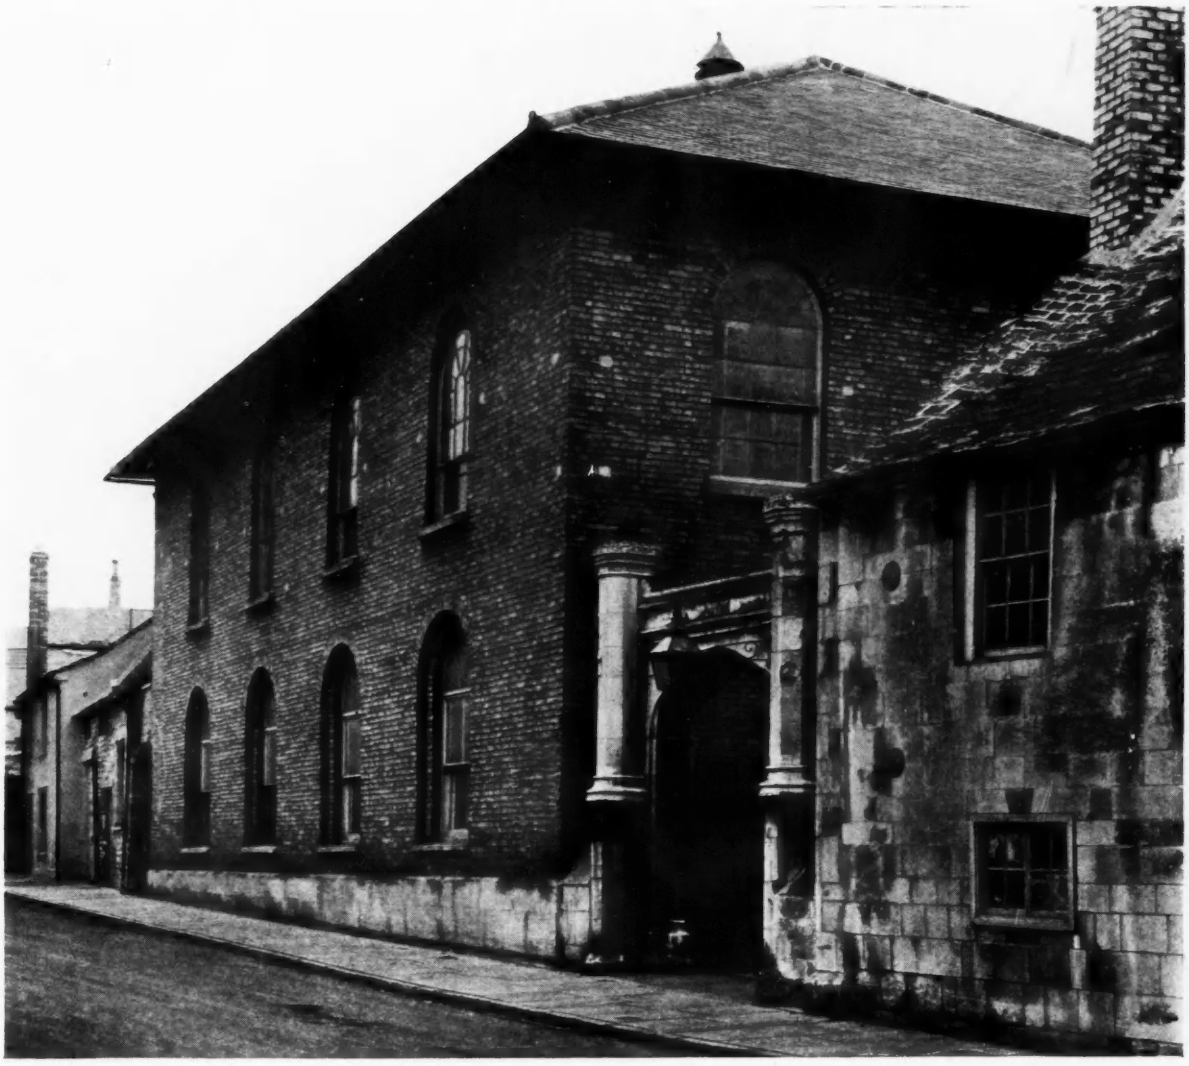
[BY OUR SPECIAL REPRESENTATIVE]

Prevention of Fire in Buildings

IN the House of Commons last week Mr. Grahame White asked leave to introduce a Bill to make further and better provision with respect to means of escape from buildings in case of fire. He said that, unfortunately, there were a very large number of buildings which, either through faulty construction or because there had been neglect to provide proper means of escape, were veritable death-traps in cases of fire. The first clause of the Bill, which had been promoted in the first instance by the United Kingdom Commercial Travellers' Association, provided that, in the case of every new building which was more than two stories in height, or where the upper story of any one floor was more than 22 ft. from the ground, there should be provided such means of escape for the persons employed therein, or sleeping therein, or resorting thereto, as might be considered reasonable in all circumstances of the case. The buildings to which these conditions should apply were tenement dwellings, flats, maisonnettes or buildings which were to be used as hotels, boarding houses, boarding schools, nursing homes, and the like. It was suggested that no such building should be occupied until a certificate had been given by the local authority that adequate means had been provided and that they existed in working order.

The second clause provided in regard to existing buildings that if, in the opinion of the local authority, such building was not already provided with adequate means of escape in the case of fire arising, they might call on the owner, by notice served in writing, to make such provision as might be considered reasonable in all the circumstances of the case, and the owner should then take the necessary steps to make such a provision. The third clause provided that similar conditions should apply in the case of buildings which were being converted and were to be used for any of the purposes he had just described.

A further clause sought to provide that in hotels and similar buildings there should be adequate lighting of passages during the hours of darkness. The clause would also give powers to local authorities to require the owners to provide certain forms of mechanical apparatus for the extinction of fire. The Bill also contained a clause providing that anyone who was aggrieved by any provision should have the right of appeal to a court of summary jurisdiction.



Leave was granted and the Bill was brought in.

Building Industry Unemployed

Miss Bondfield, the Minister of Labour, informed Sir A. Steel-Maitland that during the twelve months ended September 22, 1930, the average number of insured persons, classified as belonging to the building industry, recorded as unemployed in Great Britain, was 121,761.

Importation of Granite

Mr. W. R. Smith, Parliamentary Secretary to the Board of Trade, told Sir R. Gower that during the twelve months ended October 31 last, 244,000 tons of granite (other than setts and pavement curbs and monumental and architectural granite), of a declared value of £188,000; and 109,000 tons of granite setts and pavement curbs, valued at £304,000, were imported into Great Britain and Northern Ireland registered as consigned from foreign countries.

ENGLISH PRECEDENT
No. 144
CONGREGATIONAL CHAPEL, STAR STREET, STAMFORD, LINCOLNSHIRE

This unassuming design is an example of what may be done by the most simple and economical means to achieve the degree of importance and dignity suitable to a building of this type.

The large, semicircular-headed sashes at once differentiate it from the cottage architecture—mostly seventeenth century—by which it is surrounded. The ground-floor windows are set back 4½ inches beyond the plane of those on the first floor, the openings being given a double reveal. Though wall and roof materials alike are alien to their surroundings, the juxtaposition is not unduly harsh.

LETTERS FROM READERS

The New Architecture

SIR,—I have always considered the Crystal Palace, apart from the triviality of its present setting, one of the most magnificent, expressive and significant of all modern structures. Sir Reginald Blomfield seems to think so too, and suggests that there are no modernist buildings in glass and steel today to compare with it. This, I think, is also true, but I doubt whether anyone has, since 1851, had such an opportunity as Paxton had, for it must be remembered that there never has been an attempt since to house a great international exhibition under a single roof.

With smaller buildings of the same type very beautiful new forms have been invented and used, such as the concert hall at the Gothenburg Exhibition, with its parabolic wooden principals and stepped glass roof, a version of which we are now fortunate enough to possess in Easton and Robertson's fine hall for the Horticultural Society in Westminster. It appears to me that the modernists frankly recognize the greatness of the Crystal Palace, for in any historical attempt to view their movement as a whole which I have read, I notice they always start with that structure. As far, therefore, as this building is concerned there is an unexpected track of common ground between them and Sir Reginald. C. H. REILLY

Housing: The Counter-Revolution

SIR,—My attention has been drawn to the leading article in your issue of November 5 under the above heading, in which you refer to the scheme recently put forward by my Federation. I was sorry to read the unfortunate references to the house-building industry under such epithets as "jerry builder" and "Philistines," which rather point to the deduction that you approach the matter from a biased point of view. Abuse is so easy and so meaningless. You remember, Mr. Editor, that Mr. Pecksniff was an architect, but it would be both unkind and untrue to draw any general conclusions from that. House-builders have been extensive clients of the architectural profession, and the housing question calls for the best united efforts of all concerned if it is to be solved in our time.

Apparently you disapprove of a density of twenty houses to the acre for cottages, although I should imagine that the majority of your readers will agree that a density of that degree is quite capable of treatment with amenity. My Federation does not ask "that all the other safeguards against deterioration should be abolished." What the scheme does is to offer to build all the houses required at the rents which people can pay, and to do this at half the cost of the present subsidy. At the same time, the house-building industry would regret any necessity for a return to the bad old pre-war days either for wages for the workmen, financial conditions for the masters or crowded slum building for the dwellers in the houses.

The present policy of housing has resulted in an expense to the country of several hundred millions (approximately £400,000,000) for Council houses, whilst private enterprise, at a cost to the public of about one-tenth of that amount, has produced double the number of houses. What is now proposed is that private enterprise shall be assisted to build the houses which the working people require, and I submit it would be to the benefit of all three parties—the public, the architect and the builder—if some steps were taken, under due safeguards, mark you, for that to be done.

NORMAN MCKELLEN
(SECRETARY, NATIONAL FEDERATION OF HOUSE BUILDERS)

New Ways in Architecture

SIR,—Mr. Harry Holland's letter in your issue for November 19 calls for little comment from me, as we are in so much agreement, but I am glad he stresses one most important and serious consideration: to wit, that, whilst there is in much modern music and architecture evidence of a similar trend, there is between these two realms of art a vital difference. Monstrosities in the one can, by consensus of educated public opinion, be relegated to deserved oblivion, as a mere passing noise not to be repeated, and no great harm is done beyond waste of time. No such effect is possible in architecture. Today, with no limit save compliance with Building Acts and local bylaws, which affect design to but a limited extent, anyone can put up anything providing funds are available; and it is urgently necessary for the credit and dignity of the architectural profession, and the protection of public interests, that the R.I.B.A. and allied societies seek the co-operation of the Government and local authorities to rationalize and control all building development.

It is tragic how many buildings of decent proportion, good materials and happy treatment, are pilloried by execrable and unsuitable neighbours, and how many designs side by side, each good in isolation, are completely out of tune by ill-considered juxtaposition. How many a practitioner wishful of respecting, say, a prevailing skyline, or cornice height, or general architectural treatment and atmosphere is, because there is no possibility of support from public authorities, at the mercy of clients with insistent views of their own!

There is a move in the right direction—limited, certainly, to the preservation of the countryside—in the scheme introduced by Mr. Longden, and now issued for consideration and adoption by architectural societies. It is worthy of the one and, with possible modifications, of both. If this first step can be taken, let the underlying principle be further extended. If the R.I.B.A. is wide awake, the danger of hide-bound traditionalism and of stereotyping design can be avoided, although these dangers are far less grave than the results of the present chaos. In this connection I am inclined to cross swords with Mr. Holland.

There are today, for reasons outlined in my lecture, totally new problems in design, and types of buildings are required serving purposes behind which there are no traditions, and here there does, it seems to me, lie a legitimate field for new and original essays in design; and I seriously suggest that it is at once the duty of the R.I.B.A. to encourage, train and foster such originality, but also to protect the public from ill-digested and free-lance attempts in this direction. I will join with Mr. Holland so far as to insist that a fundamental element in the production of any original forms of architecture is a reverence for, and a knowledge of, all that is summed up in the word "tradition." HUGH MACINTOSH

Preservation of Old Buildings

SIR,—I wonder what the extreme modernists in sculpture will have to say to the glowing words uttered by the S.P.A.B. in praise of the Anglo-American Oil Company's successful conversion of a Queen Anne building into up-to-date modern offices?

Lovers of England and English things will assuredly echo the words of praise. It was just after the Armistice that the finest architectural sites in England, and, to a lesser degree, Scotland and Ireland and Wales, began to be littered with buildings like cotton mills, square, straight, pseudo-efficient and undeniably hideous. No one, to be just, not even a modern poet, has ever claimed beauty for the new structures. All that has ever been said for them is that they were in the style of erections now going up in the United States, Sweden, or some other foreign country.

That is always enough for the sheep who are our modern generation. It is well that they should be reminded that Queen Anne, after all, is not dead.

ALFRED PRAGA

ARCHITECT'S FEES: COUNSEL'S OPINION

G. M. writes: "*I am in the midst of a dispute with some clients with regard to the payment of fees. After preparing unusually elaborate preliminary drawings and perspectives, with which at the time my clients expressed entire satisfaction, they have now decided to either abandon the scheme or employ another architect. They kept me waiting some months before conveying to me any such idea, and then inquired what I would consider a reasonable fee. Naturally, I sent them a copy of the R.I.B.A. Schedule of Professional Charges, and enclosed an account for services based thereon amounting to 1½ per cent. upon the estimated cost of the works.*

"*My clients then handed the matter over to their solicitors to deal with, and after I had tried to keep open the way to a friendly settlement, I have now had to instruct my solicitors to issue a writ for the amount of my account. It is at their request that I am now making investigations to try and find as many precedents as possible wherein the Courts have upheld our Institute's Schedule in such matters. What is your expert's opinion?*"

I am unable to discover a case where the Courts have taken judicial notice of the existence of the R.I.B.A. Schedule of Professional Charges, so that unless the charges are agreed to, either expressly or by implication by the parties, at the time of the formation of the contract, then in my view they will not govern the terms of the contract.

It appears that attempts have been made from time to time to induce the Courts to accept these charges as customary, but so far as I am aware, without success—see Gwyther *v.* Gaze (1875), Hudson on Building Contracts, 3rd ed., Vol. II. p. 21; Farthings *v.* Tomkins (1893), 9 T.L.R. 566. The observations of Lord Coleridge, C.J., in Burr *v.* Ridout (*The Times* Newspaper, February 22, 1893) set forth the position with clarity. In that case there was a dispute as to the fees to be paid to the architect owing to non-erection of the buildings on account of the high cost, but no provision was made in the contract for such contingency, and the question was whether the R.I.B.A. Schedule of Professional Charges would apply.

If the parties to that contract had not incorporated the said schedule as a term of the contract, then it would be necessary for the jury to decide what sum should be paid for the work and labour done, and they would not be bound to arrive at the same sum as the scale fixed by the R.I.B.A. The Lord Chief Justice said: "I will not allow the Institute to dictate to juries what sum is to be paid for work not done, and unless there is clear proof that they (the R.I.B.A. Schedule of Professional Charges) were part of the contract I will treat the rules of the Institute as mere waste paper."

On the other hand, Kennedy, J., in Whipman *v.* Evenlt (Roscoe's Digest of Building Cases, 4th ed., 171) has held that it is right to take into consideration the practice adopted by a large proportion of the profession as to what is a proper fee, and to use it as a guide in arriving at a reasonable sum.

I have dealt with the general law on the subject. The question for consideration is whether it applies to the facts before me. I observe, therefrom, that a writ has been issued, consequently there is an action pending, and the matter is *sub judice*. In the circumstances, I decline to express an opinion as to whether the general law governs the particular facts before me.

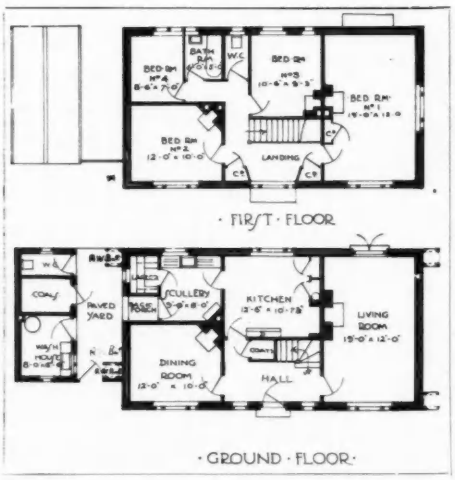
E. F. I.

HOUSE AT GREGYNOG

DESIGNED BY T. ALWYN LLOYD

THIS house at Gregynog, near Newtown, North Wales, is built of eleven-inch brickwork, finished with cement roughcast, with a light colour-wash, while the roof is covered with North Wales green slates. Goitre rough facing bricks have been used in constructing the chimney-stacks.

Wood casements of the type that open outwards in pairs in the centre are provided, to give the maximum of ventilation. The floors of the entertaining rooms and of the hall are of 1¼-inch pitch pine blocks, but the kitchen and scullery have tiled floors.



As will be seen from the plans, a paved yard leading to an isolated washhouse, coal store, etc., adds to the amenities in a very compact plan.

A general view from the south, showing entrance front.

The view from the west shows the isolated washhouse, etc., and the french windows which open from the dining-room to the garden.

The ground- and first-floor plans.

MODERN CINEMA DESIGN

Excerpts from Mr. J. R. Leathart's Lecture at the R.I.B.A.

A perspective drawing, by Laurence Wright, of the front of the new cinema at East Sheen (Leathart and Granger, architects). "Upward flooding of wall surfaces from concealed sources is combined with concentrated visible illumination in the cone-shaped urn at the top of the central bay feature, together with the neon sign title panel. Three distinct locations of light are arranged for—one at the top of the bay, one at its base, and one on the canopy top."

THE modern cinema in all its complexity of planning and equipment has been aptly described as the architecture of pleasure. It is therefore important in forming a critical opinion of this type of building to regard its appeal as being essentially directed to the great majority of average people who find in their picture theatres stimulation and pleasure in the atmosphere of warmth and comfort, of colour and decoration—exotic in many cases, it is true—as a contrast with the drab monotony of their daily routine.

The outstanding development of the modern cinema is in its mechanical equipment, both as regards heating and ventilation, and electrical installation. The science of acoustics is now realized to be of greater importance as a basis upon which the auditorium is to be shaped than the selection of the style for the interior decoration.

In the new East Sheen Cinema the volume per seat is 154 cubic feet. The ceiling is parallel with the floor; each has a rake of 1 in 10. The reverberation coefficients for this theatre are :

Full auditorium	..	1·0 seconds
2/3rd ,,	..	1·25 ,,
1/3rd ,,	..	1·5 ,,
Empty ,,	..	2·0 ,,

The rear walls only are lined with acoustic tiles, as absorbent surfaces. The talking film produces primary reverberations set up in the recording studio, which are in turn augmented by the reverberations set up within the auditorium itself. To reproduce the sound as originally taken, it is therefore desirable to eliminate these secondary or house reverberations as much as possible. This can be satisfactorily accomplished by reducing the volume to within the limits quoted previously; by the use of directional loud speaker horns behind the screen—the most common form adopted for talking apparatus installations—which can be adjusted to cover all seats; by the use of absorbents in the rear auditorium walls, and by thick carpeting on all floors with heavily upholstered seats. In addition to these precautions care should be exercised to eliminate the risk of parallel side-wall inter-reflection or flutter by absorbents either in the form of acoustic wall covering or by draping the walls with decorative banners or hangings. The fan-shaped auditorium, both in plan and section, counteracts to a great extent the tendency to acoustical imperfection, providing that the ratio of the rear auditorium width to the proscenium width is not excessive.

Usually the gallery front is on a level with the loud-speaker horns, and particularly if it is struck from a centre situated at the back of the stage there is a great risk of the gallery front returning the sound falling upon it in a concentrated form upon the loud speakers. This may cause echoes or stationary waves. To avoid this fault the front is better polygonal on plan, with three or more straight facets and inclined backwards on section. It is necessary, too, to consider the exclusion of noise from traffic outside the building; the insulation of the organ chamber from the structure of the main building itself, and the prevention of noise therefrom penetrating to adjoining property; the insulation of all moving machinery within the building, such as ventilation fans, generators and transformers. Solid brickwork in cement of adequate thickness is the remedy for the first two sources of weakness. The insulation of internal running machines is a matter of treatment with cork, rubber, or canvas, used as the contingencies dictate.

The volume of the auditorium of the Richmond Cinema is somewhat greater than at Sheen—170 cubic feet per seat. The atmospheric treatment of the interior decoration governs the high front portion, and this contributes to the increase in volume. The reverberation coefficients are :

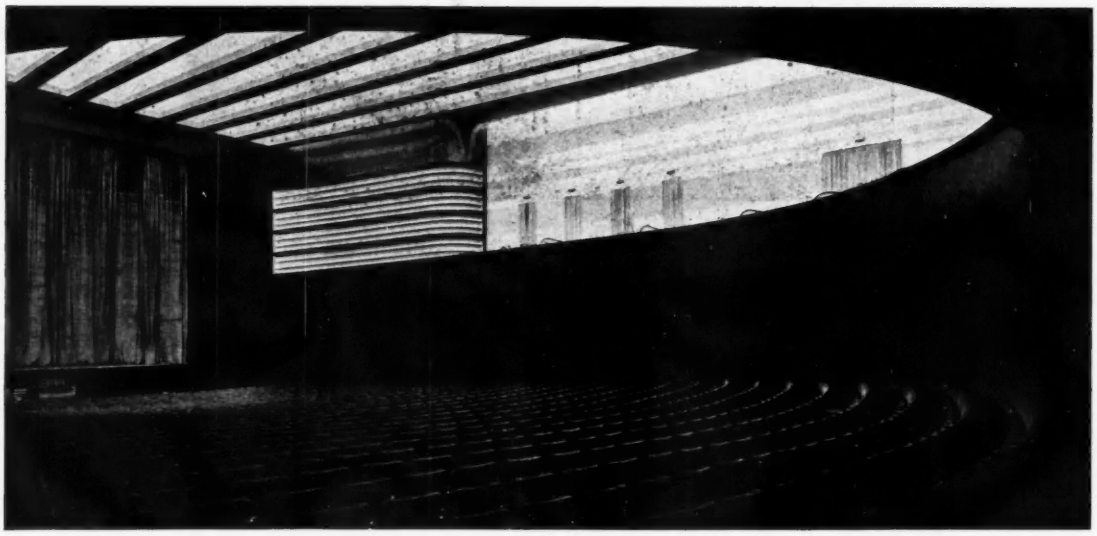
Full auditorium	..	1·5 seconds
1/3rd ,,	..	2·3 ,,
Empty ,,	..	3·4 ,,

The only absorbent is on the front of the transverse lighting gallery. The results are particularly satisfactory, as the loud speakers do not require excessive amplification to carry the sound to the rear seats. The introduction of sound reinforcing coves at the back of the auditorium contributes to this result.

The increasing tendency for kinemas to function equally as theatres must serve as a warning that too many absorbent surfaces in an auditorium will render the natural human voice and the orchestra somewhat lifeless in effect and create a tendency to flatten the tone thereof.

The safety of the public in places of entertainment must obviously be the first consideration, not only of the licensing authorities, but of the architect himself. Nevertheless, it has to be admitted that the English regulations considerably impede the imaginative and spacious planning we are accustomed to find in modern Continental work. Perforce must the English cinema be separated into compartments by means of cut-off fire-resisting doors and screens, and the cramped effect of passing through numerous doors to reach the balcony is apparent in all instances.

In cinema design the outstanding current tendency is to internationalize decorative forms. That is to say, the recognized architectural characteristics of each particular country are being gradually abandoned. Hitherto it has been possible broadly to place national tendencies with a certain amount of surety; for instance, the American passion for expressing architecture in terms of Roman orders, influenced by an almost unlimited expenditure of the dollar.



Consider for a moment the tendencies of recent English interior design. Since the Armistice there have been three definite phases: first, the Neo-Grec; second, what may be termed the umbrella period, under which were sheltered and nurtured the Chinese, Egyptian, Spanish, Italian and Tottenham Court Road styles; and third, the infiltration of Continental ideas, largely from French sources.

This confusion of thought, this inability to produce a reasonable standard of achievement, has been due to a great extent to the prevailing habit of English theatre architects of considering the decorative scheme as an afterthought, and then of requesting firms who deal in everything from frocks to furniture to submit schemes and prices for fibrous plaster and paint. The lowest tender is invariably chosen, irrespective of creative merit. As a result, our theatres are swamped with waves of fashion of miserable mediocrity. In but few instances are theatre architects individually responsible for the complete design and ensemble of their cinemas.

Chronologically, the Kensington Cinema belongs to the first post-war phase mentioned previously. It has all the paraphernalia of the Neo-Grec —coffers, entablatures, frets, rondels and the rest of the characteristic features of this style. It was opened five years ago, and, together with the recently opened New Victoria, demonstrates the extreme ends of the gamut of styles. In Mendelsohn's famous work, the Universum, Berlin, finality in elimination of decorative motifs and the possibilities of the integral use of light as definite elements in the treatment of the interior are vigorously demonstrated.

The outstanding point of difficulty in interior design is the treatment of the junction of the balcony front with the side walls of the auditorium. The spandrel-shaped wall surfaces formed by the rake of the balcony are only emphasized by elaboration. The common method of proportioning the wall treatment with applied architecture to suit the clear height from floor to ceiling in front of the balcony, if carried through to the rear of the auditorium, becomes truncated and excessive in scale as it passes the balcony. This is the primary defect in the use of pilaster and entablature as a continuous side-wall form of decoration.

The Skandia, Stockholm, has been described as the most beautiful theatre in the world. It is therefore interesting to observe the influence of the atmospheric type of interior of its treatment. As in all modern Scandinavian work, there is an extraordinary quality of aloofness of a clear, cold beauty, which is as national in expression as the music of these northern races.

The Universum, Berlin (Erich Mendelsohn, architect). "*Finality in elimination of decorative motifs and the possibilities of the integral use of light as definite elements in the treatment of the interior are vigorously demonstrated.*"

Welwyn Theatre, Herts, is an English example of the prevailing breakaway from tradition. This auditorium shape is based on acoustical considerations and is primarily dictated thereby. The ceiling acts as both a light and sound reflector.

The important aspect of the appearance of the kinema exterior at nightfall has only comparatively recently been appreciated to its full extent. There are three types of external illumination, the first where the light units are part of the structure of the design in which they are interwoven, as in the Titania-Palast, Berlin. In this case, except for the concentrated cornice lighting, the front is not flooded. The effect is obtained by contrasting horizontal illuminated panels with dark wall surfaces. The possibilities of this original treatment are apparent, and

point to a profitable field of invention in this direction.

The second type of night architecture is illustrated in the new Sheen Cinema. Upward flooding of wall surfaces from concealed sources is combined with concentrated visible illumination in the cone-shaped urn at the top of the central bay feature, together with the neon sign title panel. Three distinct locations of light are arranged for—one at the top of the bay, one at its base, and one on the canopy top. In addition, the canopy soffit is flooded and the light reflected from a "Staybrite" steel surface under. The effect of these light sources can be accentuated by using colour media in the flood lamps.

The third type of illumination is from within the building, through decorative windows or perforated grilles, as in the Piccadilly, Berlin; but the possibilities for conspicuous effect are somewhat restricted by this method.

There is the utmost conflict of opinion between cinema owners and their architects as to the amount of space on the front of the building which must be allocated to advertising matter. On the one hand, the claim is made that the man who runs a picture house is selling a film entertainment and must be allowed to advertise this fact on his building. From the architect's standpoint this necessity is admitted on principle, but he knows from bitter experience that the extent of the activities of the owner in this direction are by no means limited.

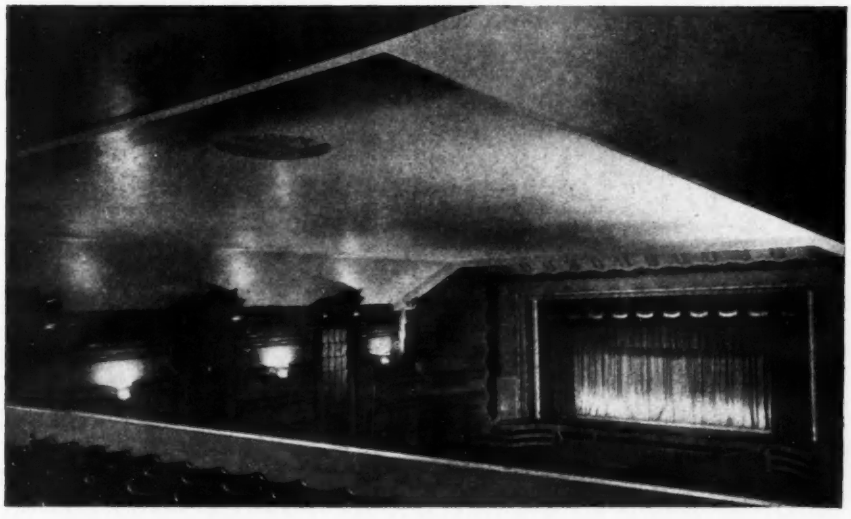
It is an ironic commentary upon the whole question of publicity that the prospective picture patron must be stunned by flashing lights, by crudely-painted scenic effects spread across the façade, perforated only to allow access to the entrance doors, and by 48-sheet posters printed in the most flamboyant colours known, before he can be enticed within the cinema. It is, in fact, entirely unnecessary to over-advertise; but American boosting methods in the film trade are accepted as the apotheosis of publicity in this country.

In the New Victoria Theatre the central entrance features have succumbed to the dictates of the promoters, and their clean vertical lines have been obliterated by the neon lettering at the top and the sprawling advertising frames below; this, despite the fact that reasonably adequate space has been provided by the architect for advertising purposes at eye level. This clash of wills between client and architect usually results in a victory for the former.

In practice an architect must realize that his employer cares not for his architecture, and would prefer his cinema façade to be a bill-posting station. A bylaw is urgently necessary to control cinema front advertising in our towns and cities; with the growth of a sense of civic dignity on the part of the public, this must assuredly come to pass.

There are some outstanding tendencies in the best modern cinema design which should be briefly recorded. The simplification of decorative form, together with greater use of illumination as an integral part of the design, is the most important. There is as yet no articulate expression of modernity in England. We are in this country going through a form of "Rake's Progress"; that is, the Continental scrap-heap is being raked for ideas; every passing fashion and whim is being seized upon, and there is much wandering into the wilderness of modern design without the sheet-anchor of architectural propriety—the classic order. Periods of tribulation usually precede those of happiness, and our travail will be worth while if we emerge therefrom with a national characteristic modern expression of English cinema architecture.

ESQUISSE FAVOURED



W. Yorks. Students' Debate

Initiated by associate members of the above society, a discussion took place at its Leeds headquarters on November 27, the question being whether esquisse design was essential to the furtherance of good architectural design. Mr. Allan Johnson occupied the chair.

Mr. D. Steel, for the affirmative, said he was in favour of the esquisse method because its object was to bring out as quickly as possible a student's ideas on a given subject in its most easily criticizable form. Esquisse had other qualities: it quickened powers of observance, and the subject always, whenever encountered afterwards, evoked a keener interest in its possibilities. He did not think that the method was sufficiently practised in schools of architecture.

Speaking in the negative, Mr. P. J. N. Penlington thought that the method prevailing in many architects' offices was far superior to that of the schools. Office practice made a greater appeal to him. Interchange of ideas among the staff was no only permitted but encouraged, and this resulted in a far better design being produced. The esquisse method was bad, because it required them to master the essentials of the subject, and make all necessary sketches, to produce a finished design in one day—a task which was almost impossible.

Mr. F. W. Allison, Mr. E. Seel, Mr. G. L. Broadbent, Mr. Norman Culley, Mr. Butler Wilson, and Mr. R. A. Easdale also spoke. Those present voted in favour of esquisse designing.

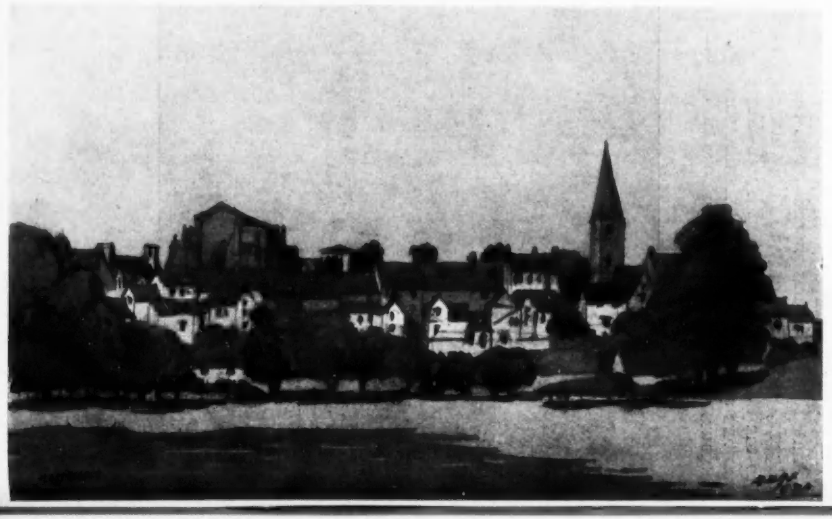
Welwyn Theatre, Herts. (L. de Soissons and A. W. Kenyon, architects). "An English example of the prevailing breakaway from tradition. This auditorium shape is based on acoustical considerations, and is primarily dictated thereby. The ceiling acts as a light and sound reflector."

THE SKETCH CLUB

SEVENTEENTH SESSION

A.A. MEMBERS' HOLIDAY SKETCHES

THIS is a "visitors' session." By kind permission of the artists concerned, a small, arbitrary selection has been made from this year's exhibition of holiday sketches by members of the Architectural Association. The show, open to all members, was remarkable for the variety of subjects and of media — etchings and even photographs were hung. Usually the one has happily dictated the choice of the other.



Among the essays that bear some relation to architecture, watercolours are in the ascendant, for there is nothing like your watercolour for realizing effects of atmosphere, and it appears that it is by the tricks of light on buildings that the architect is chiefly beguiled when, on holiday, his mind turns to his besetting art. The study of "Pontresina," by A. B. Yeates, is typical, in its soft brightness, caught in the moment of realization. The two by A. B. Knapp Fisher are particularly luminous; the originals are suffused with a rich, quiet, golden glow which black printing ink is quite powerless to suggest.

H. T. Brock Griggs's "In the City," a large etching (with some fascinating middle tones in aquatint) of the

The Salute, Venice.

Royal Exchange, might be termed an essay in cast shadows, and shows how even metal upon unyielding metal may be made to trace a particular mood.

There is the glow of the South about P. J. Westwood's "The Salute, Venice," charging with lemon and rose a study in form that is almost stereoscopic in its realization; and the colder light of the North about D. H. Beaty Pownall's "Copenhagen," accentuating its sharply expressed voids and solids.

In "Rue des Tonneliers," by H. W. Richmond, there is the authentic touch of the architect: pencil and brush trace a reliable record of forms and textures. The "Malta" of H. M. Fletcher does not reveal the burning Mediterranean of high summer, but is quiet in tone, with interest centred on the interesting shapes taken by the bastions and curtain walls. There is clever brushwork and some very hot colour in C. J. E. Marshall's "Sloop Inn, St. Ives" that shows the amenability of oils to certain purposes.

The feeling for form has guided the hand of Miss Raemakers, and the artist's economical mind has eliminated all but essentials. C. M. Shiner's "Venice" is frankly impressionistic, but shows judgment in the grading of pencil tones. Bruce Flegg's Brittany watercolour is one that suffers most by reduction to mere

black and white : even the shadows are luminous.

Casting back, I note that almost without exception, where figures are introduced, their drawing is weak, a common failing but remarkable, considering that much of the architect's life is spent devising backgrounds for the human form.

QUESTIONS THAT ARISE

Planning of School

F. G. C. writes: "*I have been consulted as to the planning of a building for use as a small private preparatory boarding school. Can you inform me as to what cubic space per head it is usual or desirable to allow in such a building for (a) dormitories, (b) class-rooms? Also, what works of reference should I consult on these and other points that arise in the design of such a building?*"

The information your correspondent desires is to be found in the old Building Rules of the Board of Education. These rules still form the basis on which plans should be prepared.

With regard to the building regulations for secondary schools, there must be a floor area of not less than 65 sq. ft. per child and the cubic space not less than 700 cubic ft. No dormitory should contain less than three beds, and there should be a space of at least 3 ft. between beds. In girls' schools it is desirable that for those over twelve years of age cubicles should be provided. These may be formed either by means of curtains or partitions, or a combination of both. In any case, the curtains or partitions should not be carried right up to the ceiling, and windows should be arranged on each side of the room so as to ensure cross ventilation. These windows should be provided with hoppers at the bottom, so that a constant stream of air may pass through the room during the night.

For classrooms, a space of no less than 16 sq. ft., and preferably 18 sq. ft., should be allowed. Desks should accommodate one scholar only, and it is best to have independent chairs and not a seat fixed to the desk. G. H. W.

Party Wall

G. Y. writes: "*How can I determine if the external wall of my house is a party wall?*"

The definition of a "party wall" under Local Authorities bylaws is as follows:

(*a*) A wall forming part of a building, and being used or constructed to be used in any part of the height or length of the wall for separation of adjoining buildings belonging to different owners, or occupied or adapted to be occupied by different persons.

(*b*) A wall forming part of a building and standing in any part of the length of such wall, to a greater extent than the projection of the footings on one side, on grounds of different owners.

The general rule is that the common user of a wall separating properties of different owners is presumptive evidence that the wall and the land on which it stands belong to the owners of those properties in equal moieties, as tenants in common.

When, however, the precise extent of the grounds can be ascertained, the presumption of a tenancy in common does not arise. A. T. A.

Wiring Thatched Roofs

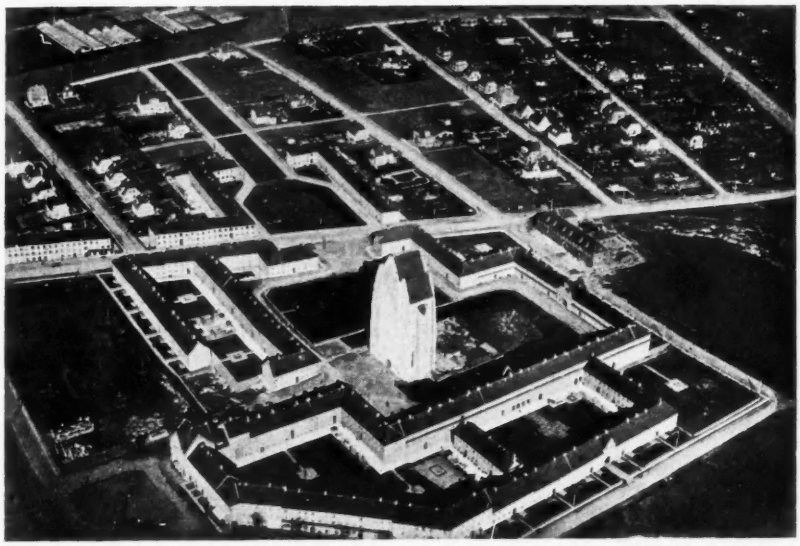
T. C. writes: "*I am having some cottages re-thatched and I wish to cover the roofs with galvanized wire netting to prevent damage by high winds and birds. What is the best method of securing the matting, especially in the valleys? What size of mesh should be used?*"

I would suggest using half-inch mesh galvanized rabbit wire. The most vital points to protect are the verge, the eaves, and the "roving" or capping, below which birds commonly enter. The thing to guard against in fixing is any spike or rod driven *down* through the thatch, which might afford an easy passage for wet. Wiring over the ridge may be bound through the roof from side to side with wire, and at the eaves and verge one end of the wiring may be stapled to the wall face and the other wired to the hazel pegs securing the runners.

Hips and valleys should be covered with a width of wiring laid in the direction of their intersection and wired to the edges of the netting covering the slopes. Any fixings necessarily driven into the thatch should be pushed in at a slightly upward slope so as not to conduct water. A. B.

COPENHAGEN, PAST AND PRESENT

IT is a little staggering to hear that the ordinary bicycle has played the most important part among improved means of traffic in the development of the outer districts of Copenhagen. When the period of scarcity of dwellings began after the world war, a great exodus took place to the "lots" of the so-called *Parcelforeninger* (lot-owners' associations), although these lots were far from being ripe for settlement. Since then it has been a great task for the associations as well as the authorities to straighten things out. The community has assisted greatly by granting public loans for the construction of roads and sewers.



In recent years the population has become infected with a keen desire for better homes, with the result that the standard of the houses and dwellings has, without legislation, been considerably improved. The great turning point occurred at the beginning of the present century, when three districts were annexed to the capital, providing the opportunity for housing a constantly increasing population in good open settlements under rural conditions.

In the outer districts of the city the *Parcelforeninger* embraces about 170 associations, representing about 13,000 lots. On all these lots, aggregating in total an area of about 2,500 acres, cottage restrictions are imposed. The regulation of the outer districts in accordance with the restrictive stipulations is not, however, limited to the lot-owners' associations. An open settlement, partly with serial houses

Plan of Settlement at the Grundtvig Church, Copenhagen. Only the tower of the church, designed by P. V. Jensen Klint, has yet been built.

and partly with various types of three-story houses, has also been secured on other areas owned partly by private persons and partly by the community. Among other districts are the quarters surrounding the Grundtvig Church (see illustration on this page) at Borups Allé and Genforenings Plads.

The most recent progress in dwelling culture in Denmark may especially be ascribed, as in other countries, to the fact that private building speculation was abolished completely during the building crisis which followed in the wake of the war. Not only was the municipal building activity far more guided by town-planning considerations than formerly, but a general condition for receiving municipal support was the fulfilment of corresponding requirements in respect of good and justifiable building plans.

In the older quarters of the city, five-story dwellings are prevalent, but here, too, a higher standard has been introduced by a change to the open-block type, with courtyards, gardens and playgrounds for the children. The municipal parks and the gardens open to the public cover an area of about 500 acres. In addition, there are the lakes lying within the city, which constitute a valuable supplement to the park areas. Further, a considerable number of parks are planned in the outskirts. It is the aim to provide as many resting places and playgrounds as possible. They are very highly frequented, especially in the interior quarters.

The environs afford also great possibilities for a fine comprehensive housing scheme, but it is evident that no central, harmonical and city-like development of Greater Copenhagen can be undertaken as long as the administration is parcelled out among so many hands.

Copenhagen: Development and Town Planning Conditions. Stadsingeniorens Direktorat Byplanafdelingen, 1930.

SOCIETIES AND INSTITUTIONS

WEST YORKSHIRE SOCIETY OF ARCHITECTS

"WHERE Are We Going?" was the title of a lecture delivered by Mr. H. S. Goodhart-Rendel, F.R.I.B.A., at a meeting of the above society. Mr. Norman Culley, F.R.I.B.A., presided.

The lecturer remarked that prophecy stood first among the dangerous trades, yet he did not shrink from foretelling what was likely to happen to architecture, and that was simply : what had happened to it before. Having arrived at what they thought was a new point, they forgot having been there before, and congratulated themselves upon an important advance.

The unvarying progresses of art had their own rhythm of shock and recoil. Folks who kept Lent rigorously were apt, after Easter, to spring back like a piece of elastic into greater indulgence than before. If the severity of present taste held out much longer there could be foreseen some amusing debauchery following upon it.

All fashions had their recurring phases. The feminine costume showed a definite, though still repressed, tendency to "billow." But no woman could billow in a drawing-room that looked like an operating theatre. One could not melt satisfactorily to the strains of Mendelssohn, seated in a chair made of large croquet hoops and indiarubber sheeting. Unless our modernist designers introduced a little fluff into the fabric of life, they would find themselves badly in the rear of the hasty retreat towards the well-padded dug-outs of the Victorian days.

Art was not exploration. There was no advantage in seeking new fields except where the old ones had become foul. What mattered most was, not who did a thing first, but who did it best. The ideas now put forward under the ugly name of "functionalism" were very old, but were now served up, flavoured with engineering.

The speaker thought that the next change would be toward "curliness," by which he meant ornament. The present asceticism could not last. It was the intolerable imposition of the few, not the free choice of the many. As far as living-rooms were concerned, one wanted to be something more than a mere blot upon a colour scheme. One wished to be a self-respecting person in enjoyable surroundings.

A just equilibrium between reason and fancy was the dream of the sanguine. At present there seemed no hope of such combination. Age and youth were at war. Our young architects were such fierce realists : our elder ones such whimsical romantics. If there existed an equilibrium, it was a deadlock between die-hards. One thing was certain : an architecture of reason alone could not subsist. Eliminate fancy, and one of architecture's choicest ingredients was lost.

Mr. G. H. Foggitt, F.R.I.B.A., in moving the vote of thanks, observed that the elder men had not been trained in the modern style, and so had only tradition to guide them. He agreed that there would be a rebound from functionalism when it had exhausted itself by the excesses into which it seemed to be drifting.

Mr. J. E. Stocks seconded the vote.

STOCKHOLM TOWN HALL

At a meeting of the Architectural Association, Mr. H. Austen Hall, F.R.I.B.A., read a paper on "The A.A. Excursion to Sweden and Denmark, 1930."

Mr. Hall said his first impression of the Stockholm Town Hall was one of complete harmony combined with endless invention in the diversity of its detail and the splendour of its decoration.

The treatment of the brickwork was unusual. The bricks themselves were very large and were not by any means what should be considered a good facing brick. But they were extensively chiselled on the surface by the use of pneumatic tools, a process described as "masonry," and Ragnar Ostberg, the

architect, recorded it as his opinion that a better effect was obtained by this means than if the bricks were purposely moulded.

The Town Hall of Stockholm was a great adventure in architecture, and one that was entirely successful. It was the essence of adventure that it might not be successful, but in this case we had the initial determination of all concerned that the best result alone would satisfy them, and to attain this result no hurried decisions were reached. The slowly ripening judgment of the architect was allowed to reach its matured conclusion. He was given complete control of everything, even to the smallest detail of equipment.

RENAISSANCE ARCHITECTURE

"Style and Fashion in Architecture" was the subject of a paper read by Mr. R. A. Duncan, A.R.I.B.A., to students at the Northern Polytechnic, Holloway, N.

Archæology, said Mr. Duncan, had proved that architecture and its attendant plastic and decorative arts provided a sure indication of the qualitative as well as the quantitative value of a civilization. The trained observer was able not merely to reconstruct a past social organization and economic system, but to deduce beliefs and compute moral worth even in the absence of any other evidence. Architecture responded with great sensitiveness to all those deep-rooted social impulses which were often but half understood at the time at which they occurred; the art represented a sort of reflex action.

If the whole range of development of an architecture was examined, a great number of variations and deviations from the main theme would be found, but it would also be apparent that the theme was not greatly affected by these vagaries. It would be noticed that some of them became merged into the line of development so as to be indistinguishable from it. The theme was called the style and the variations fashions.

The lecturer, who illustrated his remarks by many lantern slides, spoke of the Renaissance period and its connection with style and fashion. He continued by saying that Renaissance architecture was most vital in its early period before the complete domination of the individual architect was established in design. While the craft schools, a legacy of the Middle Ages, were still an important element in building activities, classical forms were used as so much design material. With the growth of more definite knowledge about the Classical World, and as it became more and more possible to apply that knowledge to an exact reproduction of a past manner of living, so it declined as the real source of inspiration. The knowledge did not then help the arts, the reason being that it was, humanly speaking, impossible to recapture a concept that had been superseded, still less an emotion based on it. The Renaissance was more susceptible to the fluctuations of fashion than any previous historical style, except, perhaps, that of Imperial Rome. The causes were the natural tendency of autocracy to dictate form and the unreasoned copying of a court entourage and the lesser gentry, and also, perhaps, even more (its opposite) the individualism of artists who acquired momentary vogue. England, by comparison with France, had far less continuity. There were striking fundamental dissimilarities between the work of Jones, Wren, Vanbrugh and Gibbs. There was a big window style and small window style—Palladian, Baroque. The travels of architects were less important in French development than they were to England, but the sum-total effect of developments which were the true growth of architectural style approximated to the same end in all European countries at the close of the Renaissance in spite of fluctuations of fashion. There was an underlying European style of which it was possible to see the evolution and which would sooner or later be the expression of the Atlantic culture as a whole. The breakdown of the Renaissance tradition occurred more or less simultaneously in all countries for the reason that they were bound by the same cultural bonds expressing themselves in similar economic systems and social institutions.

The most fundamental thing that was established at the Renaissance was the right of the individual to acquire knowledge for himself and freedom to choose the source.

HOUSING AND TOWN PLANNING CONFERENCE

At the National Housing and Town Planning Conference, held at Blackpool, a resolution was passed welcoming the promise of a Bill to extend town-planning powers, and to secure rural amenity.

Dr. Raymond Unwin, F.R.I.B.A., in addressing the conference, said it was essential for the welfare of the country that there should be legislation this year, in order to co-ordinate industrial and housing development, and so prevent the whole countryside from being ruined by haphazard and sporadic development, which was greatly encouraged by improved transport. It was also necessary that the areas to which the slum clearance people were to be removed should be planned in advance. Among the chief amendments to the Town Planning Act required, he suggested, were the following:

1: Power to be given for regional or joint town-planning authorities to prepare effective regional schemes, without prejudice to the rights of the individual local authorities to prepare supplementary schemes in greater detail for their respective areas. Where the schemes of the individual local authorities have been first prepared, the regional authorities to be entitled to prepare supplementary schemes dealing with the larger regional matters. 2: Power to be given for both joint regional and local town-planning schemes to include a provision enabling development or redevelopment schemes to be made for particular areas for the purpose of facilitating and controlling the more detailed layout and supplementary zoning of these areas, as they become ripe for development; or for the redevelopment on similar lines of decaying or badly planned areas. 3: Facilities to be given for such development or redevelopment schemes to be prepared by the regional or local authorities, or to be submitted by groups of owners controlling, say, not less than two-thirds of the area included, for approval and adoption by the planning authorities, subject in the usual way to the approval of the Ministry of Health. 4: Town planning powers, as above amended in regard to administration, to be extended to apply generally to all land whether likely to be used for building purposes or not. 5: The powers of zoning under town-planning schemes should be extended.

Mr. F. W. Platt said that in 100 years Manchester had spent £4,500,000 in street improvements, because she never had a town plan.

Sir Theodore Chambers, in presenting a memorandum prepared by the Garden Cities and Town Planning Association, discussed the most suitable organization to inaugurate and control such schemes as the formation of a statutory development board on the lines of the Central Electricity Board. He did not think either unassisted private enterprise or the normal machinery of the local authorities was adequate. It was at the same time essential that any organization set up should be closely linked to the local authorities, which were the recognized town-planning bodies. The most suitable body would be a "board" constituted somewhat on the lines of the Central Electricity Board or the London Traffic Board. It might be assured of the sympathetic assistance of the Ministries of Health, Transport, and Agriculture, and be given a status that would overcome many of the objections that might otherwise be raised, owing to the inevitable dangers

of large-scale freehold ownership unless suitably controlled.

Other memorandums were presented on "The Different Renting under the Housing Act, 1930"; "The Present Housing Situation in England and Wales"; and "The Housing Act, 1930: Improvement Areas and the Model Bylaws," by Mr. E. D. Simon, M.P., Mr. John G. Martin, and C. Kellick Millard, M.D., respectively.

ROMANESQUE ARCHITECTURE IN FRANCE

Sir Banister Fletcher, P.R.I.B.A., lecturing at the Central School of Arts and Crafts on Wednesday last, described the Romanesque Architecture in France.

There were, he remarked, few such buildings in France except those left by the Romans, and these largely influenced the main character of French architecture during the Romanesque period of the mediæval style.

THE CHARTERED SURVEYORS' INSTITUTION

By Order of His Majesty's Privy Council an application for permission to change the name of the Surveyors' Institution to "The Chartered Surveyors' Institution" has been approved.

REGISTER OF ARCHITECTS AND STUDENTS

The R.I.B.A. has drawn attention to the fact that at 9 Conduit Street, W.1, two registers are kept: (1) containing the names of advanced students of recognized schools, and (2) containing the names of architects willing to take such students.

The intention is in this way to assist advanced students up to the stage of the completion of their qualifications for exemption from the Final Examination; one of the qualifications for exemption from the Final Examination being twelve months' experience in an office during the fourth and fifth years of the school course.

The Council hope that general use will be made of the registers, and that as many architects as possible will send their names to be placed on the register.

ANNOUNCEMENTS

Mr. Arnold Inman, of 5 Paper Buildings, Temple, has been appointed by the Home Secretary as a member of the Tribunal of Appeal under the London Building Acts. Mr. Inman is a well-known member of the Western Circuit.

Mr. William Walter Wood, F.R.I.B.A., M.I.STRUCT.E., has temporarily transferred his Plymouth office to Oversound House, Down Thomas. Telephone Number: Plymstock 176Y. His London address remains 257 Oxford Street, W.1, but the Telephone Number has been changed to Mayfair 1071.

[For list of Competitions see last issue.]

THE ARCHITECTS' DIARY

WEDNESDAY, DECEMBER 3

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Exhibition of photographs of buildings visited on the A.A. Excursion to Sweden and Denmark. Until December 20.

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "The Building of the Mansion House." By Sydney Perks, F.S.A., F.R.I.B.A., F.S.I. **8 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "French Mediæval Architecture: The Gothic Period—The Cathedrals." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Second of three public lectures on "Stockholm and Its Environs." By A. M. Wijk. (Lantern Illustrations.) **5.30 p.m.**

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. At the Swedenborg Hall, 20 Hart Street, Bloomsbury, W.C.1. Sessional Meeting. "The Cost of Operating Industrial and Private Electric Generating Sets compared with Public Supply." By E. G. Phillips, M.I.E.E., A.M.I.MECH.E. **7 p.m.**

EXHIBITION OF MODELS OF OLD LONDON. At the Golden Cross Hotel, Strand, W.C.2. The models are the work of John B. Thorpe. **2.30 p.m.**

THURSDAY, DECEMBER 4

WEST YORKSHIRE SOCIETY OF ARCHITECTS. At the College of Art, Leeds. General Meeting. "Places of Entertainment." By W. Milburn (Jun.), B.SC., F.R.I.B.A., F.S.I. **7 p.m.**

GEFFRYE MUSEUM, Kingsland Road, Shoreditch, E.2. "Tudor Houses and Furniture." By C. H. B. Quennell, F.R.I.B.A. **7.30 p.m.**

VICTORIA AND ALBERT MUSEUM, Cromwell Road, South Kensington, S.W.7. Lecture Theatre. "Symbolism in Mediæval Art." By Dr. G. G. Coulton, F.B.A. **5.30 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Yates Lectures. Last of a course of eight public lectures on "Greek Myths and their Representation in Art." By Professor A. E. Gardner. (Lantern Illustrations.) **5 p.m.**

LONDON MASTER BUILDERS' ASSOCIATION. Annual Dinner to be held at the Connaught Rooms, Great Queen Street, W.C.2. **7 p.m.**

SOCIETY OF ANTIQUARIES, Burlington House, S.W.1. Ordinary Meeting. **8.30 p.m.**

FRIDAY, DECEMBER 5

INSTITUTION OF MECHANICAL ENGINEERS, Storey's Gate, Westminster, S.W.1. "Machinery and Methods of Manufacturing of Sheet Glass." By Professor W. E. S. Turner. **6 p.m.**

SATURDAY, DECEMBER 6

Sunrise, 7.49 a.m. Sunset, 3.52 p.m.

INSTITUTION OF STRUCTURAL ENGINEERS. Lancashire and Cheshire Branch. Annual Dinner and Dance, to be held at the Grand Hotel, Aytoun Street, Manchester.

MONDAY, DECEMBER 8

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Cantor Lecture III. "Modern Domestic Scientific Appliances: Miscellaneous Devices." By Professor Charles R. Darling, F.I.C., F.INST.P. **8 p.m.**

TUESDAY, DECEMBER 9

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. Manchester and District Branch. At Milton Hall, Deansgate, Manchester. Paper by P. G. Fairhurst, M.A., A.R.I.B.A. **7 p.m.**

WEDNESDAY, DECEMBER 10

CHARTERED SURVEYORS' INSTITUTION. Annual Dinner of the Quantity Surveyor Members, to be held at the Connaught Rooms, Great Queen Street, W.C.2. **7.30 p.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "Persian Textiles." By A. L. B. Ashton. **8.30 p.m.**

INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Informal Meeting. "Atmospheric Pollution Due to Combustion of Fuel, and Methods of its Prevention." By John S. Owens, M.D., A.M.INST.C.E. Chairman: Sydney B. Donkin. **6 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "French Mediæval Architecture: The Gothic Period—Rheims Cathedral." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Last of three public lectures on "Stockholm and Its Environs." By A. M. Wijk. (Lantern Illustrations.) **5.30 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS. Lancashire and Cheshire Branch. At the College of Technology, Manchester. "Methods of Securing Masonry to Framed Buildings." By E. G. Warland, A.INST.S.E. **7 p.m.**

THURSDAY, DECEMBER 11

SHEFFIELD, SOUTH YORKSHIRE AND DISTRICT SOCIETY OF ARCHITECTS AND SURVEYORS. At the University, Sheffield. "Maltese Architecture." By Professor L. P. Abercrombie, M.A., F.R.I.B.A. (Tea, 5.30 p.m.) **6.15 p.m.**

GEFFRYE MUSEUM, Kingsland Road, Shoreditch, E.2. "Old English Furniture and the Men Who Made It." By Ingleson C. Goodison. **7.30 p.m.**

THURSDAY, DECEMBER 11 (*continued*).

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "The Æsthetic Side of Structural and Constructional Engineering." By Howard Robertson, F.R.I.B.A. South Wales and Monmouthshire Branch. Visit to works of Braithwaite & Co. (Engineers), Ltd., Newport. **6.30 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. Dundee Sub-Centre. At the University College, Dundee. "Electricity and Mining—A Story of Progress." By A. V. Reis. **7.30 p.m.**

FRIDAY, DECEMBER 12

FACULTY OF ARCHITECTS AND SURVEYORS. Fourth Annual Dinner to be held at the Hotel Metropole, Northumberland Avenue, W.C. 6.45 for 7.15 p.m. **6.45 p.m.**

ILLUMINATING ENGINEERING SOCIETY. Visit to the Chiswick Works of the London General Omnibus Co., Ltd., at 4 p.m. A meeting will be held in the Lecture Theatre of Holophane, Ltd., Elverton Street, Westminster, S.W.1, at 6.30 p.m., when a paper on "Glasses for Use with Invisible (Ultra-violet and Infra-ray) Rays," illustrated by demonstrations, will be read by Dr. S. English. **4 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS. Western Counties Branch. At the Merchant Venturers' Technical College, Unity Street, Bristol. "A Comparative Study of Retaining Walls." By E. S. Andrews, B.SC., M.INST.C.E. 7.30 p.m. Midland Counties Branch. At the Chamber of Commerce Buildings, New Street, Birmingham. Discussion on: "Some Problems in the Design of Roof Members," to be opened by A. C. Ansell, B.SC. 7 p.m. **7 p.m.**

BOROUGH POLYTECHNIC, Borough Road, Southwark, S.E.1. Exhibition of Students' Work. 6 to 9 p.m. (Saturday, December 13. 2 to 9 p.m.). **6 p.m.**

SATURDAY, DECEMBER 13

Sunrise, 7.57 a.m. Sunset, 3.51 p.m.

INSTITUTION OF ELECTRICAL ENGINEERS. North-Eastern Centre. At the Armstrong College, Newcastle-on-Tyne. Informal Discussion on "Heating in the Home." **7 p.m.**

MONDAY, DECEMBER 15

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Pantomime (until December 18 inclusive).

WEDNESDAY, DECEMBER 17

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "French Mediæval Architecture: Fortified Towns, Castles, Hotels-de-Ville." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

THURSDAY, DECEMBER 18

INSTITUTION OF ELECTRICAL ENGINEERS. Teesside Sub-Centre. At the Cleveland Technical Institute, Middlesbrough. "Surge Investigations on Overhead Line and Cable Systems." By S. W. Melsom, A. N. Arman, B.SC. (ENG.), and W. Bibby, B.SC. (ENG.). **7 p.m.**

SATURDAY, DECEMBER 20

Sunrise, 8.2 a.m. Sunset, 3.53 p.m.

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. Manchester and District Branch. Visit to Partington Gas Works.

SATURDAY, DECEMBER 27

Sunrise, 8.5 a.m. Sunset, 3.57 p.m.

WEDNESDAY, JANUARY 7, 1931

INSTITUTION OF STRUCTURAL ENGINEERS. Lancashire and Cheshire Branch. At the Engineers' Club, Albert Square, Manchester. Paper by J. Theo. Halliday, F.R.I.B.A. **7 p.m.**

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. At the Swedenborg Hall, 20 Hart Street, Bloomsbury, W.C.1. "Notes on the Theory of Radiant Heating." By C. G. Heys Hallett, M.A. **7 p.m.**

THURSDAY, JANUARY 8

SHEFFIELD, SOUTH YORKSHIRE AND DISTRICT SOCIETY OF ARCHITECTS AND SURVEYORS. At the University, Sheffield. "Some New Buildings in Sweden and the Stockholm Exhibition." By E. R. Jarrett, A.R.I.B.A. (Tea, 5.30 p.m.) **6.15 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "Thames House." By R. Travers Morgan, A.M.INST.C.E. **6.30 p.m.**

FRIDAY, JANUARY 9

INSTITUTION OF STRUCTURAL ENGINEERS. Annual Dinner to be held at the Mayfair Hotel, W.1. 6.45 for 7.15 p.m. Midland Counties Branch. At the Chamber of Commerce Buildings, New Street, Birmingham. "Some Considerations Affecting the Construction and Reconstruction of Bridges in Urban Areas." By E. R. Knight, A.M.INST.C.E. 6.30 p.m. **6.30 p.m.**

MONDAY, JANUARY 12

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. "Modern Painters." By R. Wilenski. 8 p.m. Exhibition of Examples of Modern Painting. Until January 24. **8 p.m.**

TUESDAY, JANUARY 13

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. London and District Branch. At the Borough Polytechnic, Borough Road, Southwark, S.E.1. "Concealed Floor Heating." By John H. Francis. 7 p.m. Manchester and District Branch. At the Milton Hall, Deansgate, Manchester. "Hot-Water Heating." By R. Thorp. **7 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. North Midland Centre. At the Hotel Metropole, King Street, Leeds. "Surge Investigations on Overhead Line and Cable Systems." By S. W. Melsom, A. N. Arman, B.SC. (ENG.), and W. Bibby, B.S. (ENG.). **7 p.m.**

OBITUARY

HAROLD BAILEY

WE regret to record the death of Mr. Harold Bailey, F.R.I.B.A., of Malden.

Mr. Bailey, who was 68 years of age, was an authority upon town planning, estate development and the design of golf courses; he was responsible for the layout of the Malden Golf Links and the design of the club house, as well as the Coombe Hill Golf Club house.

He was first elected to Malden Council in 1906, and retained his seat until his retirement in 1921.

JOSEPH C. MAXWELL

Mr. Joseph Charlton Maxwell, F.R.I.B.A., a partner in the firm of Messrs. Stienlet and Maxwell, architects, of Newcastle, died recently, after a short illness.

Mr. William Henry Shepstone, of Nailsea, Somerset, architect, left £3,084 (net personalty £214).

LAW REPORT

RIGHT TO DAMAGES FOR DELAY FROM SUB-CONTRACTOR

Dawnay and Sons, Ltd. v. *Holloway Bros. Court of Appeal. Before Lords Justices Scrutton, Greer and Slesser*

THIS was an appeal by the defendants, Holloway Bros., of The Wharf, Grosvenor Road, Westminster, S.W., from the judgment of Mr. Justice Branson in the King's Bench Division in favour of the plaintiffs, Messrs. Archibald D. Dawnay and Sons, Ltd., of Steelworks Road, Battersea, on a preliminary issue in the action.

The action was brought by Messrs. Dawnay and Sons to recover a sum of £2,000 they alleged to be due from the defendants under a contract of August, 1928, for work and labour done.

The defendants were the main builders and contractors to build the Masonic Peace Memorial in Great Queen Street, and they employed the plaintiffs, Messrs. Dawnay and Sons, as sub-contractors for a great deal of the iron work. There was a provision in the sub-contract under which the plaintiffs were liable for certain liquidated damages for delay, and there was a corresponding penalty exacted under the head contract with the building-owners. There was some delay on both sides, but in the events which had happened, the defendants, under the head contract, had not been compelled to pay any damages, the architect having extended their time. The defendants by their defence to the plaintiffs' action admitted that the amount sued for was due, but said that as the plaintiffs had failed to carry out the contract in the stipulated time the sum of £2,000 was due to them from the plaintiffs by way of liquidated damages and for this amount they counter-claimed. In answer to the counter-claim the plaintiffs contended that as the defendants had not in the circumstances had to pay any penalty to their building-owners, that put an end to the question of damages so far as the plaintiffs were concerned. The question whether that was so or not was the preliminary issue now before the Court for trial.

Mr. Justice Branson decided the point in favour of the plaintiffs, holding that the damages could only be recovered from the plaintiffs if the penalty was exacted under the agreement between the defendants and the building-owners. As the penalty had not been exacted the preliminary point, he said, must be decided in favour of the plaintiffs, Messrs. Dawnay and Sons. From this result Messrs. Holloway Brothers now appealed.

At the conclusion of the arguments the Lords Justices held that Mr. Justice Branson had come to a proper conclusion and dismissed the appeal.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors, specialists and sub-contractors for the buildings illustrated in this issue :

Adelphi Theatre, Strand, W.C.2 (pages 824, 828–830). General contractors, Pitcher Construction Co., Ltd. Sub-contractors : Lalique (Breves, Ltd.), decorative lighting effects ; Strand Electric and Engineering Co., Ltd., lighting installation and stage equipment ; Lift and Engineering, Ltd., revolving stage; Theatre Equipment, Ltd., seating; Clark and Fenn, Ltd., fibrous plaster; Hall and Dixon, Ltd., tapestry and decoration; Sinnott, and Marshall & Co., sanitary fittings; E. B. Bain & Co., ventilating and plenum; John Stubbs and Sons, marble; T. F. Firth and Sons, Ltd., carpets; Merryweather and Sons, Ltd., safety curtain and fire protection; Morris Singer, Ltd., Oram handrail; Golding and Truelove, metalwork; Hitchins Laminated Wood Products, Ltd., woodwork; Rheocrete Pumice Stone Slab Co., Ltd., partitions; R. Fox and Sons, spray bronzing; New Systems Private Telephones (London), Ltd., " Princeps " electric clock; St. Mary's Wharf and Cartage Co., Ltd., demolitions.

Alderley Edge Festival Hall (pages 831–836). General contractors, I. Massey and Sons. Sub-contractors : James Bennett and Son, steel roof principals and steel frame and gearing of movable floor; Henry Hope and Sons, steel window; Christie Patent Stone Co., artificial stone; Risboro Furniture, Ltd., seating; Morrison, Ingram & Co., sanitary fittings; Frank Wood & Co., electric lighting; Hindshaw & Co., fibrous plaster; Geo. Wragge & Co., marquise; Saunders and Taylor, heating and ventilating; Hollis Bros. & Co., Ltd., wood-block flooring; G. Broadbent, curtains, etc.

FACULTY OF ARCHITECTS AND SURVEYORS

On Saturday, November 21, about fifty members of the Faculty of Architects and Surveyors visited the brick-making works of Messrs. Vimax Machinery Co., Ltd., Nutfield Road, Merstham, Surrey. The party left Westminster, by saloon coach, for Croydon, where the visitors broke the journey for luncheon at the Red Lion Hotel, at the invitation of the directors of the company. On arrival at the works the visitors were given the opportunity of touring the works either with the guides or otherwise. The writer took the former course. In the first instance the party were shown the automatic " Vimax " brick-making machine in operation. This machine, it is claimed, has a normal output of 2,400 bricks per hour. Here, after the correct proportions of sand and cement had been fed to the mixing chamber adjoining, and sufficient water added, the bulk material, in a semi-dry state, was charged to the moulds in predetermined quantities, each brick being mechanically consolidated under pressure of about 1½ to 2 tons. After pressing, the bricks were delivered to the platoons, which are carried on the machine by a roller conveyor; they were then placed in specially designed crates and removed to the setting sheds. The bricks are standard size, but, on changing the moulds, they may be varied, within limits, to various sizes.

Then on to the sand-pits—covered by thirty feet of water—where the sand, comprised of practically pure silica, is sucked up by means of a pontoon pump and deposited into bins. It is then conveyed to the mixing shed, where the cement and colouring content is added; thence delivered to the machine. Although when inspecting the sand, it was raining hard, the visitors were not in the least dismayed and showed extreme interest by plying the guides, Commander Gibson and Messrs. C. and G. MacKenzie, with many questions. The writer asked how long the supply of sand would last, and he was informed that it would be anything from twenty to thirty years. The shed where the finished bricks are stored was next visited : bricks of many different hues meet the demand for brilliant colours, which is the keynote of modern decoration. Commander Gibson stated that one could have any coloured bricks, even yellow with green spots ! Lastly, a workman demonstrated how the bricks could be cut to any shape or size by means of a trowel.

In conclusion, the following paragraph may be quoted from the firm's booklet : " The walls of houses built of ' Vimax ' bricks have shown no penetration of moisture under the severest weather tests; the bricks ' breathe,' that is to say, they have the same facility to absorb moisture as good clay bricks, and do not encourage condensation on the surfaces of inner walls."

K.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The Middlesex County Education Committee has approved of the proposal of the Brentford and Chiswick D.C. to provide a new elementary school for 250 infants on a site in Boston Road, BRENTFORD, at a cost of £8,825.

The Accommodation Sub-committee of the London Education Committee recently recommended that public notices be issued of the Council's intention to provide new elementary schools at BRIXTON for 1,300 children; at CLAPHAM PARK for 500 children; and at STREATHAM HILL for 400 children.

The Surrey Education Committee is to proceed with the erection of an elementary school on the Brickfields site, CHEAM.

A scheme for converting the Grand Music Hall, CLAPHAM, S.W., into a cinema is to be proceeded with.

The L.C.C. has informed the Lewisham Council that the Minister of Transport is prepared to make a grant towards the cost of rebuilding the Ladywell Bridge, LEWISHAM, S.E., which is estimated at £61,000.

The designs of Messrs. Swan, Norman and Clay have been adopted for an extension of the Darrell Road school, RICHMOND.

Plans passed by the SLOUGH U.D.C.: Eighteen shops with flats over, Bath Road, Cippenham, for Mr. W. Varney; fifteen houses and shops, Uxbridge Road, for Mr. C. W. Burcher (subject to combined drainage agreement); two shops with flats over, Farnham Avenue, and two shops with flats over, Woodland Avenue, for Mr. W. Warren; eight houses, Furnival Avenue, for Messrs. Smart and Fretwell; seven houses, Carlisle Road, for Mr. A. F. Williams (subject to combined drainage agreement); two houses off Woodland Avenue, for Mr. A. F. Williams (subject to combined drainage agreement); two houses, Farnham Road, for Messrs. W. Stevens and Sons; house, Leeds Road West, for Mr. A. F. Williams; house and garage, Farnham Avenue, for Mr. A. H. Hillier; bakehouse, Bath Road, Cippenham, for Mr. Cork.

The cost of building thirty-six flats in Garratt Lane, STREATHAM, is estimated at £21,205, and the fifty-one flats to be built in Fountain Road, TOOTING, will cost £33,452.

The enlargement of the THORNTON HEATH Baths is to cost £34,400.

The WEST HAM T.C. has received sanction from the Electricity Commissioners to borrow sums amounting to £63,840 for rental wiring scheme, building work and provision of sub-stations.

EASTERN COUNTIES

We are informed that the site of the Post Office, DOWNHAM, Norfolk, has been sold for the erection of a cinema and dance hall. Messrs. J. Laurie Earnell and W. Dymoke White are the architects.

The SCUNTHORPE U.D.C. is to purchase approximately forty-two acres of land from Sir Berkeley Sheffield, Bt., for extension of the Council's housing estate. The estimated cost is £1,440.

The SOUTHEND Council has approved the purchase of a site of 18½ acres of land for the Boys' High School, Southend. The land is part of the Earl's Hall estate, Prittlewell.

SOUTHERN COUNTIES

Plans have been prepared by Henry G. Baker, for a new kinema to be erected on a site in Ockford Road, GODALMING, for County Cinemas, Ltd. The new theatre will have seating accommodation for 1,500 persons.

After a delay of nearly a year, the HOVE Education Committee has decided on the erection of a new school on the Knoll housing estate. The portions of the school to be proceeded with will be of one story, and will consist of a central entrance block, two halls, twelve class-rooms, and a combined woodwork and metalwork centre. There will be accommodation for 568 children, and the cost will be £21,317.

SOUTH-WESTERN COUNTIES

The Black and White Coaching Co. has given instructions for the preparation of plans for a coaching station, to be erected on a site of three acres of land at CHELTENHAM.

Plans passed by the HURSLEY R.D.C.: House, Northend Road, Chandler's Ford, for Mr. D. W. Birch; alterations to bungalow, Ford Avenue, Chandler's Ford, for Mr. C. E. Ford; house, Winchester Road, Chandler's Ford, for Messrs. Jackson Bros.; pair of semi-detached houses, Ford Avenue, Chandler's Ford, for Mr. F. C. Baker; bungalow, Park Road, Allbrook, for Mr. Rickman.

MIDLAND COUNTIES

Mr. W. E. Sanders Salt is to apply at the December Sessions of the Public Entertainments Committee for approval for the erection of a kinema on the Beeches estate, Yardley Road, ACOCK'S GREEN.

The HINCKLEY R.D.C. has decided to purchase 6·4 acres of land on the Gravel Pit Farm at Barwell, as a site for the erection of further working-class dwellings, at an agreed price of 2s. 6d. a square yard net.

The Ministry of Health have sanctioned HINCKLEY R.D.C.'s proposal to erect 118 more houses of the non-parlour type, and these will be allocated to the various parishes as follows: Burbage, thirty houses; Sharnford, six; Sapcote, twelve; Golding, eight; Earl Shilton, fifty; Stoney Stanton, twelve.

The LEICESTER Corporation is recommended to build 150 houses on the Braunstone estate, at a cost of £63,915.

NORTHERN COUNTIES

The directors of the King's Theatre, Waterfoot, have acquired the whole of the land and buildings of the Kozy Cinema, Burnley Road, BACUP, on which they propose to erect a new super-cinema. Local architects were recently asked to submit designs in a limited competition. The designs are now being considered.

The Palace Theatre, BARROW, was closed recently in preparation for reconstruction work, at a cost of £10,000. The interior will be gutted and rebuilt with seating accommodation for 1,300 people. There will be a new front entrance, with also an entrance in Forshaw Street. It is hoped to reopen in three months' time.

Messrs. Cowe and Lawson are preparing plans for a new cinema to be erected at ESTON, near Middlesbrough.

The LIVERPOOL City Council recently debated the housing problem as it concerns overcrowding in the north end of the city, and has decided to purchase a site near the Bootle boundary, at a cost of £20,000, for the erection of 200 tenement dwellings.

Inquiries are being made of NEWCASTLE Municipal Housing Committee, regarding the possibility of the committee selling or leasing a site on the Cowgate estate, for the purposes of a kinema. The committee is to give further consideration to the proposal before announcing its final decision.

Representatives of the Corporations of SOUTH SHIELDS and TYNEMOUTH, meeting in private at South Shields, decided to recommend the construction of a tunnel under the Tyne between North and South Shields, at an estimated cost of £1,240,000. A deputation was appointed, comprising members of the two Corporations, to ask the Minister of Transport to make a grant of 90 per cent. towards the cost of the scheme. The remaining 10 per cent. would be borne by the two boroughs.

Plans for the cinema to be erected for J. H. Stansfield at St. Petersgate, STOCKPORT, are to be submitted to the authorities for approval at an early date. The architect is John Knight, F.R.I.B.A., and the cost £27,000.

The SUNDERLAND Corporation has under consideration a scheme for transforming Roker and Seaburn into what is hoped to be one of the finest seaside resorts in the country. Included in the general scheme are plans for the erection of a super-cinema near the sea front, as well as hotels, shops, cafés and boarding-houses.

SCOTLAND

At a meeting of the Public Health Committee of the ABERDEEN County Council it was decided that the building of workmen's houses, in various districts, under the Housing Acts, should be proceeded with as follows: Bridge of Don, twenty houses; Aboyne, six; Lumphanan, four; Torphins, six; Old Deer, four.

The CAMPBELTOWN T.C. has adopted a scheme, the plan for which has been prepared by Mr. Brodie, for the widening of Askomil Walk so as to form a promenade. The total cost is estimated at £56,000.

Among petitions granted at a sitting of the EDINBURGH Dean of Guild Court were the following: Four bungalows, Strachan Road, Blackhall, for C. H. Dunlop; house, Castle Avenue, Corstorphine, for Mr. P. Macdonald; two bungalows and two garages, Observatory Road, Blackford Hill, for Mr. W. Patterson; additions, Leith Nautical College; two cottages and two garages, Milton Road, Portobello, for Mr. J. Macdonald.

In connection with the slum-clearance scheme of the FELLING Council, the architect has submitted plans of the various types of houses needed to re-house the displaced tenants. A detailed statement is to be prepared, showing how an economic rent can be worked out, on a suggested basis of 100 houses.

A site at Netherlee Road, Linn Park, GLASGOW, has been acquired by Messrs. Mactaggart and Mickel, Ltd., for the erection of fifty three- and four- apartment bungalows, which will be ready for occupancy by May.

The Department of Health has agreed to the proposal of KILSYTH T.C. to proceed with a further housing scheme, comprising the erection of eighty-eight houses.

The NORTH BERWICK T.C. has decided to acquire more ground for another housing scheme.

The RENFREW T.C. has approved of the Housing Committee's recommendation to erect sixty-four houses in Renfield Street and Fulbar Lane, and thirty-two houses in Ferguson Street, but awaits the approval of the Ministry of Health.

The following figures show the progress that has been made in State-aided housing schemes in Scotland to October 31, 1930: 1919 Act, by local authorities, 25,129: 1919 Act, by public utility societies, 421; private subsidy schemes (1919 Additional Powers Act), 2,324; slum-clearance schemes, 12,175; under construction, 2,130: 1923 Act, by local authorities, 4,033: 1923 Act, by private enterprise, 18,879; under construction, 945: 1923 Act, by public utility societies, 80: 1924 Act, by local authorities, 46,405; under construction, 6,051: 1924 Act, by private enterprise, 2,931; under construction, 57: 1924 Act, by public utility societies, 127; under construction, 16: 1930 Act, by local authorities, under construction, 58; demonstration houses, 17; steel houses erected on behalf of Government by Scottish National Housing Company, 2,552. Total houses completed, 115,073; total under construction, 9,257. Total, 124,330.

WALES

Plans passed by the CONWAY T.C.: Three houses, Deganwy Road, for Mr. A. North; house, Victoria Drive, for Mr. R. Wynne, Clifton Road, Llandudno; two houses, Albert Drive, Deganwy, for Mr. Haxby; two villas, Warren Drive, Deganwy, for Mr. H. Sidebotham; two semi-detached bungalows, Deganwy Road, for Mr. J. Grundy.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1*s.* 3½*d. per hour;* LABOURER, 1*s.* 3½*d. per hour ;* NAVVY, 1*s.* 3½*d. per hour ;* TIMBERMAN, 1*s.* 5*d. per hour ;* SCAFFOLDER, 1*s.* 4½*d. per hour ;* WATCHMAN, 7*s.* 6*d. per shift.*

Broken brick or stone, 2 in., per yd.	
Thames ballast, per yd.	0 10 0
Pit gravel, per yd.	0 15 0
Pit sand, per yd.	0 12 6
Washed sand, per yd.	0 13 0

Screened ballast or gravel, add 10 per cent. per yd.
Clinker, breeze, etc., prices according to locality.

Portland cement, per ton	£2 8 0
Lias lime, per ton	2 0 0

Sacks charged extra at 1*s.* 9*d. each and credited when returned at* 1*s.* 6*d.*

Transport hire per day :

Cart and horse	£1	3	0	*Trailer*	£0 15 0
3-ton motor lorry	3	15	0	*Steam roller*	4 5 0
Steam lorry, 5-ton	4	0	0	*Water cart*	1 5 0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.
RETURN, fill, and ram, ordinary earth, per yd. £0 1 6
SPREAD and level, including wheeling, per yd. 0 1 6
FILLING into carts and carting away to a shoot or deposit, per yd. cube . 0 10 6
TRIMMING earth to slopes, per yd. sup. 0 0 6
HACKING up old grano. or similar paving, per yd. sup. 0 1 3
PLANKING to excavations, per ft. sup. 0 0 5
DO. over 10 ft. deep, add, for each 5 ft. in depth, 30 per cent.
IF left in, add to above prices, per ft. cube 0 2 0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup. . 0 2 1
DO. 6 in. thick, per yd. sup. 0 2 10
PUDDLING, per yd. cube 1 10 0
CEMENT CONCRETE, 4-2-1, per yd. cube 1 17 6
DO. 6-2-1, per yd. cube 1 12 6
DO. in upper floors, add 15 per cent.
DO. in reinforced-concrete work, add 20 per cent.
DO. in underpinning, add 60 per cent.
LIAS-LIME CONCRETE, per yd. cube . £1 14 0
BREEZE CONCRETE, per yd. cube 1 7 0
DO. in lintels, etc., per ft. cube 0 1 6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube 0 3 9
FINE concrete benching to bottom of manholes, per ft. cube 0 3 0
FINISHING surface of concrete spade face, per yd. sup. 0 0 9

DRAINER

LABOURER, 1*s.* 3½*d. per hour ;* TIMBERMAN, 1*s.* 5*d. per hour ;* BRICKLAYER, 1*s.* 8½*d. per hour ;* PLUMBER, 1*s.* 8½*d. per hour ;* WATCHMAN, 7*s.* 6*d. per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0 0 10
DO. 6 *in., per ft.*	0 1 3
DO. 9 *in., per ft.*	0 2 3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0 5 6
DO. 6 *in., per yd.*	0 8 0
Portland cement and sand, see " Excavator " above.	
Leadwool, per cwt.	£2 0 0
Gaskin, per lb.	0 0 4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft. 0 4 3
DO. 6 in., per ft. 0 5 0
DO. 9 in., per ft. 0 7 9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft. 0 8 3
DO. 6 in., per ft. 0 10 3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1*s.* 8½*d. per hour ;* LABOURER, 1*s.* 3½*d. per hour ;* SCAFFOLDER, 1*s.* 4½*d. per hour.*

London stocks, per M.	£4 5 6
Flettons, per M.	2 12 6
Midhurst white facing bricks, per M.	5 0 0
Multi-coloured facings, per M.	7 7 9
Best red facings, per M.	7 7 9

BRICKWORK in stone lime mortar, Flettons, or equal, per rod	30 0 0
DO. in cement do., per rod	32 10 0

DO. in stocks, add 25 per cent. per rod.
DO. in blues, add 100 per cent. per rod.
DO. circular on plan, add 12½ per cent. per rod.
DO. in backing to masonry, add 12½ per cent. per rod.
DO. in raising on old walls, etc., add 12½ per cent. per rod.
DO. in underpinning, add 20 per cent. per rod.

HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup. £0 1 0
BEDDING plates in cement mortar, per ft. run 0 0 3
BEDDING window or door frames, per ft. run 0 0 3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run 0 0 2
CUTTING do. in old walls in cement, per ft. run 0 0 4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup. 0 0 7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run 0 3 6
DO. 14 ft. by 9 in. do., per ft. run 0 6 0
FLAUNCHING chimney pots, each 0 2 0
CUTTING and pinning ends of timbers, etc., in cement 0 1 0
FACINGS, fair, per ft. sup. extra 0 0 3
DO. picked stocks, per ft. sup. extra 0 0 7
DO. red rubbers, gauged and set in putty, per ft. sup. extra 0 4 9
DO. in salt white or ivory glazed, per ft. sup. extra 0 5 6
TUCK pointing, per ft. sup. extra 0 0 10
WEATHER pointing, do. do. 0 0 3
TILE creasing with cement fillet each side, per ft. run 0 0 6
GRANOLITHIC PAVING, 1 in., per yd. sup. 0 5 0
DO. 1½ in., per yd. sup. 0 6 0
DO. 2 in., per yd. sup. 0 7 0
If coloured with red oxide, per yd. sup. 0 1 0
If finished with carborundum, per yd. sup. 0 0 6
If in small quantities, in finishing to steps, etc., per ft. sup. 0 1 4
Jointing new grano. paving to old, per ft. run 0 0 4
Extra for dishing grano. or cement paving around gullies, each 0 1 6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup. 0 0 7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup. 0 8 0
DO. vertical, per yd. sup. 0 11 0
SLATE DAMP COURSE, per ft. sup. 0 0 10
ASPHALT ROOFING (MASTIC) in two thicknesses, ½ in., per yd. 0 8 6
DO. SKIRTING, 6 in. 0 0 11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup. 0 5 3
DO. DO. 3 in. 0 6 6
BREEZE fixing bricks, extra for each 0 0 3

MASON

MASON, 1*s.* 8½*d. per hour ;* DO. *fixer,* 1*s.* 9½*d. per hour ;* LABOURER, 1*s.* 3½*d. per hour ;* SCAFFOLDER, 1*s.* 4½*d. per hour.*

Portland Stone :	
Whitbed, per ft. cube	£0 4 6
Basebed, per ft. cube	0 4 9
Bath stone, per ft. cube	0 3 0
Usual trade extras for large blocks.	
York paving, av. 2½ in., per yd. super	0 11 0
York templates, sawn, per ft. cube	0 7 6
Slate shelves, rubbed, 1 in., per ft. sup.	0 2 6
Cement and sand, see " Excavator," etc., above.	

HOISTING and setting stone, per ft. cube £0 2 2
DO. for every 10 ft. above 30 ft. add 15 per cent.
PLAIN face Portland basis, per ft. sup. £0 2 8
DO. circular, per ft. sup. 0 4 0
SUNK FACE, per ft. sup. 0 3 9
DO. circular, per ft. sup. 0 4 10
JOINTS, arch, per ft. sup. 0 2 6
DO. sunk, per ft. sup. 0 2 7
DO. DO. circular, per ft. sup. 0 4 6
CIRCULAR-CIRCULAR work, per ft. sup. 1 2 0
PLAIN MOULDING, straight, per inch of girth, per ft. run 0 1 1
DO. circular, do., per ft. run 0 1 4
HALF SAWING, per ft. sup. 0 1 0
Add to the foregoing prices, if in York stone, 35 per cent.
DO. Mansfield, 12½ per cent.
Deduct for Bath, 33⅓ per cent.
DO. for Chilmark, 5 per cent.
SETTING 1 in. slate shelving in cement, per ft. sup. £0 0 6
RUBBED round nosing to do., per ft. lin. £0 0 6
YORK STEPS, rubbed T. & R., ft. cub. fixed 1 7 6
YORK SILLS, W. & T., ft. cub. fixed . 1 10 0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup. 0 1 3
DO. 2½ in. thick, per ft. sup. 0 1 6

SLATER AND TILER

SLATER 1*s.* 8½*d. per hour ;* TILER, 1*s.* 8½*d. per hour ;* SCAFFOLDER, 1*s.* 4½*d. per hour ;* LABOURER, 1*s.* 3½*d. per hour.*
N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200 :

Portmadoc Ladies			£14 0 0
Countess			23 0 0
Duchess			32 10 0
Old Delabole	*Med. Grey*		*Med. Green*
24 in. × 12 in.	£42 11 3		£45 1 0
20 in. × 10 in.	31 4 3		33 0 6
16 in. × 10 in.	20 18 0		22 4 9
14 in. × 8 in.	12 1 0		12 16 3
Green Randoms, per ton			8 3 9
Grey-green do., per ton			7 3 9
Green peggies, 12 in. to 8 in. long, per ton			5 13 9

In 4-ton truck loads, delivered Nine Elms station.

Clips, lead, per lb.	£0 0 6
Clips, copper, per lb.	0 2 0
Nails, compo, per cwt.	1 6 0
Nails, copper, per lb.	0 2 2
Cement and sand, see " Excavator," etc., above.	
Hand-made tiles, per M.	£5 18 0
Machine-made tiles, per M.	5 8 0
Westmorland slates, large, per ton	9 0 0
DO. *Peggies, per ton*	7 5 0

SLATING, 3 in. lap, compo nails, Portmadoc or equal :

Ladies, per square	£4 0 0
Countess, per square	4 5 0
Duchess, per square	4 10 0

WESTMORLAND, in diminishing courses, per square 6 5 0
CORNISH DO., per square 6 3 0
Add, if vertical, per square approx. 0 13 0
Add, if with copper nails, per square approx. 0 2 6
Double course at eaves, per ft. approx. 0 1 0

SLATING with Old Delabole slates to a 3 in. lap with copper nails, at per square.

	Med. Grey	Med. Green
24 in. × 12 in.	£5 0 0	£5 2 0
20 in. × 10 in.	5 5 0	5 10 0
16 in. × 10 in.	4 15 0	5 1 0
14 in. × 8 in.	4 10 0	4 15 0
Green randoms		6 7 0
Grey-green do.		5 9 0
Green peggies, 12 in. to 8 in. long		4 13 6

TILING, 4 in. gauge, every 4th course nailed, in hand-made tiles, average per square 3 17 6
DO., machine-made do., per square . 3 7 6
Vertical Tiling, including pointing, add 18*s.* 0*d.* per square.
FIXING lead soakers, per dozen . £0 0 10
STRIPPING old slates and stacking for re-use, and clearing away surplus and rubbish, per square . 0 10 0
LABOUR only in laying slates, but including nails, per square . 1 0 0
See " Sundries " for Asbestos Tiling.

CARPENTER AND JOINER

CARPENTER, 1*s.* 8½*d. per hour ;* JOINER, 1*s.* 8½*d. per hour ;* LABOURER, 1*s.* 3½*d. per hour.*

Timber, average prices at Docks, London Standard, Scandinavian, etc. (equal to 2nds) :

7 × 3, per std.	£22 0 0
11 × 4, per std.	30 0 0
Memel or Equal. Slightly less than foregoing.	
Flooring, P.E., 1 in., per sq.	£1 4 6
DO., *T. and G., 1 in., per sq.*	1 4 6
Planed boards, 1 in. × 11 in., per std.	30 0 0
Wainscot oak, per ft. sup. of 1 in.	0 1 6
Mahogany, Honduras, per ft. sup. of 1in.	0 1 4
DO., *Cuba, per ft. sup. of 1 in.*	0 2 6
DO., *African, per ft. sup.*	0 1 3
Teak, per ft. sup. of 1 in.	0 1 2
DO., *ft. cube*	0 14 0

FIR fixed in wall plates, lintels, sleepers, etc., per ft. cube 0 4 6
DO. framed in floors, roofs, etc., per ft. cube 0 4 6
DO. framed in trusses, etc., including ironwork, per ft. cube 0 8 6
PITCH PINE, add 33⅓ per cent.
FIXING only boarding in floors, roofs, etc., per sq. 0 13 6
SARKING FELT laid, 1-ply, per yd. 0 1 6
DO., 3-ply, per yd. 0 1 9
CENTERING for concrete, etc., including horsing and striking, per sq. 2 0 0
TURNING pieces to flat or segmental soffits, 4½ in. wide, per ft. run 0 0 4½
DO. 9 in. wide and over, per ft. sup. 0 1 2

[*continued overleaf*

CARPENTER AND JOINER: *continued*

SHUTTERING to face of concrete, per square	£1	10	0
DO. in narrow widths to beams, etc., per ft. sup.	0	0	6
USE and waste of timbers, allow 25 per cent. of above prices.			
SLATE BATTENING, per sq.	£0	12	6
DEAL boarding to flats, 1 in. thick and firrings to falls, per square	2	10	0
STOUT feather-edged tilting fillet to eaves, per ft. run	0	0	6
FEATHER-edged springer to trimmer arches, per ft. run	0	0	4
STOUT herringbone strutting (joists measured in), per ft. run	0	0	6
SOUND boarding, ¾ in. thick and fillets nailed to sides of joists (joists measured over), per square	2	0	0
RUBEROID or similar quality roofing, one-ply, per yd. sup.	0	2	3
DO., two-ply, per yd. sup.	0	2	6
DO., three-ply, per yd. sup.	0	3	0
TONGUED and grooved flooring, 1¼ in. thick, laid complete with splayed headings, per square	2	5	0
DEAL skirting torus, moulded, 1¼ in. thick, including grounds and backings, per ft. sup.	0	1	0
TONGUED and mitred angles to do.	0	0	6
WOOD block flooring, standard blocks laid herringbone in mastic:			
Deal 1 in. thick, per yd. sup.	0	10	0
DO. 1¼ in. thick, per yd. sup.	0	12	0
Maple 1¼ in. thick, per yd. sup.	0	15	0
DEAL moulded sashes, 1¾ in., with moulded bars in small squares, per ft. sup.	0	2	6
DO. 2 in. do., per ft. sup.	0	2	9
DEAL cased frames, oak sills and 2 in. moulded sashes, brass-faced pulleys and iron weights, per ft. sup.	0	4	6
MOULDED horns, extra, each	0	0	3
DOORS, 4-panel square both sides, 1¼ in. thick, per ft. sup.	0	2	6
DO. moulded both sides, per ft. sup.	0	2	9
DO. 2 in. thick, square both sides, per ft. sup.	0	2	9
DO. moulded both sides, per ft. sup.	0	3	0
DO. in 3 panels, moulded both sides, upper panel with diminished stiles with moulded bars for glass, per ft. sup.	0	3	6
If in oak, mahogany, or teak, multiply 3 times.			
DEAL frames, 4 in. × 3 in., rebated and beaded, per ft. cube	£0	15	0
Add for extra labour, per ft. run	0	0	1
STAIRCASE work:			
DEAL treads 1¼ in. and risers 1 in., tongued and grooved, including fir carriages, per ft. sup.	0	2	6
DEAL wall strings, 1¼ in. thick, moulded, per ft. run	0	2	0
If ramped, per ft. run	0	4	6
SHORT ramps, extra, each	0	7	6
ENDS of treads and risers housed to strings, each	0	1	0
2 in. deal mopstick handrail fixed to brackets, per ft. run	0	1	6
4½ in. × 3 in. oak fully moulded handrail, per ft. run	0	5	6
1¼ in. square deal bar balusters, framed in, per ft. run	0	0	6

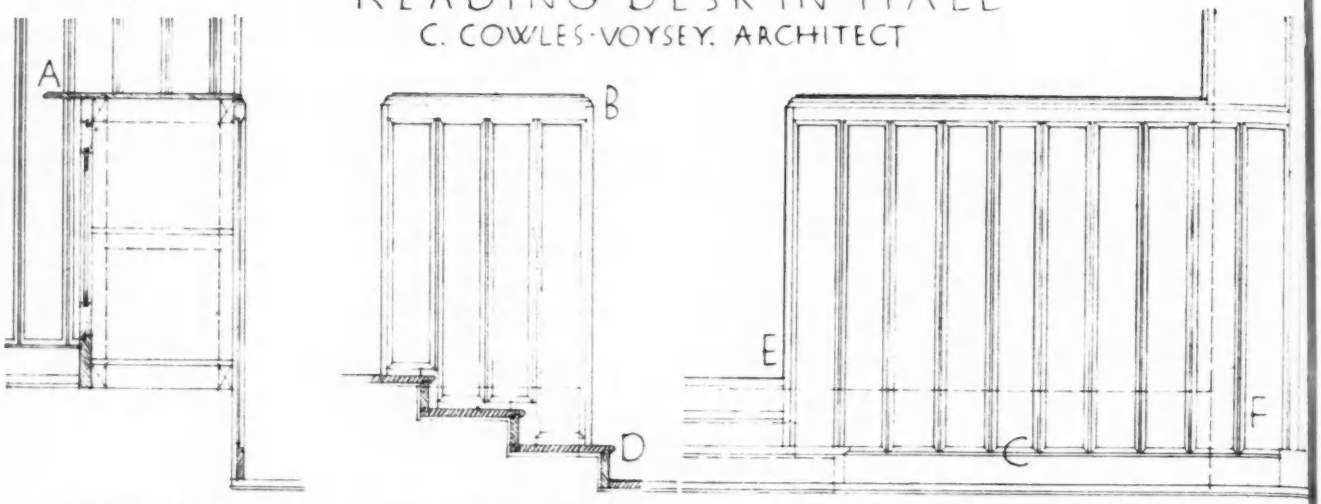
A WEEKLY SERIES

READING DESK,
KINGSLEY HALL, BOW, E.3
Designed by C. COWLES-VOYSEY

THE photograph shows one of a pair of reading desks flanking the opening of the apsidal end of the Assembly Hall, other details of which were given in our issues dated October 22 and November 19 last.

These desks, which are made entirely of English oak, have been designed in a restrained and dignified manner in keeping with the rest of the room, which, although intended primarily for secular purposes, is frequently used for Divine service. While admirably fulfilling their purpose on these occasions, they in no manner obtrude their character upon the occupants of the room at other times.



Reference to the drawings will explain the general construction and details.

The drawings overleaf may be read with architects' scales.

A NOBLEMAN'S BRICKS

THE political situation, in so far as it affects the import of foreign materials, is so dubious that many manufacturers are waiting to see which way the finger will point, and whose finger it will be.

In spite of rumours, we do not think an election is probable for several months, and, even if it were, the duty of every citizen is to put into immediate practical effect his desire to reduce the number of unemployed in Great Britain. The architect has a heavy responsibility in the matter, for he can encourage the supply of British goods by specifying them for his clients' works.

During the housing "drive," after the war, there were at times shortages of cement, bricks, and sanitary and other goods, and some British manufacturers were inclined to charge exorbitant rates. In consequence, foreign firms, owing to their reasonable prices, obtained a connection here—a matter for which the home manufacturers have mainly themselves to blame. With practically two million persons unemployed, Great Britain must forget all that. Both corporations and individuals must support the industries of the nation.

For years the Departments of State have given a preference to Empire products in their building specifications. We are surprised that more of the great landlords have not followed this good example. The London ground-landlords are in a position to enforce conditions similar to those enjoined by the State for work on their estates, which cover an enormous portion of London—areas on which a large amount of rebuilding is now proceeding. Many of these ground-landlords are traditionally or politically associated with the policy of stabilizing the home market. Are they consistently using their power to apply that policy in the matters connected with their own estates?

We know at least one case where this elementary condition for the improvement of commerce is not only disregarded, but its opposite condition is being imposed; that is, the specification of a foreign material is being dictated, contrary to the architect's wishes. And that material is brick, of all things.

The ground-landlord's case is that during the shortage of bricks Dutch bricks were used on a certain building in the West End. To preserve the amenities of the street, the fiat has been issued that similar foreign bricks are to be used in an adjacent building, to be erected, by the by, for an entirely different use.

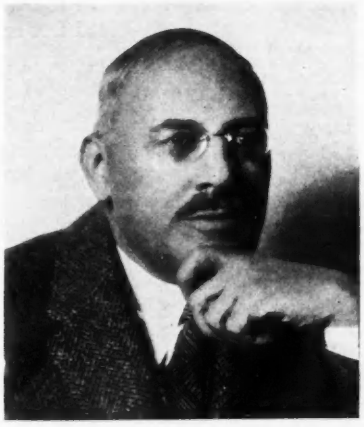
We are the more astonished at this instruction, because the ground-landlord concerned is one of the most enlightened in England and a patron of the arts. Surely he realizes that, for variety and beauty of colour and texture, English bricks are pre-eminent in the world, and that our makers are such skilled craftsmen as to match any alien brick closely enough to satisfy the most exacting critic; whilst any difficulty in the matter of size is so slight as to be adjustable on the joint.

Or is it a case of some general ruling, as to control of elevations, made by the ground-landlord, and interpreted too strictly by his agents?

We know of another building on the same estate, but in a different street, in which only British materials have been used throughout, surely a more desirable precedent to follow.

The instinct of rural landlords is to use not only English but local materials. With the advent of cheaper transport and the incidence of death duties, there is a temptation to buy in the cheapest market. Thus come the French tiles in Thatcham, and American plywood in Woodford Oaks; the speculating builder with a thankful heart follows the gentry over the financial fences.

We confess to being somewhat sceptical of any rapid amelioration of our discontents by political parties. We place reliance mainly on individual effort, and our hope not in a nostrum but in a million remedies from a million men and women.



ONE WAY AND ANOTHER:
ii: ANCIENT AND MODERN IN SWEDEN

It is well known that the Stockholm Town Hall harked back to traditional forms, but most people accepted the knowledge hazily, not having met with what was traditional in Sweden. These two photographs bring out marked similarities between the new building and the very ancient Royal Manor of Bachaskog, in Scania. One may notice the courtyard plan, the corner tower, and the partiality for long lines of unbroken walling, all features conspicuous in the design of the Town Hall; and this building may explain in some measure the extraordinary vigour of Ostberg's interpretation of national building.

Knowing this, the conception of Stockholm Town Hall as the sublimation of a national way of building is heightened, and the feeling of its being an isolated monument to one man's imaginative complexity no longer needs explanation, since its roots are seen to stretch back through the ancient soil of his country.

NEWS & TOPICS

Josef Hoffmann, who celebrates his sixtieth birthday on Monday next. In 1898 Hoffmann, Josef Olbrich and their friends founded the Viennese Succession, a group of architects, artists and craftsmen who were the real pioneers of the Modern Movement. The year following he was appointed Professor of Architecture at the Vienna Institute for Art and Industry, where he still directs his famous Fachklasse für Architektur. *His influence in this country has been considerable, and is plainly discernible in Heal's new building, and many of the large London houses erected in the decade prior to the war.*

JOSEF HOFFMANN

THE sixtieth birthday of Josef Hoffmann, which falls next Monday, is to be the occasion of an international testimonial to the man who has been called with good reason "the first architect of the Modern Age." As an architect, Hoffmann's influence in this country has been considerable, and is plainly discernible in Heal's new building, and many of the large London houses erected by William Willett in the decade prior to the war. In the design of villas he was the first to consider habitability before style, building outwards from a logical plan, and as a craftsman of everything from tombstones to teacups, he has continued the work Morris and Ruskin began, but in a wholly different spirit, substituting fitness for purpose for the ideological cant of "art for art's sake" and irrelevant moralisings. He has also studied as no one before him the form-giving function of all the innumerable small objects which together constitute the organic unity of a house.

★

Josef Hoffmann was born at Pirnitz on December 15, 1870. After passing through the School of Arts and Crafts at Brünn, he spent a year building new barracks in the Baroque City of Würzburg. In 1892 he came to Vienna, where he studied for two years under Hasenauer, at the Imperial Academy of Fine Arts. In 1894 he became the pupil of Otto Wagner and only a year later his partner. In 1898 Hoffmann, Josef Olbrich and their friends founded the Viennese Succession, a group of architects, artists and craftsmen who were the real pioneers of the Modern Movement. The year following he was appointed Professor of Architecture at the Vienna Institute for Art and Industry, where he still directs his famous *Fachklasse für Architektur*. In 1903 he started, in conjunction with Koloman Moser, the "Wiener Werkstätte," an organization with which his name and personality have ever since been identified. The gulf between the "Wiener Werkstätte" and Liberty's is the gulf between Josef Hoffmann and William Morris. In 1912 he founded the Austrian "Werkbund," of which he has been a tower of strength. He has designed Austrian Pavilions for the Exhibitions at Paris in 1900 and 1925, Buenos Aires, Rome, Dresden, Leipsic, Cologne, Stockholm and Copenhagen.

★

The pity is that Hoffmann, who created the Viennese style and has made it familiar throughout the world, should never have had the opportunity of designing any public buildings. Virtually all his work has been in the field of domestic architecture and decoration. His earliest villa dates from 1902. The Sanatorium at Purkersdorf is a presage of the severest Modernism. The Haus Ast (1910) and the Haus Bernatzig (1912), like the villa colony at Kaasgraben, are very English-looking and equally simple. The Palais Stoclet (1905-1911), in the Avenue de Teroueren in Brussels, which is faced with white Swedish marble, is perhaps the best known of his earlier buildings; though the Haus Skywa in Vienna (1913) is much more characteristic. The model sales rooms at the Wiener Werkstätte (1918) are typical of Hoffmann's decorative genius. To have seen over the Haus Knips in Vienna (1924) with Hoffmann himself as guide to those exquisite interiors, is an experience I shall always remember. Hoffmann was a staunch friend and admirer of the late Rennie Mackintosh, and befriended him in his distress. At sixty, Hoffmann's genius is as green and vigorous as ever. It is to be hoped that the R.I.B.A. may soon honour itself by honouring a man who may be described as the *doyen* of European architects.

SIR LAWRENCE WEAVER MEMORIAL

It was in July last that a movement was put on foot with the object of commemorating in perpetuity the name of the late Sir Lawrence Weaver. At first an exhibition hall in London was proposed, but so much evidence has reached the Committee of the general feeling that the memorial should be directly associated with Ashstead, that they have now secured a suitable site in close proximity to the factory of Ashstead Potters, Ltd. There it is intended to erect a recreation hall, for the use of the men employed in an undertaking founded by Sir Lawrence solely to give employment to wounded ex-service men, embodying, if found practicable, offices and showrooms for which there is a great need, with perhaps a cloister added. The Committee ask for leave to devote subscriptions already received to this new object, and would welcome further financial support. Contributions should be sent to the Hon. R. Stafford Cripps, K.C., 3 Elm Court, Temple, E.C.4.

RE-PLANNING ALREADY DEVELOPED AREAS

A very interesting and workable plan has been advanced by Sir Theodore Chambers to deal with schemes of re-planning in already developed areas. He remarks, with what justice I am not prepared to say, that neither private enterprise nor the normal machinery of local government is adequate to deal with the volume of intricate financial and other adjustment involved by such schemes, and that a system of Improvement Boards and a Central Commission,

rather similar to the Central Electricity Board, could overcome many of the difficulties.

*

Supposing a district was to be re-planned on local initiative, the Board would be composed of property owners, with adequate representation of official and government bodies. The Board would have a statutory right to buy property, lay out streets and re-plan under safeguards as to curtilage, open space, etc., etc., and, being representative of all those owning property and having a financial interest in the area, some of the gravest objections, and the heavy load of compensation payable under local governmental re-planning, would be entirely obviated. On the other hand, the Board's official status would carry with it the necessary control over such large scale freehold ownerships. It is an idea which one hopes may be freely discussed, even if it no more than offers a release from further mass production of government officials.

WEST ESSEX ARCHITECTS' BADGE OF OFFICE

The beautiful badge for the West Essex Chapter of the Essex, Cambridge and Hertfordshire Society of Architects, illustrated on this page, was designed by Professor Richard L. Garbe, A.R.A., F.R.B.S., and is to be worn by the presiding Chairman during his term of office. It is executed in silver, with neillo and cloisonné enamel, and takes the form of a circular band with an inscription, around which are arranged three shields containing the arms of Essex, Cambridge and Hertford in niello. The centre device, in gold and blue cloisonné enamel, symbolizes the golden portal of architecture, with the river below, symbolizing the River Thames as the southern boundary of the Chapter's activities. From the outer circle spring at top and bottom two curved lozenge forms and a pierced fret as enrichment.

The badge of the West Essex Chapter of the Essex, Cambridge and Hertfordshire Society of Architects. It was designed by Professor Richard L. Garbe, and is to be worn by the presiding chairman during his term of office.

*

This beautiful example of the jeweller's art was executed by Mr. H. Murphy, well known in the Art and Crafts movement, and has been presented to the West Essex Chapter by Mr. William Evans, F.R.I.B.A., a member of the Chapter, an inscription to this effect having been placed on the reverse of the badge. To the ribbon is attached silver bars to perpetuate the Chairmen of the Chapter. The past holders of the office whose names are already inscribed on the bars are : Messrs. J. J. Crowe, J.P., O.B.E., A.R.I.B.A., and Christopher M. Shiner, A.R.I.B.A. The present holder is Mr. S. Phillips Dales, F.R.I.B.A.

THE BEARDED BUILDING ACT

The venerable London Building Act is on the run, which is, perhaps, an undignified manner of describing the effect of the report presented by the Committee of the R.I.B.A. Conference on Building Regulations, but not so far from fast when the contents of this remarkable document are known.

*

What London architect has not counted his losses of time and temper, as he dashed from one den of officials to another, seeking their consent to sensible departures from an obsolete code ? Just think what it means to have to obtain consents from several different quarters before plans for a theatre can be put in hand—and some of the committees may be on holiday ! Then, as a light relief from these depressions, be warned that in Marylebone the Bidet waste is taken into a soil pipe, in Westminster far otherwise, for it is into the waste pipe that the Bidet goes.

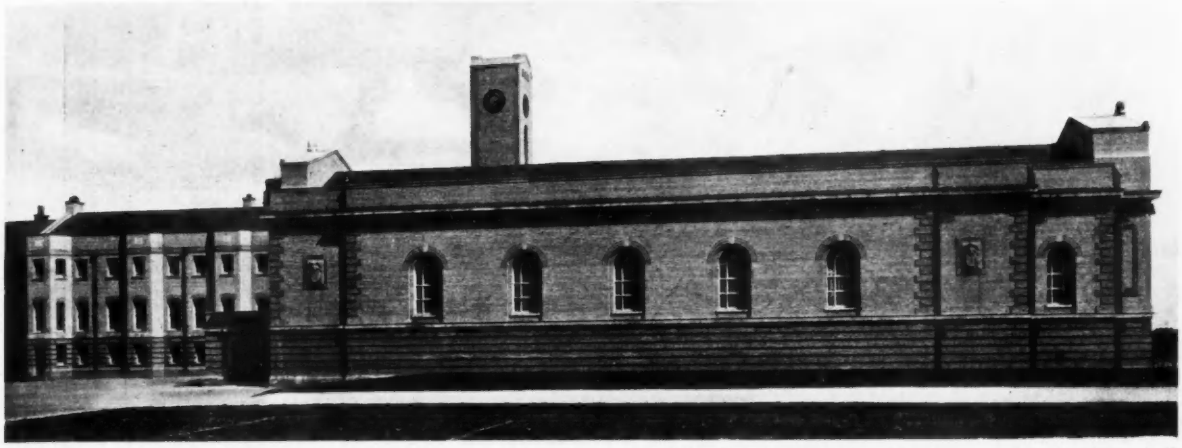
*

Back again to stern realities, to consider the Water Companies and their 1872 regulations. Under these historic regulations only certain taps may be used, spring taps being in certain places forbidden. And the push button apparatus for flushing tanks is frowned upon, what though it is a piece of mechanism tested and found efficient years ago in New York and many other places.

THE NATURE OF THE LAW TO BLAME

The whole trouble, as Mr. Shelley in his lecture at the R.I.B.A. pointed out, rests in the nature of the law by which these things are ordained. In London it is an Act which, once made, requires a further Act to amend or repeal it, where elsewhere it is a bylaw, capable of constant revision in the light of advancing building science.

*



But I can't help laughing, with Sir Owen Williams, as I think of the indignant accusations of extravagance against the present building laws by gentlemen whose Queen Anne office buildings absolutely bulge with excrescence and pay about as much attention to economical steel construction as Beau Brummell himself. What an effective counterblast there might be if the L.C.C. were able to write a report about office buildings.

MAIDSTONE PRISON SITE

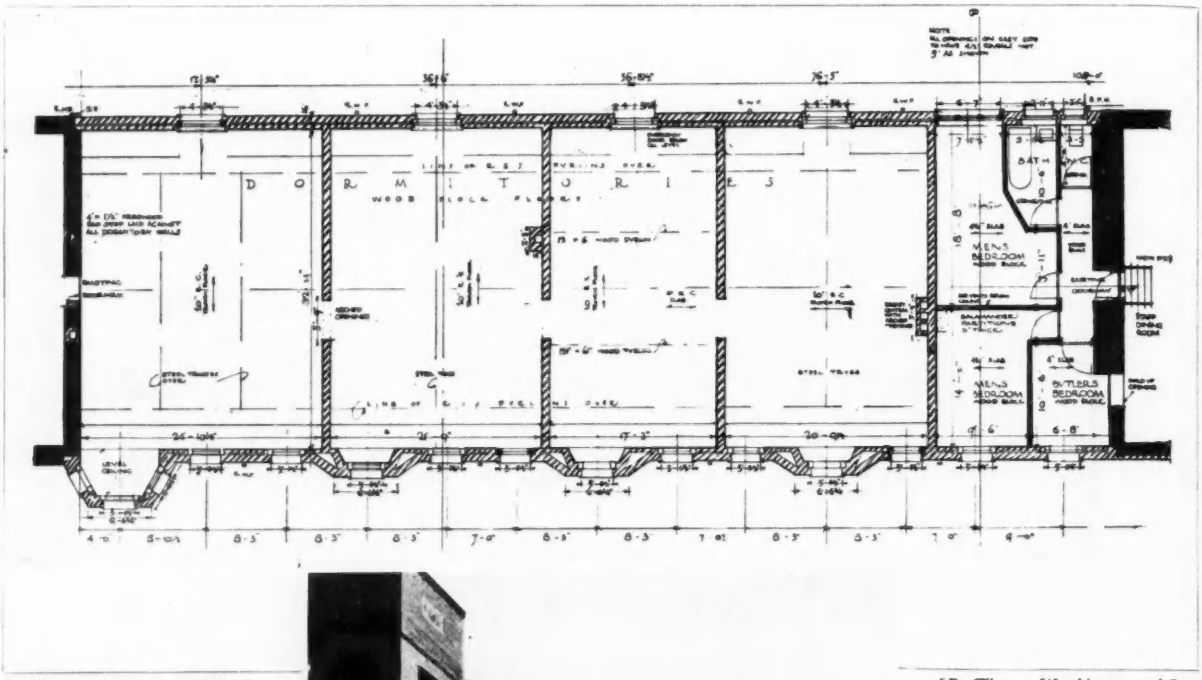
Kent County Council have selected one of three alternative schemes submitted by Mr. Harding Thompson for the lay-out of the Maidstone Prison site for county buildings. Mr. Thompson's scheme incorporates the present county building in an extended half-courtyard which must unfortunately face uphill. This apart, the scale of the forecourt must undoubtedly invoke a very dignified composition of buildings, even though its final completion will be a matter of some years. ASTRAGAL

NEW COMMON ROOM AT ROSSALL SCHOOL

DESIGNED BY THOMAS WORTHINGTON AND SONS

In this view of recent developments at the school the new block appears to the left of the photograph. Nearer at hand is the dining-hall, completed a year or two ago by the same architects. The buildings face west, and are carried out in silver-grey bricks in two tones.

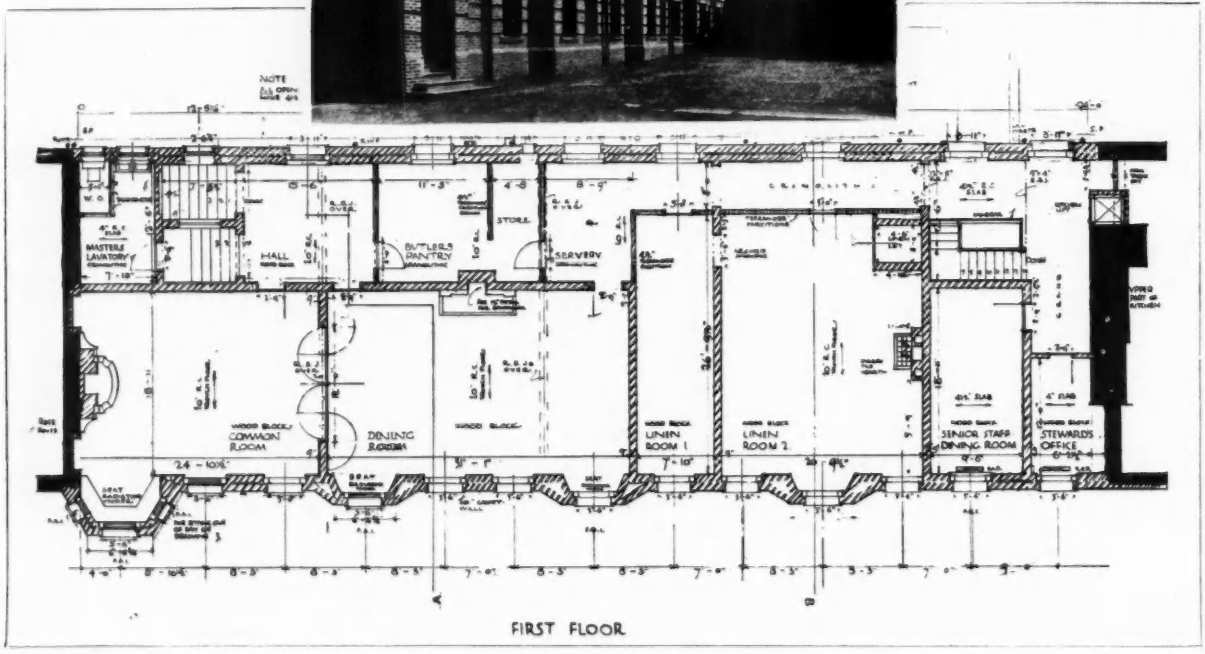
THE new block here pictured and described is part of a scheme of building and rebuilding, spread over a number of years, undertaken by the Governors of Rossall School. Thus, rather more than two years ago, a new dining-hall was completed to the designs of Mr. Hubert Worthington, of Messrs. Thomas Worthington and Sons. (It was fully illustrated in THE ARCHITECTURAL REVIEW for August, 1928.) Thereupon, the old dining-hall, which it superseded, was pulled down. And upon the site thus vacated the same architect has now provided accommodation that has, for its most important feature, a masters' common room, but also includes boys' clothes locker rooms, linen rooms and dormitories. The lockers, sewing-room, larders, etc., are on the ground floor, whilst on the first floor is the masters' common room suite, with a separate entrance and staircase, and beyond this the linen rooms, stewards' office, etc. On the second floor there are dormitories for forty boys, entered from Rose House on the north side of the block; at the further end of which are the men's and butlers' bedrooms and cubicles. To provide such a variety of services on a site of no very considerable area necessarily introduced complications in planning, and the various solutions arrived at will be of special interest.



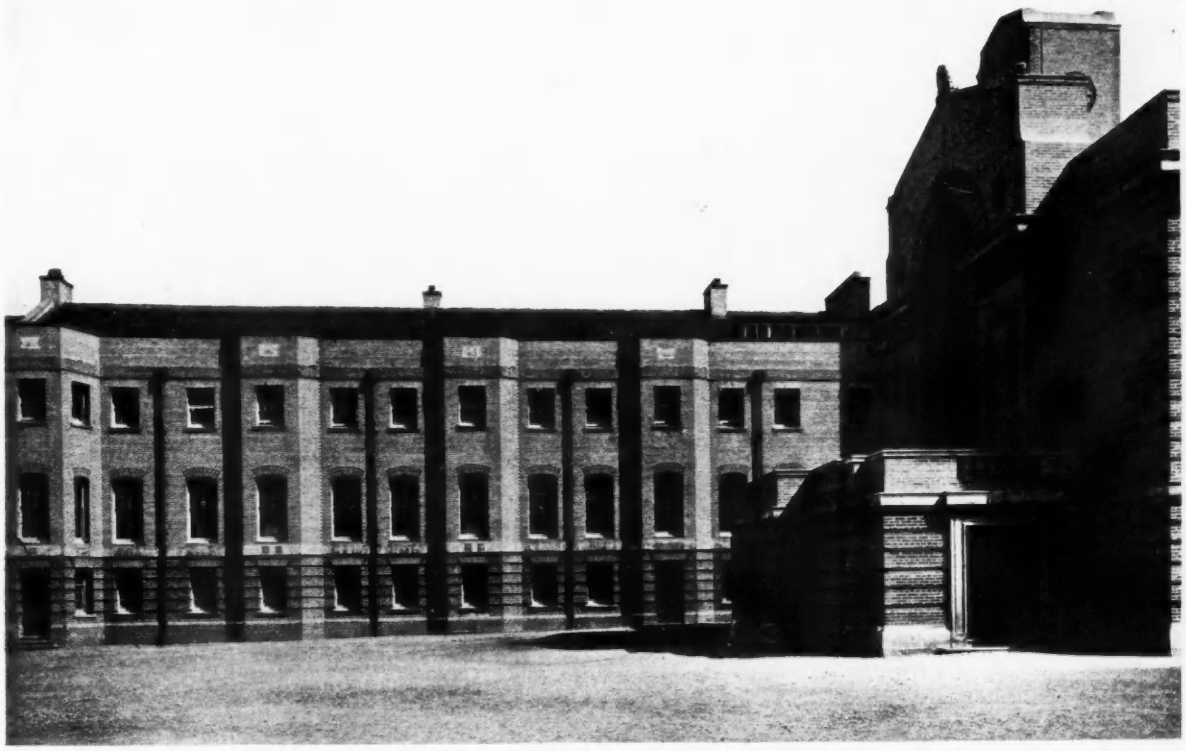
The school buildings are close to the sea, at Fleetwood, Lancashire, and the possibility of encountering running sands was one that had to be faced, as when the dining hall block was undertaken, in designing the foundations.

The new building is faced, as in the case of its predecessor, with silver-grey bricks in two tones, the darker shade

Excellence of craftsmanship in the bricklaying is revealed by this study of the new block taken from the south-west, and showing the entrances for masters and for boys, to left and right, respectively. The first-floor stringcourse is of Portland stone.

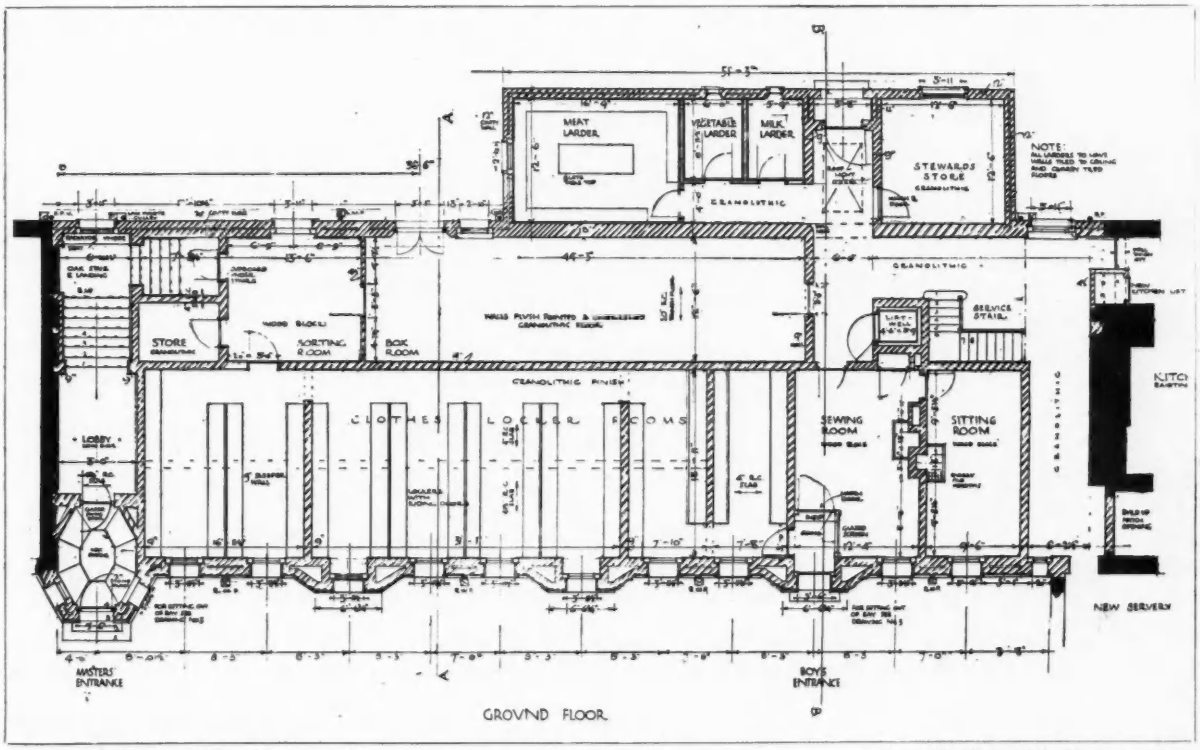


D

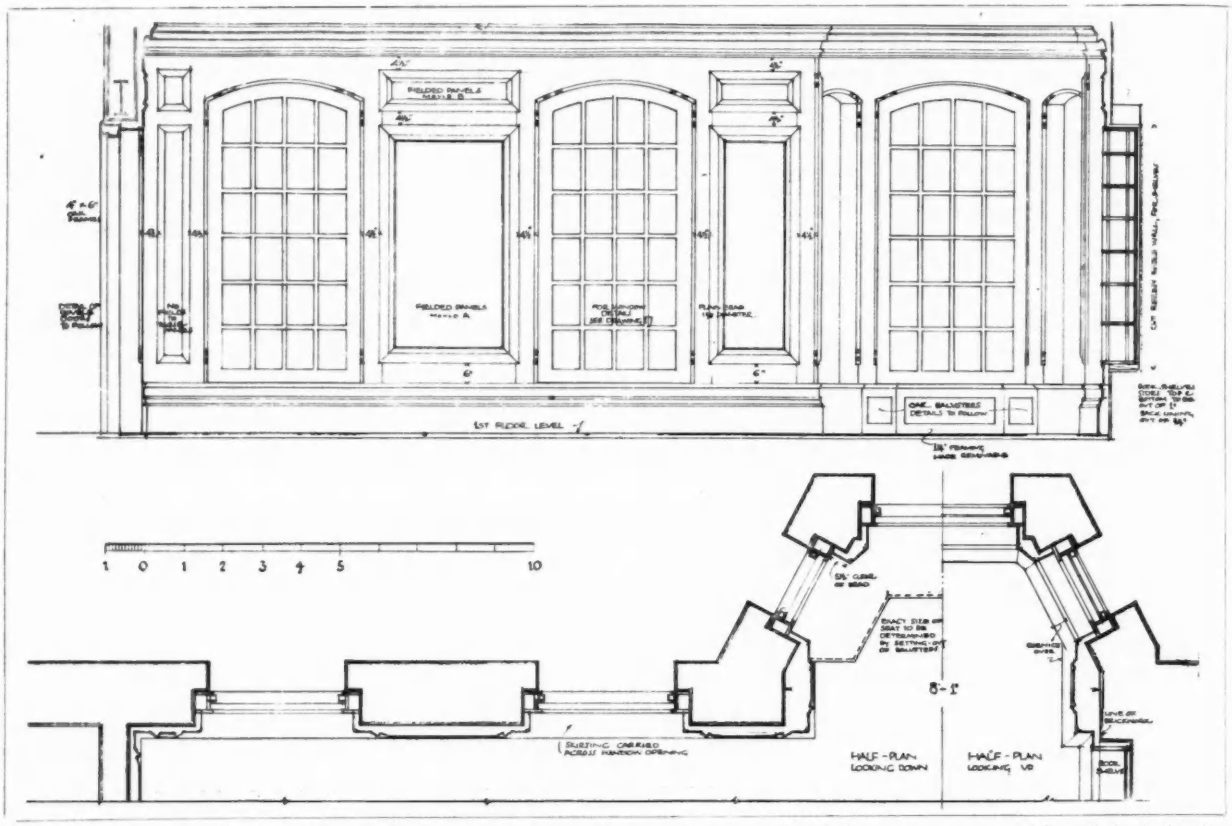


Rossall School, Lancs.; additions] [*By Thomas Worthington and Sons.*

On this page are reproduced a photograph, taken to give an impression of the grouping of the common-room block and the dining-hall block, with its clock-tower ; and the architects' drawings of the second- and first-floor plans of the former. The upper is devoted to dormitories for boys quartered in Rose House, next door, on the north, and to bedrooms for the butler's staff. The masters' common room is the chief feature of the first floor, and the most important room in the house : considerable space is allotted to linen rooms, a senior staff dining-room, served from the kitchens in the dining-hall block, etc.



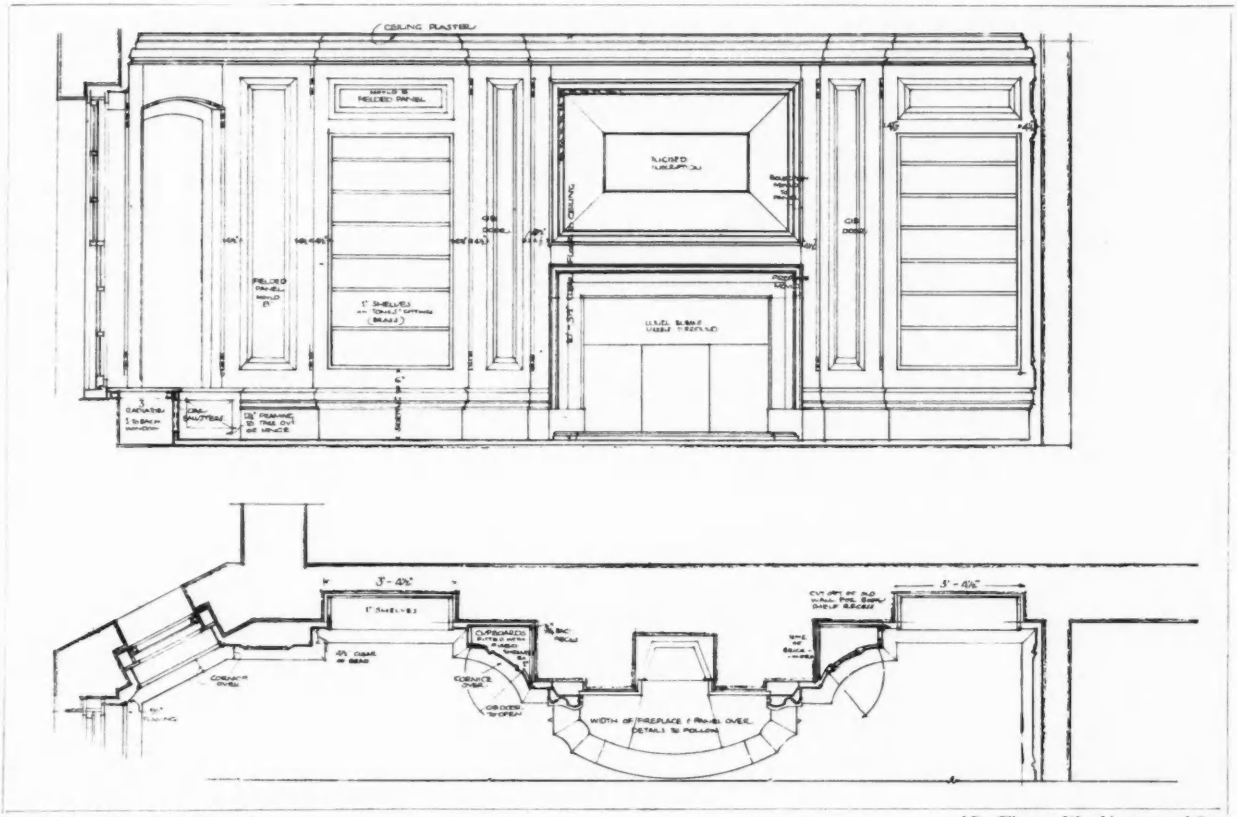
FIRST FLOOR



A general view of the new building. On the extreme left (but not here shown) is Rose House, one of the boys' boarding houses, and on the right are the kitchen quarters attached to the existing dining hall block.

Rossall School, Lancs.; additions] *[By Thomas Worthington and Sons.*

The architects' drawing of the ground-floor plan, reproduced to the same scale as those on the facing page. Here are boys' clothes locker rooms, a sewing room and a sitting room. On all plans, existing walls are shown black, and new work is hatched.



A reduction from the architects' half-inch scale elevation of the panelling on the west side of the common room. The effect of the deep bay illustrated on the right is seen on the left of the photograph reproduced below.

Rossall School, Lancs.; additions] *[By Thomas Worthington and Sons.*

This view of the common room shows the general appearance of the panelling, which is carried out in English oak. Drawings of only two sides appear here; the design of the others, which consist of symmetrical panels, will, however, be inferred from the right-hand wall.

Rossall School, Lancs.; additions.] [*By Thomas Worthington and Sons.*

The panelling of the north side includes bookshelves and the fireplace, with an inscription recording the presentation of this decorative feature of the new common room by an old Rossallian. The marble of the fireplace is Lunel Rubane.

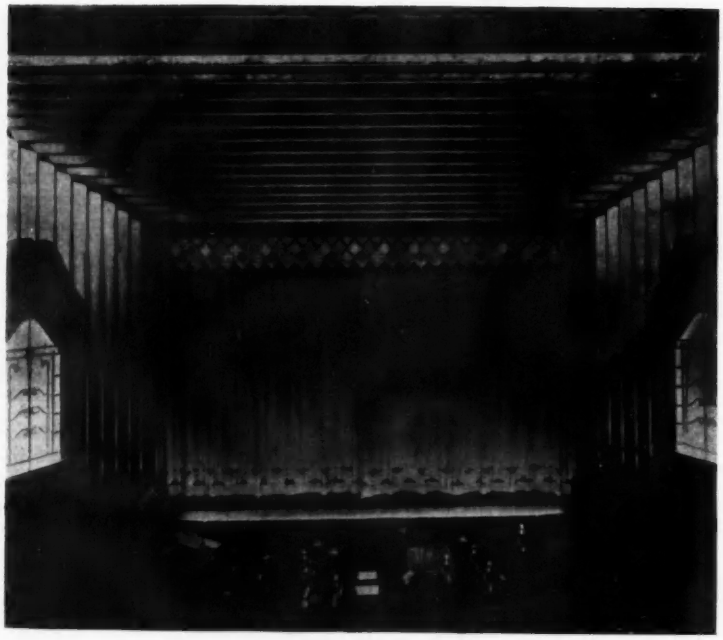
for the channelled ground floor, the arches of the first-floor windows and the stringcourse at the top, and the lighter tone for the remainder of the building. The first-floor string is of Portland stone and so are the four carved panels in the parapets of the bay windows. In these panels are sculptured three mortar boards and birch rods to indicate the masters' quarters, a rose to represent the house which uses the dormitories, a mitre as the school crest, and a wicker basket with blankets, etc., to indicate the linen rooms.

The masters' common room is panelled in English oak. On the panel over the fireplace is the following inscription: "An old Rossallian who left School in 1886 presented the panelling of this room as an expression of the gratitude which he and his generation feel towards the many Masters of his time who gave long years of devoted service to Rossall."

The Mansion House

Mr. Sydney Perks, F.R.I.B.A., architect and surveyor to the City of London Corporation, read a paper on "The Building of the Mansion House," at the Royal Society of Arts, last Wednesday.

A near view of the fireplace. The panel above it bears the incised inscription, hardly discernible in the photograph.



Alderman Sir Thomas Vansittart Bowater, Bt., M.P., presided.

Mr. Perks remarked that he believed the Mansion House was the only structure now existing which, like the Palace of the Doge at Venice in the Middle Ages, was a residence, a court of justice, and a prison.

After describing Dance's building in detail, by means of lantern slides, the lecturer continued by saying it was nearly 200 years since the Mansion House was designed; the neighbourhood was the most important and valuable part of the City, where new buildings were constantly being designed by the leading architects of today. But the Mansion House "held its own," and a thoughtful observer might ask if there had been much improvement in our architecture in 200 years. Had not the spirit of advertisement crept into our designs? A big building seemed to shout "Look at me, I'm a Bank," and the next building seemed to cry out "Don't look next door, look at me, I'm an Insurance Office"; and so they competed for publicity. In the meanwhile the Mansion House seemed like an ancient dame, to smile and snub them with its quiet dignity, and show the contempt of the old regime for the *nouveaux riches*.

The brick and Bath stone front to Finchley Road is equipped with apparatus for flood-lighting the towers containing stairs leading to the balcony, and several pairs of large and small permanent panels are provided for advertisement posters

The stage and proscenium. The arch is finished in dull gold, and the curtain is brick-red, with satin appliqué of geometrical patterns in various colours. The prevailing tints in the theatre are beige and blue.

ORPHEUM
Finchley

DESIGNED BY YATES,

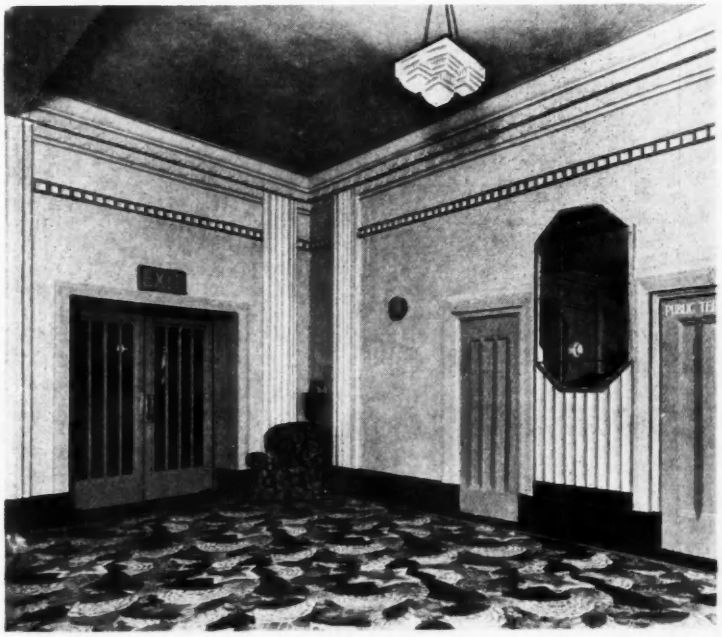
THE Orpheum Theatre, erected upon an open site in the Finchley Road, at Temple Fortune, Golder's Green, has seating capacity for no fewer than 2,400 persons. Londoners whose usual beats lie within or well clear of what used to be known as " the three-mile circle " are apt to remain oblivious of what is going on around the outskirts of this colossal city, and may well feel some surprise at the magnitude of the public presupposed; not so those who have kept an eye on the rapid growth of what is fast becoming in itself a subsidiary metropolis.

In a cinema enterprise of this size considerable space has to be devoted to accessory accommodation; accordingly there is a spacious foyer, and a café and tea-room at balcony level afford accommodation for 300, while large waiting-spaces have been provided on the ground floor.

The main elevation is symmetrical, and, with its two dominating towers,

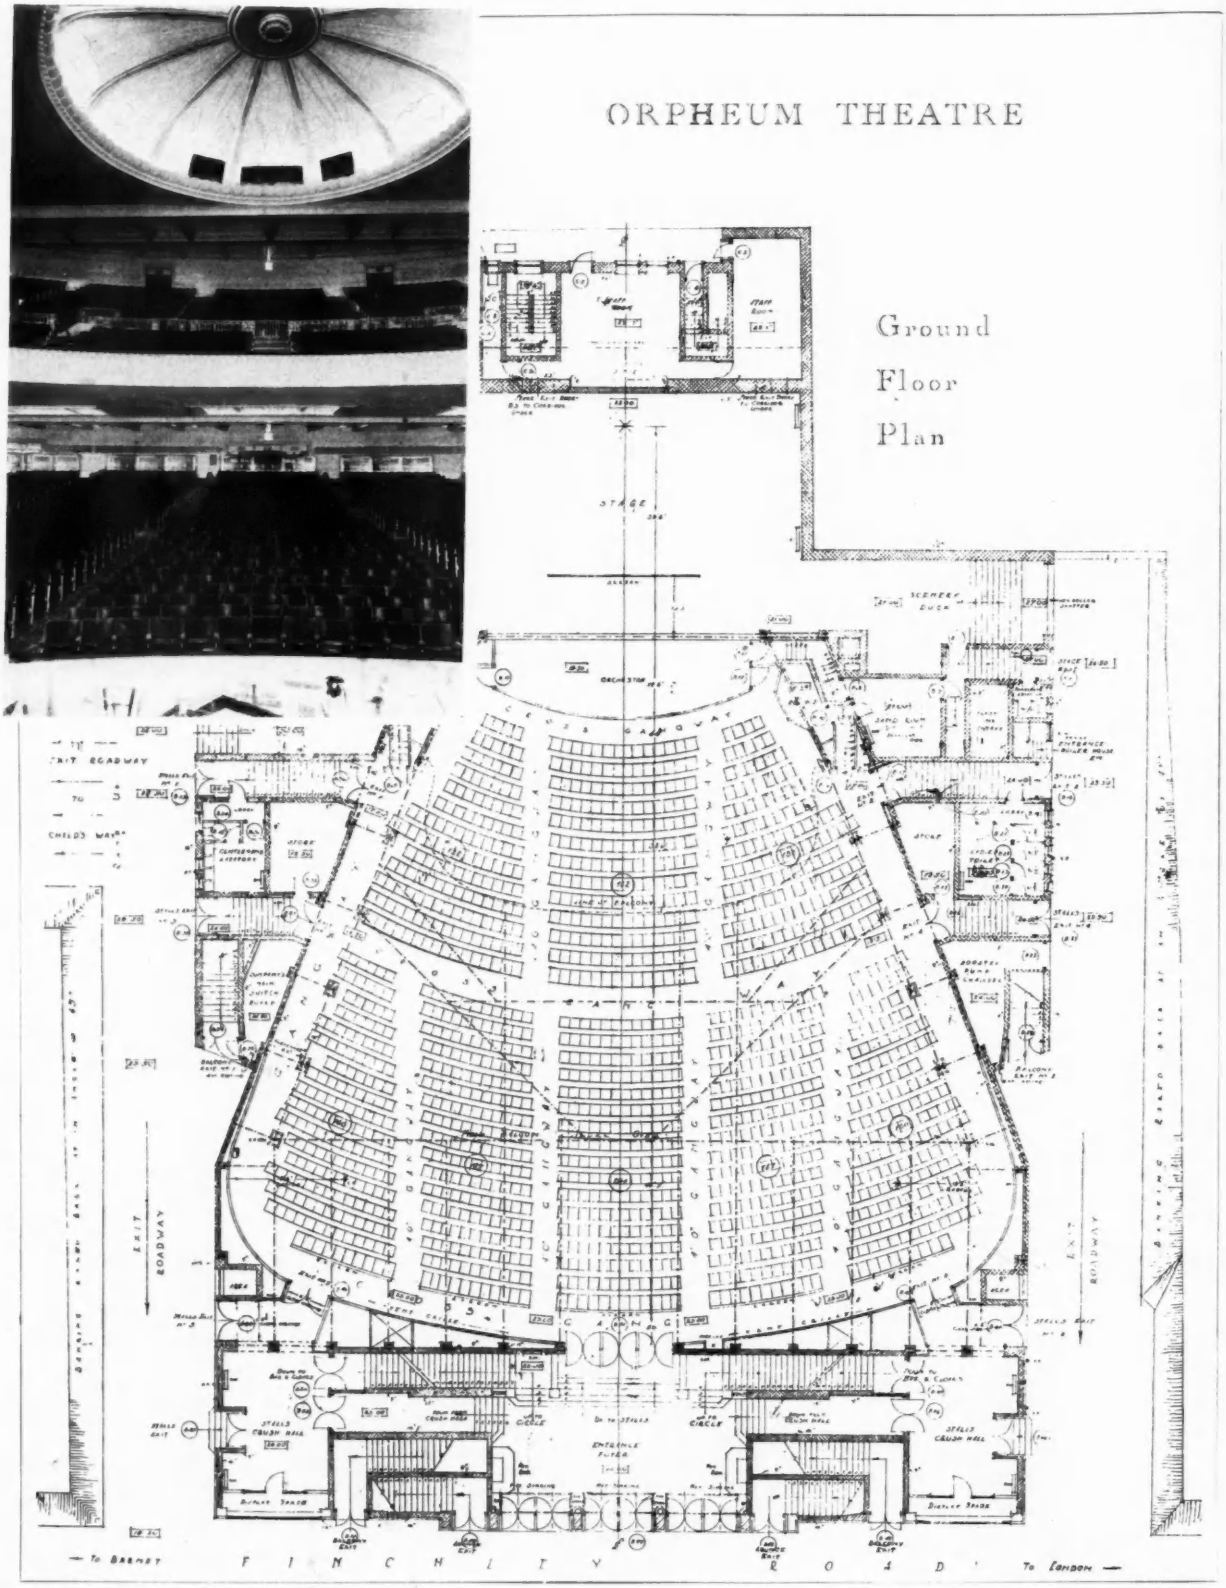
The entrance foyer, showing a pay-box ; stairs up to the crush-hall, café and tea-lounge, which is planned on the main front, on the floor above, and direct to the balcony, respectively ; and the three pairs of doors leading to the stalls.

THEATRE



Road, N.W.

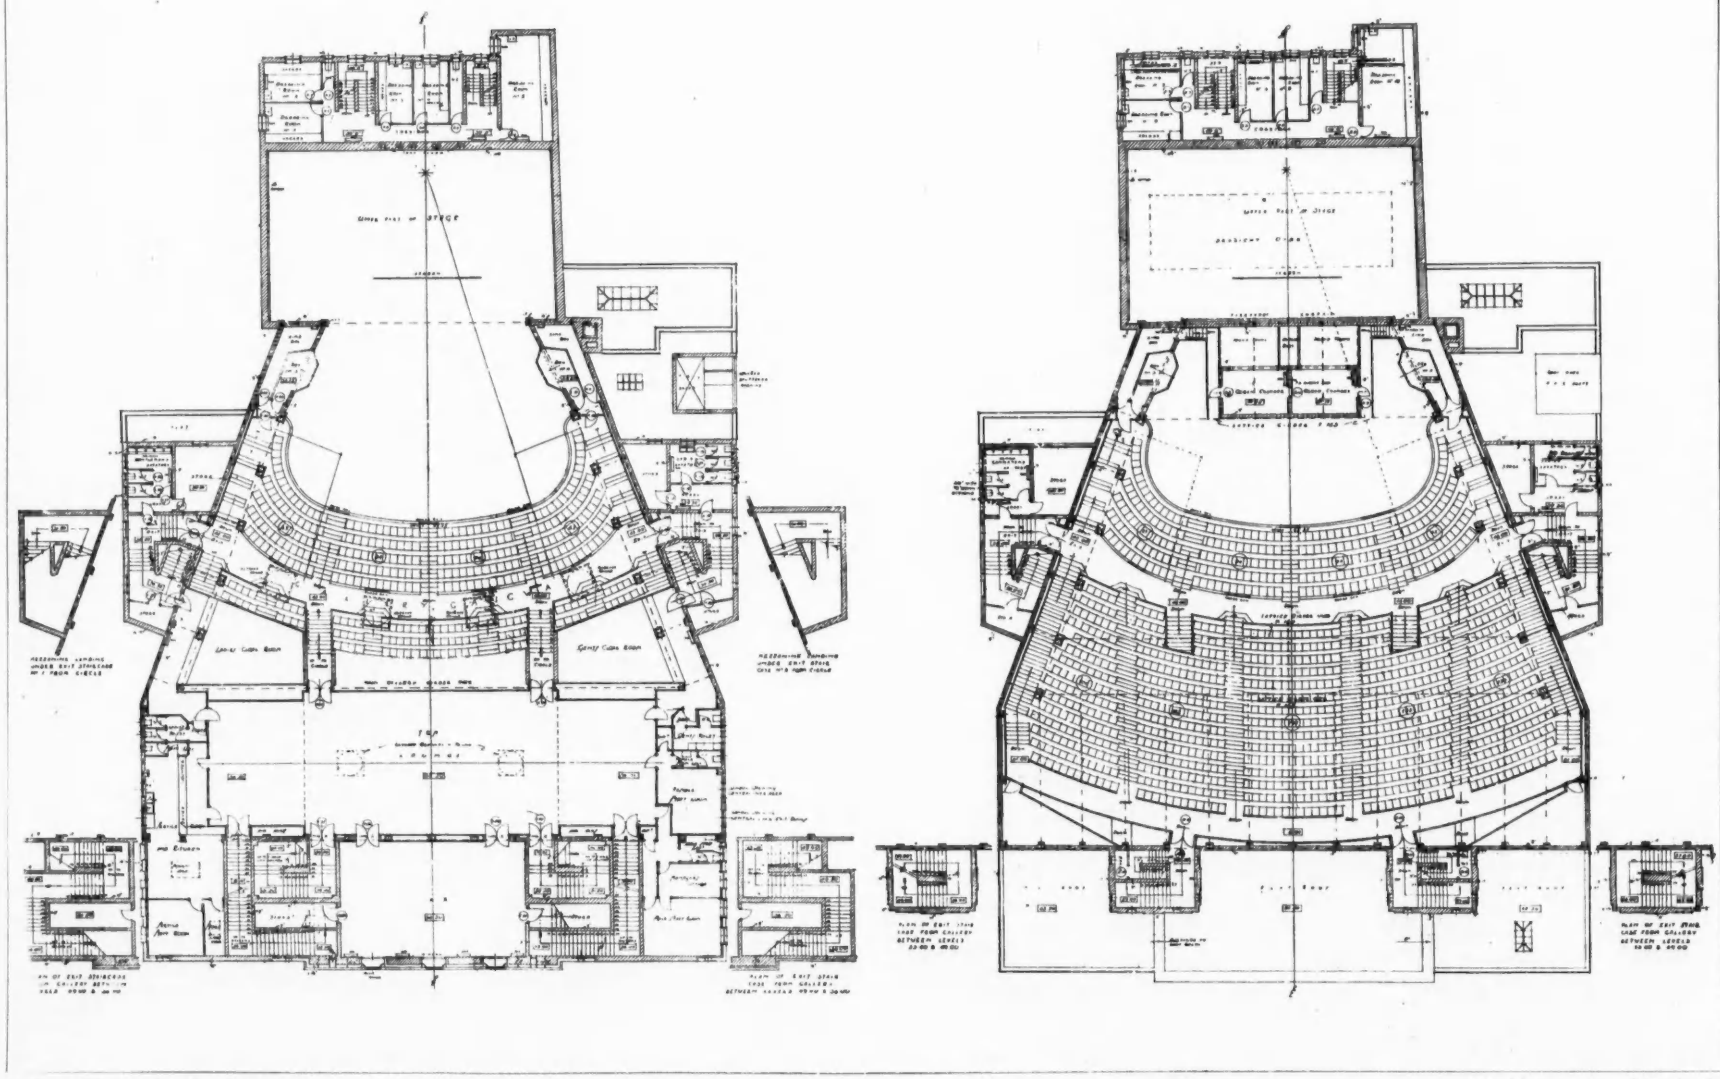
COOK AND DARBYSHIRE



flood-lit by night, is constructed in purple-brown Gloucester bricks, with cornices and facings of Bath stone. Large poster spaces have been expressly designed.

Within, the scheme of decoration, not only of the auditorium but of the foyer, tea-lounge and café, is carried out on modern French lines, but is kept of a very simple character. Tones of beige predominate, with enrichments in blue. For example, the panels at the base of the dome in the centre of the auditorium ceiling are in blue, but gold has been sparingly used in the dome itself; the proscenium arch is also in dull gold.

A glance at the plans will reveal the manner in which the very complete service of amenities demanded by the modern picture-house public has been disposed. The problem of rapid exit will be found to have received special attention; and here it takes place in the most favourable circumstances, a lateral road running either side of the front.



A corner of the tea-room, which is decorated in warmer tones of the same colours used in the auditorium : the carpet is in rich autumnal reds and browns. Tray lights are suspended from the ceiling.

Orpheum Theatre, Finchley Road, N.W. [*By Yates, Cook and Darbyshire.*

The ground-floor plan; and a photograph from the stage, to give an impression of the size of the house. The site, with its exit roadways on either side, is almost ideal from the point of view of planning convenient circulations and the multifarious adjuncts of a modern theatre for picture and stage purposes. Total accommodation is for 2,400 patrons.

O pheum Theatre, Finchley Road, N.W.] *[By Yates, Cook and Darbyshire.*

Plans of the first and balcony floors. The café and tea-room, extending across the frontage at the lower of these levels, will accommodate 300 persons. Ample dressing-room and scenery dock space is provided behind the scenes, while the situation of the organ chamber above and in front of the stage, and the arrangements for rapid exit from the balcony, will be appreciated.

BUILDING CONTROL AND LEGISLATION

General Recommendations

THE general recommendations contained in the memorandum on Building Legislation and Control, presented to the Minister of Health and signed by Lord Ebury and Mr. Maurice E. Webb, F.R.I.B.A., chairman and vice-chairman respectively of the conference dealing with this subject, are as follows :

1 : In view of the fact that any Building Regulations—unless subject to constant revision—must become out of date almost as soon as drafted, owing to the continual advance in the development of the science and practice of building, they should be reviewed on a national basis and should be confined to broad questions of principle, provision being made for the establishment of new machinery representative of all the interests concerned to advise upon the making of regulations as and when necessary in order to meet constantly changing conditions and requirements.

2 : Building control under local Acts be made the subject of bylaws or regulations governing technical structural requirements.

3 : Machinery be created for giving national application to new methods or materials of construction and Standard Industrial Specifications.

4 : The report on steel-framed buildings now being prepared under the auspices of the Department of Scientific and Industrial Research be accepted as a national standard, and that an interim report be published with the least possible delay.

5 : National sanitary regulations be drafted to effect uniformity of practice and of interpretation by City, Borough or District Councils.

6 : Water Companies' Regulations, which are very arbitrary and exacting, should be revised to meet modern building requirements, and that the Minister of Health should have power to require this as in the case of building bylaws.

7 : The most far-reaching consolidation of consents be effected (particularly in London).

[In dealing with the question of building control, the situation in respect of London naturally acquires particular importance.

The following recommendations relate to present specific features which require consideration not merely as London problems, but as problems requiring in many cases national settlement.]

8 : Subject to suitable fire provisions, all restrictions as to cubicle limitations be removed, except in the case of warehouses and factories engaged in inflammable processes.

9 : The restrictions imposed upon stores which limit the ceiling height of the topmost story to 80 feet from the pavement be abolished and commission given for two stories in the roof above the 80 foot line.

10 : Provided the building over 80 feet keeps within the angle of 75 degrees, no special permission should be required for its construction on vertical and horizontal planes.

11 : The whole question of permissible heights of buildings be considered in conjunction with zoning.

12 : The provisions in the London Building Act, 1894, restricting the extent of the windows above the ground floor to half the area of the wall, to be rescinded.

13 : There should be no restrictions in the development of suitable sites for the purpose of buildings serving a variety of purposes, such as restaurants and theatres, shops and flats, etc., provided that adequate precautions be taken to avoid fire risks and that the restrictions regarding separate entrances, staircases, lifts, etc., should be relaxed.

14 : A single code of bylaws should be adopted at any rate for the whole of the London district.

15 : When a block of buildings occupies an island site the same regulations which govern height at the front should govern the height at the back.

16 : Bylaws should provide, in the case of lifts, for fire-resisting shafts and fire-proof sliding doors only.

17 : In view of the fact that present Acts of Parliament leave too much discretionary power to the administrative authorities as far as possible where the Acts have to be varied to suit modern forms of construction, this should be done by way of regulations, which could be varied from time to time.

18 : A definite code for theatres and restaurants, applicable to the whole of London, be prepared.

19 : Canopies should be allowed of suitable constructions, irrespective of the nature of the user of the building.

20 : The present regulations governing means of escape should be reviewed with due regard to modern requirements.

21 : London should be placed in the position to deal directly with such technical matters as thicknesses, systems of constructions and materials of walls, coverings of roofs, etc., instead of Parliamentary sanction having to be obtained for every detail.

22 : In the preliminary stages of framing or modifying old bylaws or regulations help from an advisory council of the industry should be sought in some form before any new Regulations are presented to Parliament.

THE CONFERENCE MEETING

At a conference of the representatives of the various associations, held at the R.I.B.A. last Friday, a resolution to form the Technical and Economic Advisory Council, proposed by Lord Ebury and seconded by Mr. Sydney Tatchell, F.R.I.B.A., was carried unanimously. Sir Banister Fletcher, P.R.I.B.A., presided.

Mr. Greenwood, Minister of Health, who, it will be remembered, received a deputation on the subject last July, opened the conference with a speech in which he welcomed the proposal to form the advisory council. He thought it a very good thing that an industry should take steps to rationalize itself and to make itself articulate. One of the most important problems was that of the building regulations, in which connection they would find the position in London of primary interest.

It was desirable that the nation should have the advantage of the use of new materials and new methods of construction. So far as the Ministry of Health was concerned, he welcomed the formation of the council, because it would provide one large body to whom the Department could look for advice, and which could approach the Ministry in a representative capacity.

Following is a list of the representatives of the associations :—

R.I.B.A. (Sir Banister Fletcher, president; Messrs. Maurice Webb, Sydney Tatchell, Louis Blanc, and Howard Robertson). British Steelwork Association (Messrs. J. D. Stitt, M. Buxton, C. J. Kavanagh). Institution of Civil Engineers (Sir Clement Hindley and Mr. David Anderson). Institution of Mechanical Engineers (Mr. Alan E. L. Chorlton, C.B.E.; Mr. Ernest Boynton). Institution of Electrical Engineers (Mr. F. W. Purse). Institution of Structural Engineers (Messrs. Ewart S. Andrews and H. D. Searles-Wood). Royal Sanitary Institute (Capt. W. T. Creswell). National Federation of Building Trades' Operatives (Mr. T. Barron, president). National Federation of Building Trades' Employers (Mr. E. J. Strange). London Master Builders' Association (Messrs. G. L. Edwards and H. J. Holloway). London Employers' Association (Lord Ebury, and Messrs. Martin de Selincourt, J. B. Stevenson, and H. Kay). Building Industry Council of Review (Messrs. A. C. Bossom, B. S. Townroe, and H. B. Bryant). Incorporated Association of Retail Distributors (Mr. E. J. B. Lloyd). Hotels and Restaurants Association (Mr. S. W. Burleigh). Association of British Chambers of Commerce (Major John Colville, M.P.). Chartered Surveyors' Institution (Mr. E. C. Harris). Brewers' Society (Mr. H. F. Fuller). Society of West End Theatre Managers (Mr. R. H. Gillespie). Federation of Civil Engineering Contractors (Mr. G. M. Burt). Building Materials Manufacturers' and Suppliers' Committee (Messrs. H. J. C. Johnston, P. M. Stewart, and J. C. Halliday). Institute of Builders (Messrs. R. A. Costain, R. L. Roberts, and P. J. Spencer). British Medical Association (Sir T. Eustace Hill). Lift Manufacturers (Mr. D. W. R. Green).

ENGLISH PRECEDENT

No. 145

COTTAGES, PETERSHAM, SURREY

The mansard roofs and dormers of these cottages, built for a charity, strike a note of bravura which had become rather rare after Vanbrugh's death. They have the bold effect which is usually so costly that "the pose of the prosaic" is preferred. In this case the simplicity of plan and construction has given a reasonably cheap building.

Pantiles, 150 years ago, were thought inferior in effect to plain tiles, and were used mainly for outbuildings and back elevations. It must have been the rich colour and texture on such well-shaped steep roofs as these which signalled in the Romantic Revival. The adjacent cottage is a perfect, and necessary, foil.

—[P. M. STRATTON]

LETTERS FROM READERS

Soot-Bound

SIR,—I was interested to read your delightfully satirical leading article entitled "Soot-Bound" in your issue for November 26. As you remark, the progress of smoke abatement makes a sad tale; in fact, it is more than a tale—it is a veritable serial story. What are the reasons for the survival of this unquestioned and universally acknowledged evil? The case for smoke abolition, on economic, æsthetic and humanitarian grounds, is absolutely unassailable, and is well known to all who lead or create public opinion. Why, then, does smoke continue to be poured from the chimneys of our factories and houses? Why should there have been the necessity, last year, to form a National Smoke Abatement Society?

There are three important factors which, I think, should be considered:

1: There is little doubt that industrial smoke is decreasing: not fast enough, by any means, but, nevertheless, appreciably. This has been accelerated in many areas by the wise and continuous application of the law, although, elsewhere, the public health authorities have not yet awakened to their duties. Secondly, the growing realization among engineers and fuel technologists that smoke can be avoided and that its elimination means efficiency and economy, is doing a great deal. The laggards, however, require an additional incentive to progress.

2: That, in spite of the increased use of gas, electricity and various types of solid smokeless fuels, there is no marked diminution of the domestic nuisance, owing to these influences being counterbalanced by the large number of new houses erected during the post-war years, the vast majority of which use raw coal in at least one fire.

3: That the solution of the nuisance does not rest mainly upon the passing of laws and the development of new fuels and appliances, but upon more difficult and obscure factors. A tremendously strong tradition in favour of the coal fire has to be broken down, and in its place created an eagerness for clean and smokeless fires, as well as a disgust with smoke, such as already exists with regard to other forms of filth.

The formation of this public opinion requires a widespread and intensive propaganda, and this is the work that the National Smoke Abatement Society is setting out to do. At present its activities are sadly limited owing to an entirely inadequate income. It is therefore seeking and gaining new allies, representing various interests and points of view. Among those co-operating with the society there should surely be all the architects of the country; for what suffers more from the ravages of smoke than the works of the architect, and, also, who can do so much to bring about rational methods of heating as can the architect?

But most architects are strangely apathetic—they prefer, like others, to toast their toes at the open fire. May I, however, take this opportunity of asking them to consider what opportunities they have of helping to do away with this plague? May I also suggest that those who are interested should assist by becoming members of the National Smoke Abatement Society? The writer will be happy to supply all particulars, on request, at 71 Eccleston Square, Westminster, S.W.1.

ARNOLD MARSH
(GENERAL SECRETARY, NATIONAL SMOKE ABATEMENT SOCIETY)

Housing: The Counter Revolution

SIR,—Will you kindly accord me the hospitality of your columns to urge upon all local authorities the importance of maintaining good standards of planning, design, construction and amenities in their housing and rehousing schemes. This vital question of standards was considered at the National Conference of Local Authorities, recently held at Blackpool, under this Council's auspices, at which upwards of 700 delegates from all parts of Great Britain were present.

The attention of the Conference was drawn to a report of the National Federation of House Builders, extracts from which have recently appeared in a number of journals. That report invites the Government to introduce a new scheme of State assistance for houses erected by private enterprise. It also contains some suggestions for reducing the standard that has been generally adopted, and recommends, *inter alia*, that a density of at least twenty cottages to the acre should be allowed in industrial areas, and that rows of eight houses would be economical. This style of building, it is stated, "provides for greater warmth or 'cosiness' in the house; is more neighbourly, and gives many people a greater feeling of security."

I am glad to be able to state that the National Conference, by an overwhelming majority, decided to give no countenance to any proposals for reducing the standards of British homes erected with the Government's assistance. Experience has shown conclusively that with a layout plan adapted to twelve houses to the acre, no additional expense is involved in maintaining this density. Moreover, a tenant having a garden sufficient to be worth cultivation may easily derive produce worth 1s. a week or more from his garden, and is therefore in a better position to pay the rent for his dwelling, while securing all the added amenities free of cost. The report further draws attention to the high cost of road-making, apparently overlooking the fact that increased density of building must tend to increase rather than diminish the cost of roads. Many economies, both in width and character, which may be secured with low density, would be impracticable with the higher density.

Seeing that the houses to be built are expected to have a useful life of at least sixty, and probably a hundred, years, during which period standards of housing may be expected to rise rather than fall, it would surely be very improvident for local authorities to build, or in any way encourage others to build, houses that are below the minimum standard which has already been generally recognized.

May I remind your readers that the "Tudor Walters Committee," appointed by the Local Government Board in 1917, confirming the advice of previous Committees, unanimously reported in 1918 that:

> The number of houses should not exceed twelve to the acre in urban and eight to the acre in rural areas. If the layout plan is carefully prepared to provide suitable building plots and frontage, no addition to the cost of development need generally be involved on account of such limitation.

This statement has been amply proved by experience, and it is a source of satisfaction that, during the period of great housing activity, both by municipal and private enterprise, and despite the abnormally high cost and many other post-war difficulties, the standards prescribed by public and technical opinion as essential to national health and well-being have been generally maintained.

It is recognized, of course, that exceptional circumstances may justify special variations, and particularly varying sizes of individual gardens, but this affords no reason for any general increase of density. In all cases the maximum average of twelve houses to the acre in urban areas should be adhered to for new developments. If in any particular instance there may be reasons why the private gardens should be made smaller, then the area devoted to open space and playgrounds should be proportionately increased. Surely, sir, the nation has already paid, and is yet to pay, a sufficiently heavy price for the ignorance and folly which led to much of the house building of low standard during the nineteenth century.

The slum areas, and the still vaster areas of dreary industrial dwellings, the removal or improvement of which forms one of our hardest and most expensive tasks today, are directly due to just such short-sighted advice as to the cutting down of the standard of housing. Would it not be sheer madness to repeat this mistake? While there is little likelihood that the Minister of Health will entertain suggestions such as have been put forward, the report of the Federation of House Builders indicates that there are still those who cannot distinguish between cheapness and economy; and lest members of local authorities should be misled by such mistaken suggestions, it is desirable that any proposals to sacrifice the minimum standards, which have been established with great effort, should receive the unqualified condemnation of every housing reformer.

JOHN G. MARTIN
(SECRETARY, NATIONAL HOUSING AND TOWN PLANNING COUNCIL)

New Ways in Architecture

SIR,—It is evident that Mr. Hugh Macintosh and myself are travelling along the same road and towards the same objective, i.e. some form of control of building development, particularly in respect of street architecture.

One may enunciate proposals, including the invocation of the R.I.B.A., the allied societies and Parliament in co-operation, in an endeavour to achieve the object. However, the rock upon which these proposals are likely to be wrecked, when principles are applied to particular cases, is that of vested interests.

To be effective, more so than the admirable scheme advanced by Mr. Longden, the conditions must be as adamant as the Building Bylaws, and subject to similar sanctions in respect of non-compliance. In addition to medals for the delightful building, I would advocate fines for the delinquent.

I am whole-heartedly in sympathy with Mr. Macintosh's earnest plea for the suppression of the leprous and exotic travesties upon a noble art, and I would like to see a practical outcome to this plan. Although I expressed myself as being sufficiently old-fashioned to respect tradition, I have nevertheless marched with the times as regards the requirements of modern buildings.

It is the exaggerated functionalism with which I quarrel. I maintain that all modern requirements, which are largely matters of planning, can be achieved in a building expressing its function without sacrificing tradition in the fundamental elements of its composition.

HARRY HOLLAND

Architects' Fees

SIR,—Counsel's opinion on the above subject, reported on page 840 of your issue for December 3, lets us know where we now stand in this matter. It seems extraordinary that the Lord Chief Justice should give such a ruling as quoted.

What protection has a Member of the Institute if the law court takes up this attitude? It is curious that lawyers generally consider themselves qualified to assess the value of the work of a profession of which they are almost entirely ignorant. Every architect of experience knows that in the case of work abandoned, all the thinking part is very often done as fully as if the work were actually under way, and drawings are often no test or standard of the amount of time and labour which has been spent on preliminaries.

In the provinces this is a most serious problem, especially in these days when so much work is cancelled after the finished sketches and estimates have been prepared.

It is time the Institute took steps to protect its members so that the courts should recognize the scale which has been arrived at after long experience, and which is obviously reasonable where the work has been carried out in an honest and conscientious manner. Neither lawyers nor laymen generally have the faintest idea of the processes which work has to go through before it can be presented to the non-initiated.

I do not see why the courts should dispute the scale of the Institute when they accept the evidence of experts in other professions and occupations, in questions regarding the value of work done.

X. X.

Bungalophobia

SIR,—I hope the sense of my letter which appeared in your issue for November 26 was not misconstrued by Mr. Casson, or any other readers, as a result of the curious omission of the words " in the district of Oxfordshire " (" in which I am at present living ") in the setting up of the first paragraph.

I am glad to be able to say that I do not, and would not, live in the structure referred to at whatever cost—that is the very point !

I also notice that the compositor set up a description of his own invention under the illustration accompanying my letter. " Before " and " After," as I left it was, in my opinion, sufficient to indicate that the left-hand illustration depicted an ordinary disused railway carriage as dumped on the site, and that the right-hand one illustrated what quite an unskilled (if ingenious) owner made of it under the advice given him by the local Town Planning Committee. The roof obviously is of thatch, and not of asbestos slates as you state. The metal casements are of course out of proportion, but considering they are old ones re-used, and the whole job cost the man something under £50, it is not a bad effort at providing an emergency dwelling without any undue disfigurement of the countryside.

THOMAS THOMSON

[For any embarrassment occasioned by the omission referred to by our contributor from a somewhat ambiguous sentence, our apologies are due. The caption, however, was not the invention of the compositor; nor, in it, did we make any reference to the roof, so obviously of thatch.—ED., A.J.]

Preservation of Old Buildings

SIR,—It is gratifying to all concerned to read the approval expressed in your columns of our efforts on behalf of the Anglo-American Oil Company to preserve No. 25, the corner house of Queen Anne's Gate, London, that delightful relic of Queen Anne. The fact remains, however, that many similar eighteenth-century buildings, valuably representative of the best standards of our traditional architecture, are still being regarded as derelict and demolished to the grievous loss of the community.

It is not generally realized that eighteenth-century houses possess many advantages essentially modern in character. Their simplicity of external treatment is fully in accordance with present ideas, and the ample window space makes them eminently light and habitable when adapted to the current requirements.

H. H. WIGGLESWORTH
A. G. R. MACKENZIE

Rebuilding of Middlesex Hospital

SIR,—It is an extraordinary thing that one of the physicians of the Middlesex Hospital should complain that in the rebuilding of this hospital no provision has been made for open-air and sun treatment, and that this hospital should not have the advantages which Hippocrates had 2,000 years ago at the island of Cos.

In my opinion, hospitals should not be rebuilt at enormous cost in cities, but be moved out to bungalows, fitted with open-air verandas, placed in the country. A receiving station suffices in the city, and motor ambulances to convey the patients. By such means hospitals could be rebuilt perhaps for the value obtained for the city site, anywhere for far less cost, and we know that open-air treatment is the best.

(SIR) LEONARD HILL

Mr. E. J. Whitwell has removed his offices from 62 Orchard Road, Erdington, to 5 The Drive, Hunton Hill, Erdington, Birmingham.

LAW REPORT

DISPUTE OVER ANTIQUE PANELLING AND PERIOD MANTELPIECES

Speyer v. *Phillipson and others. Chancery Division. Before Mr. Justice Luxmoore*

THIS was an action which raised an interesting question as to the ownership of valuable antique panelling of oak and pine—the oak panelling being of the Stuart period and dated 1620, and the pitch pine panelling dated about 1720—and period mantelpieces.

The plaintiff was Mr. E. Speyer, of Mansfield Street, Portland Place, W., and he sued Mrs. M. C. Phillipson, Mr. H. Phillipson, Mr. J. D. Arthur and Mr. A. S. N. Horn, as executors of the late R. H. Phillipson, for a declaration that the panelling in a suite of rooms on the third floor of 74 Portland Place was in the nature of a landlord's fixture, or an improvement or addition to the premises within the covenant of a lease, the reversion of which was now vested in the plaintiff. Plaintiff also asked for an order for the delivery up of the panelling at the end of the lease, together with certain period mantelpieces.

Mr. Macaskie, K.C., for the plaintiff, said the question was whether the panelling put into the flat by the tenant had become landlord's fixtures. Defendants denied that the panelling had been permanently fixed so as to become part of the structure, or that its removal would injure the premises, and they claimed the right to remove the panelling and mantelpieces. Counsel said his contention was that the panelling and mantelpieces had become landlord's fixtures, as the inference to be drawn was that they were a permanent and substantial improvement to the flat. Counsel mentioned that period mantelpieces had been placed in some of the rooms and the rent of the flat was £900 per annum.

Mr. Robert Peel, K.C., for the defendants, argued that the panelling and chimneypieces were not landlord's fixtures, as defendant only desired to enjoy it while he remained in the flat.

Evidence was given by Mr. J. Naylor, F.R.I.B.A., that the panelling was worth £5,000 and would appreciate in value; and by Mr. C. E. Ballard, of Messrs. Stair and Andrew, Ltd., antique dealers, that Mr. Phillipson purchased the panelling for £2,100 in 1920.

Mr. Justice Luxmoore gave judgment for the defendants, holding that the panelling and chimneypieces were removable by the defendants.

His lordship said the question he had to decide was the purpose for which the panelling and mantelpieces were put in. The plaintiff argued that these were embellishments attached to the structure in such a way that they became landlord's fixtures. Here annexation was only one of the matters to be considered, and it was anything but the most important in his view. This panelling and these mantelpieces were valuable chattels and were acquired by the late Mr. Phillipson for the decoration of his flat, which he held on a term for twenty-one years from 1912. His lordship thought it would be a little surprising for a man to spend so much money as Mr. Phillipson did in panelling which would pass to the landlord after he had enjoyed it for a few years. His lordship had had before him a report from which it appeared that the structure of the rooms had not been altered by what the tenant had done. Taking it that Mr. Phillipson's intention was to beautify his flat, he could not come to the conclusion that the panelling and chimneypieces were landlord's fixtures. In his view they were tenant's fixtures and removable as such.

The plaintiff further submitted that the panelling and chimneypieces constituted improvements and additions to the premises and therefore passed to the landlord. But to his mind that meant improvements and additions to the structure. In that case it would not include anything in the nature of tenant's fixtures. Under these circumstances he held that the plaintiff's claim failed, and he entered judgment for the defendants, with costs.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Ancient Monuments Bill

THE Ancient Monuments Bill has been introduced into the House of Lords. This is the measure, foreshadowed by Mr. Lansbury, to afford greater protection to Hadrian's Wall and other ancient monuments.

Preservation of Buildings

At question time in the House of Commons Mr. Mander asked what steps were being taken to preserve buildings of historical or architectural interest under the Ecclesiastical Commissioners' control; and what buildings had been scheduled under the Ancient Monuments Act during the last three years.

Mr. Middleton said that the buildings of historical or architectural interest under the Ecclesiastical Commissioners' control were such as were on estates owned by the Commissioners. As owners, the Commissioners took reasonable care for their preservation. Buildings, etc., on the Commissioners' estates scheduled under the Ancient Monuments Act during the last three years had been: Cawood Castle, Yorkshire; certain barrows (near Wells), Somerset; Roman station (Vinovia), Binchester, Durham.

Reconstruction at Whitehall

Captain Eden asked the First Commissioner of Works whether it was the intention of the Government to proceed with the reconstruction at Whitehall; and what would be the cost of the work.

Mr. Lansbury said that the answer to the first part of the question was in the affirmative. In regard to the second part, the cost of the work was estimated at £2,215,000.

Calton Hill Site

Mr. McKinlay inquired of the First Commissioner if he had definitely abandoned the Calton Hill site in Edinburgh for the erection of new Government offices; and, if so, would he approach the Glasgow Corporation with a view to securing a Glasgow site.

Mr. Lansbury said that the answer to the first part of the question was in the affirmative, and to the second part in the negative.

Protection of Ecclesiastical Buildings

Sir John Withers asked the First Commissioner whether he was satisfied that the undertaking given by the authorities of the Church of England that they would protect their ancient buildings, as the result of which ecclesiastical buildings in use were excluded from the protection of the Ancient Monuments Act, 1915, was being carried out; and whether, in view of the extended facilities for the demolition of churches given by the Union of Benefices Measure, 1923, he would consider the desirability of extending the Act to include ecclesiastical buildings.

Mr. Lansbury said he had considered this question and had come to the conclusion that it would be inadvisable to extend the Act so as to include ecclesiastical buildings in use.

No Grant for Quarry Owners

Major Owen asked the Minister of Agriculture whether he was aware of the refusal of the Commissioners of Crown Lands to recommend a grant to the Amalgamated Slate Association, Ltd., and that this refusal involved the placing of approximately 300 men permanently out of employment; and whether, in view of their circumstances, he would make recommendations to the Commissioners to reconsider their decision.

Dr. Addison said that the Commissioners of Crown Lands were aware of the misfortunes which had befallen certain quarries in Caernarvon, which had been worked for many years.

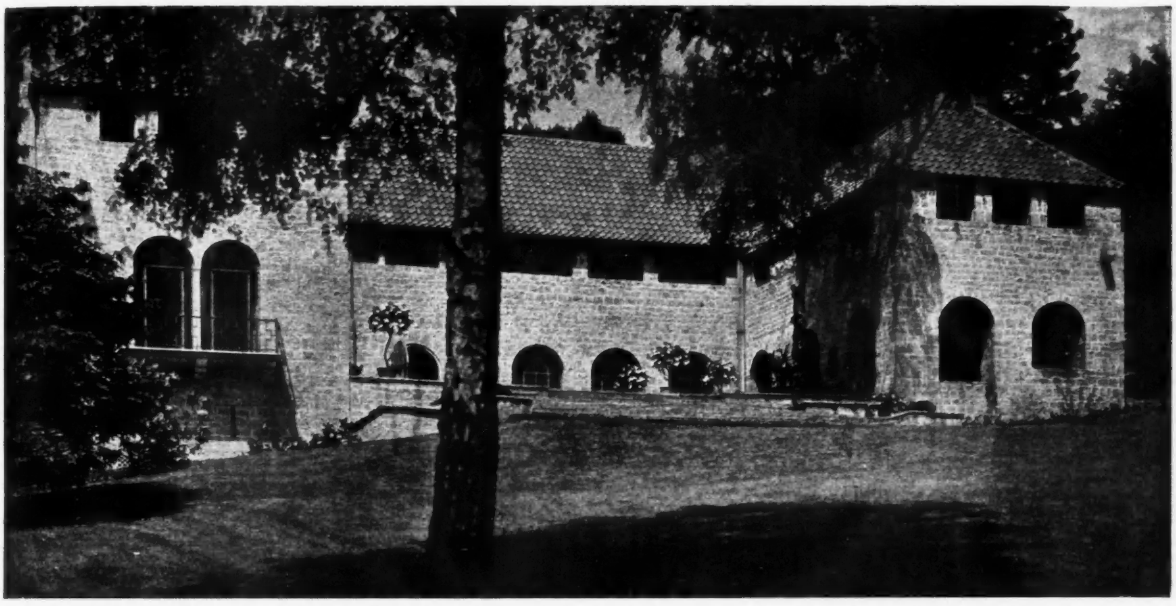
Looking from the loggia, across the fountain court, towards the music-room. The loggia ceiling is executed in unsawn pine logs ; the hanging lantern is of brass, burnished on the inside, and has a verdigris finish on the outside.

A corner of the music-room. All the woodwork, including the floor and the ceiling beams and fillings, is bleached a silver-grey colour. The door on the right leads to the hall ; that on the left to the small bolt hole to the library. The cupboard conceals a loud speaker.

"Marylands," Hurtwood, Surrey.]

The double window at the south end of the music-room is divided by an octagonal Irish green marble column, and gives on to a balcony overlooking the south front.

[*From* The Architectural Review.]



A view of the fountain court at night, looking towards the loggia. In the foreground is seen a part of the illuminated blue mosaic pool and one of the jade frogs which spurts water into it.

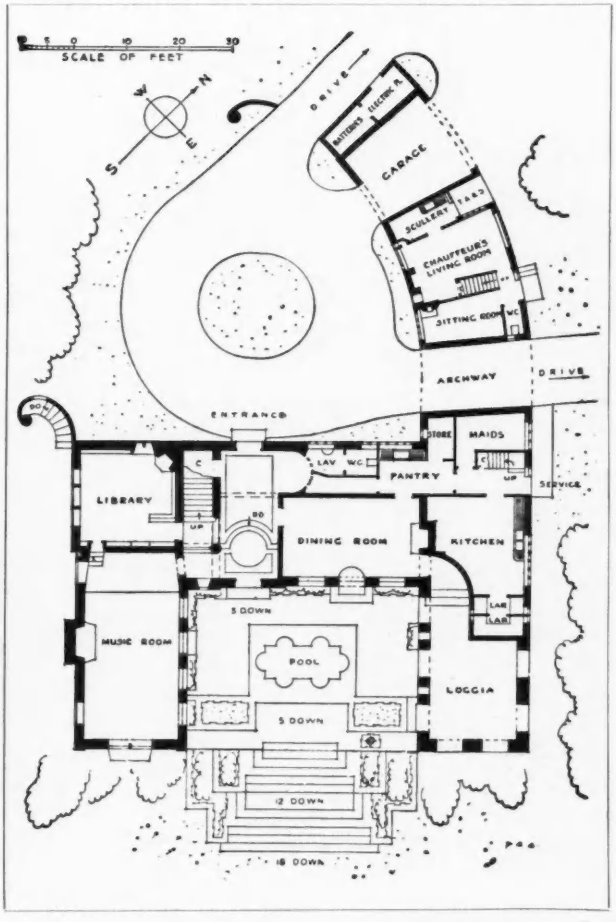
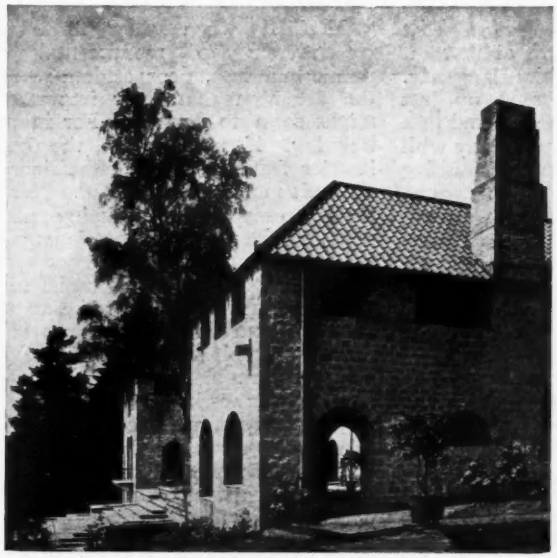
A COUNTRY HOUSE AT HURTWOOD, SURREY

DESIGNED BY OLIVER HILL





[By Joseph Hill.

The south front. The house has been built almost exclusively of local stone, which quickly weathers to a warm grey colour; the roof is covered with Swedish jade green glazed pantiles. The steps in the centre of this façade lead up to the fountain court, on the right of which can be seen the silver birch tree incorporated in the scheme.

"MARYLANDS," Hurtwood, Surrey, illustrated on this and the facing page, is one of the many interesting features of the current issue of *The Architectural Review*. As will be seen from the accompanying plan, the house possesses, in addition to the more usual accommodation, a music room and a fountain courtyard overlooking the garden. Here, the silver birch tree previously existed and has been happily incorporated in the scheme.

The architect's layout plan of the house and grounds. The garage and chauffeur's living quarters are situated on the right of the entrance drive.

This view, taken from the south-east, affords a glimpse of the fountain court, looking through the loggia.

"Marylands," Hurtwood, Surrey.]

E

THE SPECIFICATION WRITER

On the Job: Demolition

BY THE GUV'NOR

In the last Specification Writer (issue for November 26) specifying for demolitions was discussed. This was for theory. For practice, now, we offer readers observations actually made on the job. Incidentally, it is the first of a series of notes from the same hand which are to deal with several of the important early phases of building works.

IN these days the erection of a large building in London almost invariably involves the removal of out-of-date structures prior to commencing operations. House-breaking or demolition has now become a highly-specialized business. It is usually defined as breaking down the structure to the ground level and gutting all internal walls, leaving only such as are acting as abutment in holding up earth or adjoining properties.

Owing to the immense amount of transport required over a short period, it has gone beyond the reach of the ordinary builder to do this work economically; also an entirely different class of men are employed under different rules and with special insurance schedules, keeping these men and the ordinary builders' men quite separate.

These specialist contractors usually combine the business of house-breaking with that of excavation and the supply of materials. By this means they are able to keep their transport fully employed and have a ready market for such old materials as may be fit for re-use, e.g. bricks if sound may be cleaned, or if broken can be crushed and used as hardcore or as aggregate for concrete where permissible.

Whilst demolition is looked upon as providing the lowest type of employment connected with building, at the same time present-day problems require the use of scientific methods and apparatus, and these are often brought into use. The pneumatic drill is now used extensively when substances will not yield readily to the ancient and still very efficient mattock (without which no photo of demolition in progress is complete). The oxy-acetylene blowpipe is brought into use for cutting up steel girders or trusses.

Another phase of this work worthy of consideration is the increasing tendency to keep the lower floors of a building open to the public while pulling down above. "Business as usual" is all very well, but the risk is too great and should *not* be allowed. Lives have already been lost, and no guarantee can be given against repetition of these accidents.

The trouble is, it is almost impossible for anyone to ascertain the exact condition of existing walls. In the case of very old property, which may have changed hands several times, it is quite common to find that cross-walls have been altered from time to time; shifting some openings, filling up others, without due attention to bonding, so that the wall has become just a mass of small pieces, which, as soon as floors are disturbed, topple down.

I have seen cases where cross-walls have been entirely cut away through a story and bressummers placed over, having their ends supported in quite a different manner than the designer planned, and concentrating the load in a position quite inadequate and ready to collapse unexpectedly during operations.

The great bugbear is the party wall. The prevailing practice of rebuilding the external walls whilst still retaining the old party wall condemns itself. The act of thicknessing the wall by means of a thin skin of new work to allow of additional height being carried only aggravates the danger, as it is not infrequently found that what appears on the face of it to be a sound modern wall is really only a mass of bricks which have reverted to their natural clay! It will often be honeycombed by flues not properly filled in or bonded and held from collapsing only by the aforesaid thin skin of new work, and is thus incapable of standing alone when the lateral support of the floors is withdrawn.

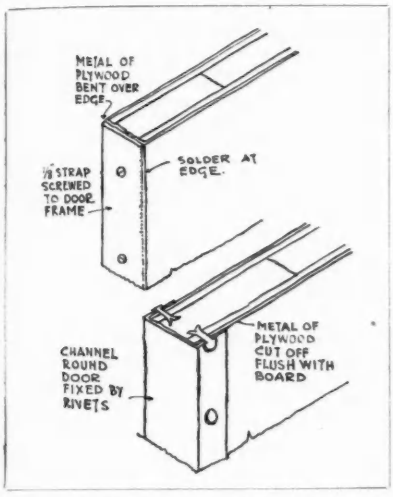
It is here that another branch of the housebreakers' business comes in—that of shoring. Shoring is a very important and delicate operation if done properly. Shores should be tightened up just sufficiently to take the weight and that is all. A stroke or two too many with the wedging up may result in pushing the wall over.

After the structure has been cleared of all fittings and gutted of roof, partitions, etc., but not floor joists or cross-walls, any shoring required should be set out. It is usual to strut the ends of the party walls on the front and rear elevations as a matter of course. As regards the party walls, these have to be dealt with on their merits and taking into consideration the work proposed to be done on them. No wall should be underpinned to any depth without being shored temporarily.

If care is used, it is possible to place the shoring in such a way that it will not have to be touched until finally struck. Lack of foresight in placing shoring correctly may result in heavy charges later for moving or replacing it, involving a certain amount of risk to the wall besides.

The architect should be able to indicate the position of any steelwork likely to be fouled by the shores, which may be erected usually to clear such positions without loss of efficiency, an ordinary position being about 3 ft. in from the building face. Intermediate spacing in the case of fairly good walls should be about 12 ft. apart and with doubtful or poor walls 8 to 10 ft. apart. New walls should not need shoring except when underpinning extensively.

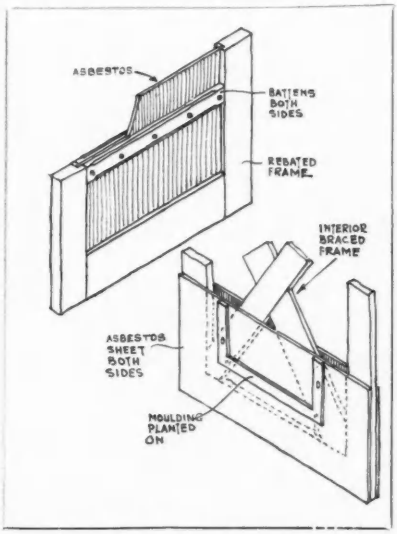
Another consideration is that the sole-pieces of the shoring sets should be laid at the depth it is proposed to excavate and pits dug for the purpose if necessary; otherwise it will happen that they will either have to be undercut and strutted up or left resting on a small dumpling which may crumble and leave the shore a dead weight on the wall, tending to drag it over instead of giving it support.



SOME interesting particulars of tests of composite hollow-brick and concrete beams have recently been carried out in America. Beam tests were carried out on from two to six cells of ¾ in. wall thickness, square or rectangular in cross-section, up to 12 in. by 12 in., inserted between stronger concrete ribs 4 in. thick. They indicated that one row of bricks was equivalent in resisting shear to a concrete rib of the same depth and having a width of from 1·6 in. to 2·4 in. The researches are the subject of paper No. 181 of the United States Bureau of Standards.

The Cost of Doors

EXCEPT when they form the entrance to monumental or public buildings, doors seldom receive the attention that their importance might seem to demand. For in any building, if not always the chief interior feature, certainly the door is the unit most often repeated. Nevertheless, except for specifying panel doors for the more aristocratic parts of the house and other well-known types in a gradually descending social scale down to the ledged entrance to the tool shed, no serious effort has been made to exploit the possibilities of the various forms.



In domestic work one naturally thinks of a door as a piece of joinery, but there are other materials besides plain wood on the market today that are well worth a trial. One of the most decorative of these consists of a thin sheet of metal on a backing of plywood. One method of making this into doors

is to apply a sheet (which is manufactured in sizes 7 ft. by 3 ft.) to each side of a thin pine or deal framing. The fixing may be by means of ornamental-headed screws, and the metal may be left projecting beyond the

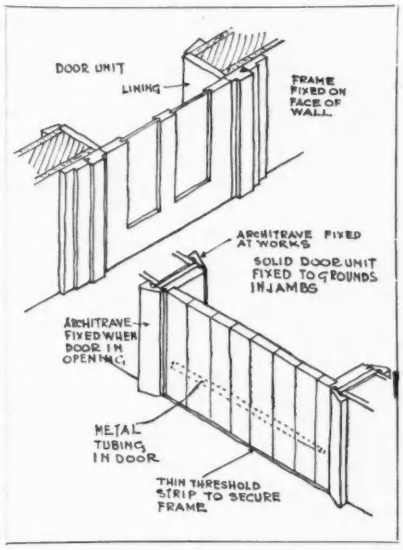
edges of the sheets sufficiently far to be bent round the edges of the frame at top and sides.

Various methods are adopted for securing the two edges of the metal, the most common being an $\frac{1}{8}$ in. metal strip fixed all round the edge of the door. Alternatively, one side only is left projecting and bent right round the frame, but this necessitates a mitre at the angles or on the face of the door. The makers have a third method, which is called "sealed edges," and gives a flush surface and a neat joint. Aluminium, owing to the lack of a reliable solder, cannot be finished in

this way. In specifying metal-faced plywood it is well to remember that the weak spot is the exposed edge of metal and wood, and wherever used this should be made waterproof. Ordinary butts can be used to hang the door, but the lock should be a rim lock.

Another type can be built up by using plywood panels metal-sheeted both sides in an ordinary panelled door. Mouldings round the panels are unnecessary, and an aluminium finish on these with the stiles and rails painted a lacquer red makes a very decorative feature. Such a door can be fitted with a mortice lock, and the cost is no more than the ordinary panelled door, the metal-plywood costing about 10d. per foot super.

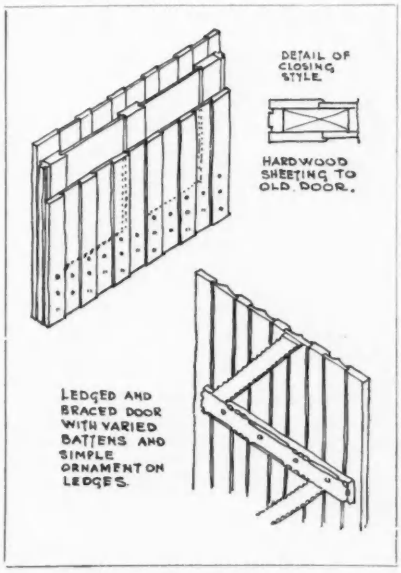
A cheaper type of door may be made by using asbestos sheets screwed between two light framings. These were tested shortly after the war by the Department of Scientific and Industrial Research during the building of experimental cottages at Amesbury, Wilts, and proved satisfactory, but here again rim locks only can be fixed.



Another type is produced by framing a door with $1\frac{1}{2}$ in. frame rebated to a $\frac{3}{16}$ in. sheet of asbestos board, the horizontal rails being $\frac{1}{2}$ in. and double screwed to each other through the sheets. Another door of this type may be made by covering a $\frac{7}{8}$ in. framing with wall-board, securing this to the frame with a fillet nailed in the form of a panel. Asbestos can also be used in this manner, but it is not so satisfactory, as the edges are brittle and liable to chip unless protected. Both these types of doors are slightly more expensive than imported Swedish doors, but have the advantage of being British-made.

Some doors are manufactured complete with frames and fittings for building direct into the openings. In theory this effects a considerable saving of cost, but as the openings may not vary more than $\frac{1}{4}$ in., builders when estimating for this type of door sometimes charge additional labour to the bricklayer for special care required in forming openings. These solid doors are reinforced by steel tubing, and when making comparisons in price their thickness of $1\frac{1}{4}$ ins. must be remembered.

A $1\frac{1}{2}$ in. square-framed door complete, made by the builder, costs approximately £2 10s., and the average price for a $1\frac{1}{4}$ in. door supplied complete is about 70 per cent. of this, exclusive of extra labour in bricklayer.



Most of these doors have a standard shape of 2 ft. 8 ins. by 6 ft. 8 ins., but a type is manufactured standardized at 6 ft. 4 ins. in height, and pleasing both in proportion and design. A novel method of fixing them on the face of the wall instead of fitting the frame into the opening has been evolved, and this gets over the difficulty of exact bricklaying dimensions. The cost is approximately 60s. complete.

In reconditioning houses of the last century, the Victorian four-panel door defies all attempts to bring it into harmony with any modern scheme of

decoration, and it is usually scrapped in despair. This is a pity, as the doors are as a rule of excellent workmanship. Where the jamb linings are sufficiently deep the door may be sheeted with thin hardwood battens, the stiles planed down and covered with a hardwood strip. The old mortice lock can be refixed with a longer spindle and a new type of handle. The cost of this thin sheeting will be approximately equal to that of a new first-quality deal door.

Several variations may be made with the common ledged and braced door,

now relegated to humble service in outbuildings. The monotonous V-joint and bead can be changed into a moulded lamb's tongue or other type,

and with a little ingenuity and variety in the thickness of the alternate battens a pleasing effect can be obtained at little extra cost. Smaller and thicker sizes can be substituted in place of the ugly 4 in. by 1 in. ledges, and by following the practice of the old wheelwrights some effective arris ornamentation may be done with the simple spoke-shave. A door so designed and picked out in colour in the manner of the old country farm wagon becomes a cheap and interesting feature. The Swiss have many traditional patterns made by simply cutting the edges of door braces that add enormously to the beauty of many humble doorways. The total cost of such a door is approximately £2.

Too often in confined spaces the opening of the ordinary door is a problem, and in some houses the landings are positively dangerous to the unwary. A solution might be found in adopting the door hinged at the centre as well as the side, which slides on a rod concealed in the door head, in the manner of the telephone cabinets in the Underground stations.

Locks and furniture are expensive items, and money might often be saved by considering whether it is necessary to be able to secure every door in a house from either side. In many rooms a bolt on one side with some simple form of ball catch is all that is required in addition to a wooden knob or handle. Butt hinges in all sizes are the cheapest means of hanging ordinary doors, but for heavy varieties the old pin hinge minimizes leverage, and is probably a sounder method than the cross garnett. PANTILUS

A BULLETIN has been published by the Department of Scientific and Industrial Research (H.M. Stationery Office, price 3d. net) to present in brief form the more important conclusions and recommendations which it has been possible to make as a result of experimental work carried out at the Building Research Station on methods of bonding new concrete to old. The bulletin is written by Norman Davey, B.SC., A.M.INST.C.E., who rightly points out that the evils attendant upon the careless bonding of new concrete to old are not always fully appreciated. Poor bond between two sections of a structure may render it incapable of satisfactorily resisting the stresses set up by the differential shrinkage movements of the material on either side, or movements due to settlement. Faulty joints made in work from day to day may weaken the whole structure. Moreover poorly constructed joints may become susceptible to the percolation of moisture which on freezing may cause disintegration of the concrete; and chemicals in solution are liable to penetrate the faulty joints, causing disintegration in the concrete mass and efflorescence which may disfigure the structure.

LITERATURE

THE HONEYWOOD SETTLEMENT

IT will be no news to readers of THE ARCHITECTS' JOURNAL that Karshish did find the second Honeywood File. When the first file concluded with the acknowledgment of Sir Leslie Brash's appreciation of his architect's services we all must have felt that the last word had not been written, but perhaps feared that Karshish might have neither the time nor patience to wade through Spinlove's filing cabinet to see how he fared through the perilous passage of accounts and settlement. Indeed, knowing its contents, Spinlove might have been reluctant to disclose them to the critical eyes of his friend. But Karshish has a kindly touch, and the lapse of four years since the job was cleared up probably helped matters. It is possible also that Mrs. Spinlove (*née* Brash) may have had some part in it. She at any rate possessed qualities of humour and good sense that her husband lacked. And so it comes about to our great delight and instruction that *The Honeywood Settlement* (File No. 2 and final) after running serially in these pages, is in our hands in book form. And what a feast of good things it provides!

With *The Honeywood File* and its present companion volume Karshish has provided architects, both young and old, with the two most valuable guide-books on professional practice which have been published. Herein are set out the many pitfalls which encompass the path of the general practitioner and, what is of even more value, the manner of their avoidance. So reasonable and just are the author's commentaries that the reader scarcely realizes what a wealth of wisdom underlies them. Into every page of the volume the author has imparted a

Liverpool Cathedral, as it will appear. Architect: Sir Giles Gilbert Scott. (Photo: Stewart Bale.)

[*From* The Future Development of South-West Lancashire.]

delightful touch of humour—Grigblay on Drains, and Bloggs on Flues, are valuable contributions to technical literature. How familiar to the older reader is the sequence of events, how vividly do they recall to his mind the early days of practice—the pathetic attempts to "sugar the pill" for the client; the terror of that bogey of dry-rot!

These two volumes should be included in the list of books recommended by the R.I.B.A. for students, and no client, present or prospective, should be without them—certainly no practising architect. The Architectural Press is to be congratulated on persuading Karshish to contribute the second file, and upon its enterprise in publishing it in book form. SYDNEY TATCHELL

A NEW REGIONAL REPORT

THIS volume contains the report of the South-West Lancashire Regional Planning Committee, and indicates the lines of the future development of a region which includes the Port and City of Liverpool, the great manufacturing districts of St. Helens and Widnes, the residential town of Southport and many other smaller towns, with an area of about 300 square miles of intensively cultivated agricultural land.

In the preparation of the volume an attempt has been made to produce a readable and not too technical study of the problems of town development and the preservation of the countryside. It follows the system now becoming generally recognized as typical in this kind of literature, in that it opens with a brief introductory chapter, giving the main objectives of the scheme and topographical as well as historical notes as aids to the visualization of the district as it is at present. The maps and views are of great assistance to the reader, and well chosen and very clearly reproduced.

Chapter II deals with zoning, but covers a great deal more ground than would usually be anticipated under this heading, the statistical examination with its tables and diagrams being followed first by definite allocations for residential and industrial purposes, and after that by plans illustrating appropriate methods for laying out residential areas.

In the next chapter we have communications. These, in turn, are dealt with on a logical system, involving first an examination of the general requirements of the area, then passing on to the more intimate needs of each district, and finishing with detailed studies, layout planning and construction, with supplementary notes on transport by road, rail, and canal.

The open spaces, present and possible, have obviously been very carefully surveyed with a view to suitability and to the demands of the populous areas around them. The plan shows a well-devised series of parks, recreation grounds and parkways, the lines of streams dictating many of the latter, while the feasibility of dealing with spoil heaps, etc., has also been considered.

Under the heading "Architectural Amenity," such questions as the control of the arrangement and design of buildings are dealt with, together with those raised by practical needs, such as electrical conduits, petrol pumps, and other services. Historic monuments are scheduled, and the preservation of scenic beauty is not overlooked.

Reclamation, coast erosion and drainage are of exceptional importance in this area, and have consequently received particularly close consideration. The recommendations on these, and indeed on all the points covered, though naturally on general lines such as are appropriate in a regional report, are so clearly thought out as to ensure their being of very great value to the authorities on whom the development of the programme will devolve.

QUESTIONS THAT ARISE

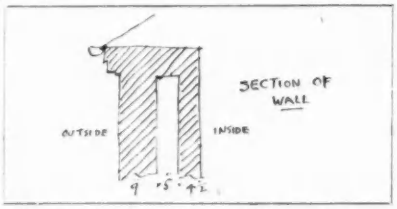
Clarifying Water

W. L. L. writes: "*I have been consulted regarding an open-air bathing pool. On inspecting the water, which is to be taken from a brook close to the site, I find, at times, this runs rather dirty. I should be obliged for suggestions as to rough filtering this water. The funds will not allow an elaborate and costly system.*"

The treatment necessary to clarify the water will depend on the nature of the discoloration. If the bed of the brook is sandy, the particles of sand will settle out as a deposit by passing the water through a sedimentation tank. Should, however, the discoloration be due to clay, the particles will be in such a fine state of subdivision as to be difficult to remove without the use of a coagulant.

A sample of the dirty water should be placed in a tall glass jar, and should it clear within 15 minutes, a properly-designed sedimentation tank will suffice. If the water does not clear, the dirty appearance is possibly due to clay which is in a very finely divided or colloidal state. The particles of colloidal matter are kept in suspension by minute electrical charges which repel them from each other, and it requires a chemical coagulant to neutralize these electrical charges.

Take another sample of the water in the glass jar, and after dissolving a small quantity of sulphate of alumina in some clear water, thoroughly mix a few drops of this solution with the sample. Now observe the rapidity or otherwise of the coagulation and settlement, which will depend on the chemical properties of the water. If carbonates are absent, coagulation will not be satisfactory, and it will be necessary to add some chalk.



The quantity of chemical to be added must be determined after an analysis of the water has been made, and will depend on the amount and nature of the impurities present. Too much chemical will result in further coagulation taking place after filtration. After coagulation the water can be passed rapidly through a coarse-grained sand or silica grit filter, either by gravitation, if the head of supply is sufficient, or it may be pumped through a pressure filter.

If the discoloration is due to peat, a similar treatment to that just described will clarify it, but it will first be necessary to add some chalk or lime to neutralize the acidity of the water.

N. H.

Hollow Walls

B. C. D. writes : "*I am about to erect a building, the walls of which are to be faced, both inside and out, with rustic brown facing bricks. The outer and inner walls*

will be 9 ins. and 4½ ins. thick, respectively. I wish to use white ½-in. joints both on the exterior and interior of the building. It was the intention to build the walls in white Portland cement, and to form a stuck joint at the same time as the building of the wall. In doing this the wall may be soiled with the cement, however. Also, we do not want the brickwork to show efflorescence. What is the most satisfactory way to gain the desired effect ?"

I do not see any difficulty in building with white joints, either putty or white cement and white sand, with either of which pointing would be unnecessary. I take it stuck joint, means struck joint, and this, of course, will be made in course of building.

There is no reason why the bricks should be stained by the putty or cement mortar, but some bricklayers keep their work cleaner than others do; nor should there be any reason for fearing efflorescence if suitable sand and bricks are used. This point might be raised with the firm supplying cement before this is specified. N. L.

SOCIETIES AND INSTITUTIONS

ARCHITECTS AND ADVERTISING CAMPAIGNS

THE consideration of a Press publicity campaign by direct advertisement was introduced by Mr. S. Phillips Dales, F.R.I.B.A., at a recent meeting of the West Essex Chapter of the Essex, Cambridge and Hertfordshire Society of Architects.

Mr. Dales said that there were many ways in which individual architects could advertise and be of value to the whole cause of architecture. They could instruct the great mass of the unthinking public, who never considered the work of the architect, and who did not and could not distinguish between the good and the bad architect.

At present trade was bad, and the architectural profession was sharing in the depression. It was an opportune moment for advertising. The policy of advertising was a good one.

During the discussion which ensued, Mr. Percy Haywood, F.R.I.B.A., questioned the wisdom of the experiment, and suggested it would have to be referred to the R.I.B.A. Mr. D. N. Martin-Kaye, A.R.I.B.A., on the other hand, supported the idea.

Mr. J. R. Leathart, F.R.I.B.A., also spoke in favour of the motion, but mentioned that a somewhat similar movement that had been set on foot in America had met with only slight support. A difficulty would be the elimination of favouritism. All jobs, he said, coming into the Chapter would be domestic jobs, and the great difficulty would be to allocate jobs to architects. He thought the R.I.B.A. should conduct the campaign.

Mr. Alan Fortescue, A.R.I.B.A., said it seemed to him that architects did not display their wares sufficiently.

Captain C. Pugh-Morgan said that to have any ordered campaign of publicity it was essential that plain, straightforward advertising should be adopted.

After the discussion, a resolution "That this meeting deems it desirable that the society should promote a Press publicity campaign by direct advertisement" was carried.

THE ÆSTHETICS OF ENGINEERING

The second of the series of public lectures arranged by the South Wales Institute of Architects (Central Branch) and the Institute of Builders (South Wales Branch) was given recently at the Engineers' Institute, Cardiff, by Mr. H. V. Lanchester, F.R.I.B.A., who spoke on "The Æsthetics of Engineering."

Mr. T. Alwyn Lloyd, F.R.I.B.A., who presided, referred to the close association of the lecturer and the city of Cardiff. The standard set by Messrs. Lanchester and Rickards in the design of the City Hall and Law Courts had been a particularly high one which the architects of the subsequent civic buildings in Cathays Park had strived to maintain.

The lecturer referred to the conflicting claims of fundamentalism and traditionalism in engineering work. He indicated that a purely logical solution of problems in structural design often achieved beauty, whereas efforts to embellish iron bridges by the addition of so-called architectural details usually led to disaster. He dealt with the beauty of the motor car, the aeroplane and the ship, and remarked that the objections to electrical pylons was, in his opinion, overdone, the pylons being, from the æsthetic point of view, comparable to the old windmills.

The lecture was illustrated by many interesting lantern slides.

A vote of thanks to the lecturer was proposed by Dr. Cyril Fox, Director of the National Museum of Wales, seconded by Mr. F. J. Thomas, F.I.O.B., and supported by Messrs. Norman Edwards and Percy Thomas, F.R.I.B.A.

ANNUAL DINNER OF THE DEVON AND CORNWALL ARCHITECTURAL SOCIETY

The first annual dinner of the Devon and Cornwall Architectural Society was held at Exeter on Thursday, November 27. The president, Mr. John Bennett, presided.

Following the loyal toast, "The Royal Institute of British Architects" was proposed by Mr. Percy Morris, who welcomed Sir Banister Fletcher, P.R.I.B.A., and pointed out that it was largely due to Sir Banister's instrumentality that nineteen of the city churches had been saved for the nation.

Sir Banister Fletcher, in reply, said that one of the chief objects of the R.I.B.A. was to secure the loyalty and discipline of the allied societies to the parent body. The Institute was rapidly making history. By the new bylaws practically every qualified architect had a right to enter the ranks of the Institute, which was something for which the Institute had been fighting for years. Within a few months they would be able to say truthfully that if there was a practising architect not within the ranks of the Institute he was not qualified in the highest sense. This would mean the protection of the public and, consequently, the confidence of the public.

In regard to regional planning, Sir Banister said the new Town Planning Bill which he hoped would shortly be enacted would enable communities to protect themselves against unsightly elevations. People should not be allowed to put up monstrosities which affected the well-being of the people who had to look at them.

Alluding to certain types of modern architecture, Sir Banister deplored that which he termed the "tiger" type: that which had no regard or consideration for the public or for surrounding buildings. The word "functional" had been used a great deal in connection with ultra modern design, but it should be remembered that a building had never been successful unless designed to suit the functions required. It was not a new word. Sound, reasonable, well-conducted and well-appointed buildings had gone to make architecture what it was and they must do their best to continue on such lines.

Sir James Owen, submitting the toast of the "Devon and Cornwall Architectural Society," said it was strange to think that the majestic progress of architecture had been marked by a continuous process of trial and error and, once elementary facts had been established, the architect with admirable ingenuity and taste set about converting stark utility into decorative loveliness so alluring that we were apt to forget that the primary purpose of those arches and buttresses was stability, not beauty.

Mr. Bennett, responding, briefly touched upon the history of the Society and expressed his pleasure at seeing present that evening a few of those members who had founded the Society forty years ago.

"Our Guests," the last toast, was proposed by Mr. H. Victor Prigg.

The Mayor of Exeter (Mr. C. J. Newman), responding, appealed to architects, when consulted by clients wishing to have premises reconstructed or rebuilt, to advise those clients to adhere to the particular traditions of a city or town.

The Mayor of Plymouth also spoke.

MODERN DUTCH ARCHITECTURE

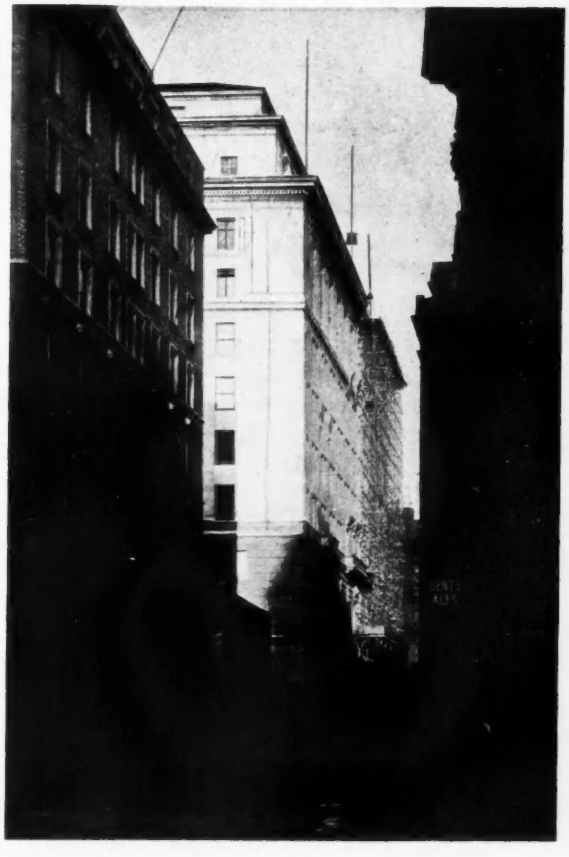
"Modern Dutch Architecture" was the subject of a lantern lecture given by Mr. Stanley J. Wearing, F.R.I.B.A., at a meeting of the Norfolk and Norwich Association of Architects, held in the Stuart Hall, Norwich.

Mr. Wearing began by referring to the older architecture of Holland. He commented on the main features, such as the stepped, shaped gables, the tall windows and ornamental doorways, illustrating his remarks with many lantern slides of old buildings.

Coming to modern architecture, the lecturer said that most of it was post-war, but there were already before the war a number of buildings which showed a complete departure from tradition.

Under the building bylaws, every city and village had its æsthetic committee on which sat architects who had the right to censor on grounds of good taste. They could reject a plan because it did not harmonize with its neighbour, either new or old. The employment of an architect was obligatory. Each town had its register in which was entered every old house that had any architectural merit, and the municipal committee forbade alterations or demolition. The new dwellings, mostly built by the municipality or by co-operative associations, enjoyed a State subsidy on condition that they made no profit. The Dutch Government had given great assistance to private enterprise, but it fixed conditions. The individual had no prescriptive rights as to where or how he should build. The "Committee of Æsthetics" was authorized to supervise schemes both as regards layout and individual designs.

The Deputy Lord Mayor (Mr. T. Glover) proposed the vote of thanks, which was seconded by Mr. H. E. Witard.



R.I.B.A. ELECTION OF STUDENTS

The following Probationers have been elected as Students of the R.I.B.A. :

Arthur, K. H. (Glasgow School of Architecture).
Ashton, R. (Architectural Association).
Brandon-Jones, J. (Architectural Association).
Brandt, J. B. (Architectural Association).
Brown, A. K. (Armstrong College, Newcastle-upon-Tyne).
Brown, G. H. (Northern Polytechnic).
Cairns, J. B. (Glasgow School of Architecture).
Cardew, G. E. (Northern Polytechnic).
Coates, U. A. (Liverpool School of Architecture).
Devereux, A. H. (University of London).
Fairweather, W. J. (Glasgow School of Architecture).
Fernandes, J. B. (Sir J. J. School of Art, Bombay).
Gascoigne, A. R. (Architectural Association).
Haigh, M. W. (Architectural Association).
Hart, R. S. (Cambridge University).
Hewitson, T. T. (Liverpool School of Architecture).
Heymann, H. B. (Architectural Association).
Hicks, J. K. (Architectural Association).

GOTHIC ARCHITECTURE IN FRANCE

Sir Banister Fletcher, P.R.I.B.A., lecturing at the Central School of Arts and Crafts, London, on Wednesday last, described the extraordinary developments of Gothic architecture as seen in the cathedrals of France. In analysing the architectural character of the style, he explained how the heavy and sombre Romanesque gave way to the light and graceful Gothic, and how this energetic and restless style of architecture was well suited to the French

A photographic study of new buildings in Brunswick Street, Liverpool. (Photo : E. C. Hardman.)

[*From* The Future Development of South-west Lancashire. *For review of this book see page 883.*]

national character, which revelled in solving the problem of producing buildings in equilibrium.

THE BRITISH EMPIRE EXHIBITION

A detailed description of the British Empire Exhibition, Wembley, was given by Mr. W. T. Bowman, O.B.E., at a meeting of the Incorporated Association of Architects and Surveyors.

Mr. Bowman said that the British Empire Exhibition (1924) invited the attention of the whole world, because it was a comprehensive survey of a great achievement in art, science and industry.

It was the industrial event of the post-war world, the first clear expression of the hope that, after the disasters and horrors of the Great War, we might enter, with confidence, upon an era of peace. Its main object was to show to each member of the great family of the British Empire, and to the world at large, what was being done in the development at home and of the various lands beyond the seas, and the enterprise and resource of the peoples living under the protection of the British flag.

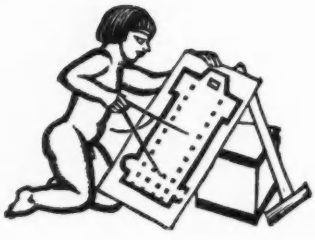
The Exhibition was a complete encyclopædia of modern industry with working illustrations, or, as H.R.H. the Prince of Wales described it, "The Empire's Shop Window."

THE HENRY SAXON SNELL PRIZE

The subject given for essays in competition for the Henry Saxon Snell Prize, 1930, was "Improvements in the Sanitary Provisions of Schools." Seventeen essays were submitted. The adjudicators did not consider that any of the essays were of sufficient merit to deserve the prize offered, and the Council of the Royal Sanitary Institute has decided to withhold the award on this occasion. Acting on the advice of the adjudicators, the Council, however, has awarded a sum of twenty guineas each, being part of the amount of the prize offered, to Mrs. Alice L. Baker and Mr. L. M. Savage.

The three essays sent in under the mottoes, "Ubique," "Pro Patria" and "Savant" were commended.

GLASGOW SCHOOL OF ARCHITECTURE



The diplomas, certificates, and prizes gained by students of the Glasgow School of Architecture for last session were awarded to the successful students at a gathering held in the Royal Technical College, Glasgow. Mr. Robert Robertson, chairman of the joint-committee controlling the school, presided, and addresses were given by Sir John Stirling Maxwell, Bt., and Mr. John Watson, A.R.S.A.

The chairman, in referring to the trend of modern architecture, said the architect was limited by the present economic conditions. They were largely under the domination of Government control, and so they had the experience of seeing town-planning areas covered with houses made on the modern system of mass production. He was sure, however, that in the interests of the profession itself, if for no other reason, they looked to the time when the economic conditions would change and allow the architect and the artist free scope to make developments.

COMPETITIONS OPEN

December 25.—A prospectus giving full particulars of the international competition for the Ukrainian State Theatre, organized by the Kharkov Town Council, Russia, was recently issued. The theatre is to be erected in the centre of Kharkov, on the site of the present Comsomolskv Square (Young Communist Square), and will contain a mass musical stage, and seating capacity for 4,000 persons. The competition will be assessed by a jury comprising a president, vice-president and fifty-six members. Prizes: 1st, 10,000 rub.; 2nd, 8,000 rub.; 3rd, 6,000 rub.; 4th, 5,000 rub.; 5th, 4,000 rub.; 6th, 3,000 rub.; 7th, 8th and 9th, 2,000 rub.; 10th, 11th, 12th, 1,500 rub. Drawings should be sent to the Kharkov Town Council on or before December 25. Copies of the prospectus are obtainable from the Embassy of the Union of Soviet Socialist Republics,

SUBSCRIPTION FORM

This form should be handed to your usual newsagent, or posted under halfpenny stamp to The Manager, The Architectural Press, 9 Queen Anne's Gate, Westminster, S.W.1, who will debit you with the amount of your annual subscription

United Kingdom and Canada £1 3s. 10d., 6 months 12s., 3 months 6s. 6d.

Elsewhere Abroad, 12 months £1 8s. 6d., 6 months 14s. 6d., 3 months 7s. 6d.

or

Please continue to send me "The Architects' Journal" for a further period of twelve months

NAME

ADDRESS

DATE

THE ARCHITECTS' JOURNAL

Harrington House, 13 Kensington Palace Gardens, London, W.8.

January 7.—The Incorporated Association of Architects and Surveyors invites competitive designs for a Model Petrol Filling and Service Depot. Assessors: Alfred Stephens Cross, M.A. (CANTAB.), V-P., I.A.A.S.; Edward H. Fryer, Deputy Secretary of the Automobile Association; and Walter Groves, Editor of *The Motor*. Prizes: 50 guineas, 20 guineas and 10 guineas for first, second and third places, respectively. Smaller awards may also be made on the advice of the assessors, and at the discretion of the Council of the Association. In addition a prize of 10 guineas and two prizes of 5 guineas each will be awarded to laymen for the best suggestions submitted with or without sketches. Full particulars, etc., are obtainable from the Secretary, the Incorporated Association of Architects and Surveyors, 1 Wilbraham Place, London, S.W.1. Latest date for submission of designs: January 7, 1930.

January 10.—The Bermondsey B.C. recently invited competitive designs for a proposed new medical clinic in Tower Bridge Road, S.E. Premiums: £250, £150 and £50 for first, second and third place, respectively. Designs should be submitted to E. Goff Clark, Town Clerk, Town Hall, Spa Road, Bermondsey, by January 10, 1931.

January 31.—The Coventry Corporation invites architects to submit competitive designs for a new Hospital for Infectious Diseases, proposed to be erected on a site at Pinley, about 1½ miles south-east of Coventry. Architects competing must be established in private practice. Assessor: E. Stanley Hall, M.A., F.R.I.B.A. Premiums, £300, £200 and £100, for designs placed first, second and third, respectively. Conditions of the competition and site plan may be obtained from Frederick Smith, Town Clerk, Council House, Coventry, until January 31. Deposit £1 1s. Latest date for submission of designs: April 30, 1931.

February 1.—The Norwich Corporation invites architects practising in the County of Norfolk to submit competitive designs for a proposed new fire station to be erected on a site in Bethel Street, Norwich. Conditions of the competition are obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. Deposit, £1 1s. Latest date for submission of designs: February 1, 1931.

April 1.—An international competition for the development of the uses of aluminium and its alloys, open to inventors of any nationality, is to be held annually by the International Aluminium Bureau. The competition will be divided into two sections. All proposals will be allocated to the appropriate section by an adjudicating committee comprised of five members. The prizes to be awarded are 25,000 French francs for the entries under Sections A (methods of working or using the metal) and B (manufacture of articles therefrom) respectively, and 50,000 French francs to the author of a suggestion which has exceptional interest or value under either section. Entries may be submitted between January 1 and April 1, 1931. Further particulars are obtainable from the Bureau International de l'Aluminium, 23 bis, Rue de Balzac, Paris, France.

No date.—The Committee of the Foundation Hospital and the Rectorate of the Royal Yugoslavian University of Zagreb invites competitive designs for the general rebuilding plans of the Foundation and Clinic Hospital of Zagreb. The competition will be assessed by a jury comprised of ten members. Prizes: 1st, 20,000 Swiss francs; 2nd, 15,000 Swiss francs; 3rd, 10,000 Swiss francs. 15,000 Swiss francs have been set aside for any further work which may be required. Latest date for submission of designs: January 15, 1931.

THE ARCHITECTS' DIARY

WEDNESDAY, DECEMBER 10

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Exhibition of photographs of buildings visited on the A.A. Excursion to Sweden and Denmark. Until December 20.

CHARTERED SURVEYORS' INSTITUTION. Annual Dinner of the Quantity Surveyor Members, to be held at the Connaught Rooms, Great Queen Street, W.C.2. **7.30 p.m.**

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to the Whitefriars Glass Works (Messrs. James Powell and Sons), The Stained Glass Studios, 100 Wigmore Street, W.1. Another visit to the same works will be made on December 11. **11.30 a.m.**

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. Ordinary Meeting. "Persian Textiles." By A. L. B. Ashton. **8.30 p.m.**

INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Informal Meeting. "Atmospheric Pollution Due to Combustion of Fuel, and Methods of its Prevention." By John S. Owens, M.D., A.M.INST.C.E. Chairman: Sydney B. Donkin. **6 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "French Mediæval Architecture: The Gothic Period—Rheims Cathedral." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

UNIVERSITY OF LONDON, University College, Gower Street, W.C.1. Last of three public lectures on "Stockholm and Its Environs." By A. M. Wijk. (Lantern Illustrations.) **5.30 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS. Lancashire and Cheshire Branch. At the College of Technology, Manchester. "Methods of Securing Masonry to Framed Buildings." By E. G. Warland, A.INST.S.E. **7 p.m.**

EXHIBITION OF MODELS OF OLD LONDON. At the Golden Cross Hotel, Strand, W.C.2. The models are the work of John B. Thorp. **2.30 p.m.**

THURSDAY, DECEMBER 11

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Science Standing Committee. 4.30 p.m. (Final and Special Examinations, December 3 to 11.) **4.30 p.m.**

SHEFFIELD, SOUTH YORKSHIRE AND DISTRICT SOCIETY OF ARCHITECTS AND SURVEYORS. At the University, Sheffield. "Maltese Architecture." By Professor L. P. Abercrombie, M.A., F.R.I.B.A. (Tea, 5.30 p.m.) **6.15 p.m.**

GEFFRYE MUSEUM, Kingsland Road, Shoreditch, E.2. "Old English Furniture and the Men Who Made It." By Ingleson C. Goodison. **7.30 p.m.**

INCORPORATED INSTITUTE OF BRITISH DECORATORS. At Painters' Hall, Little Trinity Lane, E.C.4. "The Woman's Viewpoint in Decoration." By Mrs. Grace Lovat-Fraser. (Refreshments, 9.30 p.m.) **8 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "The Æsthetic Side of Structural and Constructional Engineering." By Howard Robertson, F.R.I.B.A. South Wales and Monmouthshire Branch. Visit to works of Braithwaite & Co. (Engineers), Ltd., Newport. **6.30 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. Dundee Sub-Centre. At the University College, Dundee. "Electricity and Mining—A Story of Progress." By A. V. Reis. **7.30 p.m.**

INSTITUTION OF WELDING ENGINEERS. At the Institution of Mechanical Engineers, Storey's Gate, Westminster, S.W.1. "The Fabrication of Plant in Acid-Resisting Steels." By C. C. Hall.

SOCIETY OF ANTIQUARIES, Burlington House, Piccadilly, W.1. "Recent Discoveries in York Minster and Ripon Minster." By C. R. Peers, C.B.E. **8.30 p.m.**

INSTITUTE OF PATENTEES. At the Caxton Hall, Caxton Street, Westminster, S.W.1. "The Inventor and His Employment." By Professor P. M. Baker. **8 p.m.**

FRIDAY, DECEMBER 12

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to the Honorable Society of Gray's Inn, Holborn, W.C.1. **3 p.m.**

TOWN PLANNING INSTITUTE. At the Caxton Hall, Caxton Street, Westminster, S.W.1. "Twenty-one Years of Town Planning in England and Wales." By G. L. Pepler. **6 p.m.**

FACULTY OF ARCHITECTS AND SURVEYORS. Fourth Annual Dinner to be held at the Hotel Metropole, Northumberland Avenue, W.C. 6.45 for 7.15 p.m. **6.45 p.m.**

ILLUMINATING ENGINEERING SOCIETY. Visit to the Chiswick Works of the London General Omnibus Co., Ltd., at 4 p.m. A meeting will be held in the Lecture Theatre of Holophane, Ltd., Elverton Street, Westminster, S.W.1, at 6.30 p.m., when a paper on "Glasses for Use with Invisible (Ultra-violet and Infra-ray) Rays," illustrated by demonstrations, will be read by Dr. S. English. **4 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS. Western Counties Branch. At the Merchant Venturers' Technical College, Unity Street, Bristol. "A Comparative Study of Retaining Walls." By E. S. Andrews, B.SC., M.INST.C.E. 7.30 p.m. Midland Counties Branch. At the Chamber of Commerce Buildings, New Street, Birmingham. Discussion on "Some Problems in the Design of Roof Members," to be opened by A. C. Ansell, B.SC. 7 p.m. **7 p.m.**

BOROUGH POLYTECHNIC, Borough Road, Southwark, S.E.1. Exhibition of Students' Work. 6 to 9 p.m. (Saturday, December 13. 2 to 9 p.m.). **6 p.m.**

SATURDAY, DECEMBER 13

Sunrise, 7.57 a.m. Sunset, 3.51 p.m.

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Visit to the Royal Mews, Buckingham Palace, S.W.1. Meet at the Royal Stables Entrance, Buckingham Palace Road, S.W.1. **2.30 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS, North-Eastern Centre. At the Armstrong College, Newcastle-on-Tyne. Informal Discussion on "Heating in the Home." **7 p.m.**

MONDAY, DECEMBER 15

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Executive Committee. 4 p.m. Special General Meeting (Business). 8 p.m. **4 p.m.**

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Pantomime every evening until December 19 inclusive.

TUESDAY, DECEMBER 16

INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS, 1 Wilbraham Place, Sloane Street, S.W.1. Reception and conversazione by Alderman Culpin, L.C.C., M.T.P.I. **6 p.m.**

TOWER OF LONDON, E.C.3. "The Tower in Tudor Times." By Allen S. Walker. **11 a.m.**

WEDNESDAY, DECEMBER 17

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Pantomime Matinee, 2.45 p.m. (Evening Performance, 8.15 p.m.) **2.45 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "French Mediæval Architecture: Fortified Towns, Castles, Hotels-de-Ville." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

THURSDAY, DECEMBER 18

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Literature Standing Committee. **4.30 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. Teesside Sub-Centre. At the Cleveland Technical Institute, Middlesbrough. "Surge Investigations on Overhead Line and Cable Systems." By S. W. Melsom, A. N. Arman, B.SC. (ENG.), and W. Bibby, B.SC. (ENG.). **7 p.m.**

FRIDAY, DECEMBER 19

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Finance and House Committee. **4.30 p.m.**

LONDON SOCIETY. At the Royal Society of Arts, John Street, Adelphi, W.C.2. "South Essex: Its Docks, Industries and Houses, London's Industrial Development." By Professor S. D. Adshead, F.R.I.B.A. (Illustrated by lantern slides.) Chairman: E. M. Dence. **5 p.m.**

SATURDAY, DECEMBER 20

Sunrise, 8.2 a.m. Sunset, 3.53 p.m.

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. Manchester and District Branch. Visit to Partington Gas Works.

TUESDAY, DECEMBER 23

TOWER OF LONDON, E.C.3. "The Tower in Stuart Times and After." By Allen S. Walker. **11 a.m.**

WEDNESDAY, DECEMBER 24

R.I.B.A., 9 Conduit Street, W.1. Office and Library closed until December 27.

SATURDAY, DECEMBER 27

Sunrise, 8.5 a.m. Sunset, 3.57 p.m.

MONDAY, DECEMBER 29

R.I.B.A., 9 Conduit Street, W.1. First of two Christmas Holiday Lectures on Architecture for Boys and Girls. By the Hon. H. A. Pakington, A.R.I.B.A. (Also December 31.) **3.30 p.m.**

WEDNESDAY, DECEMBER 31

R.I.B.A., 9 Conduit Street, W.1. Christmas Holiday Lecture on Architecture for Boys and Girls. By the Hon. H. A. Pakington, A.R.I.B.A. **3.30 p.m.**

WEDNESDAY, JANUARY 7, 1931

INSTITUTION OF STRUCTURAL ENGINEERS. Lancashire and Cheshire Branch. At the Engineers' Club, Albert Square, Manchester. Paper by J. Theo. Halliday, F.R.I.B.A. **7 p.m.**

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. At the Swedenborg Hall, 20 Hart Street, Bloomsbury, W.C.1. "Notes on the Theory of Radiant Heating." By C. G. Heys Hallett, M.A. **7 p.m.**

THURSDAY, JANUARY 8

SHEFFIELD, SOUTH YORKSHIRE AND DISTRICT SOCIETY OF ARCHITECTS AND SURVEYORS. At the University, Sheffield. "Some New Buildings in Sweden and the Stockholm Exhibition." By E. R. Jarrett, A.R.I.B.A. (Tea, 5.30 p.m.) **6.15 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "Thames House." By R. Travers Morgan, A.M.INST.C.E. **6.30 p.m.**

Secretaries of architectural and allied societies are invited to forward particulars of their forthcoming meetings and visits for publication on this page. They should be addressed to the Editor at 9 Queen Anne's Gate, S.W.1.

OBITUARY

J. STARKIE GARDNER : 1844-1930

We regret to record the death of Mr. J. Starkie Gardner, the noted English metal worker and designer. He founded the metal works bearing his name in 1883, and was personal warrant holder to King Edward VII and King George V, as metal worker. Among his famous achievements were the wrought-iron gates and screens, which he designed and made, erected at Holyrood Palace as a memorial to King Edward VII. He also made and erected Victoria Gate, Hyde Park, London. At one time he was a member of the Antiquaries, Linnean and Geological Societies, and has written, lectured and read papers on antiquarian, geological and botanical subjects.

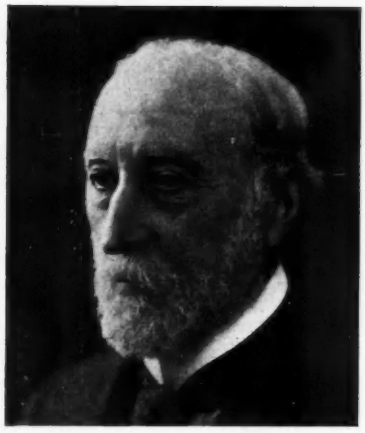
His publications included works on armour, enamels, old silver and fossil plants. He also wrote of iron; he wrote equally of the men who worked iron, and how and why they worked it. That is why his books are still so valuable. He retired from the firm bearing his name in 1923, after spending over half a century in prodigious efforts to advance the arts, wrought ironwork in particular. He died at Twyford Abbey, Park Royal, N.W.

TRADE NOTES

"God sends the meat," says a Spanish proverb, "and the Devil sends the cook." In pity on us, Dr. G. Dalen (a Nobel prize physicist) has invented the Aga Range.

It is claimed that its fuel consumption is anything from four to twelve times less than that of any other cooker of similar capacity, and that the normal annual consumption of coke in the Aga, burning incessantly, is 25 cwts., or about 22 cwts. of anthracite.

It is also claimed to be the only cooker in existence which provides continuous and absolutely automatic combustion, giving a variety of constant, specific oven and hot spot temperatures, thus dispensing with the need of any attention whatever beyond refuelling once and riddling of the ash grate twice in twenty-four hours. This automatic combustion is the fundamental feature of the Aga. The range is manufactured in one standard size, normally suitable for households of from two to twelve people. In experienced hands, however, it is said to be capable of more than this, and where it is a question of an exceptionally large household or of small hotels, schools and suchlike.



About nine gallons of almost boiling water is provided in a tank placed within the body of the cooker, and can be drawn off as required from a tap placed just above the ashpit door.

Its appearance is clean and attractive. As it is finished at the front and sides in cream enamel and on the top in black enamel, it requires no black-leading, nor in fact any sort of polishing. It is claimed that no sooting occurs, that there is no smell, and that the cleanest of kitchens and cooking conditions generally are assured with the minimum amount of trouble.

The sole agents and distributors of the Aga Cooker are Bell's Asbestos and Engineering Supplies, Ltd., Bestobell Works, Slough, Bucks.

*

No effort has been spared by the General Electric Co., Ltd., to make their new catalogue on electric light fittings thoroughly up to date and representative of period and modern design. Many hundreds of fittings, such as pendants, brackets, electroliers, ceiling fittings, standards and other lighting devices are included. It is probably the most complete catalogue of its kind ever issued. In the introduction it is stated that the designs have been created as the result of the closest possible collaboration between recognized experts in lighting and art, and may therefore be taken as being representative of the best in lighting practice. The fittings illustrated are suitable for every system of electric lighting, and offer a wide choice of finishes and decorative styles. All the illustrations are reproduced from photographs or drawings of the actual fittings listed. Sizes are indicated either by scale or dimensions, and colour-plate examples of certain typical fittings of their class are included to convey some general impression of the high-grade finish, which the firm claim is so distinctive a feature of the whole range. Where fittings of special or distinctive design are required, the General Electric Co., Ltd., place the services of their fittings design and illuminating engineering department at the disposal of clients. Realizing the value of display and demonstration, the firm have arranged attractive and comprehensive exhibits of electric light fittings at their principal showrooms, Magnet House, Kingsway, London, W.C.2, and also at each of their numerous branch showrooms through out the United Kingdom and abroad.

The late Mr. J. Starkie Gardner

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents, and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W. 1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C. 2. The price is 1s. each.]

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Plans passed by the BARKING U.D.C.: 140 houses, Alfreds Way, for Suburban Developments (London), Ltd.; additions to Rippleside Dining Rooms (Old Mission Hall), for Mr. S. F. Troutt; additions to 354 Ripple Road, and house, Movers Lane, for Mr. J. P. Graffy; additions, 488 Gale Street, for Mr. N. Davies; factory, River Road, for Messrs. H. P. Orrock & Co.

Plans passed by the BECKENHAM Council: 121 houses, Clock House Road; house, Shortlands Road; house, Brabourne Rise; house, Foxgrove Road; house, Park Road; twelve houses, Eden Way; house, Hayes Way; four houses, Wickham Way; layout of new street, Ambleside Avenue, off Abbotts Way; four residential shops, Croydon Road; layout of new street, Kangley Bridge Road; conversion into three flats, 9 Brackley Road; private garages at Colesburgh Road, Glanfield Road, Arrol Road, Shortlands Road, Kingswood Road, Eden Park Avenue, Oakway, Barnfield Wood Road, St. James's Avenue; layout of five lock-up shops, Rectory Road; six residential shops, Upper Elmers End Road; house, Foxgrove Avenue; three houses, Monks Orchard Road.

The Essex E.C. has approved the purchase of a site for a school in Parsloes Avenue, DAGENHAM, at a cost not exceeding £3,500.

Plans passed by the KINGSBURY R.D.C.: 360 houses, Grove Park Estate, for Messrs. Hilbery Chaplin, Ltd.; 162 houses, Kingsbury Park Estate, for Messrs. F. G. Parsons and Sons; 134 houses and garages, Fairfields Estate, for Mr. P. H. Edwards.

The Works Committee of the LEWISHAM B.C. recommends that plans be approved as follows: Four houses, Beaufort Gardens, for Mr. G. T. Hartman; cinema, Sydenham Road, for Mr. A. C. Mathews; five houses, Woodcombe Crescent, for Mr. F. G. Barnes; reconstruction of "The Comet" off-licence, for Messrs. J. C. Cooke and Sons.

The SUTTON AND CHEAM U.D.C. has decided to erect thirty houses of the A.2 type.

SOUTHERN COUNTIES

Plans passed by the DOVER T.C.: Twelve houses, Brookfield Avenue, for Mr. H. F. Caspall; house and garage, Elms Vale Road, for the East Kent Building Co.; two semi-detached houses, Folkestone Road.

Plans passed by the HARTLEY WINTNEY R.D.C.: Alterations and additions to Longwater Farm, Eversley, for Major Sturmy Cave; bungalow, Cricket Hill, Yateley, for Mrs. C. Wood; showroom, Victoria Road, Cove, for Messrs. C. Yeomans and Sons; bungalow, Cove Road, Cove, for Mr. W. M. Jones; house, Cove Road, for Mr. H. T. Hill; bungalow, Church Road, Cove, for Mr. A. G. Edwards.

Plans passed by the HERNE BAY U.D.C.: Bungalow, Mickleburgh Avenue, for Capt. A. Davies; house, Pier Avenue, for Miss Flood; pair of semi-detached bungalows, Albany Drive, for Mr. J. W. Jordan; bungalow, Mickleburgh Avenue, for Mr. W. Kellett; bungalow, Central Avenue, for Mr. E. J. Line; bungalow, Mickleburgh Avenue, for Mr. G. Wilkie; bungalow, Sea View Road, for Mr. M. W. Pledge; house, Queensbridge Drive, for Mr. Campbell; garage, Beach Street, adjoining Water Company's office, for Mr. A. M. Hill.

At a meeting of the MARGATE Council, a plan showing proposed building plots on land abutting on to Botany Road, which complies with the requirements of the town planning scheme, and a plan of five shops and flats, proposed to be constructed on land on the north side of Upper Dane Road (opposite Dane pumping station), were approved.

It is understood that the directors of the Southern Railway have decided to proceed with the second stage of the SOUTHAMPTON Docks extension scheme, estimated to cost about £3,000,000, and the erection of a new graving dock capable of accommodating the world's largest liners. These two schemes are part of the £13,000,000 project decided upon some time ago, involving the reclamation of 407 acres of mudland in the bay on the River Test and extending westwards for over two miles from the Royal Pier to Millbrook Point.

SOUTH-WESTERN COUNTIES

Plans passed by the BARNSTAPLE T.C.: Bungalow, Crescent Avenue, for Messrs. Woolaway and Sons; forge, etc., Mill Road, for the Devon C.C.; garage, Park Lane, for Messrs. Cooke and Sons; alterations, Welfare Centre, Boutport Street, for the Barnstaple Long Bridge Charity; rebuilding of works, Queen Street, for Mr. J. C. Southcombe.

The NEWTON ABBOT R.D.C. has received sanction to borrow £425 and £650 to purchase sites for housing at Kingsteignton and Bovey Tracey.

At a meeting of the WINCANTON R.D.C. it was decided that application be made to the Minister of Health for sanction to the raising of a loan of £30,459 in respect of the houses now in course of erection in various parts of the district. Application is also to be made for sanction to erect six houses at Charlton Musgrove.

EASTERN COUNTIES

The WAYLAND (NORFOLK) R.D.C. has decided to purchase over half-an-acre of land at Banham for the erection of houses.

MIDLAND COUNTIES

The BIGGLESWADE R.D.C. has decided to make application to the County Council for the appropriate grant towards the cost of the proposed erection of twelve houses at Henlow, ten at Arlesey, and eight at Clifton.

Plans have been prepared by Messrs. Lanchester and Lodge for the first portion of the BIRMINGHAM hospitals centre at Edgbaston, on a site of 150 acres of land. The plans provide for a general hospital for 750 beds, a block of 100 beds for paying patients and a medical school for the University, which is close by.

A scheme for dealing with unhealthy areas in DERBY is being placed before the Minister of Health. It is estimated that the number of houses which should be demolished is 1,199, involving the displacement of 1,206 families. To provide for these it is suggested that 250 houses should be erected annually for the next five years.

The WANTAGE R.D.C. has approved plans of thirty-six houses proposed to be erected in the district, for submission to the Minister of Health.

The Staffordshire Education Committee has decided to provide a new senior school for 200 scholars at WATERHOUSES.

NORTHERN COUNTIES

The BURY General Purposes Committee has resolved to recommend the Council to approve a plan for altering the Town Hall to provide a council chamber, mayor's parlour, committee rooms, and to accommodate the town clerk's, engineer's and treasurer's departments. An offer has been received for the purchase of Heaton Grove and Gardens, which has been acquired by the Corporation.

A five-year housing programme for Manchester is outlined in the report of the Housing Committee, which is to be presented at the next meeting of the MANCHESTER City Council. The estimated number of houses to be built by the local authority during the next five years is 12,000, plus 1,500 working-class dwellings erected by private enterprise, making a total of 13,500. Of these, 6,000 new houses will take the place of those to be demolished in the areas scheduled for clearance or improvement.

The NEWCASTLE Housing Committee has decided to recommend the City Council to approve a programme of slum clearance and re-housing that will involve the construction of 2,182 additional dwellings within the next five years, the demolition of 1,272 unsatisfactory dwellings, and the transfer to better conditions of 9,604 people. The houses are additional to the 3,000 sanctioned in the new housing programme issued a few months ago.

Plans passed by the RUGBY U.D.C.: Eight houses, Northfield Estate, for Mr. R. Gardner; alterations to the Horse and Jockey Inn; additional lavatory accommodation at the Royal Oak; alteration to 4 Regent Place, for Mr. R. J. Phennah; additions to the Rugby Co-operative Society's shop, Clifton Road.

The SEDGEFIELD (DURHAM) R.D.C. has agreed to build houses in the district as follows: Ferryhill, twenty-eight; Trimdon, eighteen; Cornforth and Chilton, sixteen each; Fishburn, twelve; Sedgefield and Bishop Middleham, four each; and Bishopton, two.

The Bolton Housing Director has completed plans for the reconstruction of the steel-houses off Union Road, TONGE.

The WAKEFIELD City Council has decided that in the near future the proposal for the erection of almshouses for aged people, in connection with the late Lord Brotherton's bequest to Wakefield, should be considered.

A five-year building programme for 1,700 houses, estimated at £730,000, was decided upon at a joint meeting of the WALLASEY Corporation Housing and Health Committees. Of these houses 400 will be built under the 1930 Housing Act and 1,300 under the 1924 Wheatley Act.

It is understood that Lord St. David's Committee on Unemployment has made a grant of £14,200 to the WORTLEY (YORKS) R.D.C. towards the development of land for housing purposes.

SCOTLAND

The COATBRIDGE T.C. has approved a proposal to acquire a site for the erection of fifty houses.

Mr. Tom Johnston, M.P., Under-Secretary of State for Scotland, recently inaugurated one of the largest housing schemes that the burgh of HAMILTON has so far sponsored. The scheme is situated in the Glebelands to the east of Alness Street, and involves an estimated expenditure of £90,000. The project is intended to permit of the transference of 1,300 persons from insanitary houses in the burgh. Provision will be made for seventy-two two-apartment flats, 112 three-apartment flats, twenty-eight three-apartment cottages, and sixty-eight four-apartment cottages.

The Department of Health for Scotland has authorized the SALTCOATS T.C. to begin building seventy-two dwelling-houses in the public park, at a cost of £20,689.

The Education Committee of the STIRLING C.C. has approved an estimate of £174,000 for a building programme necessitated by the raising of the school age.

Plans were passed for the erection of four blocks of houses in Leighton Street, WISHAW, at a meeting of the Motherwell and Wishaw Dean of Guild Court. The blocks will consist of two-apartment and three-apartment houses.

IRELAND

Plans passed by the DUBLIN City Architect: Shops, with flats over, Cabra Road, for Mr. M. J. Lynch; two houses, Mount Prospect Avenue, for Mr. E. Casey; shop premises, Donnycarney, for Mr. T. Michael; shop, Georges Avenue, for Mrs. Casey; four houses, Grace Park Road, for Mr. D. Delaney.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

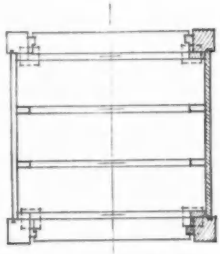
CUPOLA AT
KEMSLEY CLUB HOUSE, KENT
By E. MAXWELL FRY (ADAMS, THOMPSON AND FRY)

THE cupola to the Club House at Kemsley Village, near Sittingbourne, Kent, forms the subject for this week's detail. The architect has adopted a late-eighteenth-century manner, somewhat reminiscent of contemporary work of this nature in the Southern States of America.

The grace and lightness of this design can be judged from the photograph, while a study of the drawing overleaf will reveal the existence of details at once simple and satisfying. The weather vane has provided the excuse for a playful interpretation of Mercury in the modern manner. This is cut out of sheet iron and finished in gold, black and white.



The roof of the cupola itself is covered in copper, which assumes the charming green colour common to that metal when used in exposed positions, and this fact has been taken into account in settling the general colour-scheme.

The drawing may be read with architects' ordinary scales.

THE WHEEL TURNS

"The proper preservation of ancient monuments, which are historical links with the past, and many of which, by their intrinsic beauty, give the highest pleasure to thousands of visitors, is a work which is receiving the sympathy and approval of an increasing number of people. His Majesty's Government therefore think it to be their duty to extend, and, where needed, to consolidate their powers in order that they may discharge their trust with an efficiency which will gain general public approval."

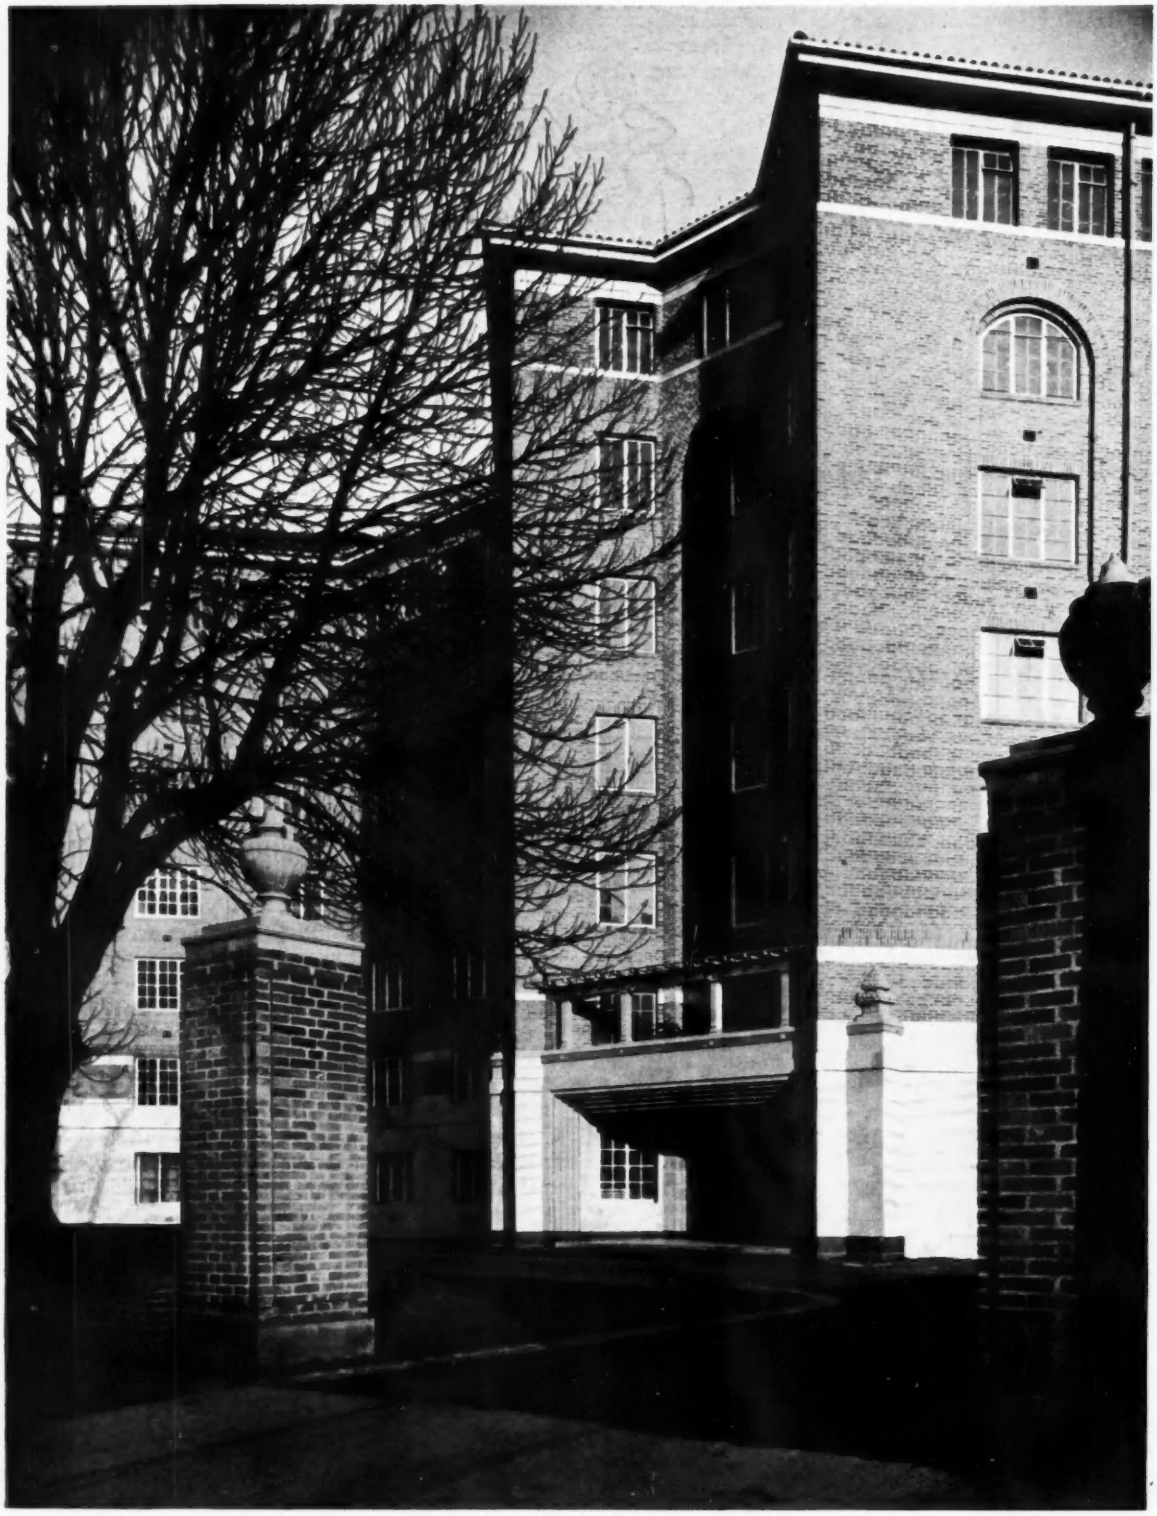
—LORD PONSONBY

A COUNTRY that preserves its ancient monuments enriches its present. Silent but eloquent, they make an ever wider reference to a past that unfolds itself about the people as they live and move and have their active being.

England, in the days of its most rapid expansion, when it multiplied itself wantonly and greedily, spreading grey eruptions of industrial activity over miles of pleasant green, was of a nature insensitive to its surroundings. It was, in its masses, of an ignorance close to barbarity. It was of two minds, of which the greater was a mammon gargantuan and terrible.

Strange that the engine that brought so much distaste with its wealth should work the miracle that in a million minds turns apathetic ignorance into receptivity and something approaching a joy in living. Yet it is true that an Act of Parliament that empowers the nation to spend money on the acquisition and maintenance of its ancient monuments could never have become law were it not that today the working classes have, by the advent of the train and motor car, become travellers in and appreciators of their own country. By such good hap we now celebrate the consolidation of an Act of 1913 in another Act which is even now passing through the House of Lords.

The older Act did little more than stake a claim, as it were. It defined an ancient monument as something worth acquisition; but it could not deal with inhabited houses, it had no control over the immediate surroundings of an ancient monument, and it had little adequate machinery for negotiation and acquisition. Nevertheless, under its terms three thousand monuments were scheduled, and a deal of reparation was performed.



This Act of 1930 imposes no limits over what may be termed ancient monuments, but better still is its machinery for safeguarding what it acquires, for it gives power to authority, either central or local, to prescribe an area of *preservation* about a monument, in which area there must be conformity to a plan that defines a setting sympathetic and congruous. Thus, the impassive dignity of Stonehenge, for so long insulted by the presence of cheap tea-houses and ugly huts, will in the future be approached across the empty plain on which for long centuries it has stood.

Stonehenge is a national inheritance, but over the country at large are monuments, large and small, in which are enshrined the spirit of locality, of history, and in their aggregation we recognize the long story of our particular genius.

The preservation of this story intact, while yet it remains, is a work of education second to none, and we could never be so poor that the loss of one stone would not further impoverish us.

Therefore we shall hope that this Act will become law in its entirety, and that the last important clause, forbidding the exportation of ancient monuments, will be made workable and efficient against a form of depredation which neither common sense nor decency can condone.

Ruskin was right when he warned us to preserve our ancient buildings. He little knew how long it would take the wheel to turn.

SALIENTS IN THE SUN

In planning Cropthorne Court, a new block of flats in Maida Vale, W., Sir Giles Gilbert Scott has adopted the expedient of laying out the window-walls of the main front, illustrated above, and the corresponding rear elevation, in a series of salients, advancing towards the sun. The result is a sensible increase in the amount of light falling into the principal rooms as compared with a flat wall, while with the old-fashioned light-well no comparison is possible. The flats are equipped with central heating, by oil fuel, and electric refrigerators. There are three tenants' entrances, all similar to that shown. Further illustrations appear on pages 899–901.

Cass Gilbert, the eminent American architect, whose election as an Honorary Foreign Academician was made at the recent general assembly of the Royal Academy. He has been described as being a Napoleonic figure in his own country : " Cass Gilbert and his Woolworth Tower stand for the American boy as Wren and St. Paul's do for the English boy." After tours of Europe and Egypt, he became assistant to Stanford White, of the firm of McKim, Mead and White. Among his larger works are the New York Custom House, the Federal Reserve Bank at Minneapolis, and the U.S. Army Supply Base at Brooklyn. His Woolworth building is illustrated on page 916 of this issue.

NEWS & TOPICS

THE CITY BYLAWS OUT OF DATE

IT is most peculiar that London should in some very important things be so far behind the provinces. Young men from the barbarous north, settling into their first London diggings, are often surprised to discover the bathroom hanging out from the back wall like a large larder; or still more surprised not to discover the bathroom at all. Lots of other funny little things come to amuse them as they settle down to becoming a Londoner—some rather nice old customs and habits; others rather silly.

★

Many of the more foolish relics have been given some ventilation by the recent report on the subject of building regulation reform, and the story is carried still further by a letter from the Minister of Health to the Clerk to the City of London pointing out that revised bylaws now allow of much greater freedom in the planning of w.c.'s, as in other matters of house drainage and the like, and that the bylaws of the City are twenty years old and much behind the times. This sounds peculiar, but it is really one of the sure signs of privilege that it is denied the luxury of trying out new devices ; consequently all old things are made to last longer than economy warrants.

PROFESSIONAL DIGNITY AND ADVERTISING

There are occasions when professional dignity looks more like a nice old gentleman dozing in a committeeman's chair than a hard-working architect seeking to justify his high calling. This is especially to be remarked in any discussion of the proper uses of advertising in spreading the knowledge of architects' services among the population. Little is said of the gratuitous advertisement presented by such bodies as the C.P.R.E. ; and no means of educating the public have been undertaken by the R.I.B.A., though it is common knowledge among architects that a little elementary information concerning what an architect will perform in great matters and small would, if conveyed in the right terms, almost immediately add considerably to the volume of work under proper architectural control. Instead, the lead is being given to local authorities and Town Planning Committees to do what they may, by advice, to lead the very ignorant along paths of propriety, without the assistance and the safeguards which only architects may provide.

MR. GREENWOOD'S REPLY TO THE N.F.H.B.

I am glad to know that Mr. Greenwood, the Minister of Health, gave a quite categorical " No ! " to the requests by the National Federation of House Builders for a compounded payment of subsidy and a distinct lowering of the standards of estate development and house building. Here is the Minister of Health's reply to Mr. McKellen :

DEAR SIR,—I am desired by Mr. Greenwood to thank you for your letter of 17th October, which has been read with interest. He appreciates the spirit in which the proposals contained in this letter have been prepared and submitted to him. At the same time, he observes that these proposals turn upon the reintroduction of a system of payment of subsidy for the provision of houses by private enterprise. This system was, of course, abolished by the action of the late Government, and that action has been confirmed by the present Government, and Mr. Greenwood regrets he cannot contemplate the submission to Parliament of proposals which would reverse that decision. —Yours, etc.

JUGGERNAUT IN BROAD STREET, W.

Just behind Regent Street, to the eastward, there is being permitted—it is almost done—a thing for which dreadful is the word. Here, amid the jungle of bricks and mortar, intersected by narrow streets and narrower courts, and approachable only by them, a motor-coach station is approaching completion. Already a board advertises frequent services to places thirty, forty, fifty miles and more out of London. Within a few months hundreds of the bulky vehicles, which of late we have seen flashing along the main thoroughfares, will daily be making tedious and impatient way to and from this lair of theirs.

★

Walking round the site, I had a vision of what the state of things will be next summer. It is true that the station faces to Broad Street, which justifies its name to the extent of just affording accommodation for five private cars—not motor-coaches—abreast. But, as I have said, to reach Broad Street from any quarter it is imperative to traverse the network of narrow surrounding streets, of which not one will take more than three cars—or two buses—side by side; all involve at least two right-angle turns; and several have incidental bottle-necks and twists all to themselves. In one or two, street markets are held, to boot. Around are tenement buildings, with children swarming across the public highway—their nearest playground—and crowded office buildings housing a hoard of workers.

★

Admitting the desirability of a motor-coach station in the heart of the West End—a dubious admission—one would have thought that considerations of reliability and economy in working, reinforced by the lesson of a garage

(for private cars) not far away that is notoriously difficult of access, would have ruled out this of all sites for the promoters. Failing that, why have the authorities not intervened ? The answer is, no doubt, that there is no authority competent to do so. It is just another instance of the crying need for town planning as affecting areas already built.

THE WHITEHALL SCHEME "A TRAGIC MISTAKE"

I referred recently to the Government proposal for building abreast of the Cenotaph in Whitehall, and from there right through to the Embankment. Sir Leslie Scott, in a letter to *The Times* of December 6, stated his personal conviction that it is a tragic mistake, and, as chairman of the Charing Cross Bridge Advisory Committee, pleaded for further consideration before the necessary Bill is introduced. His timely protest has been the signal for an outburst of influential opinion, largely directed against the official scheme. It is mainly the building line on the Embankment that is called in question : it is proposed to advance it no less than 100 feet on that tacitly agreed to in 1912, and to do away, at a stroke, with the possibility of a strip of garden space that is essential to the preservation of this most beautiful stretch of the river, between Westminster and Waterloo bridges. Once again there should be a permanent competent central authority who would, as a matter of course, deliberate upon schemes of the kind.

TO SAFEGUARD ST. PAUL'S CATHEDRAL

By the same token, the custodians of St. Paul's Cathedral, rightly jealous of their charge, will have to go to Parliament for safeguards against deep excavation within a certain area surrounding it. Canon Alexander first mooted the desirability of some such prohibition when the restoration was brought to completion, and it is he, acting on behalf of the Dean and Chapter, who has now been the means of bringing it formally before a committee of the City Corporation. "At present," he has said, "there is nothing to prevent the owners of buildings close to St. Paul's demolishing them and, in the course of rebuilding, carrying out excavations which would menace it."

COMPETITION FOR AN EXHIBITION STAND

A competition that involves the study and display of some interesting materials has been announced in connection with the Building Trades Exhibition at Manchester next April. A premium of £100 is offered for a preliminary design for a stand that will illustrate the character of the various grades of plywood manufactured by Venesta, Limited, and will demonstrate their use. The award carries with it the obligation to supervise the erection of the stand. The assessors are: Mr. Christian Barman, editor, THE ARCHITECTS' JOURNAL; Mr. W. L. Wood, editor, *The Architect and Building News*; Professor A. E. Richardson, nominated by the editor of *The Builder*; Mr. H. de C. Hastings, editor, *The Architectural Review*, and Mr. Henry Rutherford. Open to all practising architects and designers, it does indicate the value set by progressively-minded firms upon well-designed exhibition stands. Venesta, Limited, who earned the blessing of hundreds of architects some years ago by standardizing all their plywood grades, were the first clients for whom M. le Corbusier did work in England; they now seek an English solution for a similar problem next spring.

The Queen Anne elevation to Oxford Street of the new Gamage's has disappeared behind this "seasonable sign."

SCAMPED WORK IN ANCIENT TIMES

We are perhaps too much accustomed to view scamped work or "sharp practice" in building as peculiarly a vice of this sophisticated age. That it was equally rife in the Middle Ages is proved by the existence of laws against its various forms. The statute of 17 Edward IV, c. 4, 1477, quoted by Mr. Nathaniel Lloyd in his monumental *History of English Brickwork*, is a case in point; ordaining (like a British Standard Specification) not only the size of roofing tiles—as a counter-measure against fraud by sharpers whose 1,000 tiles might have less than the expected covering power—but the date upon which the earth was to be dug and its method of weathering.

★

That even the "horde of inspectors," who are now such an ever-present bogey with the rampant individualist, could not have been unknown in the days which we are apt to think of as untrammelled, may be inferred from such a historical fragment as follows, extracted from *A Short History of Ruislip*, reviewed elsewhere in this issue, which records a visit in 1572 of two "Searchers of tiles" acting under the before-mentioned Act. They found seven Ruislip tilemakers acting illegally in that they "dug and threw out earth for making tiles at Ruyslippe before the 1st of November, and did not move or turn the same earth as they should have done before the 1st day of February following."

GAMAGE-DAMAGE

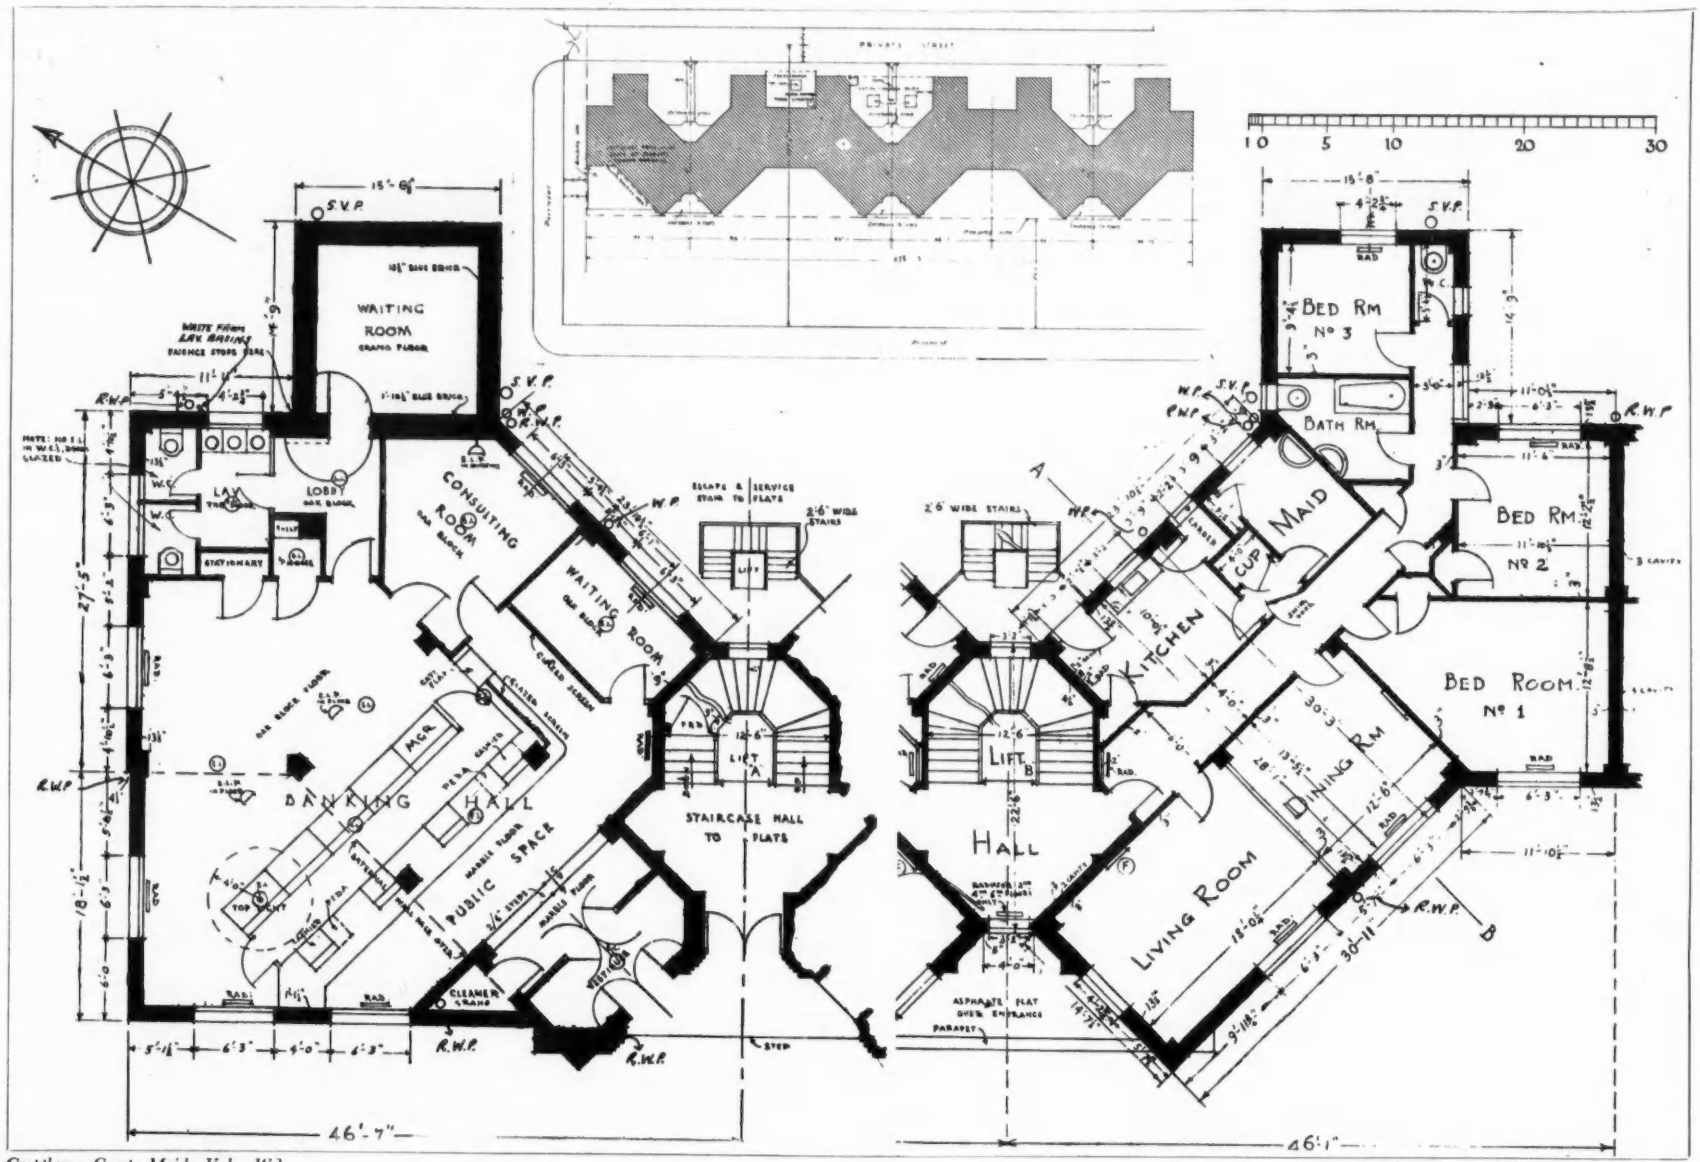
Mr. Gamage's new building in Oxford Street was opened with so much of dignified éclat, and was, moreover, so deserving of praise by reason of its architectural merit, that high hopes arose in me. Thought I, this is no ordinary shop, for the expensive apartments above the first floor require that a general air of quietness must prevail to quell that exuberance so natural in the kings of retail commerce. But no. Mr. Gamage is of no race apart. He remains constant to the traditions of a calling given to the hanging out of gaudy signs, whose patronship of the arts is but a poor thing after all. Well, well ; perhaps we expect too much of them. The kiddies have a right to enjoy the sight of Father Christmas coming in his sledge across the third, fourth and fifth story windows of a Queen Anne façade. The kiddies indeed ! What rot !

ASTRAGAL

CROPTHORNE COURT, MAIDA VALE, W.

DESIGNED BY SIR GILES GILBERT SCOTT

CROPTHORNE COURT has been specially designed to give the maximum of light and sunshine to all the rooms in every flat. It stands on a long narrow site with a frontage of about 300 ft. to Maida Vale, and overlooks a garden forecourt. The main front faces south, and has been planned to obtain every advantage of light and air from the frontage without the use of internal light wells.



The entrances to the building—there are three for the use of the tenants—are approached by a carriage drive on the main front, and those for the tradesmen are reached by a private road at the rear. The three entrances are of pleasing design, the lift gates, surrounds and grilles being of a silvered finish. Each entrance hall contains a lift and staircase, which lead to the various floors. On every floor, with the exception of the extreme northern corner of the ground floor, which contains bank premises, are two flats, one on either side of the staircase and lift.

The flats are planned to meet the latest modern requirements and to avoid all unnecessary work. The accommodation comprises : hall, living room (18 ft. 8 ins. by 13 ft. 5 ins.), leading through folding doors to the dining room (12 ft. by 13 ft. 5 ins.), which together form a reception room, four bedrooms, bathroom, two w.c.'s and kitchen, and separate tradesmen's entrance with goods lift. The kitchen and maid's bedroom are grouped together and completely shut off from the remainder of the flat.

Central heating and a system of constant hot water and refrigerators are installed; electric current is being supplied for lighting, cooking and heating at a specially reduced rate of ½d. per unit, and ample cupboard accommodation is provided. Tele-

A view from the corner of Hall Road and Maida Vale. On the principal, the Maida Vale, elevation are three entrances to the flats, leading from a carriage drive, in front of which is a garden forecourt.

Cropthorne Court, Maida Vale, W.] *[By Sir Giles Gilbert Scott, R.A.*

Block plan; ground floor plan of north end of the building; and plan of a typical flat. There are two self-contained flats on each floor, one on either side of the staircase hall. The living and dining rooms are separated by folding doors, and may be used together as one large reception room. The kitchen and maid's bedroom are grouped together and completely shut off from the remainder of the flat. The former has a separate doorway leading to the escape and tradesmen's staircase and goods lift, and telephones installed to the tradesmen's entrance.

phones are installed to communicate between kitchens and tradesmen's entrances. All fittings in the kitchens are recessed, leaving unobstructed room, and ample accommodation has been provided for the storage of trunks, etc.

The rentals vary from £375 per annum to £425 per annum, inclusive of rates and taxes, plus a charge of 5 per cent. on the rental to cover porterage, lighting and cleaning of public parts, and upkeep of grounds, etc.

No gas or coal-burning fires are provided in the building, the absence of the latter obviating the necessity for the provision of flue stacks, fuel stores and means of ash removal. The central heating is provided from an oil-burning boiler installation below ground level in the centre court adjoining the private road at the rear of the building.

The elevations are faced with warm stone-coloured faience to first-floor level, and above in greyish-pink Sussex bricks. The roof is covered with Italian Lombardic roofing tiles. Steel casements are fitted. The building line on the main frontage is 50 ft. from the pavement or dwarf boundary wall, and enables a row of trees to be retained, which greatly adds to the amenities.

One of the entrances, looking through the main doors into the hall. All the entrances are of similar design and plan.

A corner of a living-room. Each of the flats is decorated and finished internally to the reasonable choice of the tenant.

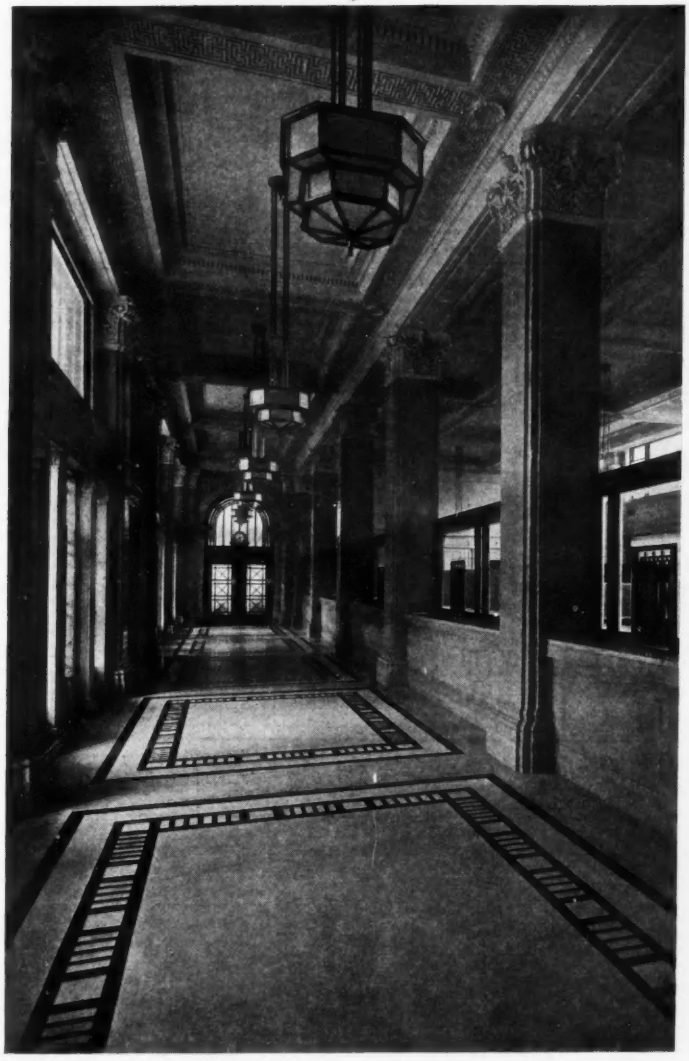
Cropthorne Court, Maida Vale, W.] [*By Sir Giles Gilbert Scott, R.A.*

living and dining rooms are separated by folding doors, and may be used together as one

[By W. A. Johnson.
The Hanover Street front. Each of the principal elevations is in Stancliffe stone, with a rusticated base, and steel windows, so arranged that they can be cleaned from inside.

The entrance from Corporation Street leads through a vestibule into the banking hall; see facing page.

Entrance to the administrative offices is from Hanover Street to provide easy access from the Society's offices across the street.



C.W.S. Bank and Administrative Offices, Manchester.]
The Corporation Street front. The building is seven stories high, and rises 90 ft. from pavement level to the top of the parapet. The spaces between the pilasters have a simple infilling of metal.

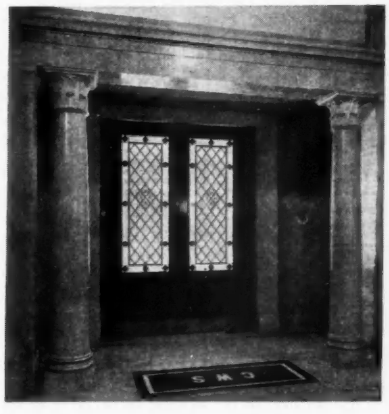
C.W.S. BANK AND OFFICES, MANCHESTER

DESIGNED BY W. A. JOHNSON

THE new bank and administrative offices of the Co-operative Wholesale Society, Ltd., has just been completed from the designs of Mr. W. A. Johnson, chief architect to the society in their Manchester area, who was assisted by the permanent staff of the architects' department. The building is seven stories high. It rises 90 ft. from pavement level to the top of the parapet, above which is a mansard roof containing the top floor.

On the ground floor, in addition to the spacious entrance hall, the banking hall and the various offices of the banking department, is the memorial erected to the memory of the employees of the society who lost their lives in the Great War. This consists of a cenotaph, with bronze lamps at either side, standing in a marble-lined, semi-circular apse, on the walls of which are inscribed the names of the fallen, the whole surmounted by a coffered semi-dome.

In the banking hall the floor of the public space is covered with Travertine marble with rubber panels. The counter is faced with marble and has a bronze grille, illuminated from above by trough lighting.

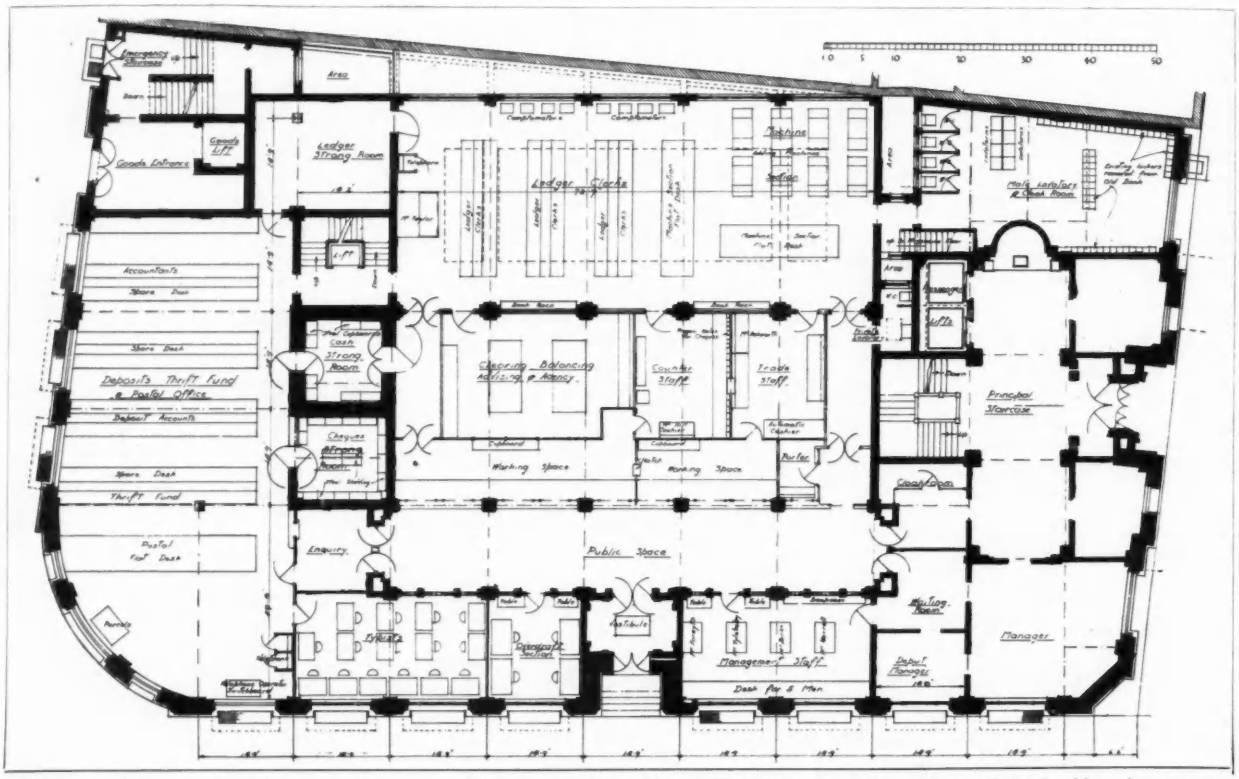


Access to the banking hall is obtained from the entrance from Corporation Street. The banking hall is 72 ft. long by 43 ft. wide, and is 19 ft. high. Stanchions supporting the floors above are lined with Roman stone, terminating in fibrous plaster capitals. The ceiling is panelled in a simple manner and the floor of the public space is covered with Travertine marble with rubber panels. The public counter is also faced with marble and bears a bronze grille, illuminated from above by trough lighting.

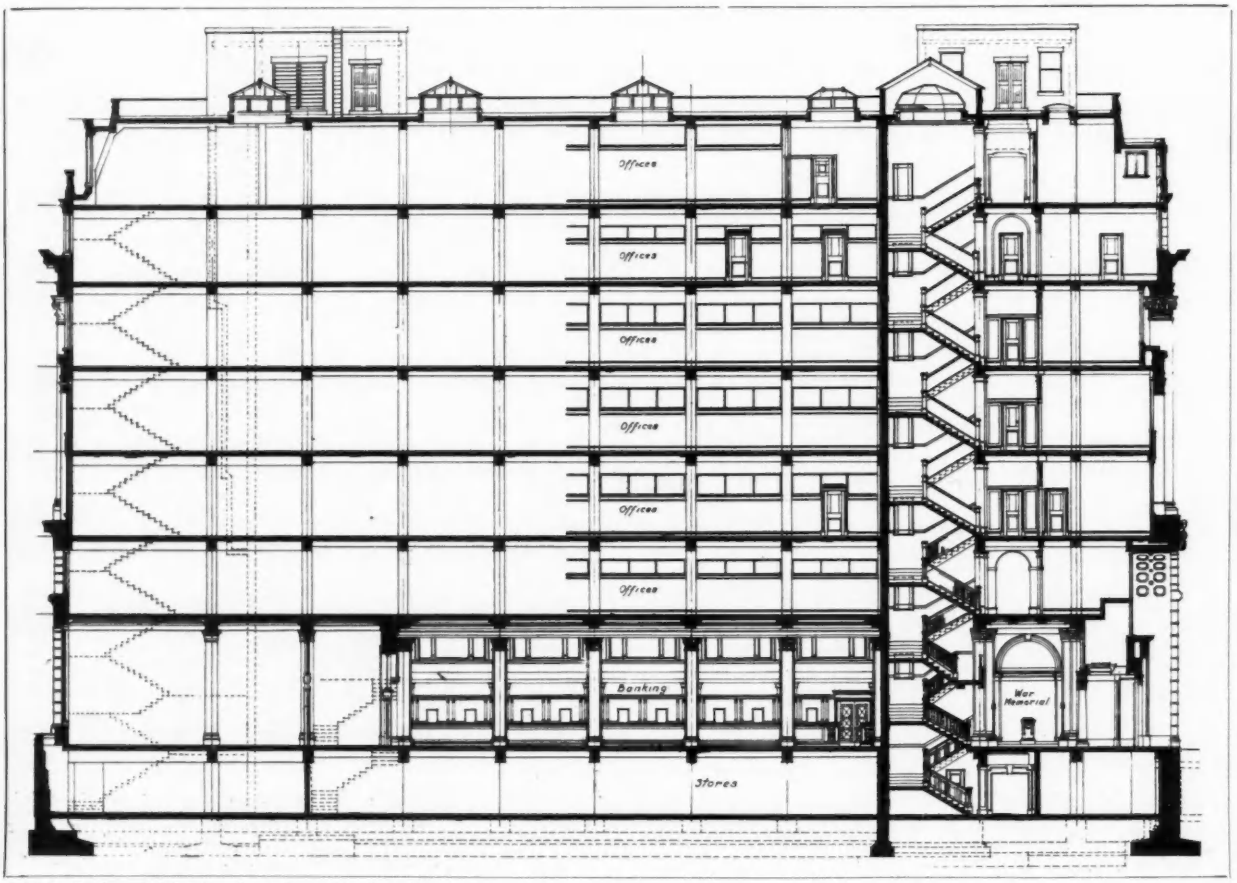
For convenience of access from the society's present offices, the main entrance hall and staircase are placed on the narrow Hanover Street front. A lofty arched entrance doorway leads to the entrance hall, from which access is obtained to the staircase and passenger lifts.

On the upper floors are offices for the solicitors, accountants, architects, engineers, publicity and advertising departments. The aim in planning has been to reduce the complex requirements of an administrative block of this character to the utmost simplicity of arrangement; to provide the largest possible uninterrupted floor space for office use; and the most direct and convenient routes to and from the offices.

The principal elevations are faced in Stancliffe stone, and have large windows, constructed of steel.

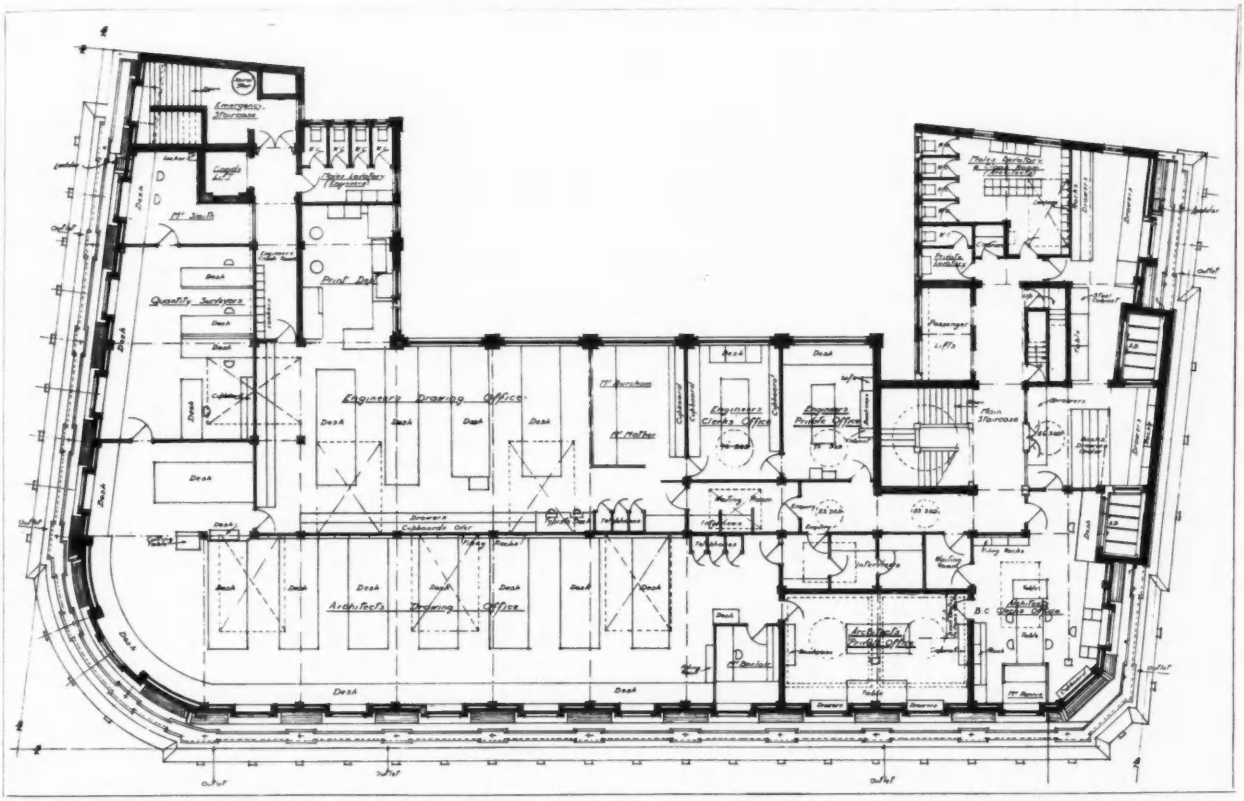


The spaces between the pilasters, with carved capitals, which run up through three stories, have a simple infilling of metal. The order of pilasters is crowned by an entablature, above which is an attic story with subsidiary cornice and balustrade.

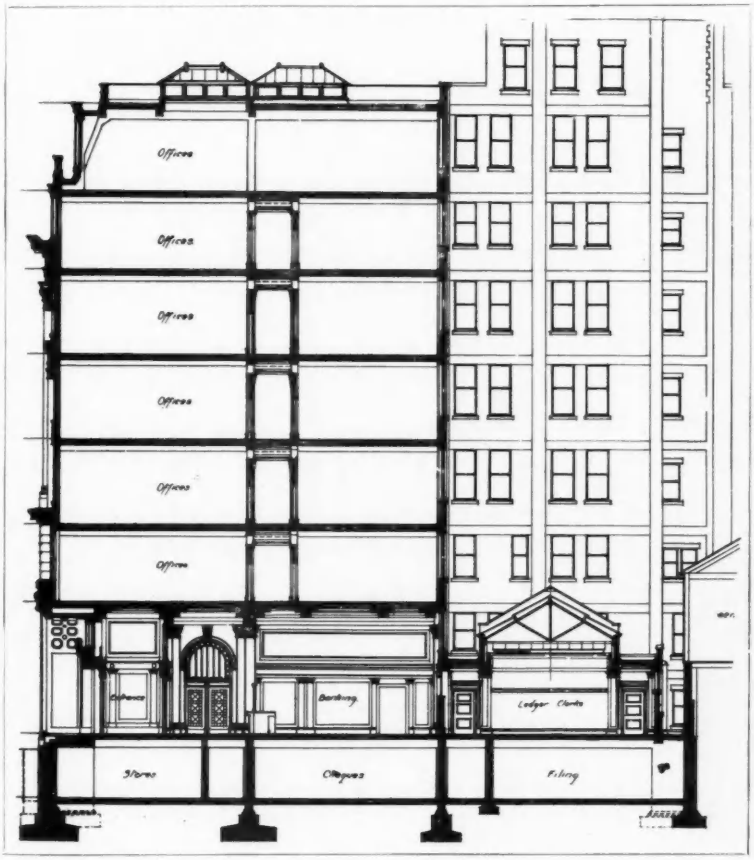


The Hanover Street entrance, looking from the hall, from which access is obtained to the main staircase and lifts.

These doors at the end of the public space lead to the enquiry, and the deposits thrift fund and postal office.



The ground floor is devoted to a main entrance hall, the public banking hall and to the various offices of the banking department. Daylight is admitted to the banking hall from windows on the main elevation and at the rear of the hall.



C.W.S. Bank and Administrative Offices, Manchester.]

Longitudinal section, reproduced to the same scale as all the drawings illustrated on this and the facing page. The building is steel-framed and encased in concrete. Floors are of steel and concrete, finished, in the majority of cases, with wood boards and linoleum.

On the sixth floor are the offices of the architects' and engineers' departments of the society. Each floor is planned with the largest possible uninterrupted floor space and with the most direct and convenient routes to and from the various offices.

Cross section. Vacuum cleaning, with a central exhauster and dust collector, and a ventilating apparatus, which warms or cools the air, are provided.

[*By W. A. Johnson*

A typical office. Post Office and inter-departmental telephones and synchronized clocks are installed.

The war memorial consists of a semi-circular apse, with a semi-dome, and a cenotaph with brass lamps at either side.

A typical staircase hall. The corridors lead direct to an emergency staircase on the opposite side of the building.

C.W.S. Bank and Administrative Offices, Manchester.]

All corridors, of brick on edge, have borrowed lights, consisting of one sheet of glass from stanchion to stanchion, above door height.

[By W. A. Johnson.

The bank manager's room, on the ground floor, contains some fine woodwork, including a bookcase, seen to the left of the illustration.

ENGLISH PRECEDENT No. 146

ST. MARY'S CHURCH, WARWICK

The form is Gothic, the detail Classic. As in Wren's western façade of Westminster Abbey, classic detail is used where it fits, twisted a little in the awkward places, and dropped altogether in really vital places. The result is disappointing after the main outline is realized. Only the arched porch under the tower retrieves the exterior from inconsequence.

LETTERS FROM READERS

Housing: The Counter-Revolution

SIR,—As author of the leading article entitled "Housing: the Counter-Revolution," I was careful to say that Mr. McKellen's "bias towards financial *interestedness* was steadied by more than a grain of allowable criticism against the system of open development by which post-war housing has been characterized."

I will return to that aspect of the case towards the end of my letter. Meanwhile I must remark that the feelings of deep suspicion provoked by Mr. McKellen's first manifesto are not dispelled by his letter in your issue for December 3. He rather adds to them than otherwise when, Sir, he asks you to accept figures proving that private enterprise has built twice the number of houses erected by public bodies at but one-tenth of the cost to the public. I do not propose to inquire into the true value *to the community* of the contrasted types of houses, but I do not believe that private enterprise has served the country one-tenth as well as the authors of the Council housing schemes which Mr. McKellen abuses so easily and with so little meaning.

Council housing has been continuous through every bad period since the war, and has attempted to cater for classes of the community which private enterprise, having more profitable things to do, has left alone. There is now a chance that the lower classes of tenant may be successfully catered for, if the utmost economies are effected. These economies may quite easily take some of the forms proposed by Mr. McKellen, but what struck others than myself was the light-hearted assumption that they should take the form of a negation of the principal virtues of careful planning in order that private individuals should make money out of the business. There was, if I may point out to Mr. McKellen, so great a stress upon the investment point of view, and so little upon the necessity for the safeguards he mentions at the tail-end of his last letter, that he must not be surprised to hear talk of Philistines: they are generally supposed to be of that frame of mind.

We are all so very truly interested in the building of really cheap houses to let at economical rents, that I feel that if THE ARCHITECTS' JOURNAL could entertain some further examination of the subject, in particular the question of longer blocks without essential sacrifice of density, it would be performing a very timely and useful work.

YOUR LEADER WRITER

[Such an examination as our correspondent suggests is now being undertaken, and it is hoped to publish the results shortly.—ED. A. J.]

Rebuilding of Middlesex Hospital

SIR,—I see in your last issue you published an interesting letter from Sir Leonard Hill, referring to the rebuilding of the Middlesex Hospital. As the architect for this scheme, I should like to correct the impression that will be gained from Sir Leonard Hill's letter.

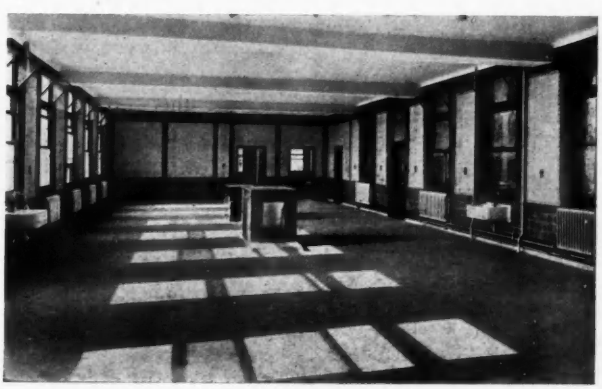
With regard to the provision for open-air and sun treatment, the present west wing has already something over 300 ft. run of 8 ft. balcony, and when the east wing and centre block are completed there will be in all some 1,000 ft. run of 8 ft. balcony available for patients in the new hospital.

With regard to the second paragraph in Sir Leonard Hill's letter, in which he expresses the opinion that hospitals should not be rebuilt in cities, this, of course, is a matter of opinion, and has been discussed at length on numerous occasions. So far as the Middlesex Hospital is concerned, this, of course, was one of the first points considered when the general question of rebuilding was dealt with by the Board, and every aspect of this problem was extensively discussed.

The Middlesex Hospital is perhaps unique in this way: that it exists on the site only as a hospital, or, in other words, the site is not available for any other form of development, as there is a clause in the hospital's lease with the Berners Estate which limits the use of the site to a hospital. Clearly, therefore, there would be no value, so far as the hospital is concerned, in the site, as it cannot be disposed of.

An added argument to the desirability of the hospital staying where it is, was, of course, the fact that more than half the buildings on the rest of the site are practically modern, and there is a very large medical school attached, and numerous other buildings used for specialist services, both for teaching, research and the treatment of patients. Clearly, therefore, it was essential that the Middlesex Hospital should remain on its present and existing site.

ALNER W. HALL



Soot Bound

SIR,—I was very interested to read the leading article entitled "Soot Bound" in your issue for November 26, and also the letter from the General Secretary of the National Smoke Abatement Society, in the issue for December 10.

As Mr. Arnold Marsh truly says, there is a tremendously strong tradition in favour of coal fires, and I think we should consider whether this tradition is based wholly on sentiment, or whether there are stronger and sounder reasons for its having such a great hold on the public mind.

I think that, without doubt, these reasons do exist. The case for the coal fire can be argued not only on the grounds of health, cheerfulness and comfort, but also upon the important factor of economy. The coal fire is a much finer ventilating agent than any other form of heating. I think that the words of an eminent authority

A balcony and one of the wards at the Middlesex Hospital. Mr. Alner W. Hall, the architect, in a letter on this page, states that when the east wing and centre block are completed, there will be no less than 1,000 ft. run of 8 ft. balcony available for patients. The right-hand photograph illustrates the ample window space provided for the admission of sunlight to the building.

on this subject, Dr. Marie Stopes, are worthy of attention in this connection :

> A glowing fire gives out something subtle, yet intensely "nourishing" to the system, "nourishing" in the way that vitamins and ultra-violet rays are "nourishing." Whatever this stimulating influence may be, it is either absent or very weak in radiation from heat in gas or electric fires. Hence, for health, a bright glowing coal fire should be present in the nursery, and in the chief living room in every house.

In case, however, the attitude of my Federation on this question should be in any way misunderstood, I think I am voicing the views of the members in stating that we should be the first to welcome any smokeless fuel which, while easily ignited, will give a cheerful hot fire, leaving little ash, and which at the same time is of a reasonable price. A well known gas engineer has, however, recently stated that low temperature coke (the most suitable form of smokeless fuel for the open grate) "is not yet a commercial proposition."

A great deal more smoke is caused by domestic chimneys than is necessary, and no effort should be spared by both merchants and consumers alike to lessen the amount of smoke issuing from domestic chimneys. A very small amount of knowledge of the correct way to handle a coal fire, and of the most suitable fuel to burn for the purpose required, coupled with the installation of modern appliances where very old ones exist, will be sufficient to this end.

It is the wish of my Federation to make this knowledge as widespread as possible, and to co-operate in any movement to that end.

I think it will interest architects to know that the Coal Trade Luncheon Club, in collaboration with the Institute of Fuel and the Government Fuel Research Board, and with the assistance of this Federation, is publishing shortly a textbook on coal, which will deal, among other things, with the matters of domestic heating and cooking. This book will contain information of the utmost interest on these subjects.

It is not perhaps generally realized that great contributions to the cause of smoke abatement have been made in recent years by manufacturers of modern open fire places, kitchen ranges and "combined stoves" (i.e. stoves which, while having the appearance and giving the undoubted comfort of sitting room fires, are designed also for cooking and for the heating of hot water).

With the first, the improved combustion leads to far less smoke being emitted than is the case with old-fashioned grates, while there are now on the market kitchen ranges and "combined stoves" which are so designed as to consume practically all their own smoke while burning coal.

GEORGE GENTRY
(SECRETARY, THE COAL MERCHANTS' FEDERATION OF GREAT BRITAIN)

Expiration of Lease

SIR,—A client of mine is shortly going out of a house, the lease of which is about to expire. Under the terms of the lease my client has to make good any defects and to leave the house in a properly tenantable condition. He is further bound to have one coat of paint put on all the internal woodwork.

For reasons with which I am not entirely familiar, my client feels deeply aggrieved at the treatment he has received from his landlords and their agents, and proposes to express his displeasure by applying to the woodwork in the house a coat of black paint. I have been asked for my opinion as to whether such a coat of paint (which would, in fact, amount to wanton damage) would be a contravention of the terms of the lease. Are any of your readers able to throw any light on this question ?

PERPLEXED

[The question asked by our correspondent is so unusual that readers are invited to forward their views on this subject for publication in the JOURNAL.]

IN THAT CONTINGENCY

The following abstracts of inquiries on the deterioration of a reinforced concrete floor and cracking of asphalte roofing, are two of a number recently submitted to the Building Research Station, and their replies thereto.

Deterioration of reinforced concrete floor

IT was reported that trouble had been experienced in a margarine factory through the flaking off of large pieces of concrete. This appeared to be due to water percolating through the reinforced concrete floors and setting up corrosion of the steelwork embedded in the concrete.

It was reported that a fairly strong solution of soda ash had been regularly used in cleaning the floors. The inquirer wished to know whether the use of soda ash has any deleterious effect on concrete, and whether its corrosive effects on steel would be greater than that of water alone.

Reply : Soda ash has no marked deleterious effect on concrete or cement, nor will it set up corrosion in steel reinforcement, and will tend rather to reduce any corrosive action set up by other agents.

From the fact that regular use of soda ash is required, it is assumed that the oils used in the manufacture of margarine find their way on to the floor. Such oils are known to have a marked deleterious effect on concrete, and the products of their decomposition may attack constituents in the cement, and would be liable to promote corrosion in steel with which they may come in contact.

It is possible, of course, that disintegration of the concrete might be accelerated by crystallization of soluble salts derived from the soda ash (or the products resulting from its reaction with constituents of the cement), with acid gases in the atmosphere. In view of the known destructive effects of animal and vegetable oils, however, this is not considered likely to be such an important factor.

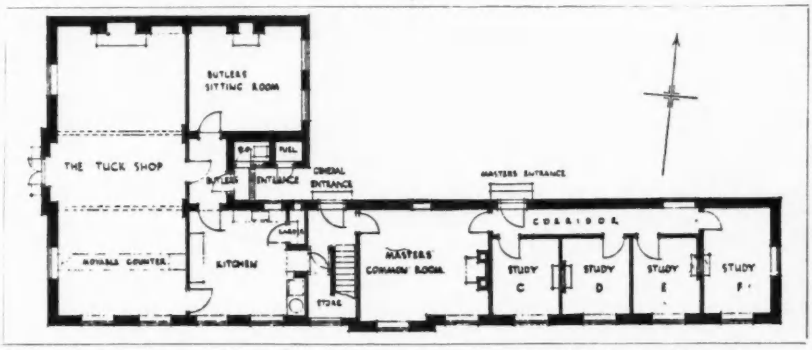
Cracking of asphalt roofing on concrete

The Building Committee of an Education Authority reported that considerable trouble had been experienced due to cracking of mastic asphalt laid on concrete roofs. Some of the large cracks had been repaired by inserting a new strip 4 or 5 ins. wide, but usually when this had been done a permanent cure was not effected, and now cracks developed near the joints. Various suggestions for repairing the cracks with asphalt mastic had been proposed by the firms who laid the original asphalt.

Reply : The case reported is very similar to one previously investigated. The cracks appeared to have a structural origin, and it was finally concluded that there was very little hope of stopping them with any plastic treatment. With cracks of structural origin, periodic movements are almost inevitable, and there is a tendency for any seal to be broken. It is probable that the best asphalt mastics are capable of accommodating quite appreciable movements of the supporting structure, and cases have been investigated where serious expansion and cracking of a concrete roof slab had not cracked the asphalt.

In the case previously investigated, repeated attempts at patching had proved unavailing and surface treatments with bituminous compositions had also failed to give any lasting satisfaction. It was finally decided to cover the roofs with a three-ply bitumen felt, mopped down with hot bitumen, and finally covered with a layer of bitumen and gritted. It was hoped that a pliable membrane of this kind would be able to accommodate itself to the movements likely to take place at the cracks. It was suggested that by omitting the bitumen dressing for a space of about 6 ins. on either side of the worst of the cracks still further freedom would be provided for possible movements.

New Masters' House EASTBOURNE COLLEGE and Butler's Quarters

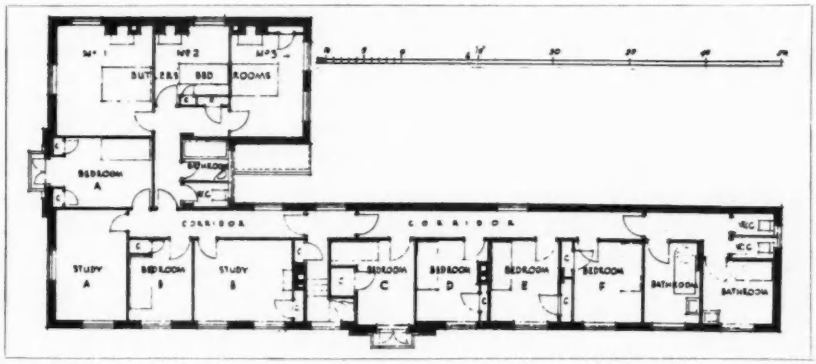


DESIGNED BY TATCHELL AND WILSON

A general view from the south. The pedimented section contains, on the ground floor, the masters' common room, and has studies to the right, and store, kitchen and tuck-shop (not here included) to the left. Above are studies and bedrooms. Apart from the tuck-shop doors, the entrances are on the north side of the wing, the stairs facing one which occurs in the angle of the L-shaped plan, next to the masters' common room.

IN this new building, which has been designed on a confined site and with strict regard to economy, the chief rooms have been arranged to obtain the best advantage from the warmer and sunnier aspects. It is built of local multicoloured stock bricks, with small red Lombardic tiles for the roof, a flat pitch being necessary owing to the narrowness of the road and the nearness of the buildings opposite.

The formal design is united by a strongly-defined overhang of the eaves, which casts a deep shadow. The windows are symmetrical, having metal casements framed between wood mullions, and the balance of the elevation is emphasized by pedimented central features with wrought-iron first-floor balconies and French casement windows.



The ground-floor plan. The tuck-shop and service quarters, including the butler's sitting-room, absorb the end rectangle, while the masters' common room and four studies occupy the wing.

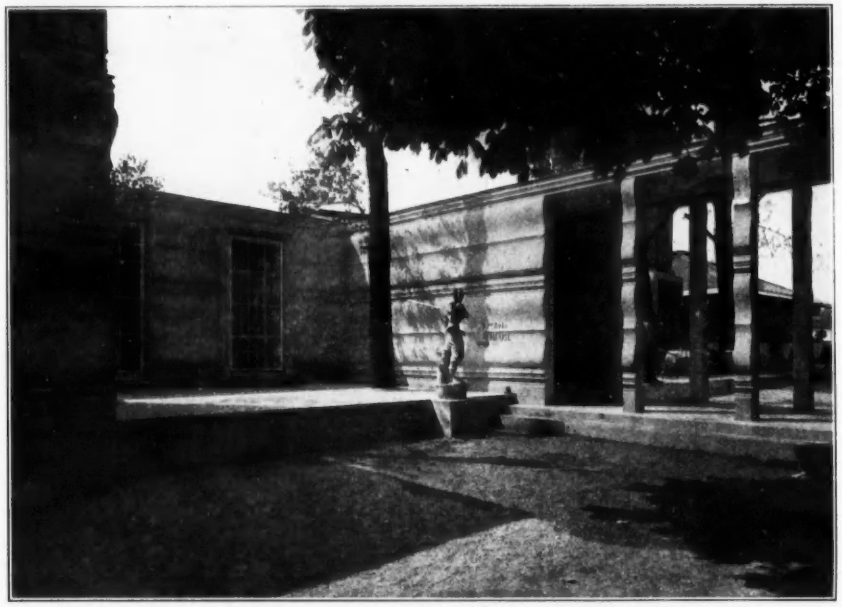
The plan is L-shaped and is the outcome of the conditions imposed by the site and the required accommodation. Six junior masters are each provided with a study and bedroom facing south on the ground and first floors.

There is a masters' common room on the ground floor, and bath and lavatory accommodation at the east end of the first floor. The school tuck-shop is entered from and faces the playing-fields on the west and connects with the kitchen, etc., and a sitting-room for the butler, the remainder of whose accommodation is on the first floor. The tuck-shop is 39 ft. long by 17 ft. wide, and is the largest apartment in the building.

Inside, the walls are treated with plain light washes and act as a foil to the joinery, which is stained a light oak colour.

The first-floor plan. Here not only the wing is devoted to corresponding masters' bedrooms, bathrooms, etc., for the studies below, but two more sets prolong the line and turn the corner.

Haus Skywa, Hietzing, Vienna (1913–15).



Hall of Haus Berl, Freudenthal, Czechoslovakia (1920–22).

SOME WORK OF JOSEF HOFFMANN

[*From* Josef Hoffmann, *by Leopold Kleiner; by courtesy of the Friedrich Ernst Hübsch Verlag, Berlin.*]

Landhaus Ast at Velden, Austria (1923).

The Austrian Pavilion at the Paris Exposition des Arts Décoratifs (1925).

THE WORK OF JOSEF HOFFMANN

BY P. MORTON SHAND

THE first duty of the architect, according to Josef Hoffmann, is to rid himself of preconceived prejudices and predilections, since form proceeds from function, and not inversely. For him the sincerity of form —by no means necessarily one and the same thing as the Neo-Puritan concept of *Sachlichkeit*, or Functionalism—comes before everything else because, now that his art has been liberated from the servility of mere reproductive imitation, the architect is free either to forge his own style, or adopt whichever most fully expresses his own individuality.

Hoffmann once scandalized the delicate artistic sensibilities of a high personage who was consulting him on the most appropriate design for the casements of his new villa by saying that the first consideration in regard to a window was whether it was easy to open and clean.

As a designer and craftsman in wood, ivory, metal and glass he has consistently subjected the smallest objects, like cigarette-boxes and sugar-bowls, to the same severe architectonic discipline as the planning of a large country house or the elevations of an important group of exhibition buildings.

Hoffmann must have designed more of the latter than any man living. Three of them were of outstanding importance. The charming Austrian Pavilion at the Rome Exhibition of 1911, with its gracefully attenuated, untraditional square columns, has been the prototype of all post-war exhibition architecture. The *Oesterreichisches Haus* at the 1914 Cologne *Werkbund* Exhibition—another columnar composition, surmounted by a double tympanum, in which vertical emphasis was almost violently enhanced by the deep flutings of the very broad shafts—proclaimed Hoffmann's fearless advance to what we now call Modernism. Finally, the *Pavillon d'Autriche* at the Paris Exposition des Arts Décoratifs in 1911, a supremely original, consummately refined and truly masterly design, unforgettable to anyone who saw it, marked the culmination of his evolution as an architect.

Hoffmann has been as great a teacher as an artist, because he has the rare gift of making his pupils feel that he is their collaborator, not an omniscient instructor. His pupils—among whom R. Mallet-Stevens, Gabriel Guevrekian and E. J. Margold are names that naturally come to mind—have left him with the mastery of handling material rather than of any particular style; and equipped with a sense of the practical needs of everyday life.

As a young man Hoffmann studied the elements of peasant architecture in cottages and homesteads with the same passionate thoroughness that others have applied to sumptuosities of the grand manner. These lessons have stood him in good stead. To him, more than to anyone else, we owe it that Europe was saved from an epidemic of *art nouveau*, and made ripe for the stern renunciations of Modernism.

There is no echo in anything Hoffmann has ever done of the quaint, the picturesque, the pseudo-rustic, or the self-consciously arresting.

Hoffmann's villas and country houses owe more than a little to English precedents: a debt which, like the modest genius he is, he delights to acknowledge. In return he has exercised a not inconsiderable influence on the work of Ernest Newton, Thackeray Turner, Guy Dawber, and George P. Bankart—names to which one is almost tempted to add those of Edward Maufe, Oswald Milne, Oliver Hill and Basil Ionides. The *Haus Henneberg* (1902), the dining-room for Fritz Wärnedorfer (1903), and the offices of the *Wiener Werkstätte* (1904), like the interior decorations of the *Graben Kaffee* (1912) and the *Poldihütte* offices in Vienna (1912) and the *Haus*

Municipal tenement-house, Felix Mottl Strasse, Vienna.

[*From* Josef Hoffmann, *by Leopold Kleiner; by courtesy of the Friedrich Ernst Hübsch Verlag, Berlin.*]

The Austrian Pavilion at the Paris Exposition des Arts Décoratifs (1925).

Landhaus Ast at Velden, Austria (1923).

Primavesi in Winkelsdorf (1913), represent the earlier phase of his development, contemporary with, and in many ways similar to, the active part of Mackintosh's career. After the war there is a rather pronounced cleavage with the Secession traditions of the *Palais Stoclet*. The *Haus Berl* at Freudenthal and the *Haus Grohmann* at Würbethal, both of which were built in 1920, are externally devoid of all ornamentation; the former, indeed, being almost a little grim. The interiors of both, however, are perfect examples of clarity and sober grace. The *Landhaus Ast* at Velden (1923), with its deliberate horizontal emphasis, is a sort of *première ébauche* of the Austrian Pavilion in the Paris Exhibition of 1925. Simpler than anything he had yet done, except perhaps the Purkersdorf Sanatorium (1904), but with just as pleasing and workmanlike elevations, is the block of working-class dwellings in the Felix Mottl Strasse, built by the City of Vienna in 1924.

One of his latest works is a memorial to Otto Wagner in a public square in Vienna: a slender, rectangular pillar of plainly dressed grey granite, without pedestal or capital. Most of Hoffmann's buildings are to be found in and around the city he cannot bring himself to leave in its—we hope transient—eclipse. It is nearly forty years since Hoffmann settled in Vienna, and in that relatively short interval his work and his pervading personality have become as much a part of the old imperial capital as the memories and monuments of the vanished Hapsburgs.

THE ANCIENT MONUMENTS BILL

House of Lords Second Reading

ON Thursday, December 11, in the House of Lords, Lord Ponsonby moved the second reading of the Ancient Monuments Bill.

He explained that an Act passed in 1913, upon which now all the activities of the Ancient Monuments Department were founded, introduced an element of compulsion and the idea of scheduling or listing ancient monuments. Since that time something like 3,000 had been scheduled. The Act of 1913 also empowered the Commissioners to give advice, and in many cases advantage had been taken of that provision. The Commissioners were also empowered to buy, accept, or become guardians of ancient monuments, and something like 280 ancient monuments had been handed over since that date. The whole scheme of preserving ancient monuments had greatly increased during the past ten years. The introduction of motor coaches had increased the number of visitors to such places.

In 1924–25 there were 160 of these ancient monuments, which were visited by 275,000 people, the receipts for admission being £5,541. Last year there were 223 of these monuments, 493,000 people visited them, and the receipts amounted to £9,839. In addition to ancient monuments, there were certain historic buildings, such as the Tower of London, Carnarvon Castle, Carisbrooke Castle, Edinburgh Castle, and so on. In 1924 the receipts from admission fees to such places amounted to £23,000, while in 1929–30 they were £26,814. The amount of money spent on ancient monuments had varied during the past five years between £45,000 and £55,000.

These places, under the guardianship of the Office of Works, were admirably preserved, and he paid a tribute to the interest shown in this Department by successive First Commissioners of Works during the past ten or fifteen years, as well as to the zeal and enterprise, intelligence and good taste of the Permanent Secretary to the Office of Works, Sir Lionel Earle. He also paid a tribute to the exact and profound knowledge and indefatigable activity of Mr. Peers, the chief inspector.

There were new elements introduced by the Bill, but a great part of it consolidated and extended the Act of 1913. The chief of the new elements was in clauses 1 and 2, which gave power to the Commissioners to prepare schemes for the protection of the surroundings of ancient monuments. Those schemes would be on the lines of town-planning schemes, but town planning was not enough; a central authority is necessary. This provision had been very much brought to the front by the threat to the amenities of Hadrian's Wall. Although the Wall and the Vallum to the south of the wall were both scheduled by the Office of Works, the ground between them or near the Wall did not come under the control of the department, and could not, under the Act of 1913, be protected by them. Fortunately, the gentleman who was conducting quarrying operations near the Wall had agreed not to do anything which would imperil the Wall, and there was no immediate danger. But that was only one instance of many where it was necessary, in order to preserve these monuments adequately to have the power to acquire certain sites and land round them.

Another instance was Stonehenge. If the Bill had been law it would have been possible to have acquired the land round Stonehenge, say a square mile of it, in order to preserve that very interesting ancient monument and prevent buildings and unsightly huts being erected round it, and it would have saved the public from a heavy sum which had to be raised to acquire the land. Had the land been acquired by arbitration, the amount of compensation, he had no doubt, would have been very much smaller.

In clause 2 there was provision for compensation and betterment. It was not anticipated that there would be many claims for betterment. Clause 3 gave power to the Commissioners to contribute to the expenses of local authorities making schemes which would have the effect of protecting the surroundings of ancient monuments. Clause 10 prohibited the export in whole or part of an ancient monument, whether it was an occupied dwelling-house or not. This was a new provision, which might be subjected to certain criticism. Houses had been taken down and exported, and others had had valuable features wrenched away and exported. The number of those cases had not been very great, but with the advance of engineering there would be no difficulty about shifting a house from one continent to another, and it was thought desirable to make provision to prevent that eventuality.

Apart from the clauses dealing with acquisition of land round ancient monuments, compensation and betterment, and prohibition of export, the Bill only consolidated and slightly strengthened the existing Act. The proper preservation of these ancient monuments, which were historical links with the past, and many of which, by their intrinsic beauty, gave the highest pleasure to thousands of visitors, was a work which was receiving the sympathy and approval of an increasing number of people. His Majesty's Government therefore thought it to be their duty to extend, and, where needed, to consolidate their powers in order that they might discharge their trust with an efficiency which would gain general public approval.

Lord Davenport expressed sympathy with the purpose of the Bill, but he considered that the clause giving the Commissioners power to make orders prohibiting export was too wide.

Lord Ponsonby said he would be very ready to pay attention to any criticisms which might be made in Committee. The idea was that the Commissioners should have some hold in notorious cases where monuments of great value, or some part of a house of great value to the nation, was going to be stripped and exported.

The Bill was read a second time.

ÆSTHETICS AND CONSTRUCTION

BY HOWARD ROBERTSON

IT is, perhaps, inevitable that the architect and the engineer should regard structure from a slightly different angle. The architect is first and foremost an artist, or should be; although few architects will willingly admit it, for fear of the inferences which critics may draw. For in spite of much evidence to the contrary, the artist is always supposed to be completely inept in practical and business matters. The engineer is primarily a scientist. There is a fundamental difference in the approach to building problems of the artist and the scientist.

The artist has what is called inspiration. He is faced with a concrete task, or provides himself with an imaginary one. He steeps himself in the problem. And then—and here is the important point—he eventually has a vision, inchoate, perhaps, of a conception. Ill-defined, vague, it nevertheless exists. Its contours are not sharp, its substance is elusive, but nevertheless the idea is there, the vision is persistent if remote.

From this vision of form, the artist passes by gradual processes towards realization. What in the beginning is abstract gradually becomes concrete. Concentration of the mind, and a perpetual concern with the problem in hand, slowly bring definition. The veils are lifted one by one; the misty conception becomes with each process more defined. Impressionism hardens into precision. And out of an abstraction has come reality.

With the scientist the process is reversed. The scientist loves facts and data. He starts therefore with definitely formulated elements of fact. But he uses them not as a collector for the mere joy of their display but to create visions. The scientist, with his basis of exact knowledge, reaches out into the realm of the imponderable. He is looking for phenomena above and beyond his data, his mind is haunted by possibilities which are visions. He is like an airman who, in a machine of proved capacity, is ready to fly into the unknown.

Architect and engineer are complementary. The former offers to the latter some satisfaction of the abstractions which the scientist craves. The latter helps the former to the realization in concrete form of his imaginings.

So, in the practice of architecture, design and structure represented by the architect and the engineer go, and always have gone, hand in hand.

The first element of architectural design is the conception arising from the programme answering the purpose and function of the building. The second is the structure by means of which the answer to the programme is realized. The third element is that of æsthetic pleasure, by means of which building, played upon by the forces of humanism, is raised to the status of architecture.

All these three are mutually sustaining. In structure alone is not to be found the soul of architecture, even though it be completely satisfactory from every scientific aspect. The corollary: a thing which functions perfectly is not of necessity beautiful. You ask me to quote an example; and I offer you a petrol pump and a gasometer. In good structure, however, reside potentialities for æsthetic satisfaction. Rhythm, harmony, proportion, are elements of eye pleasure. And a system of order lies behind the abstraction of these qualities.

But for structure to be transmuted into architecture, it must be galvanized by imagination into life. The complete satisfaction of material requirements will not, by itself, achieve architecture.

Outwardly and for the purpose of definition, architectural development may be classified according to structural changes.

The most fundamental change has taken place in structure. The introduction of exact engineering science, as applied to structure, substituted empiricism and rule-of-thumb which for centuries had fettered architectural design.

Never before had exact calculations, mathematical certainties as regards structure, been available. Engineering science gave to architecture a freedom which it had never known.

The possibilities of structure in the past have been a constant source of inspiration. But today they are more than that. They are an urge, a compelling force. For the first time in history they not only meet a demand, they begin to create it. Knowing that we can bridge vast spaces, and build towards the sky, there is felt the itch to do so. Each new progress in structure creates the urge to use it.

Structure, therefore, stands today in a position of pre-eminence. So compelling is its interest that the demand to acknowledge it, as an element of significance, is becoming general. But the reasons for doing so must not be confused with those which have often in the past been advanced. They are æsthetic and practical reasons, not ethical reasons.

We find two categories of problem in the matter of treating structure. In solving the first, we base our solution on the assumption that the structure is not a major element of interest. In the second, we regard structure as almost completely responsible for the form which the building takes. Even in the latter case, it does not follow that structural elements need be exposed. They may be enclosed, hidden by decoration, but such decoration will make mute acknowledgment of the structural form beneath.

In the first category I place the commonplace structural framework of such buildings as medium-sized houses, flats, office buildings, sheds, garages, and so forth. An ordinary steel roof truss, an occasional stanchion, give one no thrill. They are interesting, but not more so than the wires of a piano. I do not want to have these vertebræ thrust forcibly under my nose. They are functional necessities which, though perfectly designed for use, have a very minor intellectual or emotional interest.

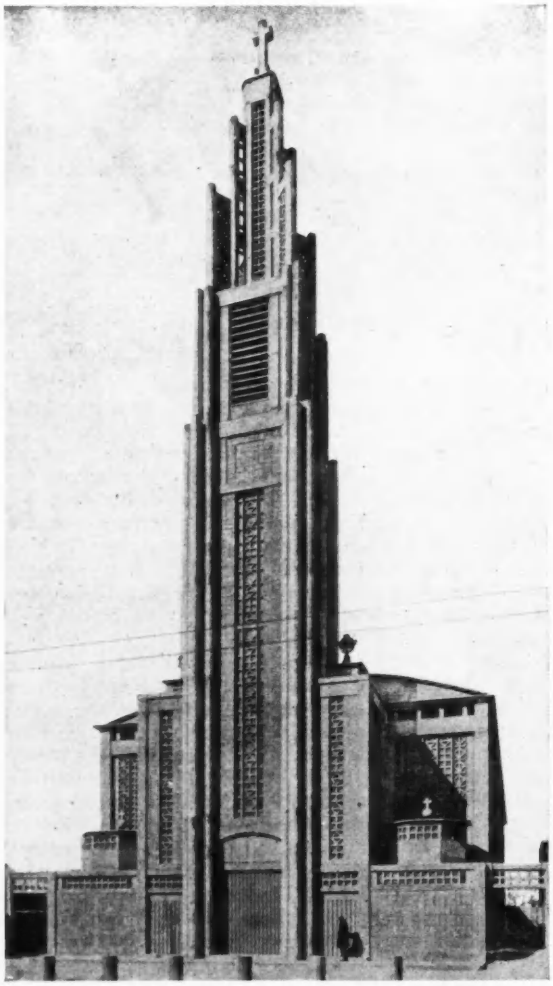
When, however, the small office of four or five stories becomes a thousand-foot skyscraper, my mental attitude alters. The physical daring involved in the erection of such a building captures the imagination. Structure so light and delicate, yet so strong and aspiring, is, I feel, worth exhibiting. Let me have, as I pass by, the sensations of this wonderful engineering organism.

This demand is the more urgent since, in the course of building, I have seen the steel structure grow. Its fragile network of members, its ordered complexity, which has enough of mystery to be poetic, has a beauty which is so often lost in the finished building.

Obviously the steelwork cannot be exposed. The architect therefore attempts to clothe it in the materials at his command, and to give to its form some suggestion of the structural vitality within. Sometimes he is successful, as in the Woolworth building, the Gothic trimmings of which are as appropriate as any other trimmings. At other times he suggests his structure by line, as in the Pan-Hellenic Tower, or by choosing forms which are only realizable in steel or concrete, as in the telegraph offices at Stuttgart. At other times he neglects expression of structure quite frankly and concentrates on the beehive character of the big office building, as in the Buhl building and dozens of other large office buildings in New York and Chicago.

Many attempts have been made to leave structure exposed and make of it

a decorative element. And the least successful are those which depart most radically from the character of steel or concrete.



Where steel or concrete is shown without embellishment, success rests on a surer basis. But here the æsthetic treatment makes greater demands, for the designer comes face to face with a problem which must be solved without subterfuge. And this is the problem of evolving structure which is not only materially perfect but which also achieves the nearest possible approach to beauty of form. Fortunately for the engineer, forms which are satisfactory from a scientific standpoint are frequently satisfactory to the eye.

The modern movement has encouraged the recognition of structure, because of its reaction against superfluities in general. Where economy is a necessity, only fundamental elements remain. And where architectural interest is desired, the form of structure inevitably receives attention. The tendency is towards frank acknowledgment, and the consideration of structure from the dual aspect of strength and æsthetic quality. An instance is the Transbordeur Bridge at Marseilles, strong, yet airy and delicate.

Concrete can also be handled with imagination and without disguise. And here tribute must be paid to the brothers Perret, of Paris, architects, engineers and builders. Their optical workroom, the garage in the rue Ponthieu, and their churches at Le Raincy and Montmagny show how closely structural and decorative form can be intermarried. In all these buildings economy in cost has governed.

Even in domestic architecture the new freedom is occasionally effecting a profound metamorphosis in accepted types. The French architects, Le Corbusier and Jeanneret, for instance, have advanced the ideal of façades and plans liberated from the restrictions of solid weight-bearing walls usually assumed as necessary for structural support.

Structure here is frankly accepted, and columns are not considered an objection. They run up through the rooms, as do the flues, and serve also to house the down pipes from the roof. For these architects drain their flat roofs from the centre, arguing with justice that in freezing weather it is in the centre of the roof that thawing

Notre Dame du Raincy.] [*By Auguste Perret and Brothers.*

"Concrete can be handled with imagination and without disguise . . . tribute must be paid to the brothers Perret, of Paris, architects, engineers and builders. Their churches at Le Raincy and Montmagny show how closely structural and decorative form can be intermarried. In all these buildings economy in cost has governed."

The Woolworth Building, New York.] [*By Cass Gilbert.*

"Obviously steelwork cannot be exposed. The architect therefore attempts to clothe it in the materials at his command, and to give its form some suggestion of the structural vitality within. Sometimes he is successful, as in the Woolworth building, the Gothic trimmings of which are as appropriate as any other trimmings."

sets in, and in consequence that is the logical site for a sump.

The architectural effect of this house is revolutionary. Yet it is the direct outcome of the structural system employed. There is a growing recognition today of the fact that structural developments can assist the architect towards the realization of ideals which are, it is true, only of recent birth.

Today, the flexibility of modern structure is influencing design. The possibilities of mushroom construction, of the cantilever, are bringing out an expression which is not only real, but one which also percolates into the realm of furniture and the smaller details of decoration.

[Paper on "The Æsthetic Side of Structural and Constructional Engineering," by Howard Robertson, F.R.I.B.A., S.A.D.G., read before a meeting of the Institution of Structural Engineers on Thursday last.]

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

The Agricultural Land (Utilisation) Bill

THE Agricultural Land (Utilisation) Bill, which authorizes the Government to set up an Agricultural Land Corporation to acquire land for demonstration farms, is now before a Standing Committee of the House of Commons; and last week Mr. Ormsby-Gore, a Unionist member, moved to provide that, among the classes of land which the Corporation may be prohibited from acquiring, shall be included land "declared by resolution of the local authority concerned to be required for the purpose of the preservation of rural amenity," or land which "is the site of an ancient monument or other object of archæological interest." As to the first part of the amendment, he gave as an example Lord Astor's farm at Cliveden, which abutted on the Thames, and, by special arrangement with the local authorities concerned, had been declared as a private open space, not to be taken for public purposes.

It was very desirable that, in the many necessary economic developments of the modern age, they should not sweep away these beauty spots. As to ancient monuments and objects of archæological interest, not all of them were scheduled yet. The process of scheduling was still going on. In counties like Wiltshire there were many of these objects. The notorious example, of course, was the tragedy of Avebury, the greatest of our stone-circles—greater and more historically important, even, than Stonehenge. Avebury had been literally turned into a farm. Some of the stones had been used for building the farm, and others had been cleared off without any safeguard at all.

Dr. Addison, the Minister of Agriculture, said he was fully in sympathy with the amendment, and, as Chairman of the National Parks Committee, he knew a good deal about the matter. In the case of the arrangement with Lord Astor, the spot would eventually be scheduled as a planning scheme.

If any area or beauty spot were so scheduled, and were acquired by the Corporation, the provisions of the Town Planning Act would apply just as much as if the land had been bought by a private purchaser. The Corporation would be in exactly the same position as a private owner. He could not accept the first part of the amendment, as the words would mean that the Corporation would be at the mercy of any local authority that happened to say that certain land was a beauty spot. He would, however, look into the matter and see what could be done. As to the second point, many ancient monuments had already been scheduled and could not be taken by the Corporation. But the wording of the amendment would prevent the Corporation from acquiring, say, an area of land in the middle of which there might be a ruin or an old abbey. He agreed that the Corporation should be subject to as strict a control as any other owner of land, and, indeed, should be a bit more meticulous as to their proceedings. If Mr. Ormsby-Gore would withdraw his amendment he would go into the matter and see what could be done.

On this understanding the amendment was withdrawn.

Houses and Housing Materials Bill

Mr. McGovern asked leave to bring in a Bill to provide for the provision of houses and housing materials by a national housing authority. He said it was generally admitted that the only thing of which there was a shortage in this country was housing for the common people, and he desired to bring in the Bill to meet that shortage. It would be necessary to acquire land throughout the country, and to get control of factories in order to provide for the materials that would be essential. The control of all factories would be essential, so that the object of the Bill, to provide houses at cheap rentals, would not be defeated by those who were in control of materials raising prices unduly high. Materials would be produced at low prices in national factories.

He maintained that local authorities at present were dominated and controlled by property owners, who did everything in their power to prevent the erection of working-class houses on a large scale, because it would tend to reduce rents and prevent them from acquiring the great profit which they desired. There were in this country 150,000 unemployed men who were trained in the art of building houses. They took every week £250,000 from the Unemployment Exchanges, for which the nation got no return. It would be better to put that money into a great housing scheme, and he proposed a five years' plan to deal with the housing shortage. For that it would be essential to provide a loan of £500,000,000, so that £100,000,000 could be spent annually. £50,000,000 of that would be spent in labour, so that they could put forward an army of 350,000 men to provide houses. They would work for five years for £3 a week average wage. This scheme would reduce unemployment and provide houses.

Leave was granted by 161 votes to 100, and the Bill was brought in.

Housing Progress by Local Authorities

At question time Dr. Hastings asked the Minister of Health if he could give the number of houses built by local authorities to date with the help of subsidies under the Housing Act, 1923, and the Housing Act, 1924, respectively.

Mr. Greenwood said that financial assistance under the Housing, etc., Act, 1923, was only available in respect of houses completed by September 30, 1929. The number of such houses completed by local authorities in England and Wales was 73,895. Up to October 31, 1930, 313,862 houses had been completed by those local authorities under the Housing (Financial Provisions) Act, 1924.

Government Contributions under Housing Acts

Mr. Greenwood informed Sir D. Newton that the exchequer contribution paid during the year 1929–30 under the Housing Act of 1919 was £6,738,118; under the Housing Act of 1923, £2,141,089; and under the Housing Act of 1924, £2,253,087. The numbers of houses completed under each Act at March 31, 1930, were respectively 175,639, 389,193 and 232,900. The Exchequer contribution paid to local authorities under the Housing Act of 1926 during the year 1929–30 was £509, and the number of houses reconstructed by the end of the year was 1,922.

Importation of Bricks

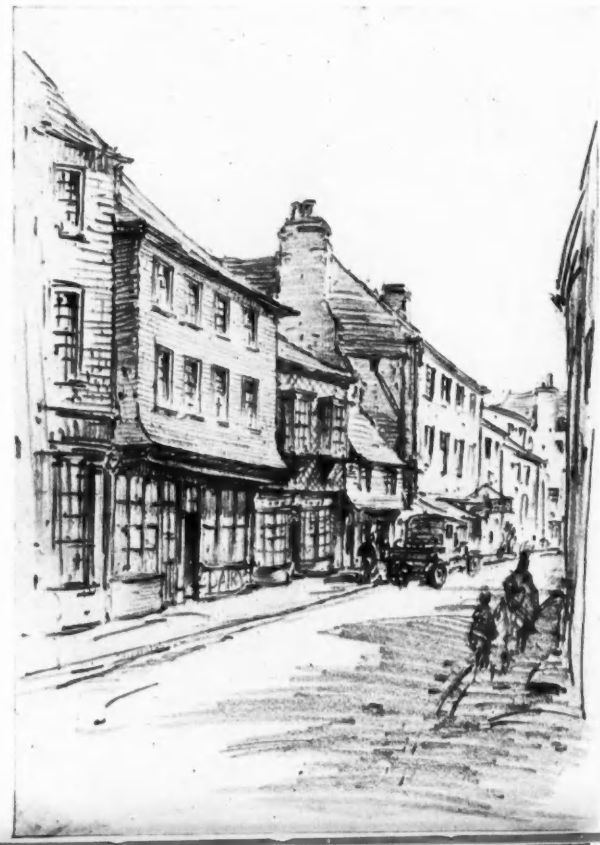
Miss S. Lawrence informed Mr. L. Smith that 207,041 thousand bricks were imported into this country during the year ended October 31, 1930, which might be taken to be approximately 5 per cent. of the annual production of bricks in this country. The total c.i.f. value of these imported bricks was recorded as £500,088. She had no information of the extent to which those bricks had been used for State-assisted housing schemes.

THE SKETCH CLUB

EIGHTEENTH SESSION

By E. B. Musman. (Pencil).
The Market Square, Stow-on-Wold, Glos.

By E. B. Musman. (Pencil).
A corner of Wilton, near Salisbury.



THE Sketch Club has now existed long enough for readers to recognize the hands of "original members." On this page are exhibited examples from two whose names will be familiar, and the subjects may safely be left to speak for themselves. On its fellow we are privileged to present a number of the pencil sketches of Maxwell Scott, together with some in pen-and-ink by Edwin Gunn, that these two artists contributed to *A Short History of Ruislip*, reviewed on page 920 of the present issue.

At the back of "The Swan," Ruislip.

LITERATURE

EASEMENTS OF LIGHT

THIS book is based on a series of articles by the author published in THE ARCHITECTS' JOURNAL during 1926. It is, however, very far from being a reprint of these articles, for much has been rewritten and still more has been added with the object of providing, in a convenient form, a large amount of information regarding the methods now available for computing the losses under consideration in any easement of light case. As the author states in his preface, he has described what he himself considers to be the best modern methods of assessing damage resulting from deprivation of light. As to the importance of the subject there can be no two opinions. The large sums involved in claims for compensation, and the long-continuing character of the damage, if such there be, make it imperative that decisions should be based on accurate and scientific data, and not on guesswork or the application of some empirical rule or set of rules.

The first chapter of the book, occupying fifty-seven pages, forms an excellent historical review and is an interesting record of the progress made between the time of Prof. Robert Kerr's paper before the R.I.B.A. in 1865 and the introduction of the conception of "daylight factor" by Messrs. A. P. Trotter and P. J. Waldram some twenty-two years ago. Chapters II and VIII are devoted to a description of photometric instruments and methods. The former contains an excellent description of the Holophane Lumeter and its accessories, and of the more elaborate instrument used at the National Physical Laboratory. Chapter VII is reprinted from a paper read by Dr. J. W. T. Walsh before the Institution of Electrical Engineers in 1927.

The principal subject-matter of immediate practical interest is contained in Chapters III to VI. The first of these chapters deals with daylight factors, their calculation and measurement, and with the manner in which daylight illumination has been found to vary with the time of day, season of the year, aspect and meteorological conditions.

Chapter IV describes the construction and use of diagrams by means of which the amount of light admitted by any window opening, or excluded by the erection of any proposed structure opposite a window, may be calculated exactly for any given point in a room. These chapters are very fully illustrated with examples of the manner in which such diagrams are employed in practical cases.

Chapter V shows how such calculations are used in the preparation of plans in which a floor area is divided by contour lines of daylight factor into areas of "good," "adequate" and "inadequate" lighting. The alteration of these areas due to the erection of some proposed structure forms the basis for the assessment of compensation for infringement, and this matter is elaborated in Chapter VI. The figure reproduced is an example of the use of such diagrams. It shows plans prepared by the author and submitted in arbitration to show the original and ultimate conditions of natural lighting in an office in Savile Row, London.

There are twelve appendices giving respectively (i) a bibliography of the subject; (ii) a list of principal legal cases; (iii) a description of the terminology used in illumination; (iv) the transmission of various window glasses; (v) a description of a daylight factor meter; (vi) the brightness of various light sources; (vii) the illumination required for various purposes; (viii), (ix) and (x) the reflecting powers of various materials; (xi) the hours of artificial lighting; and (xii) the total hours of lighting for the latitude of Greenwich.

Dr. G. H. B. Kenrick, K.C., contributes an appreciative introduction, which he concludes with the significant words: "Not only is the subject one of scientific and technical interest, but it will prove, also, to be one of great practical value."

It only remains to add that the book is well printed and is a very creditable example of the publisher's art.

Easements of Light. By John Swarbrick. London: B. T. Batsford, Ltd. Manchester: The Wykeham Press. Price 21s. net.

A SHORT HISTORY OF RUISLIP

IT is pleasant to feel that, in a world of machinery, speed and insincerity, there are still a few persons who can spare time to delve below the surface of life, where human beings take towns, buildings and roads as a matter of course, and have not the leisure or the inclination to wander in the past history of the towns they inhabit, and bring to the public eye a history as interesting as that of "The Manor of Ruyslepe."

In *A Short History of Ruislip* Mr. J. T. Cattle traces in some detail the history of this village from the formation of the strata on which it lies, through the Roman Conquest into the hands of the Normans, through the First Crusade

From Easements of Light.] [*By John Swarbrick.*

Daylight plans, prepared by Mr. John Swarbrick and submitted in arbitration, to show the original and ultimate conditions of natural lighting in an office in Savile Row, London.

into the fifteenth century when "the King granted to the Provost and the Scholars of King's College the 'Manor of Ruyslepe with a plot called Northwood and all lands belonging,' and on until the present day when 'despite ruthless road-widening, the centre of Ruislip Village still retains a great deal of its old-world character and many of its ancient buildings.' This is particularly true of the buildings surrounding the Church, which yet stands in mediæval setting."

One can surely indicate the commendable efforts of the Ruislip Association as an example of what Government supervision, employed with a nicety of discretion, can do to make or mar a district. If only more local authorities would take it upon themselves to bear the burden of rural preservation, there might be some hope for London and its suburbs a century or so hence.

The primary purpose of the handbook now under review is to stimulate an already strong local interest in the historic buildings of Ruislip, to provide a pictorial record of prominent examples of ancient buildings, and to secure the interest of owners and public bodies in the preservation of these. It contains 32 pages of text, interspersed with delightful drawings by Mr. Maxwell Scott, A.R.I.B.A., and Mr. Edwin Gunn, A.R.I.B.A. The latter has also contributed some notes on the village.

To all interested in old villages I commend this booklet. M. G. G.

A Short History of Ruislip. The Ruislip Association. Copies obtainable from A. L. Dawson, "St. Mary's," Wood Lane, Ruislip. Price 1s. (Post free 1s. 3d.)

SOCIETIES AND INSTITUTIONS

PLACES OF ENTERTAINMENT

AT a meeting of the West Yorkshire Society of Architects, held at Leeds, a lecture entitled "Places of Public Entertainment" was delivered by Mr. W. Milburn (Jun.), B.SC., F.R.I.B.A. Mr. Norman Culley, F.R.I.B.A., presided.

Mr. Milburn indicated briefly the Acts which related to these premises; considered certain typical regulations which, framed under these Acts, governed the construction and design of the premises so far as the safety, comfort and convenience of the public, performers and staff were concerned; and illustrated by examples of recently erected premises the practical application of the regulations to the actual buildings.

In the design and construction of any place of public entertainment, said the lecturer, the primary consideration to be kept in view was the safety of the public, performers and staff. The first factor which affected this aim was the site of the building. The island site was ideal, but not always attainable. The L.C.C. Regulations required that the premises abutted upon and had frontages of adequate length to two or more thoroughfares.

The frontages, except in special circumstances, should form about one half of the total boundaries of the site of the building, and permit of the provision of suitable exits from each tier or floor, direct to two or more thoroughfares. The thoroughfares were to be of such widths as would enable the persons accommodated in the building to disperse rapidly in the event of fire or panic, and afford facilities for the approach of fire appliances. There were exceptions to this general rule in cases where there was no stage to the building, and the numbers accommodated were under 2,000, it being permissible for the premises to abut upon only one thoroughfare, provided open passageways of certain definite widths were provided around the remainder of the premises.

Referring to the entrances and exits, he explained, all doors or openings approved by the licensing authority for the purposes of egress from the premises, and all such doors from the stage and dressing-rooms, had to be clearly indicated by the word "EXIT" in block letters, usually not less than seven inches high.

The L.C.C. were most particular that doors and openings, other than exits in sight of the audience, should not resemble exits, and they did not permit notices bearing the words "NO EXIT" to be provided.

In spite of all the thought and care which was devoted to render places of public entertainment safe for the public, there still remained the human element to control, and the risk of panic. The audience should have confidence in the building, and know that everything possible had been done for their safety, and that in any circumstances there was no need to take panic or alarm. It was desirable to familiarize the patrons with all exits so that they had knowledge of egress other than by the way they entered. The system in some American cities of numbering the exits and printing on the programmes plans of the floors and tiers showing the exits, was a step in this direction, for if only a few members of the audience studied the plans they would, if an emergency arose, be able to guide sections of the audience away from the building. Plans of the building placed in the foyers, or other public places, showing the exits and surrounding streets might also be of advantage. The more simple the planning and design of the building so that the public could easily grasp and understand their way about, the less risk there would be of panic or alarm.

Mr. Victor Bain, in proposing the vote of thanks, spoke of the difficulty of planning exits for buildings which were designed for more than one purpose.

In seconding the vote, Mr. G. H. Foggitt spoke of the various sets of plant and machinery, often placed fifty feet below the ground level, which were inseparable nowadays from such buildings. What had always struck him was the difficulty of combining good architecture and the necessary spaces for posters on the façades, which were often insisted upon by the building-owners. He felt that lurid posters were surely not necessary.

The lecturer, in reply, said he was afraid that control over such advertising could only become effective through bylaws framed to that end.

QUANTITY SURVEYORS AT DINNER

The second annual dinner of the quantity surveyor members of the Surveyors' Institution was held at the Connaught Rooms on Wednesday last.

Mr. J. E. Drower, who presided, referred to the profound changes since mid-Victorian days. Surveyors, he said, had changed with the rest of mankind. In those days, buildings they had to do with were not the steel and concrete constructions of today, full of pipes and wires and elaborate machinery, arrangements for heating and arrangements for cooling, contrivances for keeping out sound and telephones for letting it in, plenum and vacuum ventilation, electrical installations for power, for light, for heating and cleaning and so forth. Every day seemed to bring forth some new invention, some new form of floor, waterproofing, plaster or paint or decorative material, so that a big building was almost like a battleship, obsolete before it was finished. Surveyors must keep up with these new things, and translate them into proper surveying terms.

Nothing was more marked than the changes in the relations of employer to employed and in acknowledging the mutuality of the arrangements between contracting parties. In the relations of architect, building-owner and contractor, this spirit, if not always reflected in the contract documents, was active, and contracts were interpreted more equitably than formerly. One result of this was that the quantity surveyor's position was becoming more and more arbitral, and of increasing importance in holding the balance true between two interests. This was an honourable position calling for the best qualities of technical knowledge and character.

After the loyal toasts, Viscount Burnham proposed "Architecture and the

Building Trade." He remarked that he was out of a job for the time being, but if he ever returned to industry he would enter the building trade. When things were in the worst state of depression, the building trade continued to prosper. He believed that, although modern architecture was often criticized, the appreciation of the beautiful today was no less than it had ever been. He spoke of the beauty of the new Liverpool Cathedral, and concluded by saying that unless we had the willing service of the architects and building contractors, we were destined to fail.

Replies to Viscount Burnham were made by Dr. Raymond Unwin, F.R.I.B.A., Mr. Arthur Costain and Mr. Thomas Barron. Mr. J. Theobald proposed "The Guests" and Sir Richard Allison responded.

The last toast, "The Chartered Quantity Surveyor," was proposed by Sir John Tudor Walters, M.P.

FACULTY OF ARCHITECTS' AND SURVEYORS' ANNUAL DINNER

The fourth annual dinner of the Faculty of Architects and Surveyors was held at the Hotel Metropole on Friday last. Mr. E. F. Harmer, F.S.I., F.F.A.S., president, presided over about 200 members and guests.

After the loyal toast had been proposed by the president, Sir Clement Cooke, Bart., proposing the "Faculty of Architects and Surveyors," recalled that he was actively connected with the efforts that had been made to place the Architects' Registration Bill upon the statute book. The architectural profession had very important duties to fulfil, not only to their clients, but to the community at large. The increased use of steel and concrete demanded greater knowledge and more scientific training. In conclusion, Sir Clement said more elasticity was required in the matter of bylaw regulations affecting building.

Mr. Harmer, in response, said the membership of the Faculty had not yet reached four figures; they were within ten of the thousand, and by the end of 1930 they would no doubt have passed their immediate objective and be in a position to bring into operation a system of entrance by examination, an objective which he felt was the soundest one the Council of the Faculty could aim at to consolidate the position it had already attained.

The "Guests and Kindred Societies" was proposed by Mr. W. G. Percy and responded to by Mr. R. H. Stanger, A.M.INST.S.E. The last toast, "The Ladies," was given by Major W. P. Reynolds, O.B.E., and replied to by Miss Harmer.

After the speeches dancing took place, in the middle of which an enjoyable cabaret show was given.

MODERN TENDENCY IN STEEL CONSTRUCTION

The modern tendency and the use of reinforced concrete was the subject of a lecture by Professor C. H. Reilly, F.R.I.B.A., at a meeting of the North Staffordshire Architectural Association.

Professor Reilly directed attention to the tendency to let steel construction speak for itself and not to hide it under a "sugar coating" of stone or brick. It was allowing the material to express itself naturally in the same way that a mediæval cathedral did. He thought the new Olympia extension was a very fine thing, but he wished Mr. Emberton would pull down the rest of Olympia and go on with his work !

In speaking of New York, the lecturer explained that the congestion was not the sole reason nor the most important reason why New York built high. It was that it is quicker to travel vertically in a lift than horizontally in crowded streets.

The vote of thanks to the lecturer was proposed by Mr. Gordon M. Forsyth, and seconded by Mr. John Hughes.

PERSIAN ART

At the suggestion of the organizers of the International Exhibition of Persian Art, which will be held at Burlington House in January and February, 1931, the Council of the R.I.B.A. has arranged a public lecture on Persian Art, to be given by Mr. Arthur Upham Pope at the R.I.B.A., 9 Conduit Street, W.1, on Thursday, January 15, 1931, at 5.30 p.m.

THE ROYAL GOLD MEDAL

The R.I.B.A. has been notified that His Majesty the King has graciously approved the award of the Royal Gold Medal to Sir Edwin Cooper, A.R.A., F.R.I.B.A., in recognition of the merit of his executed work. The medal will be presented to Sir Edwin Cooper on Monday, March 2, 1931.

RHEIMS CATHEDRAL

Sir Banister Fletcher, P.R.I.B.A., lecturing at the Central School of Arts and Crafts on Wednesday last, described Rheims Cathedral, and showed how all the principles of Gothic architecture, at the period of its great perfection, were exemplified in the construction and adornment of this magnificent cathedral.

UNSATISFACTORY ELECTRIC TARIFFS

One of the most unsatisfactory matters in connection with the public supply of electricity was the extraordinary diversity of the tariffs employed, and the remarkable ingenuity of many of the "designers of such tariffs," said Mr. E. G. Phillips, M.I.E.E., M.I.MECH.E., at a meeting of the Institution of Heating and Ventilating Engineers, in discussing the cost of operating industrial and private electric generating sets compared with public supply.

His contention was that the supply companies' engineer was usually too scientific to be commercial.

Mr. Phillips pleaded strongly for the supply authorities to "commercialize" their present "scientific" tariffs or at least make an honest endeavour to educate the prospective consumer by giving one or two practical examples on their literature.

ROYAL INCORPORATION OF ARCHITECTS

At a meeting of the Council of the Royal Incorporation of Architects in Scotland, held in Edinburgh, the following were elected to the membership of the Incorporation: *Fellows:* Messrs. R. R. Grieve and J. F. Matthew. *Associates:* Messrs. J. B. Couper, G. M. Thomson, and J. D. Vardy; *Student:* Mr. Duncan Livingstone.

LAW REPORT

ARCHITECT'S CLAIM FOR FEES

Adamson v. *Purkis. King's Bench Division. Before Mr. Justice McCardie*

A SETTLEMENT was arrived at in this action which was by Colonel James Edgar Adamson, an architect, of the Meadway, Golder's Green, against Mr. William Purkis, of the Palm Court Hotel, Torquay, for professional fees.

Plaintiff claimed £4,261, the balance of fees for services rendered in connection with the proposed alterations to the Palm Court Hotel.

The defendant denied that the money was owing. He alleged that Colonel Adamson "stood in" with him in a £300,000 scheme to make Palm Court the finest hotel at Torquay, and that Colonel Adamson's fees were to be paid by a company to be formed to take over the hotel.

Colonel Adamson denied this and said that he had always looked to the defendant personally for the payment of his fees.

Mr. Fortune appeared for the plaintiff and Mr. Monckton for the defendant.

In announcing the settlement, Mr. Monckton said it was agreed that there should be judgment for Colonel Adamson for £400 in full settlement of all claims. The plans were to be returned to Colonel Adamson and each party to pay its own costs.

Mr. Fortune, for the plaintiff, concurred in the settlement and his lordship approved of it.

COMPETITIONS OPEN

December 25.—The international competition for the Ukrainian State Theatre, organized by the Kharkov Town Council, Russia. The competition will be assessed by a jury comprising a president, vice-president and fifty-six members. Prizes: 1st, 10,000 rub.; 2nd, 8,000 rub.; 3rd, 6,000 rub.; 4th, 5,000 rub.; 5th, 4,000 rub.; 6th, 3,000 rub.; 7th, 8th and 9th, 2,000 rub.; 10th, 11th, 12th, 1,500 rub. Drawings should be

sent to the Kharkov Town Council on or before December 25.

January 7.—The Incorporated Association of Architects and Surveyors invites competitive designs for a Model Petrol Filling and Service Depot. Assessors: Alfred Stephens Cross, M.A. (CANTAB.), V-P., I.A.A.S.: Edward H. Fryer, and Walter Groves. Prizes: 50 guineas, 20 guineas and 10 guineas for first, second and third places, respectively. Smaller awards may also be made on the advice of the assessors. Full particulars, etc., are obtainable from the Secretary, the Incorporated Association of Architects and Surveyors, 1 Wilbraham Place, London, S.W.1. Latest date for submission of designs: January 7, 1931.

January 10.—The Bermondsey B.C. recently invited competitive designs for a proposed new medical clinic in Tower Bridge Road, S.E. Premiums: £250, £150 and £50 for first, second and third place, respectively. Designs should be submitted to E. Goff Clark, Town Clerk, Town Hall, Spa Road, Bermondsey, by January 10, 1931.

January 15.—The Committee of the Foundation Hospital and the Rectorate of the Royal Yugoslavian University of Zagreb invites competitive designs for the general rebuilding plans of the Foundation and Clinic Hospital of Zagreb. Prizes: 1st, 20,000 Swiss francs; 2nd, 15,000 Swiss francs; 3rd, 10,000 Swiss francs. 15,000 Swiss francs have been set aside for any further work which may be required. Latest date for submission of designs: January 15, 1931.

January 31.—The Coventry Corporation invites architects to submit competitive designs for a new Hospital for Infectious Diseases. Architects competing must be established in private practice. Assessor: E. Stanley Hall, M.A., F.R.I.B.A. Premiums, £300, £200 and £100, for designs placed first, second and third, respectively. Particulars may be obtained from Frederick Smith, Town Clerk, Council House, Coventry, until January 31. Deposit £1 1s. Latest date for submission of designs: April 30, 1931.

February 1.—The Norwich Corporation invites architects practising in the County of Norfolk to submit competitive designs for a proposed new fire station to be erected on a site in Bethel Street, Norwich. Conditions of the competition are obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. Deposit, £1 1s. Latest date for submission of designs: February 1, 1931.

February 12.—Messrs. Venesta, Ltd., invite practising architects and designers to submit preliminary designs for a stand at the Building Trades Exhibition at Manchester. Assessors: Messrs. Christian Barman, H. de C. Hastings, W. L. Wood, Henry Rutherford, and Professor A. E. Richardson. Premiums: 1st, £100, and £10 each to the four competitors placed next in order. Full particulars may be obtained from the Editor of THE ARCHITECTS' JOURNAL, 9 Queen Anne's Gate, S.W.1, or direct from Venesta, Ltd., Vintry House, Queen Street Place, London, E.C.4. Latest date for submission of designs: February 12, 1931.

April 1.—An international competition for the development of the uses of aluminium and its alloys, open to inventors of any nationality, is to be held annually by the International Aluminium Bureau. The competition will be divided into two sections. The prizes to be awarded are 25,000 French francs for the entries under Sections A (methods of working or using the metal) and B (manufacture of articles therefrom) respectively, and 50,000 French francs to the author of a suggestion which has exceptional interest or value under either section. Entries may be submitted between January 1 and April 1, 1931. Full particulars are obtainable from the Bureau International de l'Aluminium, 23 bis, Rue de Balzac, Paris, France.

THE ARCHITECTS' DIARY

WEDNESDAY, DECEMBER 17

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Exhibition of photographs of buildings visited on the A.A. Excursion to Sweden and Denmark. Until December 20. Pantomime Matinee, 2.45 p.m. (Evening Performance, 8.15 p.m.) Also December 18 and 19. **2.45 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "French Mediæval Architecture: Fortified Towns, Castles, Hotels-de-Ville." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. (Lantern Illustrations.) **6 p.m.**

INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Students' Meeting. "Underground Haulage in Mines." By Professor Douglas Hay, M.C., B.SC., M.INST.C.E. Chairman: Sir William Ellis, G.B.E., D.ENG. **6.30 p.m.**

INSTITUTION OF STRUCTURAL ENGINEERS. Yorkshire Branch. At the Metropole Hotel, Leeds. "Foundations, Principles and Problems—A Provocative Study." By D. Davidson, M.C. **7 p.m.**

EXHIBITION OF MODELS OF OLD LONDON. At the Golden Cross Hotel, Strand, W.C.2. The models are the work of John B. Thorp. **2.30 p.m.**

THURSDAY, DECEMBER 18

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Literature Standing Committee. **4.30 p.m.**

INSTITUTION OF ELECTRICAL ENGINEERS. Teesside Sub-Centre. At the Cleveland Technical Institute, Middlesbrough. "Surge Investigations on Overhead Line and Cable Systems." By S. W. Melsom, A. N. Arman, B.SC. (ENG.), and W. Bibby, B.SC. (ENG.). **7 p.m.**

FRIDAY, DECEMBER 19

R.I.B.A., 9 Conduit Street, W.1. Meeting of the Finance and House Committee. **4.30 p.m.**

LONDON SOCIETY. At the Royal Society of Arts, John Street, Adelphi, W.C.2. "South Essex: Its Docks, Industries and Houses, London's Industrial Development." By Professor S. D. Adshead, F.R.I.B.A. (Illustrated by lantern slides.) Chairman: E. M. Dence. **5 p.m.**

SATURDAY, DECEMBER 20

Sunrise, 8.2 a.m. Sunset, 3.53 p.m.

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. Manchester and District Branch. Visit to Partington Gas Works.

INSTITUTION OF CIVIL ENGINEERS. Students' Visit to the Stratford Works of the L.N.E. Railway Co. (Afternoon).

TUESDAY, DECEMBER 23

TOWER OF LONDON, E.C.3. "The Tower in Stuart Times and After." By Allen S. Walker. **11 a.m.**

WEDNESDAY, DECEMBER 24

R.I.B.A., 9 Conduit Street, W.1. Office and Library closed until December 27.

SATURDAY, DECEMBER 27

Sunrise, 8.5 a.m. Sunset, 3.57 p.m.

MONDAY, DECEMBER 29

R.I.B.A., 9 Conduit Street, W.1. First of two Christmas Holiday Lectures on Architecture for Boys and Girls. By the Hon. H. A. Pakington, A.R.I.B.A. (Also December 31.) **3.30 p.m.**

MONDAY, JANUARY 5, 1931

R.I.B.A., 9 Conduit Street, W.1. General Meeting. Award of prizes and studentships. T. A. Darcy Braddell, F.R.I.B.A., will criticize work submitted. **8 p.m.**

TUESDAY, JANUARY 6

L.C.C. SCHOOL OF BUILDING, Ferndale Road, Brixton, S.W.4. Exhibition of work submitted by craftsmen and apprentices for the 1930 Competition organized by the National Painters and Decorators Joint Education Committee of England and Wales. 10 a.m. to 8 p.m. (Also January 7, 8, and 9.) **10 a.m.**

WEDNESDAY, JANUARY 7

TRADE NOTES

A new building is to be added to the already extensive works of Messrs. G. A. Harvey & Co. (London), Ltd., which cover twenty-seven acres at Woolwich Road, London. The new building is to be constructed to meet the requirements of their steel plate construction and steel furniture and equipment departments. Several hundred concrete piles have already been driven to ensure a foundation sufficiently firm to bear the heavy machinery that is to be installed. It is only two years since a large extension was made to the Harvey works, but the rapid development of the two departments has necessitated the erection of the new building. The firm are well known as sheet metal and steel plate workers, and as makers of all kinds of industrial plant, such as pressure vessels (up to 350 lb. per sq. in.), vacuum pans, food processing retorts, tar stills, creosoting plant, storage tanks of the largest size up to 116 ft. diameter, and chemical and by-product plant, some of the plant which is manufactured being their own patents.

*

The South African Steel and Iron Industrial Corporation, Ltd., have announced the accepted tenders for the construction of their new works at Pretoria; the actual contracts will be signed in South Africa in about five weeks' time. Messrs. Dorman, Long & Co., Ltd., of Middlesbrough and London, who tendered jointly with Messrs. Demag, will receive the order for the construction of the steel melting shop and rolling mills. Messrs. Dorman, Long & Co., Ltd., will supply and erect all the fabricated steelwork required in these departments, the total order involving some 15,000 tons of steel, which will be manufactured in the company's Middlesbrough works.

*

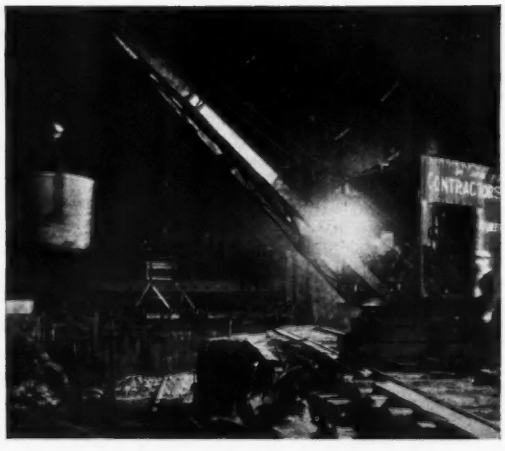
However good a product may be or favourable its market, the progress of any organization depends very largely upon the goodwill and co-operation of its employees. This is appreciated by Electrolux Limited, makers of cleaning equipment, refrigerators, water softeners, and floor polishers. Their dance, held at the Knightsbridge Hotel, was more than a social function; it was a get-together of leaders, executives, and members of all sections and departments of the business, that they might meet again, and know each other better, in a genial and relaxing atmosphere, and foster what is known in the company as "the Electrolux Spirit."

The directors of Westminster Bank, Ltd., announce with much regret that their chairman, Mr. R. Hugh Tennant, has intimated his intention to retire on December 31. Mr. Tennant will retain his seat on the board, so that his great knowledge of financial and industrial affairs may remain at the service of the Bank. The Hon. Rupert E. Beckett will succeed Mr. Tennant as chairman on January 1, and Sir Malcolm Hogg will become a joint deputy chairman on that date.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office, by our own patent expert. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated, readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATIONS



35774. Airey, Sir E. Concrete construction for floors, etc. November 28.

35281. Barton and Shear, B. Stud and slab building structures. November 24.

35759. Deutsche Stahl-Lamellenges, and Hunnebeck, E. Lattice-work structures. November 27.

35368. Haas, L., and Sedolmayer, W. Building construction. November 24.

35564. Kopelowicz. Production of building material. November 26.

The work on the rebuilding of Hays Wharf, Tooley Street, S.E., by Messrs. Holland & Hannen and Cubitts, is proceeding rapidly, and night-work is made possible by the use of Philips floodlights. This photograph is one of several taken under the artificial light and is typical of the lighting results achieved in various positions and sections of the work. On this particular job six of Philips type F.L.A. floodlights with 1,000 watt gas-filled lamps were used.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Cropthorne Court, Maida Vale (pages 899–901). General contractor, John Knox and Dyke, Ltd. Sub-contractors : Diespeker & Co., Ltd., fire-resisting floors; Crittall Manufacturing Co., Ltd., steel casements; Ames and Finnis, facing bricks and Italian Lombardic roofing tiles; Express Lift Co., Ltd., lifts; Leeds Fireclay Co., Ltd., Lefco faience and sanitary fittings; Walter Cowen, Ltd., plumbing and draining; Comyn, Ching & Co., Ltd., oil-heating apparatus and hot-water installation; Henry Green, Ltd., fire-escape staircases; Frigidaire, Ltd., refrigerators; Tredegars, Ltd., electrical work; Val de Travers Asphalte Co., Ltd., asphalting.

C.W.S. Bank and Administrative Offices, Corporation Street, Manchester (pages 902–906). General contractor, Building Department, Co-operative Wholesale Society, Ltd. The work was carried out under the management of Mr. Townley and the engineering work under the supervision of Mr. R. L. Gass, chief engineer to the Society. The firm were also responsible for the demolition, excavation, foundations, reinforced concrete, fireproof construction, electric wiring, joinery, plumbing, stonework, furniture, office fittings, cloakroom fittings, lifts and water supply. Sub-contractors : Limmer and Trinidad Asphalte Co., Ltd., dampcourses and asphalt; Higgins and Sons, common bricks and Salamander partition blocks; Shaws Glazed Brick Co., glazed bricks; Stancliffe Estates, Ltd., stone; Empire Stone Co., Ltd., artificial stone; Banister, Walton & Co., structural steel; C. W. Williams & Co., tiles; Beaumonts (Manchester), Ltd., slates; Pilkington Brothers, glass; R. W. Brooke & Co., wood-block flooring; Richard Crittall & Co., panel system of heating; Royles, calorifier; The General Electric Co., Ltd., electric light fixtures and electric heating; J. Lightfoot & Co., electric tubular heating; Davidson and Sons, ventilation; W. R. Pickup & Co., Ltd., sanitary fittings; Tonks & Co., Ltd., locks; Jas. Gartland and Sons, Ltd., door and window furniture, and floor springs; Henry Hope and Sons, casements; Gent & Co., bells and clocks; Reliance Automatic Telephone Co., telephones; J. Eastham and Son, plaster; J. Tanner and Son, decorative plaster; Bromsgrove Guild, Ltd., and Birmingham Guild, Ltd., metalwork; J. and H. Patteson, Ltd., marble; C. W. Williams & Co., tiling.

Eastbourne College Masters' House (page 911). General contractors, J. W. Woolnough, Ltd. Sub-contractors : Ames and Finnis, roof tiling; G. Matthews, Ltd., fireplaces; Empire Stone Co., Ltd., balconies; W. Bainbridge Reynolds, Ltd., metal railings; John Bolding and Sons, Ltd., sanitary equipment; Jacob, White & Co., Ltd., electric light and power; J. T. Meredith & Co., Ltd., hot water; Crittall Manufacturing Co., Ltd., metal windows.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The BERMONDSEY Council has decided to proceed under the slum clearance scheme with the work of demolishing houses in six areas.

The BETHNAL GREEN Borough Council is about to erect seventy-eight blocks of tenements in Hackney Road at a cost of over £65,000. The architect is Mr. E. C. P. Monson, F.R.I.B.A., F.S.I.

Plans passed by the BROMLEY Town Council: Nine houses, Lower Gravel Road, for Messrs. W. E. and S. Rumph; two houses, King's Avenue, and bridge over stream, Ravensbourne, for Mr. A. Frampton; two houses, Sunningdale Road, for Mr. A. Johnson; house, Southborough Road, for Messrs. Easter and Webb; two flats, Talbot Road, for Mr. J. L. Woodhams; house, 144 Murray Avenue, for Mr. C. S. Theobald; pair of semi-detached houses, The Grove; six pairs of semi-detached houses and garages, The Avenue; seven detached and one pair of semi-detached houses, Coney Hill Estate.

Mr. Ernest Bates is the architect of showrooms to be erected at 380-2 London Road, CROYDON.

The HENDON R.D.C. has passed plans for sixty-three houses to be built in Edgware, Little Stanmore and Great Stanmore.

The housing problem of the L.C.C. for the ensuing five years is expected to cost over £21,000,000. It provides for 34,670 houses and flats, and the clearance of ninety-eight acres of slum property, involving the re-housing of 30,500 people. Ten sites have been acquired in central areas for the erection of 2,792 dwellings in blocks. On the Becontree and St. Helier estates a further 13,978 houses are projected.

The plans of a factory to be erected at NEASDEN for the Bosch Magneto Co. have been prepared by Messrs. Hobden and Porri, architects.

A block of property adjoining the Law Street section of the Tabard Street area, SOUTHWARK, is to be acquired by the L.C.C., for rehousing purposes, at a cost of £32,000.

At a recent meeting of the WOOLWICH Borough Council the Housing Committee recommended that, subject to the approval of the Ministry of Health and to the sanction of the L.C.C. to the necessary loan, the Council should acquire from the Commissioners of Crown Lands a site on the south side of Eltham Road and Eltham Hill for a sum of £90,000, for housing purposes.

SOUTHERN COUNTIES

It is proposed to build a new Theatre Royal in Westover Road, BOURNEMOUTH. The new building will succeed the present Theatre Royal in Albert Road.

Plans passed by the EASTBOURNE Town Council: Three pairs of semi-detached houses, Moy Avenue; three detached houses with garages, Baldwin Avenue; detached house, junction of Longland Road and Broomfield Street; pair of semi-detached houses, Longland Road; detached house, Prideaux Road; two detached houses and pair of semi-detached houses, Dillingburgh Road. In addition, numerous alterations and additions to private houses, hotels and shops, including a number of garages, were passed.

Plans passed by the FARNHAM U.D.C.: House, Boundstone, for Mr. J. Mills; houses, Broomleaf, for Mr. H. Knott; house, Longley Road, for Mr. W. P. Gill; pair of cottages, Little Compton, for Mr. A. J. Stedman; bungalow, Shortheath, for Mr. A. J. Lehman.

Plans have been prepared for a new cinema to be erected on a site in Ockford Road, GODALMING, for Messrs. County Cinemas, Ltd. The architect is Mr. Henry G. Baker.

The REIGATE Town Council has received sanction from the Ministry of Health for the borrowing of an additional sum of £600 in connection with the provision of thirty-six parlour houses to be erected in Linnell Road on the Redstone housing site.

The TUNBRIDGE WELLS Town Council has decided to ignore the result of the unofficial poll of the town and to proceed with the scheme for the provision of new municipal buildings, etc., at an estimated cost of £171,964.

The TUNBRIDGE WELLS Town Council has resolved to make application to the Ministry of Health for sanction to borrow £2,121 for the purchase of the Rusthall Grange Farm, comprising about 14¾ acres of land, for the erection of houses.

SOUTH-WESTERN COUNTIES

The Housing Committee of BRISTOL City Council has prepared a scheme for the erection of 7,500 houses during the next five years at a cost of £3,500,000.

The CREWKERNE U.D.C. are in negotiation with the Ministry of Health for the purchase of sites at Severalls, for building purposes.

The HIGHBRIDGE U.D.C. has decided to erect a number of shops on their Market Street property.

The NEWENT R.D.C. propose to erect six pairs of cottages on land adjoining Mill Lane, Stardens.

EASTERN COUNTIES

The AMPTHILL R.D.C. has received sanction from the Ministry of Health for the erection of houses at the following places: Clophill, four; Flitton, four; Harlington, four; Haynes, two; Houghton Conquest, four; Lidlington, four; Shillington, four; Toddington, four; Apsley Guise, four; Flitwick, four; and Marston Moretaine, six.

The CHELMSFORD R.D.C. has approved the erection of houses as follow: Writtle, thirty houses; Great Baddow, twelve; Little Baddow, Ford End, Sandon and Danbury, four each; Boreham and Broomfield, twelve each; Rettendon and Roxwell, eight each; Stock, Little Waltham, Woodham Ferris, Pleshey, Highwood, Galleywood and West Hanningfield, six each.

MIDLAND COUNTIES

The COALVILLE U.D.C., at a recent meeting approved the erection of new municipal buildings subject to the sanction of the Ministry of Health.

Messrs. E. Ward (Wellingborough), Ltd., propose to erect motor showroom premises, etc., at Thorngate Street and Montague Street, KETTERING. Plans have been prepared by Messrs. Talbot Brown and Fisher, FF.R.I.B.A.

The Ministry of Health has sanctioned the acquisition by the LEOMINSTER Town Council of about seven acres of land between Gateway Lane and Ryelands Road, for housing purposes.

The OXFORD T.C. has instructed the city engineer to prepare plans and specifications, and advertise for tenders for the construction of 144 houses on the Cutteslowe estate.

At a meeting of the WORKSOP R.D.C. plans for the erection of a mansion in Welbeck Park for the Marquis of Titchfield, M.P., were approved

NORTHERN COUNTIES

The ALFRETON U.D.C. has approved a scheme for the erection of three hundred and fifty houses during the next five years, under the Slum Clearance Act.

The BILLINGHAM (DURHAM) U.D.C. has made application to the Ministry of Health for sanction to build a further hundred houses in Cowpen Lane.

An amendment to a Housing Committee recommendation that 1,000 houses be built by the GATESHEAD Town Council, restricting the scheme to 500 houses, was carried, at a recent meeting of the Council.

Plans have been deposited with the LEEDS Corporation for the new super-cinema to be erected in the Headrow for Messrs. Shaftesbury Trust, Ltd. The architect is Mr. Frank T. Verity, F.R.I.B.A.

Messrs. Percy L. Browne and Sons, architects, are preparing plans for a new block of office premises, etc., on a site in Northumberland Street, NEWCASTLE.

Plans have been approved for extensive alterations at the Royal Picture House, ROTHERHAM.

The Sutton Trust contemplate the erection of a number of tenement houses in the Seedley Road district of SALFORD. The proposed sites are at present occupied by a few old residences. Thirty-six artisan dwellings as temporary alternative accommodation for the occupants of the residences are to be erected in Gerald Road, Pendleton.

A large slum clearance scheme is to be recommended to the SUNDERLAND Borough Council by the Health Committee. The committee's recommendation is that ten areas of slum property in various parts of the borough be submitted to the Ministry of Health for designation as "clearance areas." In addition to this step the committee propose to embark on a programme of building 2,000 houses.

The WORTLEY R.D.C. has decided to erect forty-two houses at High Green and Chapeltown; thirty-six houses at Ecclesfield and Thorpe Hesley; ten houses at Grenoside; fourteen houses at Loxley and Wisewood; forty houses at Oughtbridge; and twenty houses at Stannington.

SCOTLAND

Schemes embracing an additional 136 houses have been decided upon by the Future Development of Housing Committee of the DUNDEE Town Council.

Plans for a new picture house in DUNFERMLINE were passed at a sitting of the Dean of Guild Court. It will provide seating accommodation for 1,875 persons.

Among the linings granted at a meeting of the Dean of Guild Court, GLASGOW, were the following: Houses and shops, Rumford Street, South-East; houses, Friarscourt Avenue, and Baldwin Avenue, Knightswood; houses, Cloberhill Road, Knightswood.

The INVERNESS Town Council has adopted a scheme for the erection of fifty-two houses.

The Parliamentary plans for the new steel bridge at KINCARDINE have now been deposited. It has been designed by Sir Alexander Gibb and Partners. The total cost is approximately £300,000.

The KINGHORN Town Council propose to build a hall capable of seating 600 persons on the site at Braehead lately occupied by a picture house, now demolished.

At a meeting of MOTHERWELL and WISHAW Town Council, it was resolved that during the next three years 600 houses should be built by the Council in the Motherwell and Wishaw area, at an estimated cost of £200,000.

IRELAND

The ATLEY U.D.C. has decided to take over the Woodstock Street site for the erection of twenty-three houses. Mr. Heeney, architect, who has almost completed the Carlow Road scheme of thirty-six houses, has been asked to make a plan of the new houses. The full cost of the two schemes will, it is estimated, amount to about £17,000.

The CORK Corporation has approved of a scheme for the erection of 220 houses in Bandon Road. It has also been decided that two acres of land at Turner's Cross be sold to the Irish Sailors' and Soldiers' Land Trust for housing purposes; that £15,000 be advanced to St. Joseph's Utility Building Society for erecting houses at Ashburton; and that steps be taken to acquire land for housing schemes in the north-western area and at Bandon Road. It was agreed that inquiries be made as to the possibility of raising the necessary funds for the erection of a city hall (£120,000) and a school of commerce (£60,000).

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* NAVVY, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Broken brick or stone, 2 in., per yd.	£0 11 6
Thames ballast, per yd.	0 10 0
Pit gravel, per yd.	0 15 0
Pit sand, per yd.	0 12 6
Washed sand, per yd.	0 13 0
Screened ballast or gravel, add 10 per cent. per yd.	
Clinker, breeze, etc., prices according to locality.	
Portland cement, per ton	£2 8 0
Lias lime, per ton	2 0 0
Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.	

Transport hire per day:

Cart and horse	£1	3	0	*Trailer*	£0 15 0
3-ton motor lorry	3	15	0	*Steam roller*	4 5 0
Steam lorry, 5-ton	4	0	0	*Water cart*	1 5 0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0

Exceeding 6 ft., but under 12 ft., add 30 per cent.

In stiff clay, add 30 per cent.

In underpinning, add 100 per cent.

In rock, including blasting, add 225 per cent.

If basketed out, add 80 per cent. to 150 per cent.

Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd. £0 1 6

SPREAD and level, including wheeling, per yd. 0 1 6

FILLING into carts and carting away to a shoot or deposit, per yd. cube . 0 10 6

TRIMMING earth to slopes, per yd. sup. 0 0 6

HACKING up old grano. or similar paving, per yd. sup. . . . 0 1 3

PLANKING to excavations, per ft. sup. 0 0 5

DO. over 10 ft. deep, add, for each 5 ft. in depth, 30 per cent.

If left in, add to above prices, per ft. cube 0 2 0

HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup. . 0 2 1

DO. 6 in. thick, per yd. sup. . . 0 2 10

PUDDLING, per yd. cube . . . 1 10 0

CEMENT CONCRETE, 4-2-1, per yd. cube 1 17 6

DO. 6-2-1, per yd. cube . . . 1 12 6

DO. in upper floors, add 15 per cent.

DO. in reinforced-concrete work, add 20 per cent.

DO. in underpinning, add 60 per cent.

LIAS-LIME CONCRETE, per yd. cube . £1 14 0

BREEZE CONCRETE, per yd. cube . 1 7 0

DO. in lintels, etc., per ft. cube . 0 1 6

CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube 0 3 9

FINE concrete benching to bottom of manholes, per ft. cube . . . 0 3 0

FINISHING surface of concrete spade face, per yd. sup. 0 0 9

DRAINER

LABOURER, 1s. 3½d. *per hour;* TIMBERMAN, 1s. 5d. *per hour;* BRICKLAYER, 1s. 8½d. *per hour;* PLUMBER, 1s. 8½d. *per hour;* WATCHMAN, 7s. 6d. *per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0 0 10
DO. *6 in., per ft.*	0 1 3
DO. *9 in., per ft.*	0 2 3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0 5 6
DO. *6 in., per yd.*	0 8 0
Portland cement and sand, see "Excavator" above.	
Leadwool, per cwt.	£2 0 0
Gaskin, per lb.	0 0 4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft. . . 0 4 3

DO. 6 in., per ft. 0 5 0

DO. 9 in., per ft. 0 7 9

CAST-IRON DRAINS, jointed in lead, 4 in., per ft. 0 8 3

DO. 6 in., per ft. 0 10 3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.

Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour.*

London stocks, per M.	£1 5 6
Flettons, per M.	2 12 6
Midhurst white facing bricks, per M.	5 0 0

DO. *18 in., per roll*	0 9 6
BRICKWORK in stone lime mortar, Flettons, or equal, per rod	30 0 0
DO. in cement do., per rod	32 10 0

DO. in stocks, add 25 per cent. per rod.

DO. in blues, add 100 per cent. per rod.

DO. circular on plan, add 12½ per cent. per rod.

DO. in backing to masonry, add 12½ per cent. per rod.

DO. in raising on old walls, etc., add 12½ per cent. per rod.

DO. in underpinning, add 20 per cent. per rod.

HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0 1 0
BEDDING plates in cement mortar, per ft. run	0 0 3
BEDDING window or door frames, per ft. run	0 0 3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0 0 2
CUTTING do. in old walls in cement, per ft. run	0 0 4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0 0 7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0 3 6
DO. 14 ft. by 9 in. do., per ft. run	0 6 0
FLAUNCHING chimney pots, each	0 2 0
CUTTING and pinning ends of timbers, etc., in cement	0 1 0
FACINGS, fair, per ft. sup. extra	0 0 3
DO. picked stocks, per ft. sup. extra	0 0 7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0 4 9
DO. in salt white or ivory glazed, per ft. sup. extra	0 5 6
TUCK pointing, per ft. sup. extra	0 0 10
WEATHER pointing, do. do.	0 0 3
TILE creasing with cement fillet each side, per ft. run	0 0 6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0 5 0
DO. 1½ in., per yd. sup.	0 6 0
DO. 2 in., per yd. sup.	0 7 0
If coloured with red oxide, per yd. sup.	0 1 0
If finished with carborundum, per yd. sup.	0 0 6
If in small quantities, in finishing to steps, etc., per ft. sup.	0 1 4
Jointing new grano. paving to old, per ft. run	0 0 4
Extra for dishing grano. or cement paving around gullies, each	0 1 6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0 0 7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0 8 0
DO. vertical, per yd. sup.	0 11 0
SLATE DAMP COURSE, per ft. sup.	0 0 10
ASPHALT ROOFING (MASTIC) in two thicknesses, ¾ in., per yd.	0 8 6
DO. SKIRTING, 6 in.	0 0 11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup.	0 5 3
DO. DO. 3 in.	0 6 6
BREEZE fixing bricks, extra for each	0 0 3

MASON

MASON, 1s. 8½d. *per hour;* DO. *fixer,* 1s. 9½d. *per hour;* LABOURER, 1s. 3½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour.*

Portland Stone:	
Whitbed, per ft. cube	£0 4 6
Basebed, per ft. cube	0 4 9
Bath stone, per ft. cube	0 3 0
Usual trade extras for large blocks.	
York paving, av. 2½ in., per yd. super	0 11 0
York templates, sawn, per ft. cube	0 7 6
Slate shelves, rubbed, 1 in., per ft. sup.	0 2 6
Cement and sand, see "Excavator," etc., above.	

HOISTING and setting stone, per ft. cube	£0 2 2

DO. for every 10 ft. above 30 ft. add 15 per cent.

PLAIN face Portland basis, per ft. sup.	£0 2 8
DO. circular, per ft. sup.	0 4 0
SUNK FACE, per ft. sup.	0 3 9
DO. circular, per ft. sup.	0 4 10
JOINTS, arch, per ft. sup.	0 2 6
DO. sunk, per ft. sup.	0 2 7
DO. DO. circular, per ft. sup.	0 4 6
CIRCULAR-CIRCULAR work, per ft. sup.	1 2 0
PLAIN MOULDING, straight, per inch of girth, per ft. run	0 1 1
DO. circular, do., per ft. run	0 1 4
HALF SAWING, per ft. sup.	0 1 0

Add to the foregoing prices, if in York stone, 35 per cent.

DO. Mansfield, 12½ per cent.

Deduct for Bath, 33⅓ per cent.

DO. for Chilmark, 5 per cent.

SETTING 1 in. slate shelving in cement, per ft. sup.	£0 0 6
RUBBED round nosing to do., per ft. lin.	£0 0 6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1 7 6
YORK SILLS, W. & T., ft. cub. fixed	1 10 0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0 1 3
DO. 2½ in. thick, per ft. sup.	0 1 6

SLATER AND TILER

SLATER 1s. 8½d. *per hour;* TILER, 1s. 8½d. *per hour;* SCAFFOLDER, 1s. 4½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*

N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200:	
Portmadoc Ladies	£14 0 0
Countess	23 0 0
Duchess	32 10 0

	Old Delabole	*Med. Grey*	*Med. Green*
24 in. × 12 in.	£42 11 3	£45 1 0	
20 in. × 10 in.	31 4 3	33 0 6	
16 in. × 10 in.	20 18 0	22 4 9	
14 in. × 8 in.	12 1 0	12 16 3	

Green Randoms, per ton	8 3 9
Grey-green do., per ton	7 3 9
Green peggies, 12 in. to 8 in. long, per ton	5 13 9
In 4-ton truck loads, delivered Nine Elms station.	
Clips, lead, per lb.	£0 0 6
Clips, copper, per lb.	0 2 0
Nails, compo, per cwt.	1 6 0
Nails, copper, per lb.	0 2 2
Cement and sand, see "Excavator," etc., above.	
Hand-made tiles, per M.	£5 18 0
Machine-made tiles, per M.	5 8 0
Westmorland slates, large, per ton	9 0 0
DO. *Peggies, per ton*	7 5 0

SLATING, 3 in. lap, compo nails, Portmadoc or equal:

Ladies, per square	£4 0 0
Countess, per square	4 5 0
Duchess, per square	4 10 0
WESTMORLAND, in diminishing courses, per square	6 5 0
CORNISH DO., per square	6 3 0
Add, if vertical, per square approx.	0 13 0
Add, if with copper nails, per square approx.	0 2 6
Double course at eaves, per ft. approx.	0 1 0

SLATING with Old Delabole slates to a 3 in. lap with copper nails, at per square.

	Med. Grey	Med. Green
24 in. × 12 in.	£5 0 0	£5 2 0
20 in. × 10 in.	5 5 0	5 10 0
16 in. × 10 in.	4 15 0	5 1 0
14 in. × 8 in.	4 10 0	4 15 0
Green randoms	6 7 0	
Grey-green do.	5 9 0	
Green peggies, 12 in. to 8 in. long	4 13 6	

TILING, 4 in. gauge, every 4th course nailed, in hand-made tiles, average per square	3 17 6
DO., machine-made do., per square	3 7 6

Vertical Tiling, including pointing, add 18s. 0d. per square.

FIXING lead soakers, per dozen	£0 0 10
STRIPPING old slates and stacking for re-use, and clearing away surplus and rubbish, per square	0 10 0
LABOUR only in laying slates, but including nails, per square	1 0 0

See "Sundries" for Asbestos Tiling.

CARPENTER AND JOINER

CARPENTER, 1s. 8½d. *per hour;* JOINER, 1s. 8½d. *per hour;* LABOURER, 1s. 3½d. *per hour.*

Timber, average prices at Docks, London Standard, Scandinavian, etc. (equal to 2nds):	
7 × 3, per std.	£22 0 0
11 × 4, per std.	30 0 0
Memel or Equal. Slightly less than foregoing.	
Flooring, P.E., 1 in., per sq.	£1 4 6

CARPENTER AND JOINER: *continued*

SHUTTERING to face of concrete, per square	£1	10	0
DO. in narrow widths to beams, etc., per ft. sup.	0	0	6
USE and waste of timbers, allow 25 per cent. of above prices.			
SLATE BATTENING, per sq.	£0	12	6
DEAL boarding to flats, 1 in. thick and firrings to falls, per square	2	10	0
STOUT feather-edged tilting fillet to eaves, per ft. run	0	0	6
FEATHER-edged springer to trimmer arches, per ft. run	0	0	4
STOUT herringbone strutting (joists measured in), per ft. run	0	0	6
SOUND boarding, ⅞ in. thick and fillets nailed to sides of joists (joists measured over), per square	2	0	0
RUBEROID or similar quality roofing, one-ply, per yd. sup.	0	2	3
DO., two-ply, per yd. sup.	0	2	6
DO., three-ply, per yd. sup.	0	3	0
TONGUED and grooved flooring, 1¼ in. thick, laid complete with splayed headings, per square	2	5	0
DEAL skirting torus, moulded, 1¼ in. thick, including grounds and backings, per ft. sup.	0	1	0
TONGUED and mitred angles to do.	0	0	6
WOOD block flooring, standard blocks laid herringbone in mastic :			
Deal 1 in thick, per yd. sup.	0	10	0
DO. 1½ in. thick, per yd. sup.	0	12	0
Maple 1½ in. thick, per yd. sup.	0	15	0
DEAL moulded sashes, 1¾ in., with moulded bars in small squares, per ft. sup.	0	2	6
DO. 2 in. do., per ft. sup.	0	2	9
DEAL cased frames, oak sills and 2 in. moulded sashes, brass-faced pulleys and iron weights, per ft. sup.	0	4	6
MOULDED horns, extra, each	0	0	3
DOORS, 4-panel square both sides, 1¾ in. thick, per ft. sup.	0	2	6
DO. moulded both sides, per ft. sup.	0	2	9
DO. 2 in. thick, square both sides, per ft. sup.	0	2	9
DO. moulded both sides, per ft. sup.	0	3	0
DO. in 3 panels, moulded both sides, upper panel with diminished stiles with moulded bars for glass, per ft. sup.	0	3	6
If in oak, mahogany, or teak, multiply 3 times.			
DEAL frames, 4 in. × 3 in., rebated and beaded, per ft. cube	£0	15	0
Add for extra labour, per ft. run	0	0	1
STAIRCASE work :			
DEAL treads 1¼ in. and risers 1 in., tongued and grooved, including fir carriages, per ft. sup.	0	2	6
DEAL wall strings, 1¼ in. thick, moulded, per ft. run	0	2	0
If ramped, per ft. run	0	4	6
SHORT ramps, extra, each	0	7	6
ENDS of treads and risers housed to strings, each	0	1	0
2 in. deal mopstick handrail fixed to brackets, per ft. run	0	1	6
4½ in. × 3 in. oak fully moulded handrail, per ft. run	0	5	6
1½ in. square deal bar balusters, framed in, per ft. run	0	0	6
FITTINGS :			
SHELVES and bearers, 1 in., cross-tongued, per ft. sup.	0	1	6
1¼ in. beaded cupboard fronts, moulded and square, per ft. sup.	0	2	9
TEAK grooved draining boards, 1¼ in. thick, and bedding, per ft. sup.	0	4	6
IRONMONGERY :			
Fixing only (including providing screws) :			
TO DEAL—			
Hinges to sashes, per pair	0	1	2
Do. to doors, per pair	0	1	7
Barrel bolts, 9 in., iron, each	0	1	0
Sash fasteners, each	0	1	0
Rim locks, each	0	1	9
Mortice locks, each	0	4	0

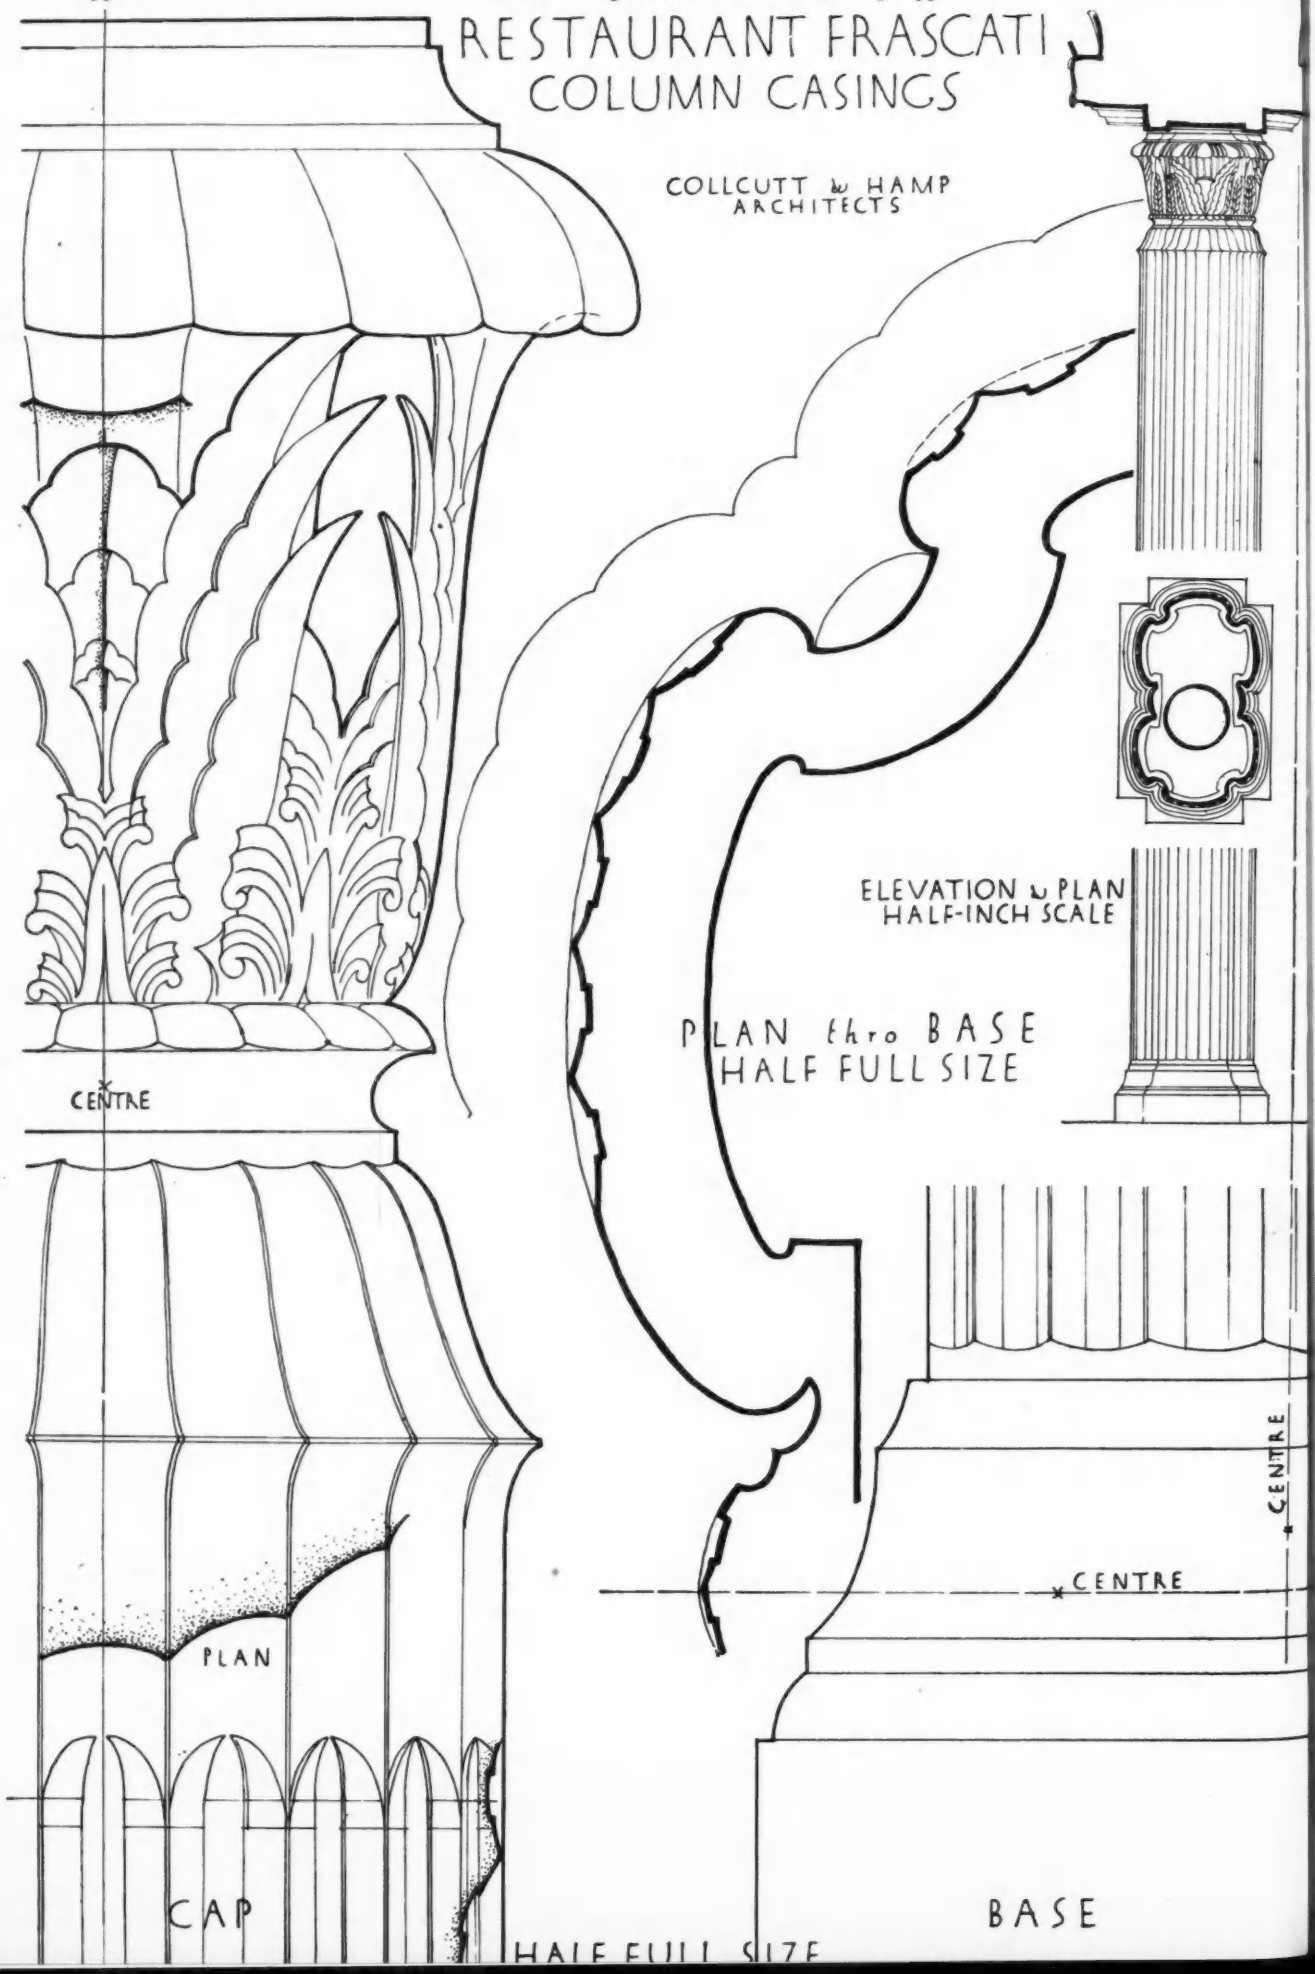
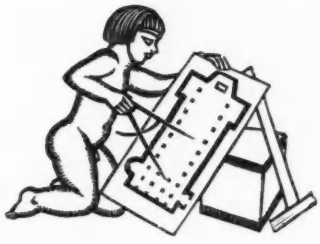
CASINGS TO STANCHIONS
AT THE RESTAURANT FRASCATI, OXFORD STREET, LONDON, W.
Designed by COLLCUTT AND HAMP



IN putting Frascati's house in order, the architects have not only succeeded in giving it a fresher and more comely face to the world, but have achieved a notable success in their treatment of the interior. The decoration is gay without being frivolous, belongs to no "style" and to no "period" beyond the style of a better-class restaurant in a big city, and the period of the twentieth century.

Quite one of the most interesting features in this extensive reconditioning is the treatment of casings to the existing stanchions, illustrated by the photograph above and by half-inch and half full-size details overleaf. Irregularity in the spacing of the existing supports has been artfully overcome by building out the casings on false centres, as it were, and the resultant grouping into a cluster of these finely-executed columns achieves a result at once rich and dramatic. The columns themselves are of hardwood, finished in silver leaf and gold lacquer, while the caps, out of reach of any damage, are of fibrous plaster, finished in the same manner.



The drawings overleaf may be read with architects' ordinary scales (½"; and 6"=1 foot).

"ROMANTIC" ARCHITECTURE

THE word *Romantic* seems to have been first used with a precise meaning about the middle of the seventeenth century. The introduction of a new word in the language indicates a new object, a new thought, or a new reaction, and the word *Romantic* seems to have been introduced to express an indirect vision which was something hitherto unknown; the vision of Nature or of art through the medium of another art, usually through the medium of literature.

It thus stood for something a little strange, something seen not quite clearly, but tinged with other values, an evoking of the past for the better enjoyment of the present, all of which things indicate an advanced degree of self-consciousness.

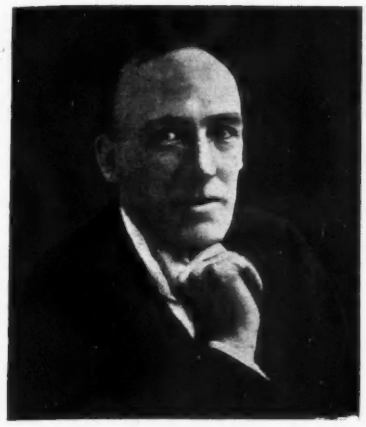
And little by little there occurred in the development of thought an almost definite bifurcation, the paths taking on the names of *Romantic* and *Classic*. But there was always this difference between them : that whereas the one was indirect, the seeing of something through the medium of something else, the other was clearcut and direct. This fact is often overlooked, especially by partisan historians of the battle, who point out that Gothic architecture is more indigenous to this country than Classic; which is in itself a debatable hypothesis, for what after all do we mean, in common parlance, by indigenous? Is the potato indigenous, is our faith indigenous, is the word indigenous indigenous? However, what is even less debatable is the fact that the Gothic revival was essentially a manifestation of the Romantic movement, a movement which saw one set of things in terms of another—a subjective movement, an imaginative movement, a literary movement.

Germany was, perhaps, the scene of the first real conflict. Indeed, as it has been put, "Goethe took upon Schiller and himself the responsibility of having added to the world's woes this famous subject of debate." The Battle of the Styles was thus nothing more than a counterpart in architecture of a vast warfare that was raging elsewhere. And it was a warfare between conflicting ideals, between conflicting temperaments.

How are these differences to be epitomized? Is it reason against imagination, and the objective against the subjective; is it perception against introspection, the finite against the infinite; is it order against disorder, the planned against the fortuitous, form against growth; is it the controlled against the uncontrolled; is it the general against the particular, the obvious against the mysterious; is it the spontaneous against the self-conscious? Actually it is surely all or any of these things, and although often enough these opposing qualities may be found side by side in the same work of art, two schools of thought have grown up, the opposition between which is based upon quite fundamental differences of outlook.

During the period when the so-called Battle of the Styles raged at its acutest the issues were fairly well defined. As knowledge of the past grew they tended to become more obscure, but even today there is a real cleavage between those in whom the formal instinct is highly developed, and those whose predilections are for the obscure and the strange. Thus the conflict, though ceasing to lie between the Gothic and Classic styles of architecture, persists nevertheless.

Of the three qualities, so important in architecture, of form, texture, and colour, that of form is surely the most important, and the appreciation of it requires a finer, a more sensitive, a more cultured mind than the appreciation of either colour or texture. Those, therefore, who set a high value upon form in architecture are exercising a rarer discrimination than those who undervalue it and favour other qualities; but, nevertheless, this favouritism is based not so much upon any error of judgment as upon a difference of temperament, a difference which would be found to affect the individual's entire outlook. Although it is unlikely that there will again occur revivals comparable with the Gothic revival, this difference of outlook will remain and will always manifest itself in architecture.



THE NEW SOUTH AFRICA HOUSE,
TRAFALGAR SQUARE, S.W.

This perspective drawing of the design produced by Sir Herbert Baker shows the aspect of the proposed building in relation to the Church of St. Martin-in-the-Fields.

Already hoardings are going up in front of the buildings that have hitherto occupied the site—the first step in a scheme of reconstruction which will change the face of what is probably the most widely known of all London views. The new South Africa House forms the most important part of the plan for rebuilding the entire island block bounded by Trafalgar Square, Duncannon Street, and the Strand, which, incidentally, is to benefit by widening. In order to secure unity Sir Herbert Baker has supervised the façades of the remainder of the block, ownership of which is shared between three parties.

It is expected that South Africa House will cost some £300,000 and will be ready for occupation in about two years' time. It will be remembered that the South African feeling was in favour of a building designed in accordance with typical Cape Dutch architecture, but it was realized that it would have been ill suited to urban purposes. Sir Herbert, in following the traditions of the Corinthian Order, seen in the National Gallery, not only for the Trafalgar Square front but for the columns of a circular colonnade at the eastern end of the site, has secured dignity and harmony.

The High Commissioner's office will open direct from the central portico ; and an exhibition hall and cinema hall are important features of the scheme.

Professor Stanley Davenport Adshead, M.A., F.R.I.B.A., M.T.P.I., whose lecture on the industrial development of South Essex is reported on page 950 of this issue. A noted town planner, he is joint editor of The Town Planning Review, *and author of several regional reports. He was responsible for a scheme for the proposed Charing Cross Bridge.*

NEWS & TOPICS

HOUSING ! HOUSING ! HOUSING !

NO one can afford to ignore a pronouncement on the housing situation emanating from Sir Tudor Walters. One does not need to be reminded from what firm basis of accomplished fact Sir Tudor speaks, and he is plainly both unimpressed with the possibilities of the 1930 Housing Act and its administration by local authorities. He sees grave unemployment among building operatives, and asks the Government for some definite indication of housing policy calculated to absorb this labour without the rise in prices associated with the ill-fated Addison schemes.

★

Housing is at the mercy of local authorities. There is nothing to ensure that the housing needs of districts are served, and not the purely financial state of the Council. There is no method of regulating the supply of housing, or of forecasting future expenditure and distribution. It is not even like electricity, which may be badly but not absolutely inequitably distributed. And yet we have felt justified in the creation of Electricity Commissioners and Boards to effect the economical distribution of electricity. Why not therefore a similar non-government board of business directors to regulate housing ?

★

Mr. Winston Churchill recently condemned the House of Commons as a bad instrument for economic problems, however well adapted to debate; and the wind quite clearly blows in that direction, to swell either the sails of Whitehall officialdom or of some new system of administration. The major issue is of course the question of prices, and that is what, under Sir Tudor Walters's scheme, would be one of the chief duties of a Housing Commission. At the moment prices are low and houses can be built for less than £300. A great programme of housing, with prices uncontrolled, would send them soaring again, piling up still heavier burdens for the future.

R.I.B.A. CHILDREN'S CHRISTMAS LECTURES

The Hon. Humphrey Pakington is again giving a series of talks on architecture for children at the R.I.B.A. this Christmas. He has taken as his subject "Architecture Today and Tomorrow," and the general theme is the close relation between architecture and life itself. In the first talk, he tells me, he will emphasize the importance of looking back, and will compare the construction and equipment of the small house of the Middle Ages with that of today. In the second talk he will suggest some of the causes of the modern movement, such as new uses of materials, new requirements of buildings, and new views on health. Illustrations will be given of modern garages, factories and churches; and the design and equipment of the modern house will be discussed. In the third talk he will deal with the future, and will urge the necessity for foresight and planning on a large scale. Views will be shown of slum areas and garden cities, and the planning of London and of Paris will be compared. He will discuss the spoliation of the countryside, and will suggest that the works of man, properly handled, may be made to enhance the works of Nature.

SALVE, SOUTHPORT !

I have always thought highly of Southport, which is a very beautiful and joyful town, built upon a waste of sand, on a flat coastline, with a hinterland of very little interest, and yet a seaside town with a real structure, some considerable architectural amenity, and more trees and flowers in its public places than any other town of a like size and opportunity.

★

The latest action of this highly civilized community is to submit to the local Architectural Society a scheme for placing minor architectural work which the Corporation are not themselves prepared to do with a panel of private architects practising in the town.

★

The Corporation will notify the Society whenever there is work to be done, and architects will be chosen from a senior and a junior panel, and will do the job in collaboration. This is a fine thing to do, and the Corporation will not regret their wise and generous action, which, let us hope, will provide them a charming collection of minor architecture.

THE DRY BONES RATTLE

I am always a little afraid when I hear it said of the present generation: "That there is plenty of ability; but the young men should study the past"—especially of sculptors ! It has always seemed to me that if anything has driven sculptors into revolt against what is known as academic tradition as opposed to living tradition, it is this admonition, ceaselessly reiterated. I know it is sense if properly understood, and followed in a spirit of resolute inquiry. But is it always meant as that sort of sense—or am I mistaken in seeming to hear the rattle of dry bones?

TREE-PLANTING AT CAMBRIDGE

The Cambridge Preservation Society are setting a bright example in their method of treating the areas which they have been able to preserve from indiscriminate development. They are determined not only to save them but to hand them down to posterity more beautiful than when they were saved. Their Trees Committee have planned a carefully-thought-out planting scheme on the society's land fronting Madingley Road—on the Coton footpath. The trees are arranged in groups, beech and sweet-smelling poplar, black Italian poplar, maple, several of wild cherry and other small flowering trees. When properly grown, these trees will make a beautifully varied colour scheme both in spring and autumn, and a pleasantly contrasting arrangement of tree forms in winter. Later on, one of the footpaths is to be planted with individual memorial trees,

of necessity a more formal matter. The society's planting is to begin this month, and will be carried on as funds come in. We seldom realize how much the face of England owes to the judicious landscape gardening undertaken by the owners of estates and their architectural and horticultural advisers, fifty, a hundred or more years ago, and what we owe to their foresight. One sound way of preserving the countryside is to follow their example.

THE DEATH-WATCH BEETLE AGAIN

I see that Mr. Powys, in his interview with *The Morning Post* of December 18, complains that the peril of the death-watch beetle may be overcried. And so it may. But it is well to remember that at Westminster Hall the decay caused by the beetle was only dealt with just in time to save a catastrophe. Between the first survey and the time it took to get the scaffold ready for repairs, one stone corbel cracked with excessive weight. The wretched little beetles, by the simple system of working in the darkness at the back of the oak wall post, and gradually eating away the end of it, caused the pressure to fall on the extreme end of the corbel. The pressure, which had originally weighted the corbel at its back end, got worse by degrees, and at last stood at a point which was rather more than the Caen stone could stand.

THE NEW WEEK-END BOOK

For several years now *The Week-end Book* has kept us company as we sped countrywards on Saturdays, or, did we not possess this encyclopædia of pleasures, we invariably found that a far-seeing and thoughtful hostess had placed it by our bedside. After seventeen reprints and with more than 50,000 copies sold, this anthology of anthologies becomes more and more indispensable. In the 1931 edition we find that Mr. Rutherston's gay ladies and gentlemen have vanished, to be replaced by various very elegant people drawn by T. L. Poulton, and for the first time our own noble profession comes into her own. Architecture—" the art preservative of all the arts "—has been given a section in the new *Week-end Book*, and for twelve pages profuse with illustrations we are carried into the realm of architecture and instructed in the art of finding our way about.

★

No longer do we fear the inevitable aftermath of a week-end at a famous country house, the dread inquiry : " Oh, you've been staying with Lord Dashwood at Dingledell. Interesting place, I've heard—what period? " To which we have feebly murmured : " Oh, it's a wonderful old place, dates back to the Middle Ages, I should think." Gone is the old ignorant vagueness. Now, with spontaneity, we shall exclaim : " Well, the main building is Late Tudor, but there is a magnificent Jacobean west wing, and a gate-house with a timber top story, etc." For muffled up in a large overcoat, *Week-end Book* in hand, we slip out in the dead of night and in the light of the moon trace out the curve of those Late Tudor windows; risk our lives climbing the rickety balcony steps in order to see those chimneys on the west wing and decide whether they be Tudor or Restoration; and run the risk of being thought utterly insane when in the pouring rain we stand on the lawn and gaze through field-glasses at the barge-boards on the west gable and, book in hand, debate—Early, Jacobean or Tudor?

★

Gone are the days when, entering the parish church, we fled at the sight of the proud and helpful Vicar, lest he should expose our ignorance and cover us with confusion with his incomprehensible remarks on the architectural features of his church. Now we approach him with confidence as we glibly admire his Early English mouldings and differentiate knowingly between his thirteenth- and fifteenth-century windows, or exclaim at the beauty of the curve of his Norman porch. Yes, we have much to thank the *Week-end Book* for !

PANTOMIMICS

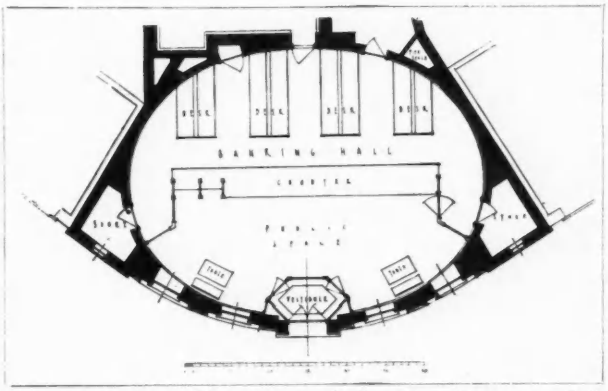
Extract from my diary, Tuesday, December 16, 1930.—With Letitia to A. A. Panto. Found ourselves in good company, Dr. Erich Mendelsohn sitting alongside President, just in front; the joke of it was, one of the fruitier of the nineteen turns turned on him. Prepared, of course, all unbeknownst; but one or two gags probably slipped in, elsewhere, to do him honour, after our insular manner. *Revue* more in Letty's line than mine, but will take it from her the percentage of bright ideas higher than in many ventures thought good enough to stage by the profesh. And they have nothing on the production : slick music, scenery, costumes, book and lighting—all students' own work, from the vertical-diagonal drop-curtain backwards. Of course, have got to remember this a strictly intimate show. Their night out : " if we've not entertained our audience, at least we've entertained ourselves." Thus, or to such effect, their final refrain. I'll bet they did both : the house screamed at shafts of satire, some of which flew over our innocent heads.

★

" Diagonal Views "—a spot of bother in a photographer's studio—owed its title to the President's address. " False Impressionism " exploited and exploded the association of ideas—the Association and *tout ce qu'il y a de la plus moderne* (L. says this a poor pun). At least two scenes modelled on real life (with personalities that I have no doubt whatever were real, too). In " U.S.A.A." probable effect on students of excursion to America (no other country considered big enough to take party any larger than this year's Scandinavian one) forecasted with such particularities as Big Boy (with chewing gum) and ukulele chorus of students; Buddy (with " hooch "); Housemaster (with graft)—obviously more caricatures, here. *Item :* fledgling architect, to whom enter plutocrat, assumed to require something in Hampton Court Palaces, actually to bestow commission to re-design boxroom to take third cistern. *Item :* serious young man in search of cloth (in spiritual sense) misdirected across Bedford Square and fetching up in A. A. Materials Bureau. *Item :* operetta, " The Sailor's Return," which I tell Letty, with my superior knowledge of the type (" Fudge ! ") I find no unworthy essay in " Beggar's Opera " vein. *Items* (several) : The Young Ladies, in sprightly dance and song.

★

Nearing end of page, but must record Mendelsohn's enjoyment of " Sic Transit." On stage, three cartoons of garden ornaments—florid nude, in relief, with two vases in support. Classical figures declaim rhetorical praise of Baroque. Snick ! Cartoons reversed : mechanistic devices and four black-clad robots. M. himself is named and appears in white uniform of chief robot. Classics put to rout. And, finally, a snippet of cross-talk : " Wot's all this 'ere Mendy—Mendly—wot's it, in the pipers ?" "Coo, don't yer knaow ? That's German for architecture, that is." "Ow, is it ? Well, that's all right, then." " Yus. Over 'ere we calls it green'ouses." ASTRAGAL

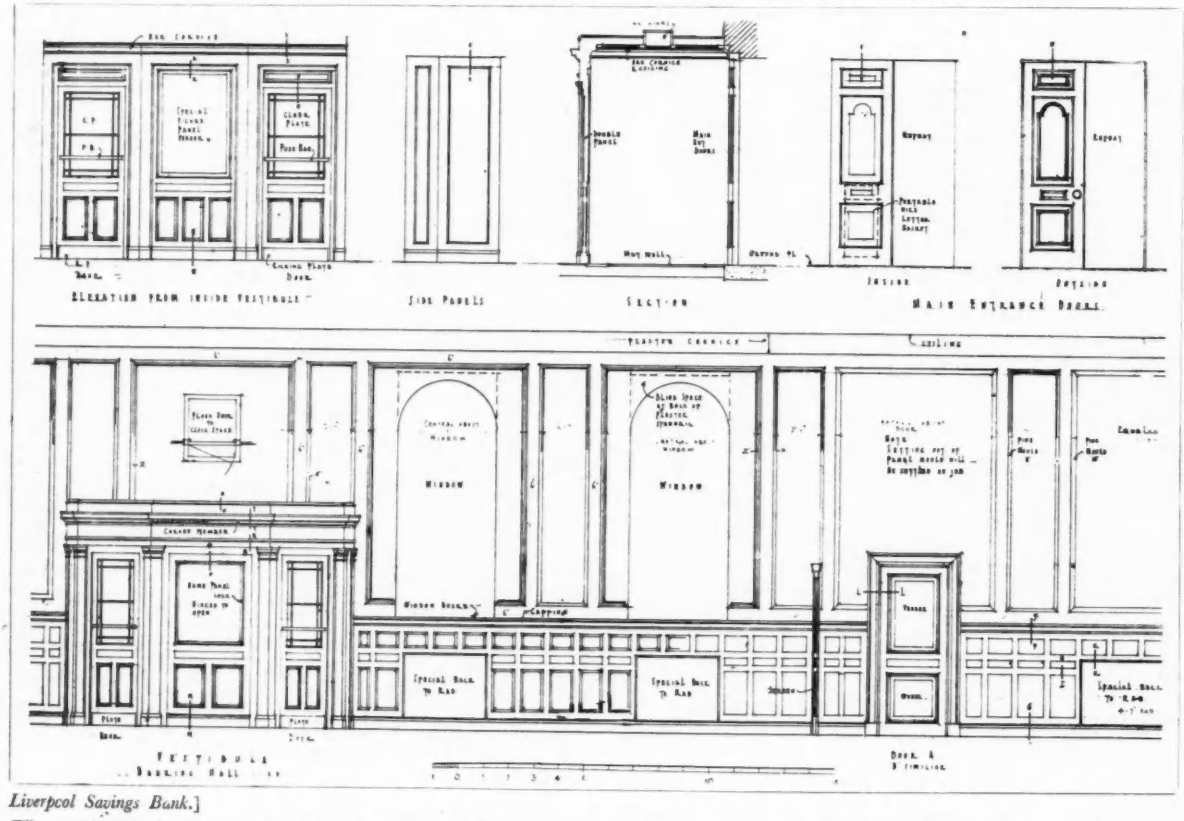


LIVERPOOL SAVINGS BANK

DESIGNED BY WILLINK AND DOD

The entrance is situated at the junction of two main streets. The door surround is of Portland stone; the step of granite. The keystone was carved by Mr. H. Tyson Smith; the lettering below the clock is of metal. The architects' elevations and sections of the main doors are reproduced on the following page.

THE Heathfield branch of the Liverpool Savings Bank is situated in a prominent position at the junction of two main streets on the outskirts of Liverpool. The site was formerly a quarry, but this had been filled in some years before the bank was built. After subjecting the subsoil to load tests, it was considered advisable to cover the whole area with a reinforced concrete raft. As it was not possible to construct a heating chamber and fuel store below this raft, the bank is heated by means of a gas-fired boiler, thermostatically controlled, and low-pressure hot-water systems with radiators. As



Ground-floor plan. The obtuse angle formed at the corner of the two streets suggested a curved façade, and from this followed naturally a banking hall, elliptical in shape. The clerks' room, lavatory accommodation and heating chamber (not shown on plan) are situated at the rear of the banking hall.

will be seen from the accompanying plan, the entrance vestibule, the floor of which is covered with Hopton Wood marble, gives on to the banking hall, elliptical in shape. In practice it has been found that this shape serves its purpose extremely well.

The counter, carried out in Austrian oak, wax polished, runs the length of the banking hall, terminating in doors leading to two small storerooms. The clerks' room is planned at the rear of the hall and leads to the heating chamber. Externally, the walls are of sand-faced bricks, with a special tile infilling, and the roof of Roman tiles.

A general view of the bank. The walls are of sand-faced bricks, with a special tile infilling, Portland stone dressings and a granite plinth; the roof is covered with Roman tiles which lend themselves naturally to the covering of a curved surface.

Liverpool Savings Bank.]

The architects' elevations and sections of the walls of the entrance vestibule, half the banking-hall, and the main doors. Four metal windows light the banking-hall; two are shown above. For the photograph of the main entrance doors, see preceding page.

DECORATION: THE WOMAN'S VIEWPOINT

BY GRACE L. FRASER

I THINK the average woman takes a much broader view of decoration than does the average man. Most men when they think of interior decoration think of the walls, ceiling and woodwork, and leave it at that. But most women visualize the room as a whole, and think not only of the skeleton of the room, but of the curtains, carpets and furnishings which will go to make up the complete room.

That women should view the subject in this manner is perfectly natural; for the carrying out of the actual decoration of the room has up to quite recently been man's work, and woman has come along afterwards and made the best job she could of it, adding the necessary furnishings, etc.

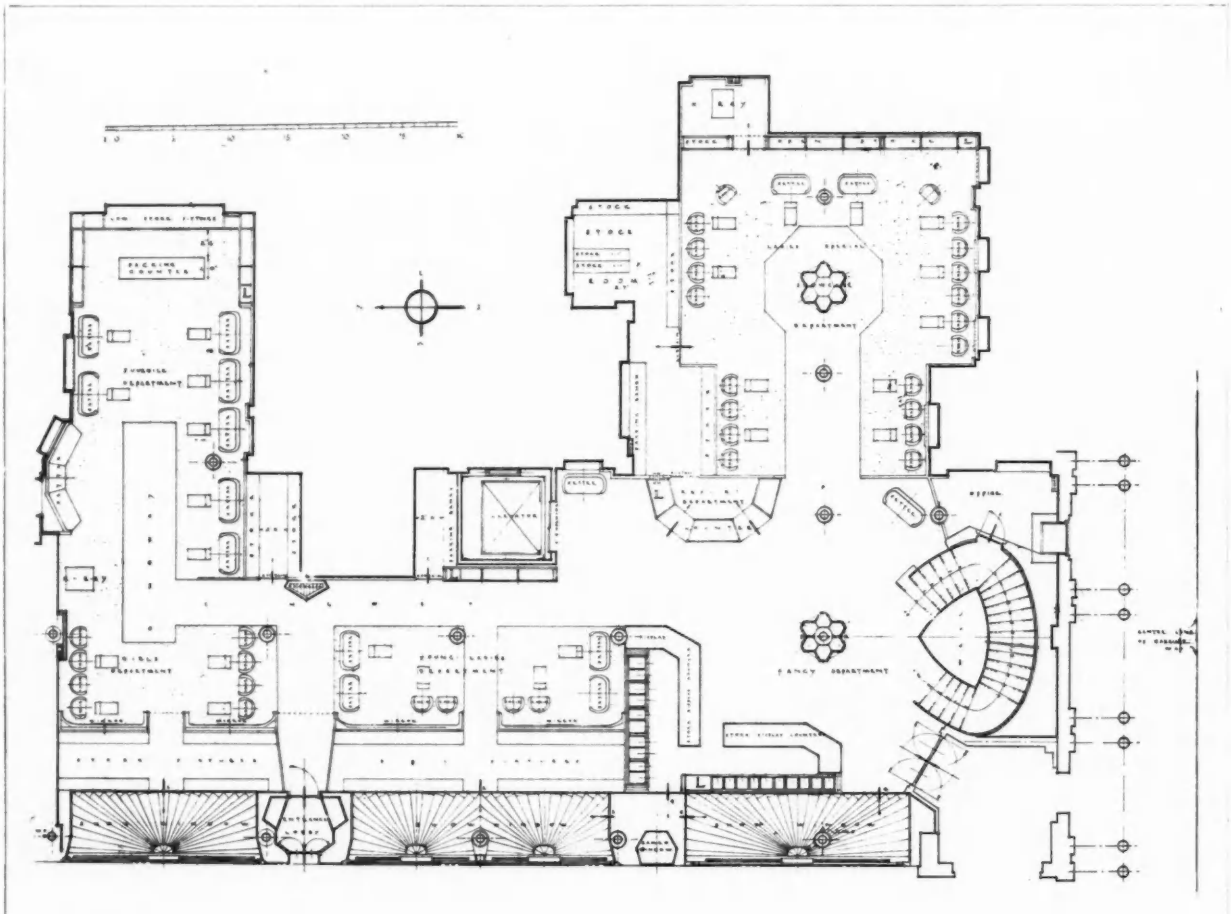
It is only quite recently that woman has become very room conscious. She did, it is true, fill and crowd it with masses of irrelevant and jarring decorative objects, but she could not have been said to be decoration conscious in any real sense of the word. All the hundred and one china and silver horrors and petty bits of furniture over which the unfortunate household stumbled during the last ten years of the nineteenth and the first ten of the twentieth centuries were not put into the room with any eye or idea as to their effect as a whole, but simply because each individual thing was liked or carried some sentimental memory. They had no relation either to each other or to the decorations of the room. But all that has changed in a most remarkable way in the last few years. The women of today are intensely keen and interested in their homes and their decoration; not only are they interested, but are studying and taking trouble about them, and they have at length very completely realized the value and importance of a suitably and well-decorated house. With this new-found interest in the æsthetic side of the house, as well as the practical, they have kept their habit of attention to detail, so that when they begin to worry out a scheme of decoration for a given room, they plan it as a whole, and not simply in terms of paint and wallpaper.

The woman of today wants, above all, a home which is not fussy and which is easy to take care of. She looks on extra mouldings and dust-collecting ridges with a jaundiced and suspicious eye. She is no longer to be put off with the remark that a moulding or cornice or picture-rail is usual; that it is usual is almost enough in itself to condemn it in her eyes. She knows perfectly well that a picture-rail in the average small house is bad because it cuts the height of the room, and she demands that it shall be taken away. If she has a Late Victorian room, with its extra and depressing height, she will then want that picture-rail back so as to focus the attention of the eye at a more reasonable height and take away from the room's bad proportions. But she is not going to accept a picture-rail without reason. This is, perhaps, a small point, but it is typical of the woman of today's whole attitude towards her house. She will not accept anything without reason, and she wants a clear and clean atmosphere.

[*By Willink and Dod.*

In the banking-hall the floor is covered with marble; the furniture is of Austrian oak, stained to a warm brown colour and wax-polished. The oak dado has been specially built up to follow the curved surface of the walls. On the left is the entrance vestibule.

The showrooms occupy part of the basement, ground and mezzanine floors of Orchard Court, a large block of flats, recently erected from the designs of Messrs. Joseph, architects. A near view of one of the shop windows appears on page 940.



DANIEL NEAL'S

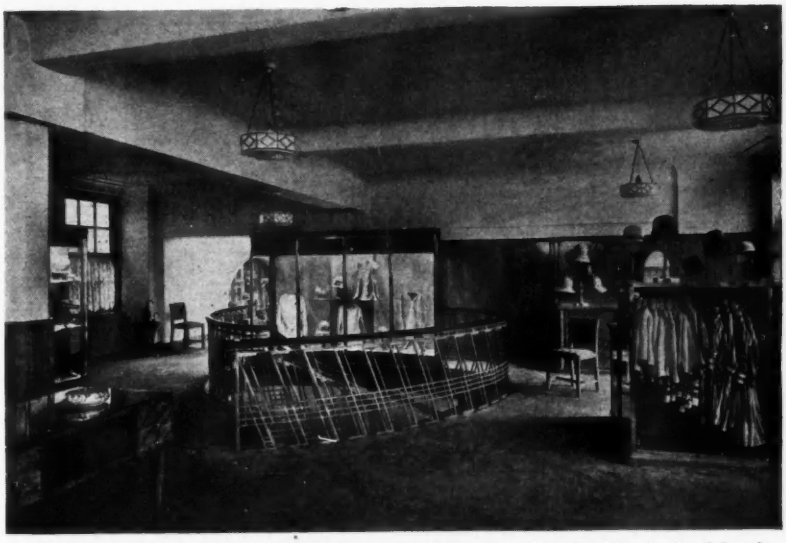
Portman

DESIGNED BY

THE new showrooms in Portman Square for Daniel Neal and Sons, Ltd., are of more than usual architectural interest. They occupy the basement, ground and first floors of that part of Orchard Court facing to Portman Square. This is a large block of flats completed in the early part of this year from the designs of Messrs. Joseph, architects. Thus was presented to Mr. P. J. Westwood, the architect for the showrooms, a problem that called for the most careful and delicate treatment, namely, that of designing a shopfront having a natural relation to and complete elevational sympathy with the existing superstructure.

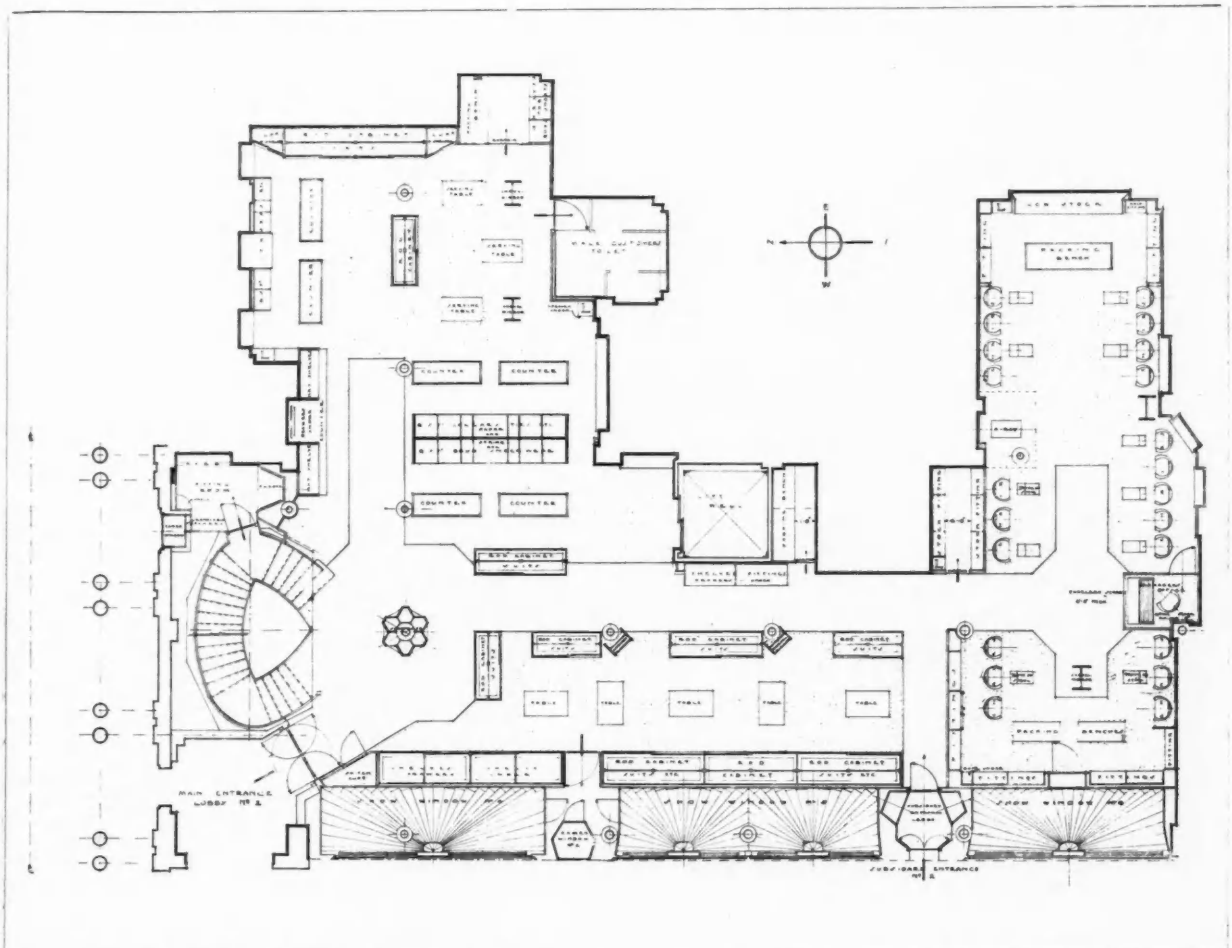
The entire shopfront, some 200 ft. long, is lined with marble, and the base is of black polished granite. Bronze has been used for the fronts and grilles, and the window backs and

The showrooms are divided into two portions by the carriageway serving the residential flats. On the ground floor of the left-hand (north) portion, as shown on the plan above, are the juvenile and ladies' and fancy goods departments. Each shopfront is about 75 ft. long and the plans show clearly the intriguing outlines of the windows and showcases.



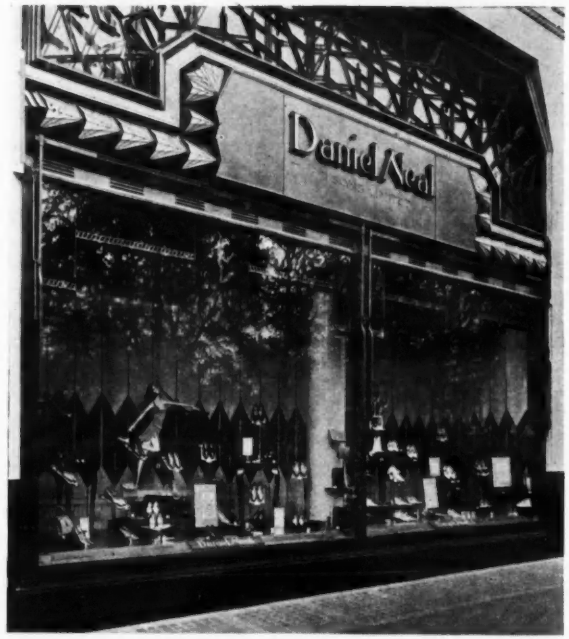
NEW SHOWROOMS

Square, W.

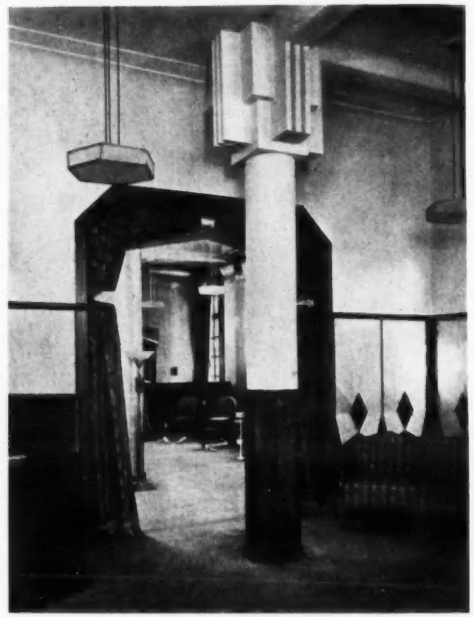


P. J. WESTWOOD

showboards are treated in the modern manner in walnut and sycamore veneer. All the decorative materials, obviously, have been selected for their peculiar qualities: marble for its impression of luxury and richness; granite for its tremendous potential strength, and when polished its powerful light-reflecting surface; and bronze for the manner in which it conveys the feeling of strength, efficiency and beauty of line. Obviously, also, the colours of the materials have been made to play their part in providing a suitable setting for the wares displayed.



The interior of the premises has been effectively panelled and fixtured throughout in walnut and sycamore. The ceilings and friezes are in a warm cream colour, and the floors are of oak. Among the many interesting features of the interior are the staircases.



A showroom and one of the two staircases. These are of teak with ebonized hand-rails and wrought-iron balustrades. The whole of the interior work, including fittings, fixtures and showcases, was specially made to the architect's designs.

On the ground floor, in the right-hand (south) block are the men's outfitting and boot departments. Each block has a staircase of original and distinctive design (see above and page 940), and a lift to the basement and the mezzanine floor. There are four entrances to the show-rooms, all leading from Portman Square, and having wrought-iron gates.

One of the two shop-window bays that bear the firm's name.

This treatment of column, doorway and light fitting is typical of such features throughout the store.

The staircases are "equal and opposite" and arresting in contour.

LETTERS FROM READERS

An Architect's Claim for Fees

SIR,—I have read with considerable astonishment the "Law Report" of the case reported on page 922 of your issue for December 17 last.

As the report is obviously a summary, we must assume certain premises as being not only highly probable, but almost certain, before a case like this would reach the court room at all.

The first point which strikes the reader is the astounding difference between the amount of the claim and the actual sum for which the case was settled. Less than a tenth of the sum claimed!

Assuming that the architect's claim was just (as I have no doubt whatever it was), this gives some indication of an architect's chances of recovering anything like full value for his labours if the question is left to the judgment of a court of law.

If the architect "stood in" as stated by the defendant, surely evidence of this would have been forthcoming in writing. The fact that the sum claimed was only the balance of fees for work done would suggest that the defendant had previously recognized the justice of plaintiff's claim for fees as architect.

In the report no mention is made of professional witnesses for either side. If such were cited to give evidence, their evidence would have been illuminating as to the amount of support one is likely to secure from individual members of the profession.

As a member of the Institute, and one who has apparently served his country with distinction, one would have expected that the gallant colonel would have been supported to the full extent of the R.I.B.A. scale by his professional witnesses.

The judge before whom the case was tried is a man of great experience, and one from whom many words of wisdom have fallen in the course of his arduous and difficult duties.

The loss of nearly £3,000 in fees for work done must be a serious matter to any but the most prosperous and successful of architects, and it is most unlikely that any architect of standing would raise such a claim as that under consideration unless it was absolutely above suspicion and bona fide.

Obviously the ethics of the matter must have been entirely ignored by either one party or the other, and it should have been possible to have discovered the real state of affairs in this respect with comparative ease.

There are other obvious side issues which space forbids dealing with, but it is satisfactory to note that the court recognized the copyright of the drawings by ordering them to be returned to the plaintiff.

One point should never be lost sight of in cases of this sort, or indeed in any case where the value of an architect's services is being assessed by professional witnesses—and that is that no attempt should be made by a professional witness to "score off" or belittle the value of such services.

WILLIAM DAVIDSON

Gamage-Damage

SIR,—I find it somewhat difficult to understand what was in the mind of your contributor Astragal in writing under the above heading in your last issue.

I gathered the impression, however, that at the beginning of his paragraph he was mourning the hurt to his architectural soul, but that before the end of it the memory of his boyhood days proved too much for him, and he relapsed into indefinite exclamations.

After all, his difficulty is only the same as that of us poor retailers, who have so many different points of view to consider. There are many arguments which could be put forward "for" and "against," but I will not trespass on your space further than to say that I am not without some slight sympathy for poor Astragal.

ERIC M. GAMAGE
CHAIRMAN AND MANAGING DIRECTOR, GAMAGES (WEST END), LTD.

The Smoke Nuisance

SIR,—YOUR JOURNAL is rendering good service in giving special prominence to the subject of smoke pollution. It is indeed most desirable to stress the fact that smoke is a public nuisance for a variety of reasons; it often prevents the life-giving rays of the sun from reaching us, and it is extremely detrimental to architecture, merchandise and vegetation.

I have noticed, however, that the use of gas and electricity is frequently commended in the Press, while scant reference is made to other smokeless heating accessories, such as anthracite and coke. Moreover, the public appear to be ignorant of the fact that solid smokeless fuels are not only more efficient, but are actually cheaper than bituminous coal for domestic heating purposes.

A well-known fuel technologist recently worked out the comparative costs of heating a room 18 ft. by 16 ft. as follows:

Anthracite (burning continuously), cost per day, 5⅝d.; coke (burning continuously), 5¾d.; ordinary bituminous coal (burning fifteen hours), 7¼d.; gas (burning fifteen hours), 1s. 10½d.

It would appear, therefore, that it is not the cost of smokeless fuels, but the innate conservatism of the average British housewife that causes so much atmospheric pollution from the domestic chimney.

PRO BONO PUBLICO

Expiration of Lease

SIR,—In reply to the inquiry from "Perplexed," on page 910 of your last issue, I know of no particular cases that shed any direct light on his client's project; but when a man sets out to test the implied meanings of a legal clause, he is holding out a very tempting—let me use the simile, football—to the legal profession who will gather round and enjoy the game to its utmost. Now the legal profession, being professional players, must be paid, however much they enjoy the game. At the end of several years the tenant might, of course, gain a wonderful revenge on his landlord in seeing him pay both teams. On the other hand——

After this uncalled-for homily, let us get back to the black paint. The first question is: Will it "cover"?—if not, it may not be "tenantable." If it will "cover," what is the matter with it? Personally, I am rather fond of it. I had an office once, all the woodwork of which was painted black, and very well it looked and very well it lasted. I can remember a rather fashionable mode of entirely black rooms; and lacquer and gold looked very well in them. It might, of course, be a little dull to have all the rooms the same; but unless the house is panelled throughout, the landlord would be able to get variety in the wall coverings.

No; I doubt the success of this jest.

H. D.

SIR,—The question in the letter signed "Perplexed," in your last issue, seems to be one for a lawyer to answer. So much depends on the exact wording of a lease, but it is difficult to understand how his client feels aggrieved, as it must be assumed that he read his lease before signing it.

Possibly there is more behind the grievance than the lease, in which case "Perplexed's" client would seem to be laying himself open to attack if he takes the proposed course of avenging his assumed wrongs.

I have heard of a case somewhat similar to this, but on reverse lines. The tenant of a house had an agreement whereby the landlord was bound to paint the outside of the (stuccoed) house once every three years. He failed to do this, so the tenant, after due notice to the landlord, painted it himself in broad stripes of red, white and blue. The affair attracted a good deal of notice and got into the papers, which was very unwelcome to the

landlord. He complained to the tenant but was told, "Well, as you would not do it, I did it myself to my own taste, and next week I am having it done again like a Union Jack." The landlord then carried out his part of the agreement.

ARTHUR WELFORD

SIR,—With regard to "Perplexed's" letter in your last issue, I recollect a similar case in like circumstances which occurred in Bishopsgate about thirty years ago. In this case all the paintwork was executed in bright yellow, which at the time was considered an offence, but might now be the height of fashion! The incident sticks in my mind because, as a consequence, the covenants of the new lease were expanded to include (after the usual "coats of good lead and oil paint"), "finished to tints approved by the lessor or his surveyor."

In the present case I should think that the words "properly tenantable condition" might lay the humourist open to attack; in the case above cited they were lacking, and the lessee was considered not worth powder and shot.

EDWIN GUNN

SIR,—If the tenant paints the whole of the internal woodwork with a coat of black paint, he is breaking the conditions of the lease, inasmuch as he is not leaving the house in a "properly tenantable condition."

Good tenantable condition or repair, according to Lord Esher in *Proudfoot* v. *Hart*, is such repair as would make the house reasonably fit for the occupation of a reasonably minded tenant, of the class who would be likely to take it.

I cannot imagine a reasonably minded tenant not objecting to a house where the whole of the internal woodwork was painted black.

SIDNEY F. HARRIS

SIR,—"Perplexed," if he has any real experience of life, knows very well that there can be only one answer to the query contained in his letter in your last issue, but one cannot help speculating on the amusing possibilities of the situation. His client wishes to "express his displeasure." This would suggest that he has had some sort of dispute with his landlord regarding certain matters pertaining to the lease.

To paint the woodwork of the house in such a manner as to "express his displeasure" would obviously ruin the property.

Should a law case arise out of any such action it is clear that, if this inquiry could be traced back to its source, the landlord might be awarded heavy damages against the tenant.

Recent cases in the courts in which architects have been implicated show clearly that the law takes little cognizance of the ethical or just aspect of cases, and if vindictiveness were suspected or proved "Perplexed's" client would certainly lose his case, no matter what were the original grounds for his grievance.

If, however, the client wishes to have a sporting shot at the business, I would suggest that he works out a scheme of black and vermilion on Chinese or Japanese lacquer lines. Say, black styles to the doors and vermilion panels, or black doors and vermilion mouldings and architraves.

Or again, he might imitate the third period of Pompeiian decoration and introduce picture post cards of cupids at the angles of his black door panels, These are mere suggestions which could be elaborated at very little expense, and he might be able to prove by expert decorative artist witnesses that the scheme had been worked out on the most approved modern lines.

But the mere fact that "Perplexed's" client wishes to "express his displeasure" implies spite and revenge, and these are low qualities only found in men of deficient culture and low breeding, and the answer to the query must be: Do the decent thing—which in this case means that the tenant must follow the implied terms of the lease.

W. D.

QUESTIONS THAT ARISE

Damp Prevention

H. O. R. writes: "*What is your expert's opinion regarding the following two queries?*

"(a) *Can any lime mortar (giving particulars of quality of lime) be depended upon to keep out damp, and is a 1 to 3 lime mortar better for this purpose than, say, a 1 cement to 6 sand and mortar? Further, does the addition of cement to lime mortar assist the damp-proofing qualities?*

"(b) *Will cellular (having the appearance of a fine sponge and uniform) brick or fine concrete function better than good quality bricks or fine concrete (apparently without air spaces), when used with the object of keeping out driving rain? I note claims are made to this effect by a company making bricks and another concrete of this type. I have no experience myself, but think there may be something in the claim for walls beyond a certain minimum thickness, and providing the air spaces do not act as capillary tubes.*"

Presumably this question (*a*), and that following, refer to mortar used in the jointing of ordinary brickwork. The ideal to aim at is a brick and a jointing of as nearly equal absorbency as possible; hence quality of brick and mortar available must interact at choice, and a direct and prescriptive answer to the question is impossible. There are very many instances where a 1 to 3 lime mortar has successfully combined with brick to produce a damp-proof wall, and there are also 1 to 6 cement mixtures which have done the same. The addition of lime putty, or water containing lime ("milk of lime") to cement mortar, by (as it were) greasing or fattening the mixture, and so admitting a closer, denser, composition—the ideal of a jointing substance—may improve the resistance to penetration, but the converse is not necessarily true.

It is unquestionably true that porosity of structure in a brick or concrete is not necessarily the same thing as absorbency, but it is not safe to apply this as a general conclusion. For a discussion of this complex matter reference should be made to the annual report of the Building Research Board for 1929, published by H.M. Stationery Office.

G.

Renewal of Paint

B. P. writes: "*I have recently completed a residence two miles distant from the nearest village and some six miles from the nearest town. The glass in the metal casement windows is secured by putty. The putty is painted green, to match the rest of the external painting. Small birds, mostly 'tits,' persistently peel off the green paint and attack the putty below. The paint and putty has been renewed where damaged, but the attack persists.*

"*The people who supplied the putty to the builders state that it is made with linseed oil, and they have always supplied the same putty to their customers without receiving any similar complaint. We are applying to the builders for a sample of the putty and have asked a chemist for his advice. He suggests mixing alum with the putty, making good with this, and re-painting.*

"*Does your expert think this will stop the nuisance? If not, what can we do? We are advised that it is illegal to lay poison for the birds.*"

Ordinary putty is commonly composed of whiting and linseed oil. As the latter is prepared from linseed, which is a favourite food of all finches, the attack by birds is understandable; it is probably rendered more readily possible by the slow hardening which such putty undergoes when used in metal casements—without absorbency.

The addition of alum would probably have the effect desired, but the right putty to use in fixing glazing to metal casements is a mixture of red and white lead with linseed oil, and it is difficult to imagine birds partaking of this as a diet! Try the alum, which would be harmless to the birds, who may have acquired a taste for putty from their previous experience, that might result in their first white lead meal proving fatal.

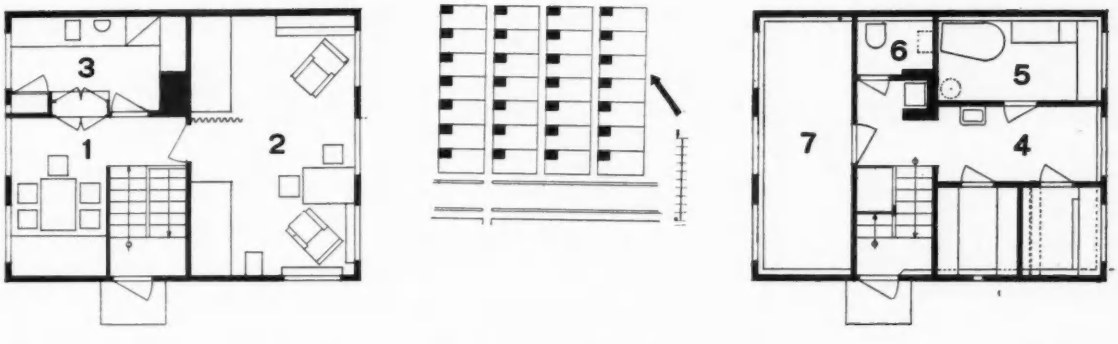
G.

Type No. 0 (see table printed on page 947). One end of the largest room (2) in the house, plans of which are reproduced below. Measuring about 10 ft. 6 ins. by 16 ft., it is designed as a sitting-room, and also to give sleeping accommodation for three. The door occurs in the right wall, and on the near side of it is a second convertible bed, similar to that shown. The third can be placed at convenience.

HOUSES SCALED TO INCOMES

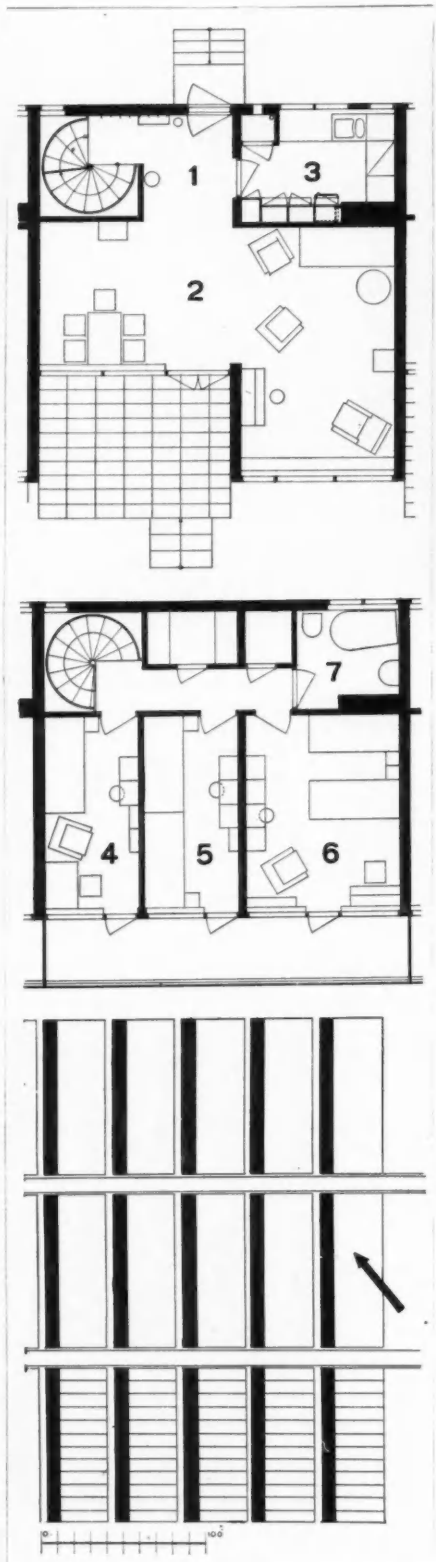
Sweden's Contribution to the Housing Problem: i

THE Housing Section of the Stockholm Exhibition (of which a general account appeared in our issue for July 16, 1930) is of far greater interest than would at first appear to the casual visitor from abroad. The exhibits are not just a collection of manufacturers' goods attractively arranged. They are a genuine contribution to constructive social thought.



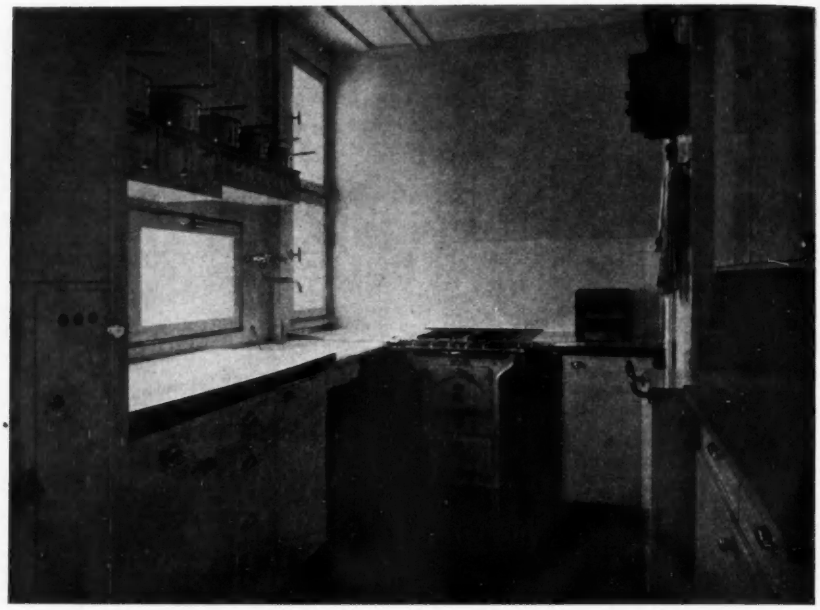
Arranged and planned on a rigidly economical basis, they show how the Swedish worker and business man earning a stated income can afford to house himself; what accommodation he can afford at the current level of economic rent, and what furniture he can afford to buy in the shops of Stockholm. The whole section is a notable effort and one which requires, in these days of haphazard living and chaotic standards, to be followed up in all countries, not excepting our own.

The account which follows is based on the notes contributed to the official Exhibition catalogue:



THE ECONOMIC SCHEME

The idea of the housing section of the Stockholm Exhibition came into being about two years ago, when a series of informal discussions took place at the home of Dr. Gregor Paulsson. At these meetings one conclusion gradually emerged, which was that a housing exhibition for people of our time must, if it is to produce any lasting result in work and policy, attack the problem of house building and house equipment from the very foundations. At the same time, it must keep in close contact with the economic realities of today. In other words, its task must be to show how we may produce the dwellings we require, and produce them at a price we can afford. By *we* is understood the great mass of people whose incomes are within those limits where the payment of rent is a sensible item in the yearly budget. All that lies beyond these limits does not enter into the scope of such an economic study, and is significant only in so far as it provides a field for the fine arts and the luxury trades.



The architects, Gunnar Sundbärg and

Type No. 0. First floor; site; and ground-floor plans: (1) dining-room, with sleeping space for one; (2) sitting-room, providing sleeping accommodation for three persons; (3) kitchen; (4) dressing-room; (5) bathroom; (6) w.c.; (7) workroom.

Type No. 8. Ground floor, first floor, and site plans. There is also a basement, containing storeroom, larder and washing room.

Type No. 8. A view of the kitchen—(3) on the plans. Other references: (1) hall; (2) sitting room; (4) and (5) bedrooms for one or two; (6) bedroom for two; (7) bathroom.

Uno Åhrén, were appointed by the committee of architects of the exhibition to work out a scheme for a series of dwellings to be included among the exhibits. When the outline of such a scheme had been produced, it was decided to hold a competition among a number of invited architects for the detailed working-out of the various types.

Attempts were at first made to represent among these type-dwellings not only the various strata of society, but also the different conditions of life prevailing throughout Sweden. This, however, proved to be impossible, and the housing requirements typical of the newer Stockholm suburbs were adopted as a standard. This choice afterwards proved advantageous in many ways; more particularly in so far as it caused the competitors to concentrate on what is in effect the most difficult and most unfavourable set of conditions obtaining anywhere in Sweden.

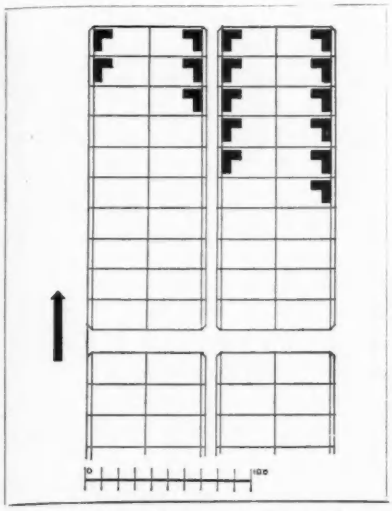
The first condition set for all the designs submitted was that they must be economically self-supporting without any form of subsidy whatsoever. Competitors were invited to give special study to the most difficult type of dwelling of all: that in which a large family has to be housed with only a small income to support it.

The maximum income for any of the dwellings included in the competition was to be 15,000 crowns (£826). When it came to defining the various economic levels which were to be provided for, it was found that official statistics gave very little help. A special investigation was, therefore, undertaken on behalf of the committee, in the course of which the circumstances of a thousand households, comprising 3,630 individuals, were inquired into. The households were chosen from all parts of the Stockholm villa and apartment districts.

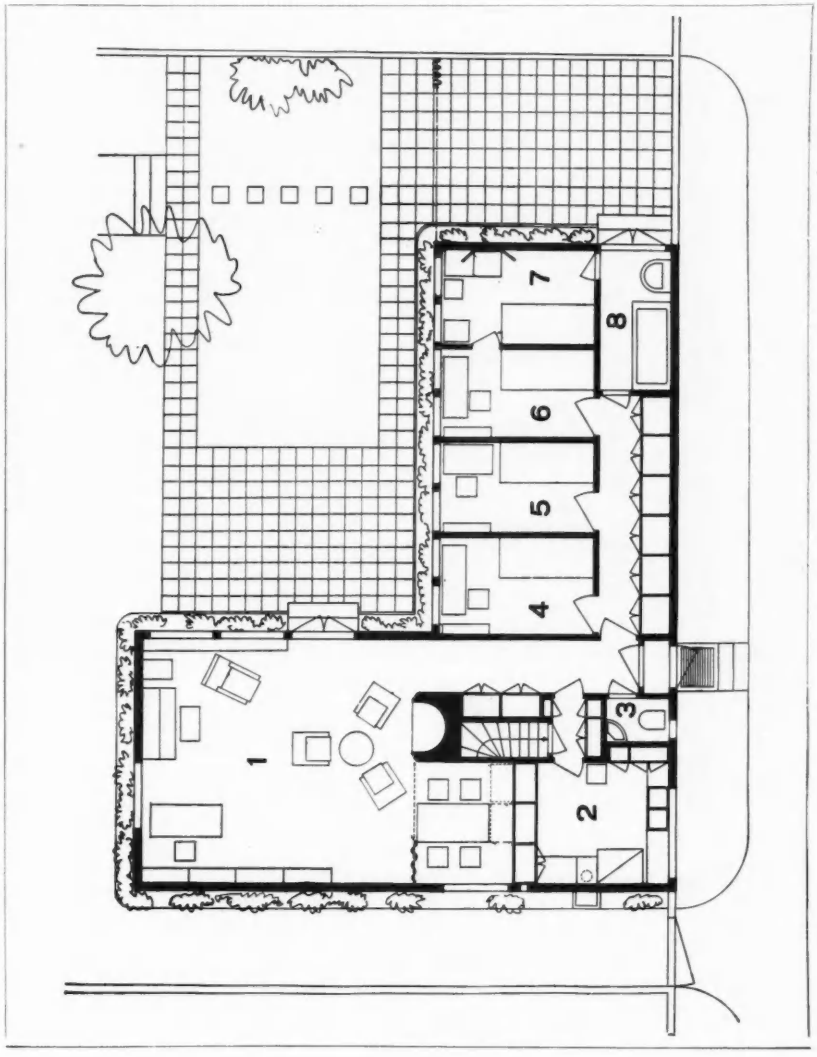
The inquiry covered the following headings:

1: Accommodation and rent. (The rent of houses was taken at a figure representing the annual charge on capital expenditure, plus the cost of services covered by the rent of flats.)

2: The size of families. (The number of persons over the age of thirteen only, was reckoned.)



3: The percentage of the household income expended in rent.



4: The comparative rent percentage for different levels of society.

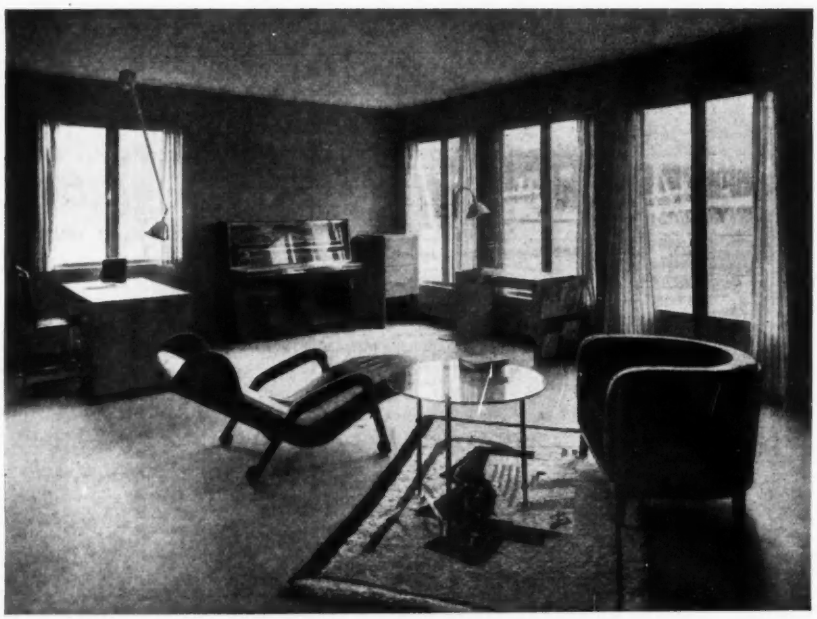
5: Density of population. (The number of occupants for every hundred rooms.)

Under this last heading it was found that a severe congestion prevailed in the smaller types of dwellings. The average number of inhabitants in dwellings containing less than three rooms and a kitchen was 176 persons for every hundred rooms.

As regards the rent percentage, it was found that among the lower grades of income, a greatly excessive proportion of this income was paid out in rent. In certain sections of the scale the percentage rose to 35 and even above, whereas 20 to 25 per cent. is as much as is generally considered legitimate.

Type No. 10. Site plan and ground plan (the accommodation is on one floor): (1) Sitting-room; (2) kitchen; (3) toilet room; (4) (5) (6) (7) bedrooms for one; (8) bathroom.

Another interesting fact which emerged was that the workers paid considerably less rent in proportion to their incomes than did the professional classes and civil servants. The highest proportion of rent was paid by the upper professional classes such as engineers, etc.



The various requirements were officially set out in a series of typical summaries (tables A and B on this page). The question was next considered whether it was possible to fix the conditions of life in still greater detail than that covered by these tables.

Table A—HOUSES.

Type No.	No. of persons (children under 13 are reckoned as ½).	Total household income.	Rental value plus maintenance.	Notes.
		£	£	
0	2–4	*circa* 165	44–49

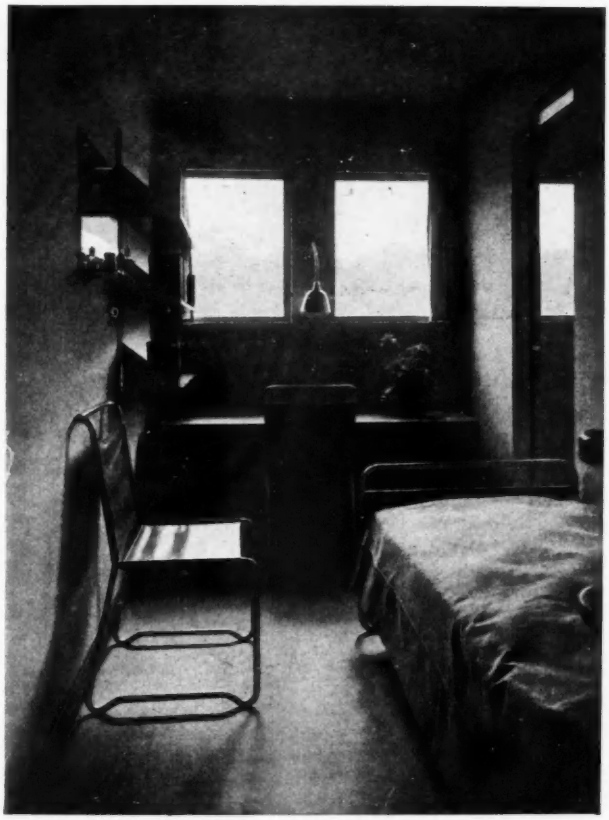
15	5–6 (including servants)	605–826	132–154

Type No. 10. Sitting-room (1). This combined parlour and dining-room occupies the short arm of the L-shaped plan, and measures some 18 ft. by 15 ft.

What are the various special requirements of a dwelling that will represent the whole of our modern conception of the individual and its relation to the family and to society? It may seem that to examine into this question is to come dangerously near to an excessive standardization of life. It is, however, becoming more and more necessary to study the normal dwelling requirements of today very closely indeed, for if the production and consumption of dwellings with all their accessories is to be properly regulated, a standard type is bound to emerge whether we like it or not. To make sure that this standard is a decent and satisfactory one is, indeed, the central question of the whole of our housing problem.

The first axiomatic requirement laid down was that every adult member of the family should have a separate room, no matter how small. The second was that in each home there should be one large room for the common use of the family. These two requirements should be met in all dwellings of whatever kind, and so should provide the opportunities for society and solitude which every person needs.



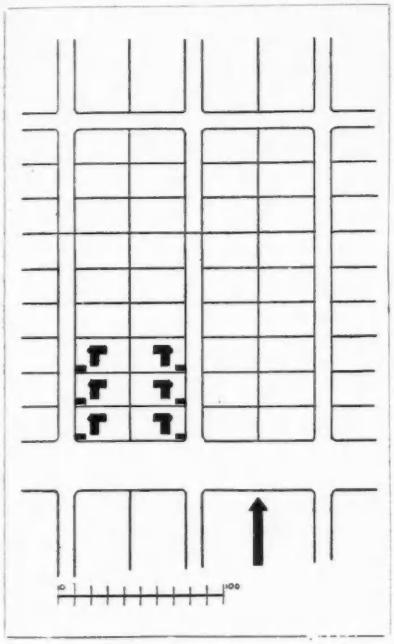
Other questions which were studied were that of aspect and sunlight, and the conditions of the preparation of food. The average size of the kitchen today is growing constantly less; and more particularly among the classes with smaller incomes. Meals consist of an increasing proportion of ready-cooked or semi-prepared foods.

The competition for the different housing types was by invitation, and the designs were assessed by a jury composed of five architects in addition to Dr. Gregor Paulsson, the Director of the Exhibition, and E. G. Asplund, the Exhibition architect. From the material furnished by the competition, the most adequately worked-out types were carefully selected and were, with certain amendments made by the jury, executed in the Exhibition grounds.

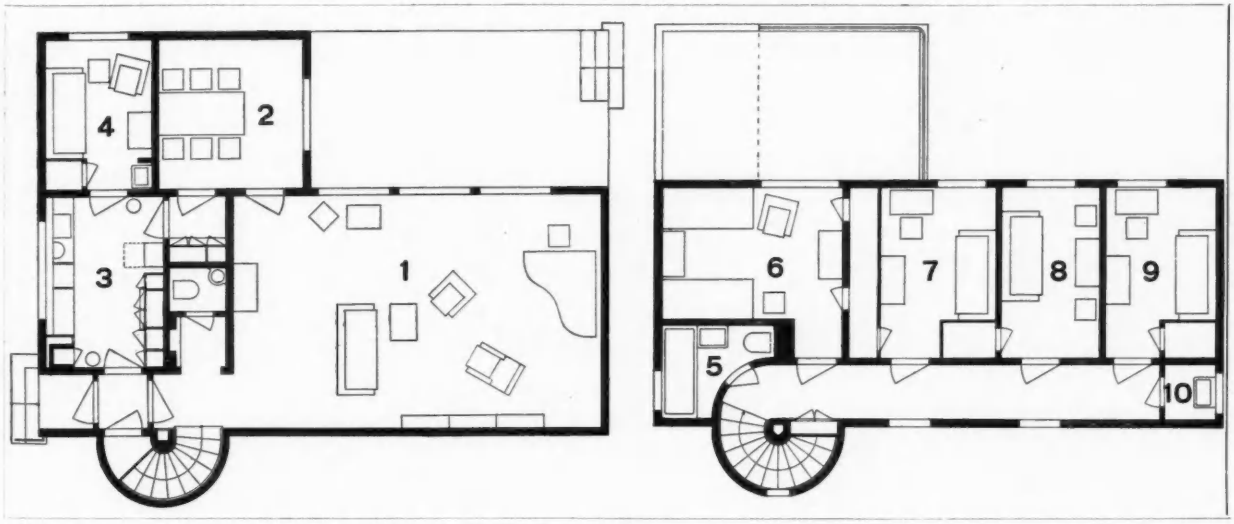
ECONOMIZING SPACE

One fairly common way of reducing the modest space taken up by the kitchen in Swedish dwellings with one living-room is to divide the area occupied by the kitchen into two parts by means of a glazed partition. The front half can then be used as a dining-room, while the rear half contains all the cooking utensils and equipment in a concentrated space. In the smallest type of dwelling this arrangement has proved in the past a considerable benefit, since the dining-room half has been used as an occasional spare bedroom and also as a day nursery in which the children are able to play under the mother's supervision, without being in the same room with her. Another well-known device is to provide the principal living-room with a sleeping alcove large enough for two single beds.

When one has to deal with dwellings containing more than one living-room, the problem of economizing space is made considerably easier. The one



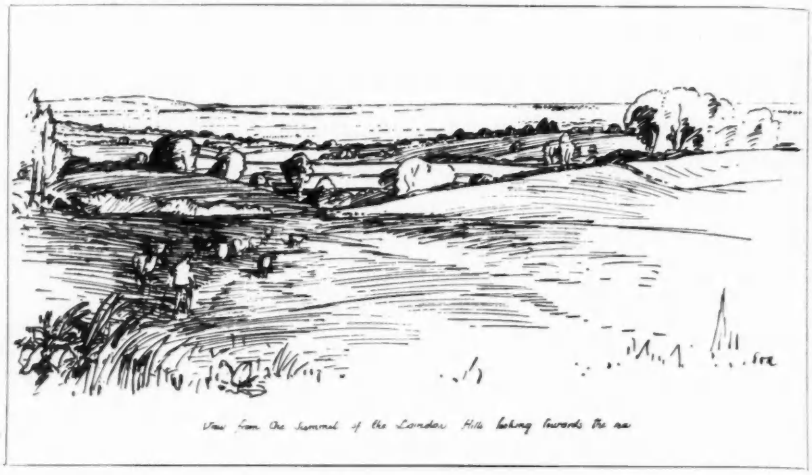
Type No. 10. Bedroom (6). This has a communicating door with that adjoining; the other two bedrooms are single. All four are served by a corridor with cupboards, leading to the bathroom.



fundamental difficulty is the minimum size of individual rooms. The Stockholm building bylaws do not generally allow a room of any kind to contain an area of less than 96 sq. ft. Clearly, a principal living-room should never be smaller than this, but it may sometimes be desirable that a spare bedroom, study, or other suchlike room should have a slightly smaller area.

It is a well-known fact that the area of a room and its cubic content have no necessary connection with its hygienic properties. Given effective ventilation, a bedroom with a floor area of 64 sq. ft. may be used by two persons and will provide far better conditions than a room twice the size inadequately ventilated. It follows that the problem of ventilation is one which has to be given special consideration when one is dealing with dwellings of the more restricted type. The height of rooms, also, may sometimes be reduced in order to effect economies. The statutory minimum in Stockholm is 8 ft. 10 ins., but in certain circumstances may be reduced to 8 ft. 2 ins. With good ventilation, however, this minimum may safely be reduced on occasion. In those places where it is possible to combine rooms of different heights, the lowering of the room height in some of the rooms results in a very great saving in the total cubic space, and may mean a difference between economic failure and success. Sometimes attempts are made to build the principal living-rooms of such a height that small rooms can be inserted on two levels, one above the other, by means of an added mezzanine. These smaller rooms will then be comparatively low, say 6 ft. 10 ins., and their combined height will be equal to the height of the principal living-room, although the cubic content of this living-room will be comparatively generous in a dwelling of its sort.

Type No. 12. Dining-room (2). This is approximately 10 ft. square on plan, and has two doors, communicating with the sitting-room and kitchen, via a pantry, respectively.



Type No. 12. Site, ground- and first-floor plans: (1) Sitting-room; (2) dining-room; (3) kitchen; (4) servant's room; (5) bathroom; (6) bedroom for two; (7) bedrooms for one or two; (8) and (9) bedrooms for one; (10) toilet room. There is also a basement, extending over the whole area of the site.

SOUTH ESSEX

BY PROF. S. D. ADSHEAD

On this page are printed extracts from Professor Adshead's paper on "South Essex: its Docks, Industries and Houses, London's Industrial Development," illustrated with two sketches from his pen, read before a gathering of the London Society at the Royal Society of Arts, on Friday last.

View from the Summit of the London Hills looking towards the sea

BEFORE the war, Essex was a county of wandering lanes, secluded villages, lonely marshes and wide stretches of pasture land reclaimed from the Thames. There were also the beginnings of those wharves and docks which are destined one day to fringe the river from East Ham to the sea.

In the spread of building, which since the war has extended beyond the nineteenth-century suburbs, no area has undergone so rapid or so complete a change as has Essex.

Essex is being transformed from a sparsely inhabited agricultural county into a vast area of factories and little houses.

Town Planning is the art and the science which controls and guides the confused efforts of single individuals, that the best interests both of the community and of the individual may result. There are influences and tendencies in modern developments that differ fundamentally from those that have obtained hitherto; we cannot resist them; it would be inadvisable to attempt to do so; we can only prepare our plans to suit the new order in a new way.

The development of Essex since the war is indicative of new and original kinds of development which it is the business of the town planner to thoroughly understand.

A higher standard of living amongst the lower and middle classes, combined with increased facilities for travelling, has, during the present century, been responsible for enticing thousands of enterprising people out of the solidly built-up residential areas of East London into the recesses of Essex, along each of the several railway lines; and industries which, until recently, were confined to the London area, have begun to appreciate the advantage of riverside sites.

These two movements are not only quite new, but have no relation to each other.

The industrial worker at the docks and at the Thames-side industries now lives either in London or in the immediate vicinity of his place of work, as, for instance, at Barking, Grays and Tilbury. The resident of Hornchurch, of Upminster and of Canvey Island has today no interest whatever in a Thames-side industry. This, however, is probably only a temporary condition.

A very cursory examination of Canvey Island, Benfleet, Thundersley, Laindon, South Dagenham, East Rainham, and dozens of other places of such mushroom growth that they are without names, shows us there is a very real difference between these very new places and the developments that have taken place nearer London and closely adjoining older residential areas such as Barking, Upminster, Brentwood and Southend.

The latter conform generally to the conditions of suburban development such as may be seen anywhere in any of the bylaw-built suburbs of London. The former, however, are more like pioneer camps in a new country.

The problem is to find sites for workers at a reasonable distance from or in close proximity to their work. Assuming that the riverside in South Essex was to develop as a densely packed industrial area interspersed with accommodation roads and branch railways, and employing approximately twenty-three hands per acre, then the industrial population employed along the banks of the river and spread over the industrial area—which contains 17,000 acres of undeveloped land zoned for industrial development — would amount to 391,000 workers.

With a strip of land averaging three-quarters of a mile in width, and extending from the Beckton Gasworks to Canvey Island, we have here a magnificent industrial area for London. There is any amount of room for wharves, docks, railway sidings, approach roads, and all the accompaniments of a great industrial area. The problem to be solved is how to deal with the housing of the operatives. In my Regional Report I have made proposals for accommodating them in numerous small townships, as reasonably near their place of work as the amenities of a residential area would permit. Residential towns, as such, are not improved by the juxtaposition of industries, and the great advantage of Essex is that the industries can easily be collected along the river, with the residential areas in close association behind.

The Beach at Shoeburyness

THE SPECIFICATION WRITER

On the Job: Excavation

BY THE GUV'NOR

NOWADAYS, when there is a tendency to sink ever deeper and deeper in order chiefly to increase floor areas of expensive sites, excavation becomes a still more important operation and a matter of great responsibility.

Owing to the nature of our London subsoil, composed as it is in most cases of swampy ground made up with a filling of anything available at the time, we very rarely find we are dealing with virgin soil. Old drains, wells or sewers all add to our difficulties, as also do roads adjoining, which have been undermined by countless works in trenching for pipe lines, cables, mains, etc. All these render the digging of deep foundations a real engineering job, and should be very carefully watched if we are to avoid repetition of such happenings as we have had recently.

The one safe way to tackle this job is to take out a trench for retaining walls, during this operation removing the existing vaults, if any, and leaving the dumpling solid to strut against. We can then build the new wall complete and allow it to take up its duty, leaving us at liberty to deal with the block-digging in a straightforward manner. However, we very rarely find ourselves in this ideal position.

Owing to the greater depths reached, we find that a self-supporting retaining wall becomes so massive that we can economize in material, in space, and in time, and lighten the load on the foundations, by so designing the wall that most of the thrust is taken by the steel framing of the main structure.

This is accomplished by forming a complete grillage system, fixed vertically in the retaining wall, consisting of stanchions at intervals, connected by horizontal beams, with other vertical members, fixed about 4 feet apart, the whole being calculated to withstand the stresses imposed upon it when connected by cross beams to the steel-frame structure (see figure one). A filling of bricks or concrete may be added just as a ground for asphalt or a face for plaster, and to encase the steel grillage, but the resultant thickness will be only a small proportion of that required for a mass wall.

This steel frame grillage may be made use of in the course of excavation by using a specially designed steel strut, cleated to the vertical steelwork and having a base-plate and abutment against the base concrete of stanchions carrying main walls, when this is possible. Then we may find ourselves once more in the ideal position of having a practically self-supporting retaining wall and the block digging may be attacked in the quickest manner, this being as child's play compared with the other.

The steam loco cranes, which still remain the most economical machines for this work, may be kept busy, and, although in London the condition of the ground does not lend itself easily, we can occasionally make use of the latest types of steam navvy or grabs with which our excavation contractors are well equipped.

Sometimes it is not practicable to use a loco crane, and, instead, a hoist of the lift type is rigged, tip wagons running on tracks of narrow-gauge being run into the cage of the hoist and raised to the top of a loading gantry before being tipped over a shoot delivering into lorries standing under.

An entirely different method of excavation is used on a site where piling is required. Piles may be driven at intervals and linked up with sheet piling as for wharf work, and the earth excavated from between. For ordinary work the piles, consisting of rolled steel joist sections, may be driven at regular distances apart, then excavation put in hand, and, as earth is removed, section by section, concrete slabs (reinforced if required) may be placed between the flanges, forming an outer skin and displacing poling boards and walings, thus saving the expense of striking timbering when the wall is being built. Very little shoring or strutting is required to keep this system in position.

It is essential that at completion of underground works the surrounding earth shall be just as solid as before being disturbed, and to this end all timber should be carefully withdrawn and all cavities filled solid. When using concrete slab fillings in place of planking and strutting, they may be cast with holes through them by means of which, after being fixed and pointed, they have all voids behind them, filled solid with Portland cement forced in under pneumatic pressure.

When excavating sites of old works premises, the foundations of heavy walls or engine beds and machine bases call for special attention. The pneumatic drill assists us here again, and in some instances it is possible to use a mild charge of special explosive to split up blocks of concrete.

Water-logged sites call for extra care, and possibly a different type of planking and strutting. One method of treating an isolated base through strata carrying water or running sand is shown by figure two. The timber sheet piling, about 9 ins. by 2 ins., is driven inch by inch as the soil is raked out from the bottom, each board being driven in turn around the pit, leaving no surface of soil exposed, and each being tightened up by means of wedges against temporary walings. This

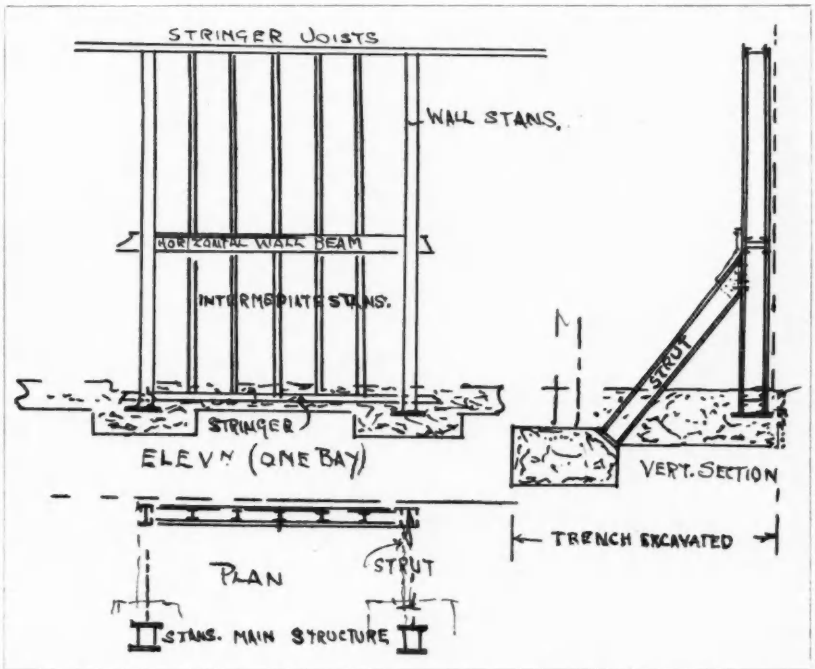


Figure one. Steel grillage system, designed to take most of the thrust of retaining wall, thus economizing in material and space, and lightening the load on the foundations.

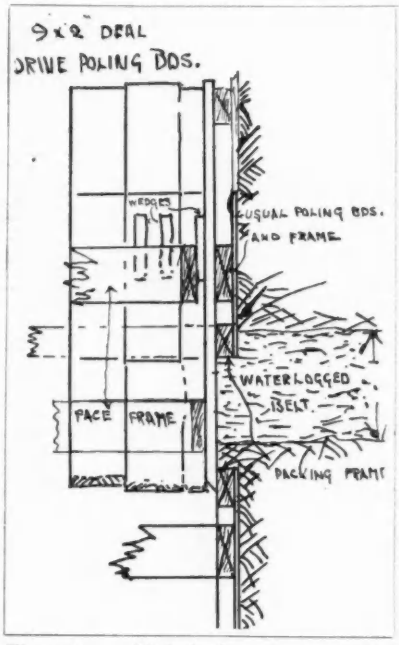

Figure two. Method of treating an isolated base, where water-bearing strata or running sand are encountered.

process is repeated until solid ground is reached when we may revert to ordinary framing again.

In timbering for excavation particular care should be taken to ensure that the timber is fit for its purpose. Struts taking heavy loads should always be of pitch pine, and cut ends should always have full bearing. Each set of framing should be laced to the set above and below as they are fixed. In dry weather the timbering should be tested daily for shrinkage and tightened up if required.

Pulverized Fuel for Central Heating

BY ALEXANDER H. HAYES

MODERN power stations have shown so definitely the value of pulverized-fuel firing, and the system has made such distinct progress, that an almost inevitable suggestion is that central heating offers another wide field for its application.

Unquestionably there are openings for pulverized-fuel firing in central heating, so far as large installations are concerned, and various plants of the sort have already been installed and operated in America. In those cases the pulverized fuel is delivered, already prepared, by suitable wagons, and the user is only then concerned with the firing problem as distinct from the drying and grinding.

Before, however, an opinion can be formed upon the applicability of pulverized fuel for central heating work generally, it is necessary to inquire what are the advantages of the system which have brought it into prominence. Briefly, these may be summarized as follows: The possibility of burning almost any grade of coal, even with very high ash content; practically perfect combustion of the fuel, given proper regulation of the fuel and air supply, and a suitable combustion chamber; rapidity with which full combustion conditions can be attained in the furnace; and flexibility in regard to increase or decrease in the rate of firing; increased efficiency giving an economy up to say 10 per cent.

In order to attain these advantages, the coal must be ground to a fine powder, in which condition it can be air-borne to the furnace; and in some cases, drying of the coal for the removal of surplus moisture is necessary in order to allow of satisfactory grinding. It will be evident that in many cases the necessity of having to instal and operate grinding equipment, except where very large quantities of fuel are being used, offsets the advantages of the process unless a regular supply of fuel already prepared can be obtained. The absence of such a supply in Great Britain is, even in the absence of any other consideration, at the moment a deterrent to general application.

The adoption of the process would in most cases involve installing a special type of furnace and boiler, also motor and blower equipment for supplying the fuel and air to the furnace. These considerations, however, cannot be put forward as objections in the case of new installations.

Reverting for a moment to the types of boiler and furnace usually adopted for central heating, it should be borne in mind that the low efficiency of these plants, compared with that of the central power-station and better industrial plants, is due not so much to bad combustion as to bad boiler construction for the maximum heat transfer. Admittedly there is greater liability of inefficient combustion, owing to the usually intermittent nature of the stoking and the absence of any fine control of air supply and rate of combustion. These latter factors account for a definite proportion of the loss of potential heat. A large proportion of heat, however, inevitably escapes with the products of combustion, and this is more easily appreciated when it is recalled that even in a modern power station the amount of heat absorbed by the boiler, as distinct from the superheater and economizer (which do not form part of the central-heating plant), is frequently little more than 70 per cent. of the total heat generated.

It is evident, then, that even with perfect combustion of the fuel the efficiency of the usual type of central-heating boiler cannot be brought very much above the figure which good practice already secures with solid fuel. Assuming, however, that compact and efficient types of boilers and furnaces for pulverized-fuel firing were available, the remaining problems would be the supply of the fuel and the disposal of the ashes.

A rational supply of powdered fuel should essentially have as its basis a price related to the calorific value of the fuel, and in such cases it is not likely that fuels with very high ash content would be considered economical for transport over long distances. Fuels of 20 per cent. to 25 per cent. ash content would necessarily find their market near the collieries, while distant markets, such as London, would be supplied with a better grade fuel, probably not exceeding 10 per cent. This ash, however, does represent a residue which would require to be removed regularly and be disposed of suitably. Here it may be mentioned that the disposal of the ash dust from pulverized fuel is not so simple as of that from solid fuel.

It will be seen that there are various technical problems involved in the general adoption of pulverized fuel for central heating, and, while none of the difficulties is insuperable, their proper solution must be a matter of time. In regard to the fuel supply, various difficulties which have been raised from time to time, such as the classification of pulverized fuel as dangerous material for transport, no longer apply. The transport question merely involves the supply of suitable wagons constructed for pulverized fuel and supplementary conveyances for road transport and local delivery.

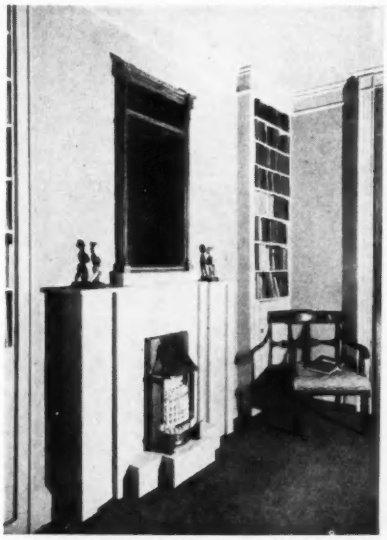
Collieries, however, do not yet seem to have awakened to the desirability of putting on to the market regular supplies of prepared fuel. Of late years much has been done in the washing and separation of small-grade coal which was at one time treated almost as waste, and it is found that this fuel has a ready and profitable market. The process might be extended considerably, for centralization of coal preparation and grinding is unquestionably the most economical procedure. The power required for this work can readily be generated at the pit head from fuel which does not justify transport charges.

Some such process of preparation and general distribution of pulverized coal is the first essential in the adoption of that fuel for general use, and the only explanation for the absence of such a supply which we can offer is the relative newness in this country of pulverized-fuel firing, and a spirit of inertia amongst those who are best in a position to initiate the scheme.

SETTINGS FOR GAS FIRES

DESIGNED BY E. MAXWELL FRY

Study mantelpiece of marble, with cast-iron fire-grate, before alteration. Typical Victorian equipment of this kind existed in the main rooms of the house from which examples are here illustrated and described. The photograph reproduced below shows its appearance after the reconstruction had been carried out, with simple and inexpensive materials.



The dining-room gas-fire setting, after remodelling. As in the case of the study, illustrated below, the fire has been raised well above floor level.

THE adaptation of existing fireplaces and grates to the uses of gas is a universal and melancholy practice that has only economy to commend it. Wherever it is *intended* to use gas for heating and a scheme of decoration is involved, the gas fire surely merits the expense of a few pounds so that it may be of a piece with the decorations instead of sitting, cuckoo-like, in a setting of other days' devising.

The psychology of the gas fire is not at once clear. Like the open fire, it is a thing to gather round, in nearly any room an obvious centre of attraction, and therefore a means of orientation; it cannot be regarded as a radiator. On the other hand, its fixed radiants and steady burning make a wide hearth unnecessary. There are no fire-irons and no ashes or coals to be kept within a curb or fender.

The gas fire is something therefore between the old open fire and the new radiator. Its one very obvious merit, insufficiently realized, is its extreme adaptability within a wide range of architectural forms that are NOT resuscitations of what are known as "period" designs.

The gas fire, for instance, is not chained to the floor. It may be raised to any height desired, as in the examples illustrated, that is obviously suited to fireside reading and conversation. Again, it may be moved forward or backward, and is better brought forward, as the old fire was of necessity better recessed. Nor does it require the heavy materials of the traditional fireplace, since it is designed for its heat to be thrown forward, and not to spread sideways and backwards.

In the study the scheme embraces bookshelves, and seemly mouldings have been superimposed on the old mantelpiece.

Rational gas fires are thus to be built of wood, asbestos sheeting, glass and metal; marble, brick and stone become luxuries.

At the moment the various firms manufacturing gas fires are still obsessed by period designs. Their most up-to-date patterns preserve a projecting hood and fender. A very few patterns with a plain, hoodless surround are available, and these are most easily incorporated within an architectural setting; but as few architects seem to want to use the gas fire in any but a stilted manner, these excellent patterns are little called for.

Were gas-fire design properly understood, it would be along the lines pointed by these patterns that advance would be made.

The January issue of THE ARCHITECTURAL REVIEW *will be a special number devoted exclusively to the City of New Delhi, India, planned and designed by Sir Edwin Lutyens, R.A., and Sir Herbert Baker, A.R.A., F.R.I.B.A. This issue will be published at the usual price of 2s. 6d.*

LITERATURE

THE TERRORS OF THE LAW

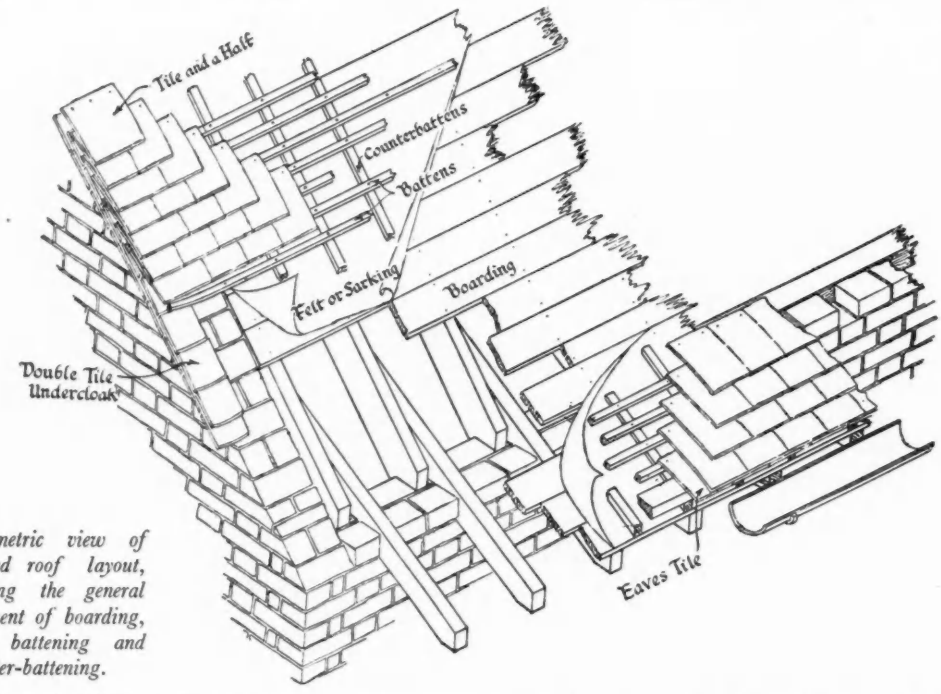
A LITTLE law, like a little learning, is a dangerous thing; but for the architect a little law is a necessity for lack of which he will be unable to take a firm position in the issues that daily present themselves; will lose ground to the weakening of his confidence in himself, his authority with others, and to the detriment of his clients' interests; and will before long certainly find himself involved in great disasters or in small ones.

Although the interpretation of niceties of law often confounds the experts and divides the judges, the idea that the law is a mysterious and terrible thing is quite a wrong one; in the main, and as it presents itself to the practising architect, it clarifies perplexities and makes difficult travelling safe and easy.

The law is so much the quintessence of logic that a well-assimilated notion of its main tenets and leading principles enables the architect to develop a kind of instinct which serves to interpret facts and guide his actions rightly and unassailably. It is this assimilated knowledge, or instinctive sense of legal values, which is the basis of a good, working, practical acquaintance with the law; but the legal text-book is slow to yield that general sense of the whole subject which is the first step to assimilated knowledge. The inquirer needs a comprehensive view of the wood before he examines the individual trees composing it; and it is the special merit of the little book now under review that it informs the reader's mind in just that way.

The book is a revised edition of *Smith's Owner, Builder and Architect*, as it is, in brief, named. It lays no claim to be a legal text-book, but is designed to guide the lay public; and those of the lay public who are entering on the practice of architecture will be excellently served by it. The picture it presents gains cogency from the arrangement of the matter in sections following the successive stages of the business of erecting a building, from considerations bearing on the drawing of contracts to those involved by a recourse to arbitration.

The work also gains much from the liveliness and lucidity of the writing and from the intimacy of its examples and illustrative instances with the facts of building operations. This last is no doubt the contribution of Mr. W. Palmer-Jones, whose services are acknowledged in the preface.



The book closes with the author's personal endorsement of the high opinion of architects expressed, in a reported case, by the late Lord Bramwell; and with an appreciation of the services rendered by architects. This would be conclusive, were other evidence lacking, that the author and his editor know well what they are talking about. Mr. T. Algernon Brown has well spent the time he has given to the revision and completion of an excellent little book. H. B. C.

The Law Concerning Owner, Builder and Architect. By James Walter Smith. Second edition revised by T. Algernon Brown. London: Effingham Wilson.

BUILDERS' MATERIALS

IN the preface to this most useful book the author very rightly draws attention to the scarcity of works on building materials which deal with the subject on other than strictly scientific lines. Indeed, for close on forty years previous to Mr. Grundy's present contribution to the literature of building technology, Rivington's *Notes on Building Construction: Vol. IV., Materials* (published in 1892), and Middleton's *Building Materials*, which appeared in 1905, have stood almost alone as comprehensive sources of information for the general enlightenment of the profession.

The subject is really so vast that for years past there has been a tendency on the part of specialist writers to devote themselves to a particular material, or group of materials, and this has led to the publication of numerous separate treatises such as Searles' *Cement, Concrete and Bricks*, Seymour Jennings' *Commercial Paints and Painting*, Blake's *Roof Coverings*, Danby's *Natural Rock Asphalts and Bitumens*, and other works of similar character.

An isometric view of a pitched roof layout, illustrating the general arrangement of boarding, felting, battening and counter-battening.

From Builders' Materials.] [*By R. F. B. Grundy.*

In the circumstances, Mr. Grundy's compact little volume—planned as it is on an eminently practical basis—is most opportune, and although it comprises but 240 pages, we are given a most excellent survey of the subject. As such, there can be small doubt but that the work now under review will be cordially welcomed both by the busy architect and the examination-haunted student.

The book contains twenty-one chapters, of which three are devoted to stone; two each to timber, brick, lime and plaster, Portland and other cements, and iron and steel; while single chapters are given to earthenware (including stoneware and terra-cotta), non-ferrous metals, concrete (mass and reinforced), bitumen (together with asphalt and tar), glass, roofing materials, and paint (comprising also varnish, distemper, etc.). The final chapter is reserved for certain miscellaneous materials—such as abrasives, asbestos and wall-papers—which cannot be classified under the foregoing categories. Besides some ninety or so illustrations—not all of uniform merit—this text-book embodies concise references to processes of manufacture, a number of tables setting forth the dimensions, strengths and weights of specific materials, valuable data relating to tests, and much other technical information of a pertinent kind. There are also extracts from the British Standard Specifications No. 12 (1925): Portland Cement; No. 15 (1930): Structural Steel for Bridges and General Building Construction; and No. 65 (1914): Salt-glazed Ware Pipes. The index might usefully be extended in a future edition.

For the very sound reason that a more intelligent knowledge of building materials is likely to be obtained if an account of their physical characteristics is accompanied by an explanation of their uses, the author has added, where it seemed wise to do so, some particulars and diagrams bearing upon their general application. These elucidations should prove of great assistance to younger readers.

In a work of this description one naturally looks for information on the many new materials which are now available for use in modern building construction. In this connection it is satisfactory to find that such representative examples as stainless and non-corrosive steel, white Portland and rapid-hardening cements—the latter including the aluminous and Portland varieties—as well as ultra-violet ray transmitting glass, all receive due mention. In the matter of Lafarge Extra-White cement, however, which is referred to on page 152, the writer of this notice suggests that it is hardly accurate to describe it as a Portland cement. The manufacturers, it will be found, do not make this claim.

Taken as a whole, the book is remarkably comprehensive, and the wide range of facts, which the author has assembled within such narrow limits, is eloquent testimony of his ordered discrimination.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Art Treasures (Overseas Loans) Bill

IN the House of Lords, Lord Parmoor moved the second reading of the British Museum and National Gallery (Overseas Loans) Bill, which carries out the report of the Royal Commission appointed in July, 1927, presided over by Lord D'Abernon, which unanimously recommended that the Trustees of the British Museum and the National Gallery should be empowered to lend objects of art and pictures for exhibition in places outside Great Britain.

It was important, he said, that the British position in the world of art should be better understood abroad. The Royal Commission had fully considered the risk of damage to the objects of art, and had reported that there was no evidence of damage of any real and lasting character having been done to pictures sent abroad under careful supervision. If there was risk, the risk would apply equally to pictures or objects of art painted or made by English artists as to those of foreign artists which were now located in England. It was a striking fact that, in our late international exhibitions, pictures or objects of art numbering over 100 had been sent to this country from eleven countries which were not the product of the art or artists of the countries concerned.

Lord Hanworth moved the rejection of the Bill. As Master of the Rolls, he said, he was charged with the superintendence of the archives of the nation. He had also been authorized by the Standing Committee of the Trustees of the British Museum to oppose the Bill. Although it had been pointed out to the Government that only two or three words were necessary to make the Bill satisfactory to the Museum Trustees, two months had passed without any assurance being forthcoming. For the purpose of reciprocity, the Trustees were willing to let the Bill go through if the objects to be lent were limited to "objects representative of British art and crafts."

Lord Crawford, who supported Lord Hanworth, said that it was commonly held that, in view of the wonderful generosity shown to us by foreign countries, we must reciprocate by sending our pictures abroad. But informed foreign opinion was by no means so friendly to those international exhibitions. Responsible custodians of national collections in several Continental countries were anxious that this country should take upon itself the responsibility of putting a check on these international exhibitions. Custodians of works of art were horrified last winter when they learned that the *Leonardo da Vinci*, with its precious cargo, was encountering heavy seas on her way to this country. Happily, the ship arrived and returned safely, but he could never be a party to encouraging any other nation to take those risks. He did not think the proper compliment to pay to Italy or other countries was to lend them examples of their own art, but rather to send them examples illustrating British artistic supremacy from 1760 to the death of Turner.

Eventually, after further criticism of the Bill, the debate was adjourned, Lord Hailsham warning the Government that if, when the debate was resumed, they were not able to meet the objections that had been raised, the second reading of the Bill would not be agreed to.

Housing and the Unemployed

Housing in relation to unemployment was discussed at some length last week in the Commons. It was opened by a Liberal member, Sir Tudor Walters, who said that 143,731 persons in the building trade were unemployed. Those men could build 100,000 houses in twelve months, and another 100,000 men could be employed for the provision of material. If the Government would set to work now and build 100,000 houses, 250,000 of the unemployed would be given work. If to that were added the saving that would accrue in unemployment benefit, they would let the 100,000 houses at an economic rent. There were hundreds of architects and surveyors out of work who would tackle a scheme like that, and would not take many weeks to do it. If he had the job of building 100,000 houses, and no one to interfere with him and no officials to say a word, he would have the houses up in less time than it took to make a report about the matter. What was needed was to get on with the job. He would also like to see some Department of the State undertaking the building of 100,000 houses for the agricultural labourers. That would add another 100,000 to the people who could be employed on housing, making 350,000 in all. A national regional planning committee should also be set up at once to survey sites and make plans for future development.

Mr. Morrison, the Minister of Transport, said that the Government had thought that the proper course to adopt was to set up a body composed of recognized experts in the main classes of works which arose under town planning, as, for instance, roads, garden cities, satellite towns, general public works, and valuation, together with some leading representative men in local government. It was not proposed that State officials or politicians, as such, should serve on the committee. It would be rather of a technical and expert character. The Government proposed to attach to this committee as assessors expert representatives of the Government Departments concerned. The terms of reference to the committee, which the Government proposed to set up immediately, would be: To consider the reports issued by the regional planning committees—many of which were, of course, in existence or in process of being set up under existing legislation — and to recommend (*a*) what schemes of work could be put in hand with due regard to the return to the community from the expenditure incurred, the need of pressing forward with the work as expeditiously as possible and of avoiding the delay of other works now being, or shortly to be, executed; and (*b*) what measures should be taken to secure that the works should be speedily carried out, with an estimate of the probable cost of the several schemes, the economic return, and the amount of employment likely to be afforded by them. Immediately that report was received, elements of considerable policy would obviously arise which they would all have to consider and on which the Government would come to the necessary conclusions. Immediate steps were being taken to appoint the committee and get it actively at work, although he could not give the names at present.

Mr. Greenwood, the Minister of Health, said that he differed fundamentally from the view that one of the real ways to deal with unemployment was a centralized housing policy. They could not, after building up the local authorities, take from them one of the big powers they possessed. This country had done more to deal with the housing situation since the war than any other country, and he would not agree to some new monopolistic enterprise that was going to override the local democratic institutions.

LAW REPORT

WHAT IS REASONABLE TIME FOR CARRYING OUT A CONTRACT?

S. Haskins and Bros., Ltd. v. *Leverett, Kearton & Co., Ltd. and J. M. Sheppard. Official Referee's Court. Before Sir William Hansell, K.C.*

THIS case had reference to the disputed value of building and decorative work, and there was a counterclaim for damages for delay.

The facts appear fully in the judgment of the local official referee.

Sir William Hansell said the case raised many important points on which there was a very complete difference in the evidence given on behalf of the plaintiffs and the defendants. The plaintiffs, Samuel Haskins and Bros., Ltd., were the well-known firm of shopfitters, and the defendants were a large firm of motor dealers. The plaintiffs' claim was for work done by the plaintiffs as shopfitters for the defendants, Kearton & Co., Ltd., at Dering Street, W., premises to be used as showrooms for cars. The order for the work was not given the plaintiffs till the middle of April, 1928. After the work had been commenced a considerable amount of extra work was ordered by the defendants, acting through their agent and architect, Mr. Sheppard.

The first question was upon what terms was the extra work done by the plaintiffs. Defendants alleged that the work was to be finished by May 1, or finished as to the ground floor or as to the shop front, and, further, the plaintiffs were to use their best endeavours to finish the work by that date, or within a reasonable time as urgent work. The real question appeared to the local referee to be whether there was any time limit set for the plaintiffs, during which they contracted to finish the work, including the extras. He was clearly of opinion that the only time limit was that the plaintiffs agreed to put in the shop front by May 1. With regard to that they were three or four days late. As to the rest of the work the contract was to be finished within a reasonable time, and he thought the plaintiffs did not know that it was a matter of considerable importance to the defendants for them to get in as soon after May 1 as was reasonably possible. The work finished on June 15. He found as a fact that eight weeks was, in all the circumstances, a reasonable time in which the plaintiffs could finish the work. There was, however, a great deal of extra work with regard to decorations, and there was the fact that the premises were also occupied by the builders. He accepted the view that eight weeks was not an unreasonable time for the plaintiffs to have taken in which to complete the work, and he so found. Therefore there was no breach of the contract to complete the work in a reasonable time. He knew there was some slight adjustment and possibly little alterations here and there after June 15, but that was not substantial and therefore, as far as the ground floor was concerned, he found there was no unreasonable time occupied.

If the plaintiffs had performed their contract, what were they entitled to be paid? Mr. Hider, an architect of great experience (and he was confirmed by Mr. Leslie, another experienced architect), had given figures, and the official referee accepted his view as to the fairness of the figures which he had put down. Mr. McMinn, the architect for the defendants, put the amount at a much lower figure. On the whole he accepted Mr. Hider's account, as he had worked it out and given the prices for everything, and the amount due on this part of the case came to £235 odd, which included an addition of 25 per cent. for profit, overheads, insurance and such-like things.

The official referee said he had carefully considered the question as to whether that was a reasonable amount on this account, but he could not bring himself to think that 25 per cent.

was a reasonable amount. Having regard to all the circumstances, he thought that 20 per cent. was a sufficient amount, and he therefore deducted 5 per cent. from the amount of Mr. Hider's total. There were one or two small deductions to be made, which left the sum of £214 8s. 9d. as being due to the plaintiffs.

There was a further claim for £92 odd in respect of special work, and he held that that was recoverable, which made a total of £306 18s. 9d. due to plaintiffs on the claim.

There was a counter-claim for damages for delay, and on this head it was for the defendants to satisfy him that the time expended over this contract was unreasonable. Defendants had failed to prove anything of the sort. Plaintiffs had satisfied him that the time they took was, in all the circumstances, reasonable. The counter-claim therefore failed.

In case he were wrong in his construction of the contract, or breach by the plaintiffs to do the work in a reasonable time, he assessed the damage, if it were recoverable, at £43 14s. 6d.

Defendants claimed £300 for loss of profit for the six weeks during which they were deprived of the use of the ground floor at Dering Street. He was of opinion that the defendants had failed to prove that any loss of profit arose from the assumed delay on the part of the plaintiffs, as he thought that they had user from May 4, and, if not, certainly from May 9 onwards.

He entered judgment for the plaintiffs for £306 odd on the claim, with costs. There would be judgment for the plaintiffs on the counter-claim, with costs, and there would be an order that the plaintiffs pay the defendant Sheppard his costs down to the time of discontinuance.

Mr. Graham Mould and Mr. Graham Brooks (instructed by Messrs. Darling and Taylor) appeared for the plaintiffs, and Mr. C. M. Mitchison (instructed by Messrs. Richardson, Sadler & Co.) for the defendants.

Plaintiffs' experts were Mr. E. J. W. Hider, F.A.I., B.A., and Mr. H. G. Leslie, and the defendants' Mr. J. M. Sheppard, F.R.I.B.A., and Mr. H. A. McMinn, F.S.I.

SOCIETIES AND INSTITUTIONS

DARCY BRADDELL ON MECHANISM

THE pros and cons of "Mechanism" were discussed by Mr. Darcy Braddell, F.R.I.B.A., lecturing at a meeting of the Liverpool Architectural Society.

He said the shadow of a revolution in house building was beginning to spread over the land. There would be many vested interests, notably those of the Bond Street decorators, that would fight it to the bitter end, because the sale of "antiques" was not encouraged by the disciples of "Mechanism." On the other hand, young men born to a worship of mechanics would support the new style, because they saw in it something that was in harmony with the life they wanted and intended to lead.

The lecturer thought that "Mechanism" in its present form was too inhuman and graceless to last, but none the less very important, because it made those brought up in the belief that the English tradition could never die look to their creed and wonder. Its main fault lay in that it was too brutally logical, and did not take into account that the present mode of life, ideas, and ideals were still those of mankind and not robots, that grace and elegance were still wanted. Here, perhaps, the group that lay between the die-hard traditionalist and copyist and the mildly enthusiastic mechanist might prove useful in the formation of a new style.

Today we had the birth of "Mechanism," because the world, particularly the young world, was passionately interested in mechanics.

MANCHESTER ARCHITECTS' ANNUAL DINNER

The annual dinner of the Manchester Society of Architects was held in the Masonic Temple, Manchester, on December 12.

Mr. J. Theo. Halliday, F.R.I.B.A., who presided, proposing the toast of the "R.I.B.A.," said it was the work of town-planners to keep civilization tidy. Referring to Wythenshawe, he stated that they were anxious that it should not be another Kingsway. They as architects had placed their services at the disposal of the Corporation in the hope that in some way they might stave off such a fate from that very beautiful piece of Cheshire. Architects could help a great deal, and they hoped that in the future speculative buildings would not be in the nature of a blot on our suburbs.

Dr. Raymond Unwin, F.R.I.B.A., in responding, said there was going to be a great field of practical work for architects to cover in the next few years. They had to see that the great quality of design was added to the large section of building work in this country which, at present, was going along without design. Materials were merely being put together without relationship or proportion one to the other, and they had no effect beyond a corrupting effect upon the public. If this continued, they would not be able to keep that sense of unity of purpose between the public and those who were building, which was essential if they were to make architecture a great art.

Prof. Patrick Abercrombie, F.R.I.B.A., said the great schemes of slum clearance would give them opportunities of adding beauty to their towns, but it was essential that they should have cleaner atmospheres.

The Lord Mayor of Manchester (Alderman Titt) remarked that, while Manchester's commercial buildings would compare with any that were going up in other parts of the country, he did not want to see the city looking like New York.

SCHOOL ARCHITECTURE IN DERBYSHIRE

At a meeting of the Sheffield, South Yorkshire and District Society of Architects and Surveyors, Mr. G. H. Widdows, F.R.I.B.A. (Architect to the Derby Education Committee), lectured on "Modern School Buildings."

Mr. Widdows said his remarks would be confined to school architecture in Derbyshire, but he paid tribute to the fact that modern school planning received its impetus from Dr. George Read, of Staffs., after the passing of the 1902 Act. The speaker pointed out that at the time of the passing of the 1870 Act, schools were of simple character and were either rectangular in plan or T- or L-shaped. Afterwards, these buildings were added to, as the need for increased accommodation arose, in such a way that there was no chance of through ventilation owing to the way the additions were made. After this came the central hall type of school, which, prior to the 1902 Act and for some time afterwards, was the standard school adopted by a large number of education authorities. In this type the rooms ventilated into the central hall, with the result that the foul air from one set of classrooms could be blown across the hall and enter the rooms on the other side.

After 1902, when the present education system took its birth, school hygiene received due consideration. It was then decided that if classrooms were to be healthy, two outside walls should be open to the fresh air to secure proper ventilation, leaving the wind as the ventilating force. By adopting these principles, various arrangements of planning could be obtained and the grouping of classrooms round a courtyard was much to be preferred. The quadrangle should be laid out with flowers, grass and shrubs, and could be made interesting by the provision of fish ponds, sunken gardens, sun dials, and the like.

The main factors in modern school-planning centred round ventilation, lighting and heating, and the speaker

went on to describe the use of doors and windows and the type most suitable to ensure adequate ventilation. In the matter of lighting, the best method was to have a continuous skylighting along the north, as this ensured adequate lighting and removed any chance of glare. If dormers were used on the south side, they should not be large, otherwise the beneficial effect of the north light would be lost.

The speaker next described the method of heating adopted in the open-air schools, and gave reasons for warming the floors in preference to other methods of heating. Slides were shown illustrating the layout of buildings and the grounds, and the interior arrangements of the halls, laboratories, etc.; slides were also shown of the furniture now in use in Derbyshire schools.

MALTESE ARCHITECTURE

"Maltese Architecture" was the title of a lecture by Professor L. P. Abercrombie, given at a meeting of the Sheffield, South Yorkshire and District Society of Architects and Surveyors, held at Sheffield University.

The lecturer, commenting on the number of fine buildings in Malta, said there was an indefinable impetus towards the creation of fine architecture, and that impetus had grown up from the time of the Knights of St. John and continued to modern days. He believed that one of the reasons was the existence on the island of an extremely fine building stone, but there were other factors, which he explained during his lecture.

R.I.B.A. COUNCIL MEETING

Following are some notes from a recent meeting of the R.I.B.A. Council.

Ralph Knott Memorial Fund: On the recommendation of the Board of Architectural Education it was agreed to accept the proposal of the Architectural Association that the R.I.B.A. Maintenance Scholarships Committee should undertake the nomination of a recipient of the Ralph Knott Memorial Scholarship each year.

Examination for the R.I.B.A. Diploma in Town Planning: The Board of Architectural Education reported that Mr. J. M. Fraser had passed the Examination for the R.I.B.A. Diploma in Town Planning. It was resolved to award the Diploma to Mr. Fraser.

The Architects' Benevolent Society: At the invitation of the Council of the Architects' Benevolent Society it was agreed that the R.I.B.A. should be nominated as a trustee of the Society.

The Library Association: On the recommendation of the Literature Standing Committee it was agreed that the R.I.B.A. should join the Library Association as a corporation.

The Fellowship: The Council, by a unanimous vote, elected Lt.-Col. P. A. Hopkins to the Fellowship under the powers defined in the Supplemental Charter of 1925.

Election of Students: The following Probationers were elected as students of the R.I.B.A.:

Denison, T. E. T. (Leeds College of Art).
de Wet, R. L. (University of London).
Farrow, J. W. (Architectural Association).
Franks, R. H. (Northern Polytechnic).
Jackson, R. J. L. (Liverpool School of Architecture).
Johnson, F. F. (Leeds College of Art).
Lingwood, P. (Leeds College of Art).
Lloyd, M. E. (Birmingham School of Architecture).
Maw, Z. T. (Architectural Association).
Mayo, M. I. (Liverpool School of Architecture).
Naude, D. F. H. (Liverpool School of Architecture).
Rogers, V. W. (Liverpool School of Architecture).
Sarjeant, J. K. G. (University of London).
Seel, E. (Leeds College of Art).
Spence, C. C. (Armstrong College, Newcastle-on-Tyne).
Stammers, C. S. (Liverpool School of Architecture).
Wise, A. G. (University of London).

ARCHITECTS AND BUILDERS' LUNCHEON

A joint luncheon of members of the South-Eastern Counties Society of Architects, the R.I.B.A. and the Southern Counties Federation of Master Builders was held at the County Hotel, Canterbury, recently.

Councillor A. W. Larkin, replying to the toast, "Prosperity to the Building Industry," proposed by Mr. H. C. Ashenden, considered that such meetings were useful functions in enabling the architects and builders to meet together and have a cross-table talk about those matters which affected the industry; for too long they had been isolated in their own particular parts instead of being one concrete whole. He believed that, generally speaking, the relations between architects and builders were quite good. He was exceedingly glad that overtures had taken place between the two bodies as a result, in the first place, of the architects sending them specimen copies of their year book, in which were starred members of the Federation who, he suggested, should be looked upon as hall-marked men, worth considering as qualified to carry out their work.

Other speakers included Messrs. Cannon, R. G. Lovell and R. H. Stevens. A paper on "Architects—Award and Agency," was read by Major Watson.

INSTITUTION OF STRUCTURAL ENGINEERS

The seventh annual dinner of the Lancashire and Cheshire branch of the Institution of Structural Engineers was held recently at the Grand Hotel, Manchester. Mr. J. H. Jameson presided.

The Lord Mayor of Manchester (Alderman G. F. Titt), in proposing the toast of "The Institution of Structural Engineers," said that some people would say that modern buildings of steel and concrete were not so beautiful as the old, but in the last few years he had seen many of these new buildings which he considered were quite as beautiful, besides being more useful.

Mr. R. H. H. Stanger, A.M.INST.C.E., in his response, said that the great question which was now occupying the minds of structural engineers was the revision of building bylaws. He was quite sure they would have the cordial co-operation of all municipalities who had building bylaws.

A STUDENTS' COMPETITION

A students' competition has been arranged by the West Essex Chapter of the Essex, Cambridge and Hertfordshire Society of Architects, open to all architectural students, not over twenty-one years of age, resident or employed in the Chapter's area. Prizes of two guineas, one guinea and half a guinea will be awarded for the best efforts, assessed by the Executive Committee of the Chapter.

It is hoped, should the work submitted be of sufficient merit, that an exhibition of the drawings will be arranged for and a criticism given by the assessors.

The subject set will be a small detached house, cost not exceeding £1,200 exclusive of land.

Particulars of the competition are obtainable on application to Mr. Arthur C. Russell, L.R.I.B.A., Hon. Secretary, "Cleadon," Great Nelmes, Hornchurch, Essex.

REGIONAL PLANNING COMMITTEE

Sir Banister Fletcher, P.R.I.B.A., has been appointed to represent the City Corporation, of which he is a member, on the Greater London Regional Planning Committee.

TWO NEW BRIDGES

At a meeting of the Newcastle and District Association of the Institution of Civil Engineers, papers were discussed on the New Tyne Bridge at Newcastle, by David Anderson, B.SC., M.INST.C.E., and on the New Wearmouth Bridge, Sunderland, by G. L. Groves, B.SC., M.INST.C.E.

The papers described the design and construction of the two bridges, and dealt fully with the ingenious methods of erection adopted in each case. A large number of slides illustrative of the progress of the two works was exhibited.

Mr. Albert Saville Buckley, of Chorley, architect and surveyor, left £8,700 (net personalty £7,486).

Mr. John Alfred Cheston, M.C., F.R.I.B.A., surveyor to the Bridewell and Bethlem Royal Hospitals, left £8,236 4s. 9d. (net personalty £8,109 0s. 7d.).

THE ARCHITECTS' DIARY

WEDNESDAY, DECEMBER 24
R.I.B.A., 9 Conduit Street, W.1. Office and Library closed until December 27.
ARCHITECTURAL PRESS, 9 Queen Anne's Gate, S.W.1. Offices closed until December 29.
EXHIBITION OF MODELS OF OLD LONDON. At the Golden Cross Hotel, Strand, W.C.2. The models are the work of John B. Thorp. **2.30 p.m.**

SATURDAY, DECEMBER 27
Sunrise, 8.5 a.m. Sunset, 3.57 p.m.

MONDAY, DECEMBER 29
R.I.B.A., 9 Conduit Street, W.1. First of two Christmas Holiday Lectures on Architecture for Boys and Girls. By the Hon. H. A. Pakington, A.R.I.B.A. (Also December 31.) **3.30 p.m.**

MONDAY, JANUARY 5, 1931
R.I.B.A., 9 Conduit Street, W.1. General Meeting. Award of prizes and studentships. T. A. Darcy Braddell, F.R.I.B.A., will criticize work submitted. **8 p.m.**

TUESDAY, JANUARY 6
L.C.C. SCHOOL OF BUILDING, Ferndale Road, Brixton, S.W.4. Exhibition of work submitted by craftsmen and apprentices for the 1930 Competition organized by the National Painters and Decorators Joint Education Committee of England and Wales. 10 a.m. to 8 p.m. (Also January 7, 8, and 9.) **10 a.m.**

WEDNESDAY, JANUARY 7
LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. "Cautionary Guide to Liverpool and Surrounding Country." By Clough Williams-Ellis, F.R.I.B.A. **7.30 p.m.**
INSTITUTION OF STRUCTURAL ENGINEERS. Lancashire and Cheshire Branch. At the Engineers' Club, Albert Square, Manchester. Paper by J. Theo. Halliday, F.R.I.B.A. **7 p.m.**
INSTITUTION OF HEATING AND VENTILATING ENGINEERS. At the Swedenborg Hall, 20 Hart Street, Bloomsbury, W.C.1. "Notes on the Theory of Radiant Heating." By C. G. Heys Hallett, M.A. **7 p.m.**
INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Informal Meeting. **6 p.m.**

THURSDAY, JANUARY 8
SHEFFIELD, SOUTH YORKSHIRE AND DISTRICT SOCIETY OF ARCHITECTS AND SURVEYORS. At the University, Sheffield. "Some New Buildings in Sweden and the Stockholm Exhibition." By E. R. Jarrett, A.R.I.B.A. (Tea, 5.30 p.m.) **6.15 p.m.**
INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "Thames House." By R. Travers Morgan, A.M.INST.C.E. **6.30 p.m.**

FRIDAY, JANUARY 9
INSTITUTION OF STRUCTURAL ENGINEERS. Annual Dinner to be held at the Mayfair Hotel, W.1. 6.45 for 7.15 p.m. Midland Counties Branch. At the Chamber of Commerce Buildings, New Street, Birmingham. "Some Considerations Affecting the Construction and Reconstruction of Bridges in Urban Areas." By E. R. Knight, A.M.INST.C.E. 6.30 p.m. **6.30 p.m.**

MONDAY, JANUARY 12
ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. "Modern Painters." By R. Wilenski. 8 p.m. Exhibition of Examples of Modern Painting. Until January 24. **8 p.m.**
SURVEYORS' INSTITUTION, 12 Great George Street, Westminster, S.W.1. "The Restoration of St. Paul's Cathedral." By J. E. Drower, C.B.E. (Lantern illustrations.)

TUESDAY, JANUARY 13
INSTITUTION OF HEATING AND VENTILATING ENGINEERS. London and District Branch. At the Borough Polytechnic, Borough Road, Southwark, S.E.1. "Concealed Floor Heating." By John H. Francis. 7 p.m. Manchester and District Branch. At the Milton Hall, Deansgate, Manchester. "Hot-Water Heating." By R. Thorp. **7 p.m.**
INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Ordinary Meeting. **6 p.m.**

WEDNESDAY, JANUARY 14
INSTITUTION OF STRUCTURAL ENGINEERS. Yorkshire Branch. At the Metropole Hotel, Leeds. "Some Problems in the Design of Steel Framed Multiple-Story Buildings." By V. H. Lawton. **7 p.m.**
L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "English Mediæval Architecture: The Pre-Mediæval Periods." By Sir Banister Fletcher, P.R.I.B.A., F.S.A. **6 p.m.**
INSTITUTION OF ELECTRICAL ENGINEERS. Hampshire Sub-Centre. At the Municipal College, Portsmouth. Short papers will be read and discussed. **7.30 p.m.**
INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. Students' Meeting. **6.30 p.m.**

THURSDAY, JANUARY 15
R.I.B.A., 9 Conduit Street, W.1. Special Meeting. "Persian Art." By Arthur Upham Hope. **5.30 p.m.**
L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Lecture by J. Stuart Lewis, M.I.STRUCT.E., M.I.E.E. **7.30 p.m.**
INSTITUTION OF STRUCTURAL ENGINEERS. South Wales and Monmouthshire Branch. Visit to Aberthaw and Rhos Cement Company's Works, Rhos.

SATURDAY, JANUARY 17
Sunrise, 7.57 a.m. Sunset, 4.24 p.m.
INSTITUTION OF HEATING AND VENTILATING ENGINEERS. Manchester and District Branch. Visit to liner at Liverpool.
L.C.C. SCHOOL OF ARTS AND CRAFTS. Visit to Dorman Long & Co.'s Works, Middlesbrough. (Party limited to 90.)

MONDAY, JANUARY 19
R.I.B.A., 9 Conduit Street, W.1. General meeting. Presentation of London Architecture Medal, 1929, and medals and prizes, 1931. **8 p.m.**
INSTITUTION OF ELECTRICAL ENGINEERS. Western Centre. Annual Dinner to be held at Bristol.

TUESDAY, JANUARY 20
INSTITUTION OF ELECTRICAL ENGINEERS. North-Western Centre. Annual Dinner to be held at the Midland Hotel, Manchester.

WEDNESDAY, JANUARY 21
LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. "Bridges." By G. H. Jack, F.R.I.B.A., M.INST.C.E. **7.30 p.m.**
ARTS BUILDING, University, Lime Grove, Manchester. "Treatment of the Smaller Houses." By Herbert A. Welch, F.R.I.B.A.
L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "The Mediæval Period: Plans, Vaults and Buttresses." By Sir Banister Fletcher, P.R.I.B.A. **6 p.m.**
DRAWING OFFICE MATERIALS MANUFACTURERS AND DEALERS' ASSOCIATION. Annual Dinner to be held at the Hotel Victoria, Northumberland Avenue, W.C. 6.30 for 7 p.m. **6.30 p.m.**

THURSDAY, JANUARY 22
INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. Paper by Professor J. Husband, M.ENG., M.INST.C.E. **6.30 p.m.**

FRIDAY, JANUARY 23
WEST YORKSHIRE SOCIETY OF ARCHITECTS. At the Technical College, Cardiff. First of six public lectures on "Egyptian and Western Asiatic Architecture." By Norman Culley, F.R.I.B.A. **7.45 p.m.**
INSTITUTION OF STRUCTURAL ENGINEERS. Western Counties Branch. At the Merchant Venturers' Technical College, Unity Street, Bristol. "Fatigue of Metals." By M. Morgan, B.SC. 7.30 p.m. Lancashire and Cheshire Branch. At the College of Technology, Manchester. "Structural Engineering in Modern Gasworks." By A. E. Pierce, M.I.STRUCT.E. 7 p.m. Midland Counties Branch. At the Chamber of Commerce Buildings, New Street, Birmingham. "Reinforced Construction at Bournemouth Gas Works." By H. M. Hale, M.I.STRUCT.E. **6.30 p.m.**

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. Manchester and District Branch. At the Milton Hall, Deansgate, Manchester. "Panel Heating." By C. M. Oates. **7 p.m.**

COMPETITIONS OPEN

January 7.—The Incorporated Association of Architects and Surveyors invites competitive designs for a Model Petrol Filling and Service Depot. Assessors: Alfred Stephens Cross, M.A. (CANTAB.), V-P., I.A.A.S.; Edward H. Fryer, and Walter Groves. Prizes: 50 guineas, 20 guineas and 10 guineas. Smaller awards may also be made on the advice of the assessors. Full particulars, etc., are obtainable from the Secretary, the Incorporated Association of Architects and Surveyors, 1 Wilbraham Place, London, S.W.1. Latest date for submission of designs: January 7, 1931.

January 10.—The Bermondsey B.C. recently invited competitive designs for a proposed new medical clinic in Tower Bridge Road, S.E. Premiums: £250, £150 and £50. Designs should be submitted to E. Goff Clark, Town Clerk, Town Hall, Spa Road, Bermondsey, by January 10, 1931.

January 15.—The Committee of the Foundation Hospital and the Rectorate of the Royal Yugoslavian University of Zagreb invites competitive designs for the general rebuilding plans of the Foundation and Clinic Hospital of Zagreb. Prizes: 1st, 20,000 Swiss francs; 2nd, 15,000 Swiss francs; 3rd, 10,000 Swiss francs. 15,000 Swiss francs have been set aside for any further work which may be required. Latest date for submission of designs: January 15, 1931.

January 31.—The Coventry Corporation invites architects to submit competitive designs for a new Hospital for Infectious Diseases. Architects competing must be established in private practice. Assessor: E. Stanley Hall, M.A., F.R.I.B.A. Premiums, £300, £200 and £100. Particulars may be obtained from Frederick Smith, Town Clerk, Council House, Coventry, until January 31. Deposit £1 1s. Latest date for submission of designs: April 30, 1931.

February 1.—The Norwich Corporation invites architects practising in the County of Norfolk to submit competitive designs for a proposed new fire station to be erected on a site in Bethel Street, Norwich. Conditions of the competition are obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. Deposit, £1 1s. Latest date for submission of designs: February 1, 1931.

February 12.—Messrs. Venesta, Ltd., invite practising architects and designers to submit preliminary designs for a stand at the Building Trades Exhibition at Manchester. Assessors: Messrs. Christian Barman, H. de C. Hastings, W. L. Wood, Henry Rutherford, and Professor A. E. Richardson. Premiums: 1st, £100, and £10 each to the four competitors placed next in order. Full particulars may be obtained from the Editor of THE ARCHITECTS' JOURNAL, 9 Queen Anne's Gate, S.W.1, or direct from Venesta, Ltd., Vintry House, Queen Street Place, London, E.C.4. Latest date for submission of designs: February 12, 1931.

April 1.—An international competition for the development of the uses of aluminium and its alloys, open to inventors of any nationality, is to be held annually by the International Aluminium Bureau. The competition will be divided into two sections. The prizes to be awarded are 25,000 French francs for the entries under Sections A (methods of working or using the metal) and B (manufacture of articles therefrom) respectively, and 50,000 French francs to the author of a suggestion which has exceptional interest or value under either section. Entries may be submitted between January 1 and April 1, 1931. Full particulars are obtainable from the Bureau International de l'Aluminium, 23 bis, Rue de Balzac, Paris, France.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

LATEST PATENT APPLICATIONS

36368. Baines, J. Compound panels for roofing, etc. December 3.

36811. Baines, J. Building units. December 6.

36853. Greig, B. Concrete, etc., construction. December 6.

SPECIFICATIONS PUBLISHED

338999. Evans, J. W. Metal window frames and casements or sashes therefor, and the method of manufacturing the same.

339090. Newman and Sons, Ltd., W., and Rollason, S. A. Apparatus for closing and checking sliding doors, gates, and the like.

TRADE NOTES

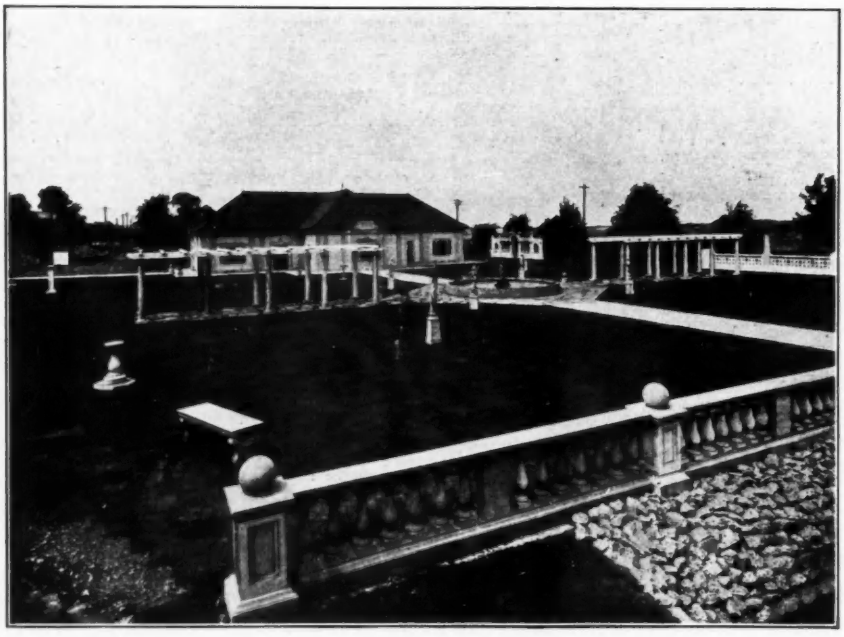
Messrs. Speirs & Co., of 16-18 Bucknall Street, London, W.C.2, have issued a new catalogue of sanitary fittings, containing a selection of their latest designs. All the goods illustrated and priced are of British manufacture. The earthenware lavatory basins and pedestal closets are designed on the best hygienic principles, and are of the highest grade in quality and finish. The fireclay lavatory basins, urinal stalls, pedestal closets and sinks are all leadless glazed and non-absorbent. The firm claim that for public institutions, schools, hotels, and other places, where strength and reliability combined with the highest form of hygiene are required, these goods cannot be surpassed. The baths are all heavy cast-iron, and the porcelain enamel, either white or coloured, is claimed to be the best quality.

*

The move of the Federation of British Industries from its old offices at the corner of St. James's Street and Piccadilly which it has occupied for so many years, took place recently, in order that the organization would be installed in its new building prior to the Christmas holidays. It will be remembered that the Federation have been building their own offices at No. 33 Tothill Street, Westminster, for the last two years. It will also be recalled that the previous building which stood upon this site was occupied by the Architectural Press.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :



Savings Bank, Liverpool (pages 935-937). General contractors, Joshua Henshaw and Sons. Mr. H. Tyson Smith, carving and modelling. Sub-contractors : Henshaw Bros., plumbing and painting; McIntyre and Sons, Ltd., constructional steelwork; Killick and Cochran, heating installation; John Hunter & Co., electrical installation; Birmingham Guild, Ltd., electric light fittings, metal lettering and name plates; Rowe Bros. & Co., Ltd., metal windows, etc.; Comyn, Ching & Co., Ltd., laylight; Milner's Safe Co., Ltd., strong room door and safe; Roberts, Adlard & Co., tiling to roof; Musgraves (Liverpool), Ltd., sanitary fittings; Korkoid Decorative Floors, Ruboleum and linoleum; J. H. and I. Sankey, Ltd., bank fittings.

Daniel Neal's New Store, Portman Court, W. (pages 938-940). Sub-contractors : Higgs and Hill, Ltd., oak floors; Hall, Beddall & Co., Ltd., plastering, teak staircases, and general decorations; Killby and Gayford, Ltd., formation of fronts, partitions, etc.; Fenning & Co., Ltd., marble and granite; Thornton Alder & Co., electric installation; Waygood-Otis, Ltd., passenger lifts: Morris-Singer, staircase balustrades and entrance gates; Lamson Pneumatic Tube Co., payment and vacuum plant; Rosser and Russell, Ltd., ventilation plant; Young, Austen, and Young, hot water, heating and domestic supplies; James Gibbons, Ltd., bronze window sashes; Harris and Sheldon, Ltd., bronze shopfronts, interior fixtures and fittings and staircase panelling; Turner, Lord & Co., ladies' fashion shoe salon; Yannedis & Co., ironmongery to special design; J. Akers, lighted name fascias; Mallinson and Sons, Ltd., specially selected veneers.

The architectural metalwork at the Orpheum Theatre, Finchley, illustrated in THE ARCHITECTS' JOURNAL for December 10, was carried out by Messrs. The Kingsmill Co., and comprised balcony balustradings, bronze section handrailing, grilles in proscenium, balustrading in the foyer, and the bronze shaped section handrails on the staircases.

*

The roof lights used in Cropthorne Court, Maida Vale, W., designed by Sir Giles Gilbert Scott and illustrated in our last issue, were carried out by Messrs. J. A. King & Co., Ltd.

A general view of the exhibition of concrete work at Kent Portland Cement Works, Greenhithe, Kent. It is one of a chain of permanent exhibitions to be installed at the works of the Associated Portland Cement Manufacturers, Ltd. and the British Portland Cement Manufacturers, Ltd. The chief aim has been to show as many different types of concrete work as possible, rather than to follow any definite architectural design, and, whilst the artistic side of concrete is the dominant feature, its utilitarian aspect has not been lost sight of. Here one may see a fine doorway; within a stone's throw is a trough for the humble pig-sty. Delicately coloured and polished slabs are shown in contrast to a section of concrete road, specially made to withstand heavy, fast-moving traffic.

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

The Housing Committee of the BARNES Council estimate that a total of one hundred new houses of a working-class type would be erected by the Council during the next five years, under the Housing Act, 1930.

The Reddins Road L.C.C. School, CAMBERWELL, is being remodelled at a cost of £12,242.

The renovation and reconditioning of the Mansion House, CITY, E.C., will cost approximately £50,000.

The plans of a new elementary school at EAST HAM have been approved by the Board of Education. The architects are Messrs. Marshall and Partners.

Work is proceeding on the excavations for the new hotel which will occupy a site of 56,000 square feet at MARBLE ARCH. This hotel, which will be completed in the early part of 1933, will be owned jointly by Messrs. J. Lyons & Co., Ltd., and the Strand Hotel, Ltd.; a separate company is being formed for the purpose. The steel frame, which is being manufactured and erected by Messrs. Dorman, Long & Co., Ltd., will weigh over 10,000 tons, and deliveries are expected to commence early in January. There will be eight floors and a roof above ground level, and, in addition, a basement and sub-basement. Owing to the vast size of the site, nearly 3,000 tons of steel will be employed before the building reaches ground level. The new tube railway station will be incorporated in the main entrance in Oxford Street, and a large booking-hall, for which Dorman, Long & Co., Ltd., have also supplied the steelwork, is at present being constructed underneath Oxford Street. The hotel will contain 900 bedrooms, and is estimated to cost £1,500,000. The architect is Mr. F. J. Wills, F.R.I.B.A. The engineers are Messrs. Reade, Jackson and Parry, and the contractors for the foundations are Messrs. Holloway Bros. The steelwork is by Messrs. Dorman, Long.

The MARYLEBONE B.C. has approved proposals by Messrs. Selfridge & Co., Ltd., for extending their Oxford Street store as far as Wigmore Street. The report showed that it was proposed to erect a large commercial building to cover the area bounded by Oxford Street, Duke Street, Wigmore Street, and Orchard Street, which would involve the stopping up of Edward's Mews and Somerset Street. The proposals also provided for the surrender to the public way not only of the existing forecourts on the Duke Street, Wigmore Street and Orchard Street frontages, but also strips of land on the Wigmore Street and Orchard Street fronts. The estimated cost is £3,000,000.

The MERTON AND MORDEN U.D.C. is awaiting the approval of the Ministry of Health for the purchase of one-and-three-quarter acres of land in Long Walk, for housing purposes.

The reconstruction of the arch in East Barnet Road, NEW BARNET, and other highway improvements in the immediate locality, are to be carried out at a cost of £30,000.

Negotiations by SOUTHWARK Council for the buying of property which is needed for the Town Hall extension have been successful.

The Mayor of Wandsworth (Councillor Lt.-Col. A. Bellamy), addressing the pupils of the WANDSWORTH Technical Institute, announced that the L.C.C. had made provision for the expenditure of £35,000 for additional accommodation at the Institute.

SOUTHERN COUNTIES.

Plans passed by the CHATHAM Town Council: Twelve houses, Montrose Avenue, for Messrs. A. E. Clifford and Co.; extension, Pagitt Street, Neville Road, and Balfour Road, for the trustees of Watts' Charity (provisionally); two houses, Neville Road, for Messrs. W. T. Davis and Son; bungalow, King Edward Road, Walderslade, for Mr. E. H. Walker; alterations to cinema, High Street, for Chatham Empire Theatre, Ltd.; alterations to Workmen's Club, 106 Palmerston Road, for Messrs. Fremlin's, Ltd. (provisionally); house, Park Crescent, for Mr. H. P. Hughes; two houses, Castle Road, for Mr. C. J. Howard; two bungalows, Clarence Road, for Mr. G. B. Silver; house, Longhill Avenue, for Mr. A. E. Attwood; cottage, Connaught Road, for Messrs. W. T. Davis and Son.

Plans passed by the HAILSHAM R.D.C.: Garage, Bodle Street, for Mr. R. S. W. Sears; office accommodation, Park Gates, Hellingly, for the County Council; bungalow, Red Pale, Warbleton, for Mrs. D. Burgess; bungalow, Cowbeech, Herstmonceux, for Messrs. Long and Blundell; bungalow, Union Road, Hellingly, for Mr. C. F. Christmas; house, Horsebridge, Hellingly, for Mr. J. Izzard.

The Finance Committee of the RYE Council has approved an amended layout plan, prepared by Mr. John Ashenden, of the upper portion of the Cadborough Housing (Surplus) Site, making provision for the erection of twelve houses.

The old RYE mill, which was destroyed by fire last summer, is to be replaced by an exactly similar structure. Plans for the rebuilding of the mill have been passed by the Rye Council.

Plans passed by the SEAFORD U.D.C.: Cottage, Firle Road, for Messrs. Godfrey Bros.; garage, "The Doon," Southdown Road, for Messrs. A. and H. Burgess; garage, "Hillcrest," Sutton Drove, for Mr. E. N. Rix; house, Salisbury Road, for Mr. W. Wilkinson; electric substation, Grosvenor Road, for Messrs. A. and H. Burgess; nine houses, Vale Road, for Messrs. Hutchings Bros.; club house, Mercread Road, for Mr. C. Morling; house, Headland Avenue, for Mr. C. Morling.

SOUTH-WESTERN COUNTIES

The BARNSTAPLE R.D.C. is to erect the following houses in various parishes: Bishopstawton, six; Bratton Fleming, four; Combe Martin, twelve; Fremington, twelve; Heanton Punchardon, four; Instow, eight; Landkey, four; Marwood, twelve; Mortehoe, six; Swimbridge, sixteen; Tawstock, four; and Westdown, eight, making a total of ninety-six.

A five-years' programme of house building, slum clearance and improvement schemes in BRISTOL, announced in our last issue, to be carried out at an estimated cost of £3,500,000, was approved at a meeting of Bristol City Council.

The CLUTTON R.D.C. has decided to erect twelve non-parlour houses in the district.

The Public Health Committee of the EXETER Town Council recommend that the Council submit to the Minister of Health a programme for the erection of 500 houses during the next five years.

Plans passed by the LANGPORT R.D.C.: Cottage, Kingsbury Episcopi, for Messrs. W. and T. Jennings; cottage, Lower Burrow, Kingsbury Episcopi, for Mr. W. Mounter; cottage, Foddington, Babcary, for Mr. J. A. Bartlett; cottage, Muchelney Ham, for Mr. S. Lenton.

The PLYMOUTH Corporation has passed plans for a new theatre to be built in place of the existing Andrews Picture House, in Union Street, Plymouth. Plans have been prepared by Mr. W. H. Watkins.

The SALISBURY City Council has resolved to proceed with a further housing scheme. Fourteen and a-half acres of land on the Pembroke Park estate are to be bought for the erection of houses.

EASTERN COUNTIES

The CAISTOR R.D.C. has accepted the recommendations of the Joint Isolation Hospital Committee with respect to their general hospital and the smallpox hospital at Osgodby. The Council has also decided to adopt a further scheme for the building of thirty houses during next year.

The CASTLE DONINGTON R.D.C. has decided on the East Way site for non-parlour type houses, to be built at Castle Donington.

A cinema with seating capacity for 700 persons is to be built at DOWNHAM, Norfolk. The building, which will include a dance hall, is to stand on the site of the existing post-office, and the latter is to be demolished almost immediately. Messrs. J. Laurie Earnell and W. Dymoke White are the architects.

A rebuilding programme involving the construction of 850 houses and the reconstruction of 1,500 others is recommended to the YARMOUTH Town Council.

MIDLAND COUNTIES

Sketch plans for the enlargement of the DERBY Technical College have been forwarded to the Board of Education for preliminary approval.

The FOLESHILL R.D.C. has approved plans for the erection of four pairs of semi-detached houses in Watery Lane and Penny Park Lane, Keresley, for Mr. W. H. Broad.

Approval was given at a recent meeting of the MALMESBURY R.D.C. for the erection of twelve new houses at Sherston.

A long report dealing with housing in Walsall during the next five years has been issued by the Housing Committee of the WALSALL Council. If 4,000 houses are erected the average annual capital expenditure will be £303,000, and if 5,000 are erected the cost will be £378,000.

NORTHERN COUNTIES

The BEDLINGTON U.D.C. intend to erect a further 700 houses. Negotiations are projected for the purchase of building sites at the West End, Bedlington Station, Cambois, and Stakeford.

The BLACKPOOL Housing and Estates Committee has approved of the proposals to acquire the old trotting track near Squire's Gate, this being a further step in the scheme to build 2,000 more houses in the district.

The trustees of the Pilgrim Trust are placing £25,000 at the disposal of the Committee for the Preservation of DURHAM Castle.

At a meeting of the GRIMSBY Finance Committee it was reported that preliminary arrangements for the purchase of the site of the old Cattle Market from Lord Yarborough had been settled. The Corporation is to build a new cattle market in the Little Coates area.

The HEYWOOD Town Council has adopted a statement for submission to the Ministry of Health, showing what it is proposed to do to provide houses in the next five years. It is estimated that about 600 houses will be provided by local authority and private enterprise combined.

The LEEDS Corporation is spending £25,000 in restoring Kirkstall Abbey, a twelfth-century edifice.

MIDDLESBROUGH's big slum area—Nile Street—is to be demolished and rebuilt under the five-year housing scheme which the Middlesbrough Housing Committee considered at a recent meeting. The area of the scheme is 2·36 acres and includes 169 houses, shops and lodging-houses.

During the next five years it is estimated that there will be 1,199 houses built by the ST. HELENS Corporation, 399 by the Health Committee to provide for those dispossessed by closing orders, and 800 by the Housing Committee. In addition, it is estimated that 500 houses will be built by private enterprise, 200 of which will probably be subsidy houses. It is also estimated that there will be 1,500 houses to be repaired.

In addition to the ordinary programme of houses to be erected, the SCARBOROUGH Town Council proposes to provide seventy-six new houses during the next five years.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarant e the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, *1s. 3½d. per hour;* LABOURER, *1s. 3½d. per hour;* NAVVY, *1s. 3½d. per hour;* TIMBERMAN, *1s. 5d. per hour;* SCAFFOLDER, *1s. 4½d. per hour;* WATCHMAN, *7s. 6d. per shift.*

Broken brick or stone, 2 in., per yd.	£0	11	6
Thames ballast, per yd.	0	10	0
Pit gravel, per yd.	0	15	0
Pit sand, per yd.	0	12	6
Washed sand, per yd.	0	13	0
Screened ballast or gravel, add 10 per cent. per yd.			
Clinker, breeze, etc., prices according to locality.			
Portland cement, per ton	£2	8	0
Lias lime, per ton	2	0	0
Sacks charged extra at 1s. 9d. each and credited when returned at 1s. 6d.			
Transport hire per day:			
Cart and horse £1 3 0 *Trailer*	£0	15	0
3-ton motor lorry 3 15 0 *Steam roller*	4	5	0
Steam lorry, 5-ton 4 0 0 *Water cart*	1	5	0

EXCAVATING and throwing out in ordinary earth not exceeding 6 ft. deep, basis price, per yd. cube . 0 3 0
Exceeding 6 ft., but under 12 ft., add 30 per cent.
In stiff clay, add 30 per cent.
In underpinning, add 100 per cent.
In rock, including blasting, add 225 per cent.
If basketed out, add 80 per cent. to 150 per cent.
Headings, including timbering, add 400 per cent.

RETURN, fill, and ram, ordinary earth, per yd.	£0	1	6
SPREAD and level, including wheeling, per yd.	0	1	6
FILLING into carts and carting away to a shoot or deposit, per yd. cube	0	10	6
TRIMMING earth to slopes, per yd. sup.	0	0	6
HACKING up old grano. or similar paving, per yd. sup.	0	1	3
PLANKING to excavations, per ft. sup.	0	0	5
DO. over 10 ft. deep, add, for each 5 ft. in depth, 30 per cent.			
IF left in, add to above prices, per ft. cube	0	2	0
HARDCORE, 2 in. ring, filled and rammed, 4 in. thick, per yd. sup.	0	2	1
DO. 6 in. thick, per yd. sup.	0	2	10
PUDDLING, per yd. cube	1	10	0
CEMENT CONCRETE, 4-2-1, per yd. cube	1	17	6
DO. 6-2-1, per yd. cube	1	12	6
DO. in upper floors, add 15 per cent.			
DO. in reinforced-concrete work, add 20 per cent.			
DO. in underpinning, add 60 per cent.			
LIAS-LIME CONCRETE, per yd. cube	£1	14	0
BREEZE CONCRETE, per yd. cube	1	7	0
DO. in lintels, etc., per ft. cube	0	1	6
CEMENT concrete, 4-2-1, in lintels packed around reinforcement, per ft. cube	0	3	9
FINE concrete benching to bottom of manholes, per ft. cube	0	3	0
FINISHING surface of concrete spade face, per yd. sup.	0	0	9

DRAINER

LABOURER, *1s. 3½d. per hour;* TIMBERMAN, *1s. 5d. per hour;* BRICKLAYER, *1s. 8½d. per hour;* PLUMBER, *1s. 8½d. per hour;* WATCHMAN, *7s. 6d. per shift.*

Stoneware pipes, tested quality, 4 in., per ft.	£0	0	10
DO. *6 in., per ft.*	0	1	3
DO. *9 in., per ft.*	0	2	3
Cast-iron pipes, coated, 9 ft. lengths, 4 in., per yd.	0	5	6
DO. *6 in., per yd.*	0	8	0
Portland cement and sand, see "Excavator" above.			
Leadwool, per cwt.	£2	0	0
Gaskin, per lb.	0	0	4½

STONEWARE DRAINS, jointed in cement, tested pipes, 4 in., per ft.	0	4	3
DO. 6 in., per ft.	0	5	0
DO. 9 in., per ft.	0	7	9
CAST-IRON DRAINS, jointed in lead, 4 in., per ft.	0	8	3
DO. 6 in., per ft.	0	10	3

Note.—These prices include digging concrete bed and filling for normal depths, and are average prices.
Fittings in Stoneware and Iron according to type. *See* Trade Lists.

BRICKLAYER

BRICKLAYER, *1s. 8½d. per hour;* LABOURER, *1s. 3½d. per hour;* SCAFFOLDER, *1s. 4½d. per hour.*

London stocks, per M.	£4	5	6
Flettons, per M.	2	12	6
Midhurst white facing bricks, per M.	5	0	0
Multi-coloured facings, per M.	7	7	9
Best red facings, per M.	7	7	9
Rubbers, 9¼ in., per M.	12	0	6
Staffordshire blue, per M.	9	5	0

DO. in raising on old walls, etc., add 12½ per cent. per rod.			
DO. in underpinning, add 20 per cent. per rod.			
HALF-BRICK walls in stocks in cement mortar (1–3), per ft. sup.	£0	1	0
BEDDING plates in cement mortar, per ft. run	0	0	3
BEDDING window or door frames, per ft. run	0	0	3
LEAVING chases 2½ in. deep for edges of concrete floors not exceeding 6 in. thick, per ft. run	0	0	2
CUTTING do. in old walls in cement, per ft. run	0	0	4
CUTTING, toothing and bonding new work to old (labour and materials), per ft. sup.	0	0	7
TERRA-COTTA flue pipes 9 in. diameter, jointed in fireclay, including all cuttings, per ft. run	0	3	6
DO. 14 ft. by 9 in. do., per ft. run	0	6	0
FLAUNCHING chimney pots, each	0	2	0
CUTTING and pinning ends of timbers, etc., in cement	0	1	0
FACINGS, fair, per ft. sup. extra	0	0	3
DO. picked stocks, per ft. sup. extra	0	0	7
DO. red rubbers, gauged and set in putty, per ft. sup. extra	0	4	9
DO. in salt white or ivory glazed, per ft. sup. extra	0	5	6
TUCK pointing, per ft. sup. extra	0	0	10
WEATHER pointing, do. do.	0	0	3
TILE creasing with cement fillet each side, per ft. run	0	0	6
GRANOLITHIC PAVING, 1 in., per yd. sup.	0	5	0
DO. 1½ in., per yd. sup.	0	6	0
DO. 2 in., per yd. sup.	0	7	0
If coloured with red oxide, per yd. sup.	0	1	0
If finished with carborundum, per yd. sup.	0	0	6
If in small quantities, in finishing to steps, etc., per ft. sup.	0	1	4
Jointing new grano. paving to old, per ft. run	0	0	4
Extra for dishing grano. or cement paving around gullies, each	0	1	6
BITUMINOUS DAMP COURSE, ex rolls, per ft. sup.	0	0	7
ASPHALT (MASTIC) DAMP COURSE, ½ in., per yd. sup.	0	8	0
DO. vertical, per yd. sup.	0	11	0
SLATE DAMP COURSE, per ft. sup.	0	0	10
ASPHALT ROOFING (MASTIC) in two thicknesses, ¾ in., per yd.	0	8	6
DO. SKIRTING, 6 in.	0	0	11
BREEZE PARTITION BLOCKS, set in cement, 1½ in. per yd. sup.	0	5	3
DO. DO. 3 in.	0	6	6
BREEZE fixing bricks, extra for each	0	0	3

MASON

MASON, *1s. 8½d. per hour;* DO. *fixer,* *1s. 9½d. per hour;* LABOURER, *1s. 3½d. per hour;* SCAFFOLDER *1s. 4½d. per hour.*

Portland Stone:			
Whitbed, per ft. cube	£0	4	6
Basebed, per ft. cube	0	4	9
Bath stone, per ft. cube	0	3	0
Usual trade extras for large blocks.			
York paving, av. 2½ in., per yd. super	0	11	0
York templates, sawn, per ft. cube	0	7	6
Slate shelves, rubbed, 1 in., per ft. sup.	0	2	6
Cement and sand, see "Excavator," etc., above.			

HOISTING and setting stone, per ft. cube	£0	2	2
DO. for every 10 ft. above 30 ft. add 15 per cent.			
PLAIN face Portland basis, per ft. sup.	£0	2	8
DO. circular, per ft. sup.	0	4	0
SUNK FACE, per ft. sup.	0	3	9
DO. circular, per ft. sup.	0	4	10
JOINTS, arch, per ft. sup.	0	2	6
DO. sunk, per ft. sup.	0	2	7
DO. DO. circular, per ft. sup.	0	4	6
CIRCULAR-CIRCULAR work, per ft. sup.	1	2	0
PLAIN MOULDING, straight, per inch of girth, per ft. run	0	1	1
DO. circular, do., per ft. run	0	1	4
HALF SAWING, per ft. sup.	0	1	0

Add to the foregoing prices, if in York stone, 35 per cent.
DO. Mansfield, 12½ per cent.
Deduct for Bath, 33⅓ per cent.
DO. for Chilmark, 5 per cent.

SETTING 1 in. slate shelving in cement, per ft. sup.	£0	0	6
RUBBED round nosing to do., per ft. lin.	£0	0	6
YORK STEPS, rubbed T. & R., ft. cub. fixed	1	7	6
YORK SILLS, W. & T., ft. cub. fixed	1	10	0
ARTIFICIAL stone paving, 2 in. thick, per ft. sup.	0	1	3
DO. 2½ in. thick, per ft. sup.	0	1	6

SLATER AND TILER

SLATER *1s. 8½d. per hour;* TILER, *1s. 8½d. per hour;* SCAFFOLDER, *1s. 4½d. per hour;* LABOURER, *1s. 3½d. per hour.*
N.B.—Tiling is often executed as piecework.

Slates, 1st quality, per 1,200:			
Portmadoc Ladies	£14	0	0
Countess	23	0	0
Duchess	32	10	0
Old Delabole Med. Grey	£45	1	0
24 in. × 12 in. £42 11 3			
20 in. × 10 in. 31 4 3	33	0	6
16 in. × 10 in. 20 18 0	22	4	9
14 in. × 8 in. 12 1 0	12	16	3
Med. Green			
Green Randoms, per ton	8	3	9
Grey-green do., per ton	7	3	9
Green peggies, 12 in. to 8 in. long, per ton	5	13	9
In 4-ton truck loads, delivered Nine Elms station.			
Clips, lead, per lb.	£0	0	6
Clips, copper, per lb.	0	2	0
Nails, compo, per cwt.	1	6	0
Nails, copper, per lb.	0	2	2
Cement and sand, see "Excavator," etc., above.			
Hand-made tiles, per M.	£5	18	0
Machine-made tiles, per M.	5	8	0
Westmorland slates, large, per ton	9	0	0
DO. *Peggies, per ton*	7	5	0

SLATING, 3 in. lap, compo nails, Portmadoc or equal:

Ladies, per square	£4	0	0
Countess, per square	4	5	0
Duchess, per square	4	10	0
WESTMORLAND, in diminishing courses, per square	6	5	0
CORNISH DO., per square	6	3	0
Add, if vertical, per square approx.	0	13	0
Add, if with copper nails, per square approx.	0	2	6
Double course at eaves, per ft. approx.	0	1	0

SLATING with Old Delabole slates to a 3 in. lap with copper nails, at per square.

Med. Grey			Med. Green		
24 in. × 12 in.	£5	0 0	£5	2	0
20 in. × 10 in.	5	5 0	5	10	0
16 in. × 10 in.	4	15 0	5	1	0
14 in. × 8 in.	4	10 0	4	15	0
Green randoms			6	7	0
Grey-green do.			5	9	0
Green peggies, 12 in. to 8 in. long			4	13	6

TILING, 4 in. gauge, every 4th course nailed, in hand-made tiles, average per square	3	17	6
DO., machine-made do., per square	3	7	6
Vertical Tiling, including pointing, add 18*s.* 0*d.* per square.			
FIXING lead soakers, per dozen	£0	0	10
STRIPPING old slates and stacking for re-use, and clearing away surplus and rubbish, per square	0	10	0
LABOUR only in laying slates, but including nails, per square	1	0	0

See "Sundries" for Asbestos Tiling.

CARPENTER AND JOINER

CARPENTER, *1s. 8½d. per hour;* JOINER, *1s. 8½d. per hour;* LABOURER, *1s. 3½d. per hour.*

Timber, average prices at Docks, London Standard, Scandinavian, etc. (equal to 2nds):			
7 × 3, per std.	£22	0	0
11 × 4, per std.	30	0	0
Memel or Equal. Slightly less than foregoing.			
Flooring, P.E., 1 in., per sq.	£1	4	6
DO., *T. and G., 1 in., per sq.*	1	4	6
Planed boards, 1 in. × 11 in., per std.	30	0	0
Wainscot oak, per ft. sup. of 1 in.	0	1	6
Mahogany, Honduras, per ft. sup. of 1in.	0	1	4
DO., *Cuba, per ft. sup. of 1 in.*	0	2	6
DO., *African, per ft. sup.*	0	1	3
Teak, per ft. sup. of 1 in.	0	1	2
DO., *ft. cube*	0	14	0

FIR fixed in wall plates, lintels, sleepers, etc., per ft. cube	0	4	6
DO. framed in floors, roofs, etc., per ft. cube	0	4	6
DO. framed in trusses, etc., including ironwork, per ft. cube	0	8	6
PITCH PINE, add 33⅓ per cent.			
FIXING only boarding in floors, roofs, etc., per sq.	0	13	6
SARKING FELT laid, 1-ply, per yd.	0	1	6
DO., 3-ply, per yd.	0	1	9
CENTERING for concrete, etc., including horsing and striking, per sq.	2	0	0
TURNING pieces to flat or segmental soffits, 4½ in. wide, per ft. run	0	0	4½

CARPENTER AND JOINER: *continued*

SHUTTERING to face of concrete, per square	£1	10	0
DO. in narrow widths to beams, etc., per ft. sup.	0	0	6
USE and waste of timbers, allow 25 per cent. of above prices.			
SLATE BATTENING, per sq.	£0	12	6
DEAL boarding to flats, 1 in. thick and firrings to falls, per square	2	10	0
STOUT feather-edged tilting fillet to eaves, per ft. run	0	0	6
FEATHER-edged springer to trimmer arches, per ft. run	0	0	4
STOUT herringbone strutting (joists measured in), per ft. run	0	0	6
SOUND boarding, ⅞ in. thick and fillets nailed to sides of joists (joists measured over), per square	2	0	0
RUBEROID or similar quality roofing, one-ply, per yd. sup.	0	2	3
DO., two-ply, per yd. sup.	0	2	6
DO., three-ply, per yd. sup.	0	3	0
TONGUED and grooved flooring, 1¼ in. thick, laid complete with splayed headings, per square	2	5	0
DEAL skirting torus, moulded, 1¼ in. thick, including grounds and backings, per ft. sup.	0	1	0
TONGUED and mitred angles to do.	0	0	6
WOOD block flooring, standard blocks laid herringbone in mastic :			
Deal 1 in. thick, per yd. sup.	0	10	0
DO. 1¼ in. thick, per yd. sup.	0	12	0
Maple 1¼ in. thick, per yd. sup.	0	15	0
DEAL moulded sashes, 1¼ in., with moulded bars in small squares, per ft. sup.	0	2	6
DO. 2 in. do., per ft. sup.	0	2	9
DEAL cased frames, oak sills and 2 in. moulded sashes, brass-faced pulleys and iron weights, per ft. sup.	0	4	6
MOULDED horns, extra, each	0	0	3
DOORS, 4-panel square both sides, 1¼ in. thick, per ft. sup.	0	2	6
DO. moulded both sides, per ft. sup.	0	2	9
DO. 2 in. thick, square both sides, per ft. sup.	0	2	9
DO. moulded both sides, per ft. sup.	0	3	0
DO. in 3 panels, moulded both sides, upper panel with diminished stiles with moulded bars for glass, per ft. sup.	0	3	6
If in oak, mahogany, or teak, multiply 3 times.			
DEAL frames, 4 in. × 3 in., rebated and beaded, per ft. cube	£0	15	0
Add for extra labour, per ft. run	0	0	1
STAIRCASE work:			
DEAL treads 1¼ in. and risers 1 in., tongued and grooved, including fir carriages, per ft. sup.	0	2	6
DEAL wall strings, 1¼ in. thick, moulded, per ft. run	0	2	0
If ramped, per ft. run	0	4	6
SHORT ramps, extra, each	0	7	6
ENDS of treads and risers housed to strings, each	0	1	0
2 in. deal mopstick handrail fixed to brackets, per ft. run	0	1	6
4½ in. × 3 in. oak fully moulded handrail, per ft. run	0	5	6
1¼ in. square deal bar balusters, framed in, per ft. run	0	0	6
FITTINGS :			
SHELVES and bearers, 1 in., cross-tongued, per ft. sup.	0	1	6
1¼ in. beaded cupboard fronts, moulded and square, per ft. sup.	0	2	9
TEAK grooved draining boards, 1¼ in. thick, and bedding, per ft. sup.	0	4	6
IRONMONGERY :			
Fixing only (including providing screws) :			
TO DEAL—			
Hinges to sashes, per pair	0	1	2
Do. to doors, per pair	0	1	7
Barrel bolts, 9 in., iron, each	0	1	0
Sash fasteners, each	0	1	0
Rim locks, each	0	1	9

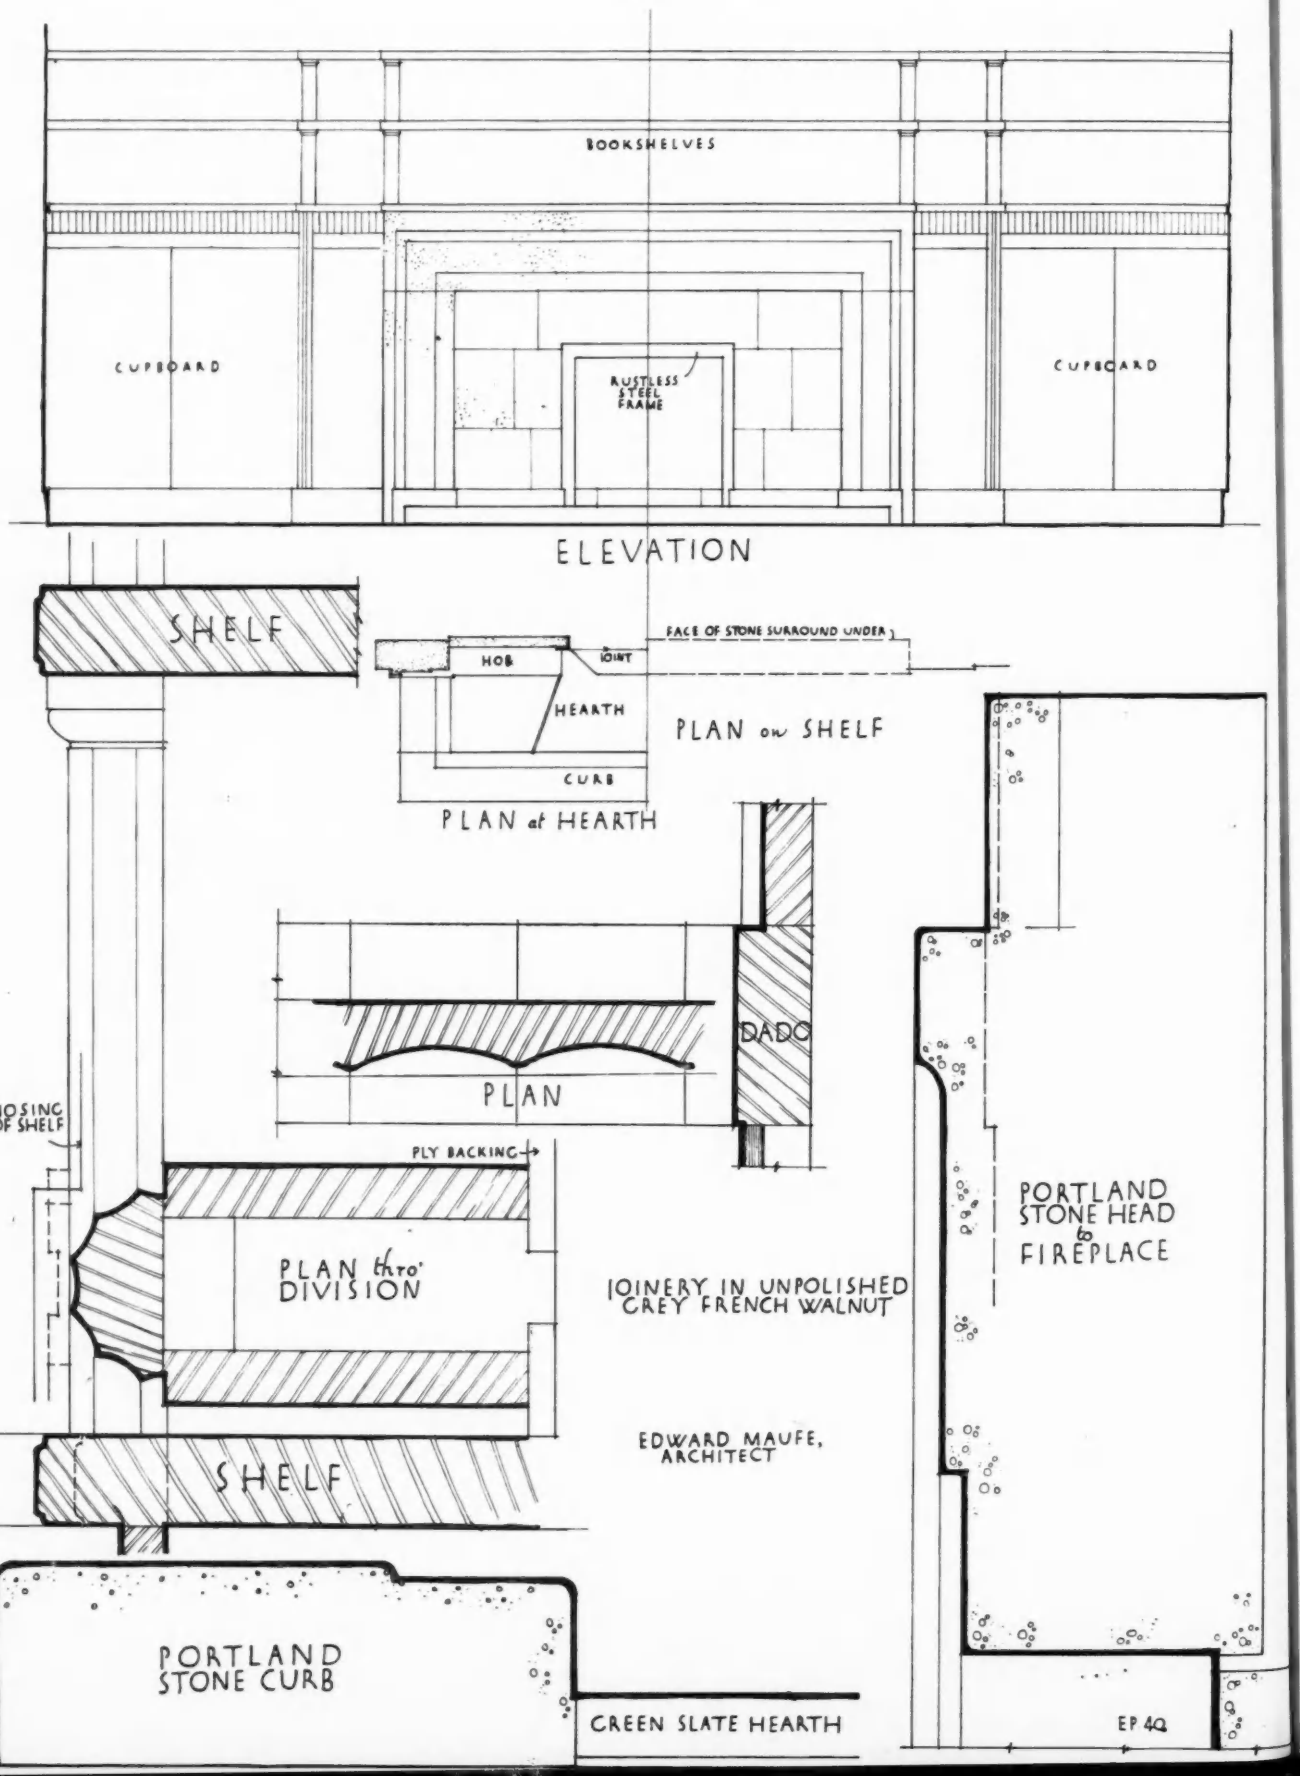
SCALE DETAILS:
A WEEKLY SERIES

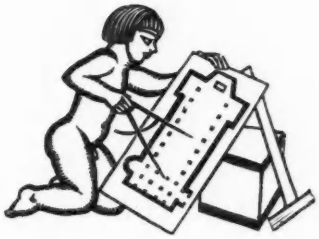
STUDY FIREPLACE,
NO. 37 PORCHESTER TERRACE, W.
Designed by EDWARD MAUFE

BY surrounding the fireplace with bookshelves and cupboards, a very dignified little composition has been achieved that incorporates some detail of a most refined character.



The surround of the fire itself, which is of Whitbed Portland stone, finished with a gritty face, takes the form of a simple architrave of flat projections. This, as it should, picks up the hearth curb in the same material, the hearth itself being of green slate in three pieces, with full $\frac{3}{8}$-inch wide joints.

All the joinery of the bookshelves and flanking cupboards is in unstained natural French walnut of a pink-grey colour, and the detail (which is shown overleaf) is interesting and carefully considered.



The photograph above shows the fireplace fixed in position, with its frame of rustless steel.

The drawings overleaf may be read with architects' ordinary scales.

GILT-EDGED BRICKS AND MORTAR

AT a time of almost universal trade depression it might seem remarkable that there should have been so much building activity as during the past year. There is no doubt that the building trades have up to the present not reflected the general tendency to decline to anything like the degree which has shown itself in so many other industries.

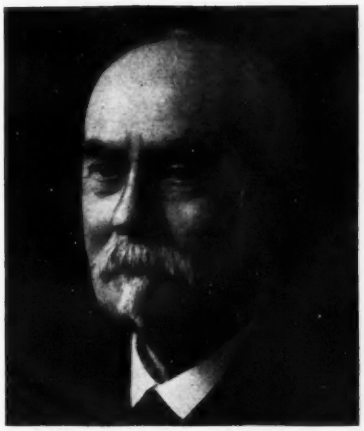
Evidence of the prevalent activity was provided by the Building Trades Exhibition last September, at which there was not only a record attendance but a record number of orders were taken. Why have these trades been more immune from the maladies which afflict the cotton and the steel industries, to mention only two of those now suffering acutely ?

In the first instance, it may be remarked that the building industry is less affected by foreign competition than are most others, for although a good deal of timber comes from abroad it is mostly of a kind which cannot be grown in England, and the importers of this foreign timber do a most profitable business. Only a small percentage of the stone and brick used for building in this country comes from foreign parts. Consequently the purveyors of building materials do not encounter to any great extent the cut-throat competition of foreign manufacturers.

Another important consideration which differentiates the building industry from others is that at a time when many kinds of Government stock are insecure, an investment in bricks and mortar is one of the most prudent that can be made. For while it is true that buildings may deteriorate in value they do not melt away in a single night after the manner of shares in joint-stock companies, which may perhaps go bankrupt as the result of mysterious happenings in Wall Street or elsewhere.

And there is yet a third cause for the present building activity, and this cause is likely to operate for some years to come. The age in which we live is an age of architectural destruction unprecedented in its extent, and the reason for this is that the period of a hundred years ago was one of very great building activity, and the 99-year leases of the structures then erected are now falling in. Although in the majority of instances these buildings have been kept in good repair and could if necessary be made to last many years more, their demolition is in most instances an economic necessity. The large ground rentals upon which the local authorities' permission to build to eighty feet or more in urban districts is contingent, renders it impossible to preserve these old buildings, in spite of the fact that very many of them are of great architectural merit.

In the course of the next ten years hundreds of thousands of pleasant three-storied and four-storied structures are destined to make way for tall buildings capable of being let at an economic rent. This process of rebuilding is likely to continue, no matter what the general financial situation of the country may be, because the ground landlords insist upon it and will continue to insist.



There are, however, still many industrialists and men of commerce who in their own interests should house their concerns in more up-to-date premises, but they have yet to be persuaded that it is advisable to incur this expenditure. In the coming year it will be one of the special tasks of this JOURNAL to ascertain how architects may put their special gift and knowledge at the service of British industry. Whether it be a question of the better planning of factories, so that the operations of manufacture may be more expeditiously and economically conducted, or whether it be a question of arranging a shop in such a manner that the arts of salesmanship can better be conducted therein, the architect must prove himself to be a well-spring of profitable advice.

Moreover, it will be his duty, in collaboration with the builder, to study every means of expediting and cheapening the processes of building, so that by skilful organization he will be able to give such good value for the money expended on building projects that the superior claims of this kind of investment will prove irresistible.

THROUGH TIP-TILTED ASTRAGALS:
A STUDY OF WHITELANDS COLLEGE

Among the many interesting features of Sir Giles Gilbert Scott's new training school for girls at Putney, which is illustrated on pages 971-975 of this issue, none is more arresting than that revealed in this photographic study. It shows a vista of the building seen through one of the numerous arched windows, which play an important part in the patterning of the front to the terrace. And these windows are given a novel effect by the upward tilting of the astragals, where they meet on the centre-line.

Sir Reginald Blomfield, R.A., to whose letters to The Times *on the subject of the design for the new South Africa House, Trafalgar Square, prepared by Sir Herbert Baker and reproduced as frontispiece to our issue for December 24, our contributor, Astragal, draws attention. Sir Reginald has, he thinks, "voiced the feelings of all right-thinking architects."*

NEWS & TOPICS

IN TRAFALGAR SQUARE

MY heart stood still when, coming round the festal portico of St. Martin-in-the-Fields, I found the dreaded hoardings rising round that stucco block that houses, on the Strand side, the Golden Cross Hotel; on its extremity, the Post Office of Charing Cross; and upon Trafalgar Square, the offices of the South African Government.

★

I love nearly all the London that Nash and his day built, but for this building I have had a peculiar and deep-seated affection. Not a sentimental one, for I know it to be founded on virtues that seem to have disappeared from London. I have loved it for its smooth surfaces, its delicate modelling, subtle and suggestive; for its affinity with the National Gallery and the Church; for the dignity of its obeisance to the Gallery at the head of the Square, for its "rightness" of architecture, for its exquisite manners.

★

And it is going; and I could weep to think of all that it takes with it, away and out of the knowledge of all that come after. It is a serious thing I speak of, because this fine building will be replaced by another so immeasurably its inferior in character and bearing that I am sorely tempted to infringe decorum by putting into print what I have in my heart to say.

★

Instead, Sir Reginald Blomfield has voiced the feelings of all right-thinking architects in two letters of dignified protest to *The Times*. And the reply to these letters exposes a point of view so wanton, and so careless of every virtue of communal architecture, that I despair of any good coming from the doleful exchange. So I bid farewell to what is going—and will close my eyes in future when I have to pass South Africa House.

SULPHUR FUMES FROM POWER STATIONS

The question of atmospheric pollution has again been raised at the inquiry which was held a fortnight ago in connection with the proposed power station for Fulham. This, like that at Battersea, is a station on the national grid system, a super-plant with a consumption of 2,000 tons of coal per week, and a correspondingly large sulphur emission. It is extremely hard to tell from reported speeches whether the systems of sulphur extraction put forward by the electricity engineers are really efficient to the extent demanded by health and reasonable economy in the upkeep of urban buildings. One feels a certain right to an attitude of suspicion in face of a very recently acquired consideration for health on the part of manufacturers and other owners of belching chimneys, and the more the experts look into the business the more they horrify us with new calculations of the enormous damage caused by the fumes of combustion.

★

Sir Frank Baines has stated that the area affected by power station fumes is far greater than one would suppose, and that London would not be by any means safe from the effects of power stations situated miles away on the lower Thames estuary. He also calculates that the damage to buildings over the country during a quarter-century is not less than £55,000,000—a sufficient incentive, one would say, to spend a good deal of time and money in bringing to *real* efficiency the existing machinery for rendering the atmosphere of towns clean and healthy. If this machinery becomes available at a not prohibitive cost, then we shall have legislation to see that it is put into general operation.

BY-PASSING OXFORD

According to the latest census the average number of vehicles, including motor-omnibuses, motor-coaches and heavy lorries, which cross Magdalen Bridge, Oxford, every day, is over 22,000. It is therefore good news that early in the New Year it is hoped to start work on a new by-pass road, which will enable heavy traffic to be diverted from the narrow streets of Oxford, where the vibration is threatening the stability of both colleges and churches. The proposed new road between South Hinksey and North Hinksey will enable traffic on the south to avoid Oxford altogether. The scheme as submitted by the Berkshire County Council has been approved in principle for a grant from the Road Fund. It is hoped that in addition there is the possibility of a northern by-pass road being commenced within the next few months.

NO JUGGERNAUT IN BROAD STREET, W.

It is curious how the æsthetic or humanitarian situation is sometimes saved by the cold logic of practicality impinging from a quite unexpected angle. When a short while ago there was talk of permitting higher buildings in London, it was not regard for design or sunlight or such-like amenities so much as the recognition of the risk of fire that won the day. And now it is not the possible risk to life and limb arising from a motor-coach station in the heart of the West End so much as considerations of traffic

congestion that have weighed with the Minister of Transport in drafting regulations that, if carried out, will render this coach station, against the situation of which I had something to say a week or two ago, useless for its purpose. We may well welcome any action which will have the effect of safeguarding such narrow, crowded streets, but, as usual, the problem does not seem to have been seen whole. There is a grave fear that the Minister of Transport's proposals will simply result in shifting the danger area from the hub to the spoke-ends, so to speak. Motor coaches are to be prohibited within a certain area ; that means, of course, that they will pick up and drop their passengers as near as they can get just outside it, and it is easily seen that what have hitherto been comparatively quiet by-streets, at a great number of points, will shortly be in the same unenviable state as would those round about Broad Street had the regulations not been made. Once again a far-sighted scheme of town-planning is the only remedy.

THE OPEN SPACES MOVEMENT IN HISTORY

Any further facilities that can be given to enable open spaces to be preserved from building are sure of a welcome from a generation alive, as never before, to the need for them : much is hoped from the 1931 town-planning measure. Looking back to the past, it is interesting to remember the struggle less than a century ago to provide parks and recreation grounds. In London, of course, the public owe Hyde Park, originally a Royal hunting-ground, and St. James's Park, formerly the grounds of St. James's Palace, to the generosity of the reigning monarch of the day.

★

The Crown also provided over £20,000 in order to secure Primrose Hill, south of Hampstead Heath, for the public, at a time when the authorities of Eton College were considering using it for building purposes. Victoria Park in the East End was completed in 1849 with money derived from the sale of York House, and Battersea Park in 1854. In Manchester, workmen's committees raised funds, and eventually three parks were bought. This success encouraged Oldham, Rochdale, Blackburn and Stockport to do likewise. The history of the movement for open spaces is one of continual struggle.

THE FATE OF RUSSBOROUGH, CO. WICKLOW

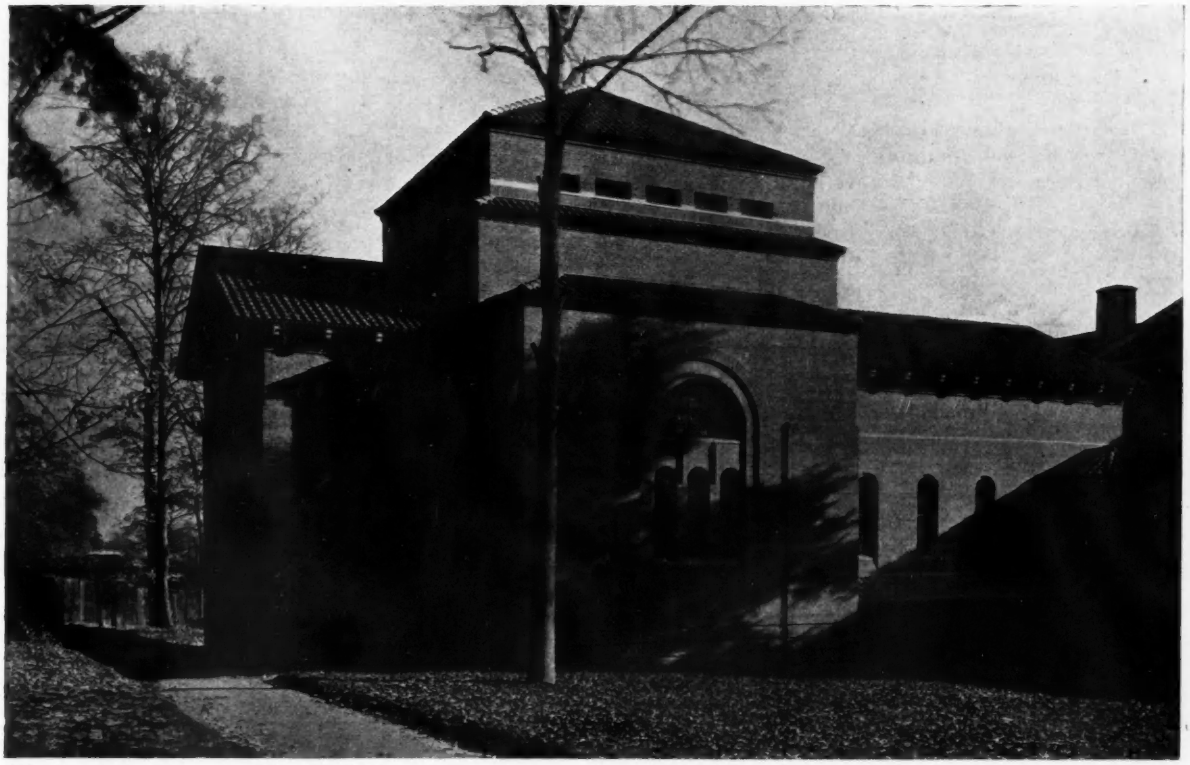
What will be the fate of Russborough ? Lady Turton, the widow of Sir Edmund Turton, recently offered it free to the Irish Free State Government as an Irish "Chequers," or, alternatively, as an Irish National museum. She has now informed Major Athoe, the Secretary of the Incorporated Association of Architects and Surveyors, that the Dail has had to refuse the offer on financial grounds, while Lady Turton herself, " as things are," cannot maintain the house and estate. Russborough is a cut-stone mansion, consisting of a centre block and wings, situated three miles south of Blessington, Co. Wicklow, and is remarkable both for its lavish internal decoration and for its long and imposing front of 700 feet. The design was the joint production of Richard Castle and David Bindon, the material being granite from the Golden Hill quarry, which supplied stone for Nelson's column. This great building took many years to complete ; in 1748 it is described as " a noble new house forming into perfection." Artificers were brought from different parts of Europe, statues from Herculaneum, marble from Sicily, and mahogany from the West Indies, the tasteful decoration of the interior being apparently the great object of the owner. After the Rebellion of 1798, when the house suffered no injury at the hands of the rebels, the King's forces were quartered there, and they committed serious damage to the many works of art with which the house was filled : pulled down roofs for firewood, cut down old timber for sentry-boxes, and left the offices and outbuildings little better than uninhabitable ruins. Russborough stands on an artificial embankment, formed probably with the clay which was excavated to form the succession of fish-ponds in front, which cover an area of acres.

" TINKER, TAILOR . . . " AT WAREHAM, DORSET

The Council of Wareham in Dorsetshire have decided with a show of firmness that if all men cannot be equal before the R.I.B.A., they prefer to do without R.I.B.A.s and get plain Misters to do their housing for them. Architecture being an imponderable matter to some councillors, I suppose it would be rash to suggest that their next Medical Officer of Health should be drawn from the ranks of intelligent and interested laymen instead of from the members of some fussy institute or other with tiresome requirements as to medical knowledge, integrity, and so on. It would be much easier and not many people would die. Anyway, we don't really want the best, you know. Just something that will suit us.

ARCHITECTURE FROM ALOFT

German architects are now studying the effect of their buildings from the air. A number of prominent architects have made special flights from this point of view. It must be remembered that one characteristic of the Germanic race is " ornung muss sein " or " there must be order." Furthermore, in every city and town in Germany there is a civic board of architects, to which building plans are submitted. Today, with the rapid advance in air traffic, it is regarded as of importance that the view from above should be sightly. Those who have flown over Germany are full of praise for the picturesque appearance of such a town as Nuremberg, for steep roofs, gables and broken lines offer a more delightful picture from above than mere flat roofs.



THE NOSE AS AN AGENT OF CIVILIZATION

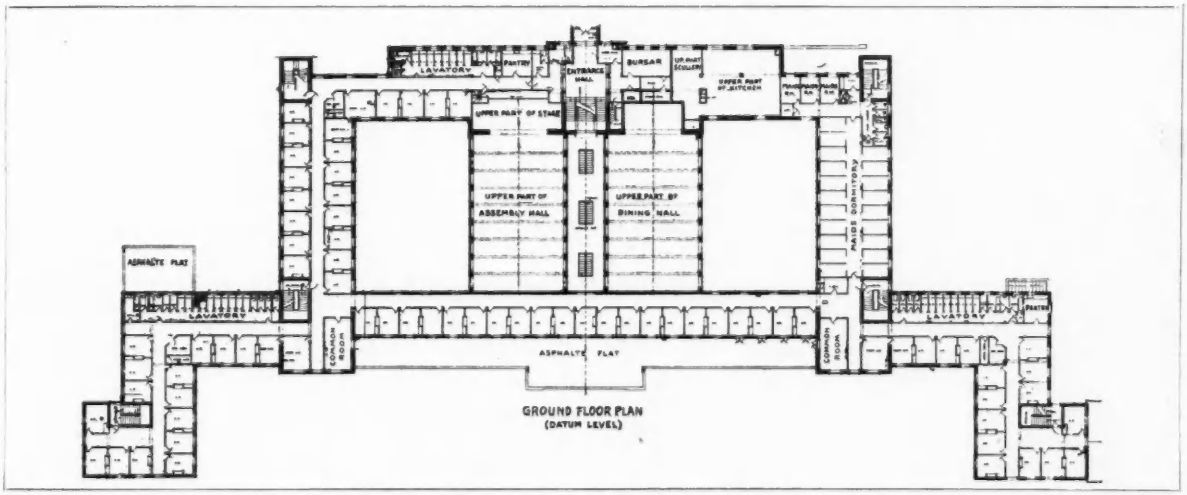
I have lately read Miss Rose Macaulay's novel, *Staying with Relations*, of which the scene lies chiefly in Guatemala. It is a book for the architect, who will feel keenly the rich description of a modern mansion finished with a bit of every style known to civilization, ancient and modern. Moreover, I hit upon the following, which seems to me to enshrine several profound truths, one at least of which I do not remember to have seen enunciated before :

★

That sense of smell we've gotten (it is Mr. James, American " realtor," who is speaking to the English travellers), I certainly think it's more a curse than a blessing, considering the strong odoriferousness of this world that we have to get about. The Spanish don't have it, either; if they did, the great Mex nation would not have arisen. That's a nation that was born out of the unparticularity of the Spanish race. It's a peculiar reflection, that the very quality which has given us northern folks our sanitary plumbing has stood in the way of our founding great nations of half-castes all the world over. Good plumbers, but poor mixers; that's what we are. Now the French, they don't get the hang of our colour problem at all; it just looks silly to them. But you folks have gotten this smell-sense worse than us, I guess; so you're worse mixers.

ASTRAGAL

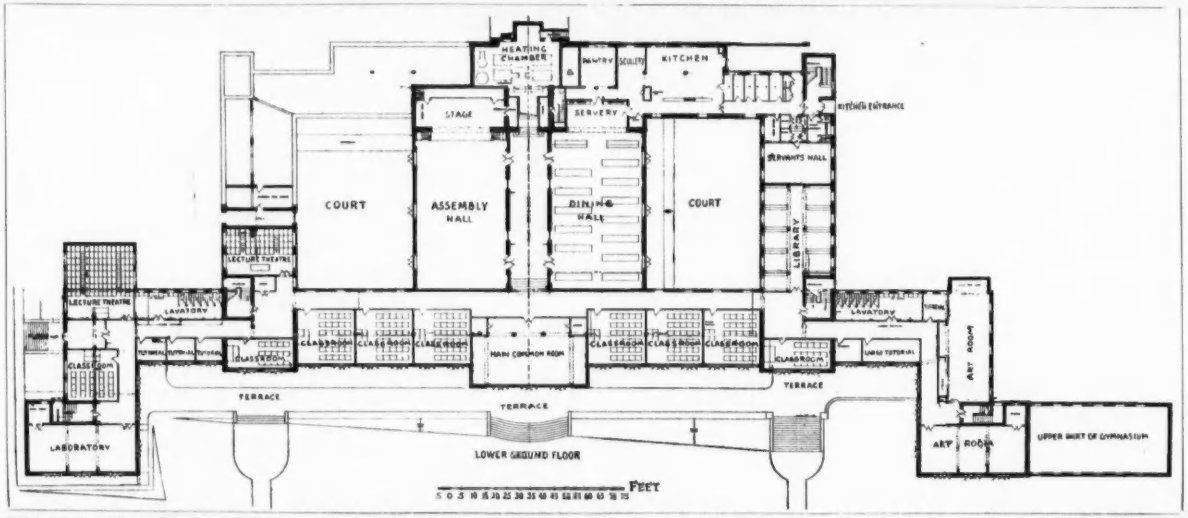
The chapel from the west. The size of the window openings was determined by Burne-Jones's stained glass, which was removed from the old Whitelands Chapel in the King's Road, Chelsea. The main building begins on the right of the photograph.



WHITELANDS COLLEGE,

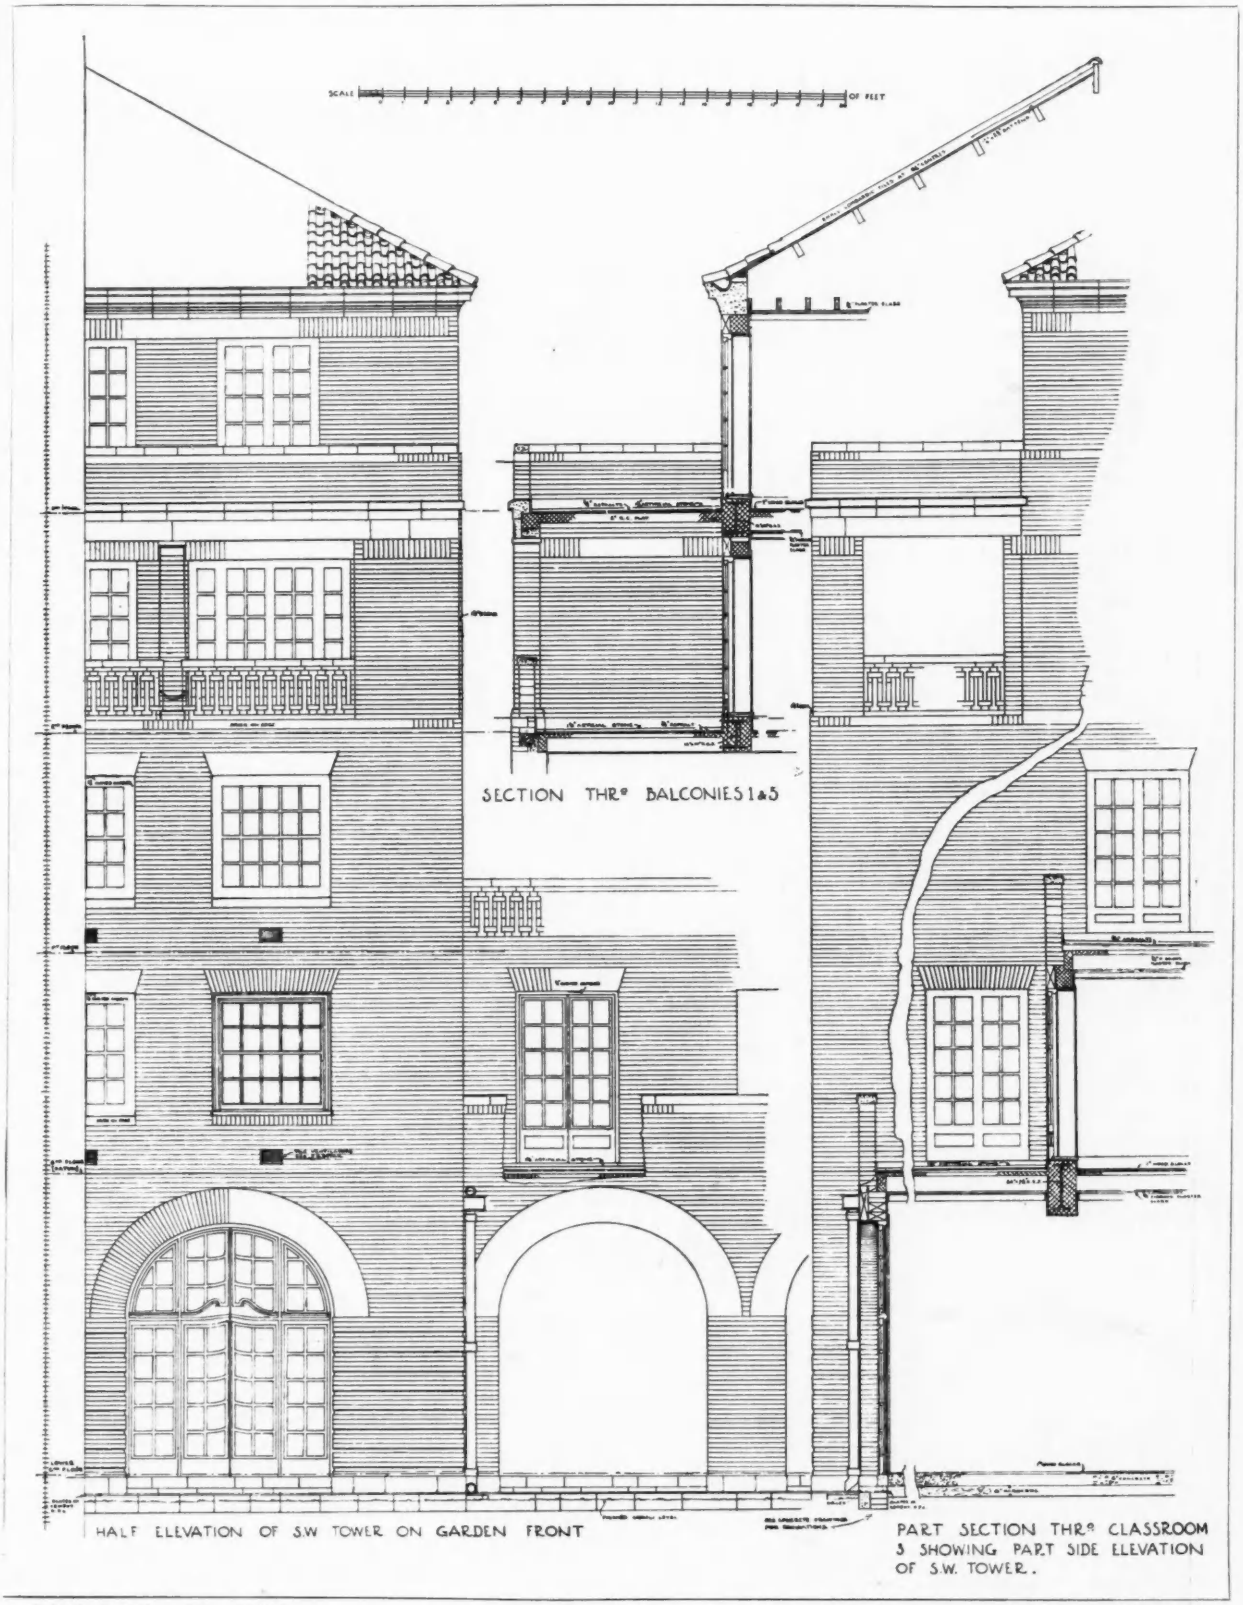
Putney, London, S.W.

SIR GILES GILBERT SCOTT,
Architect.

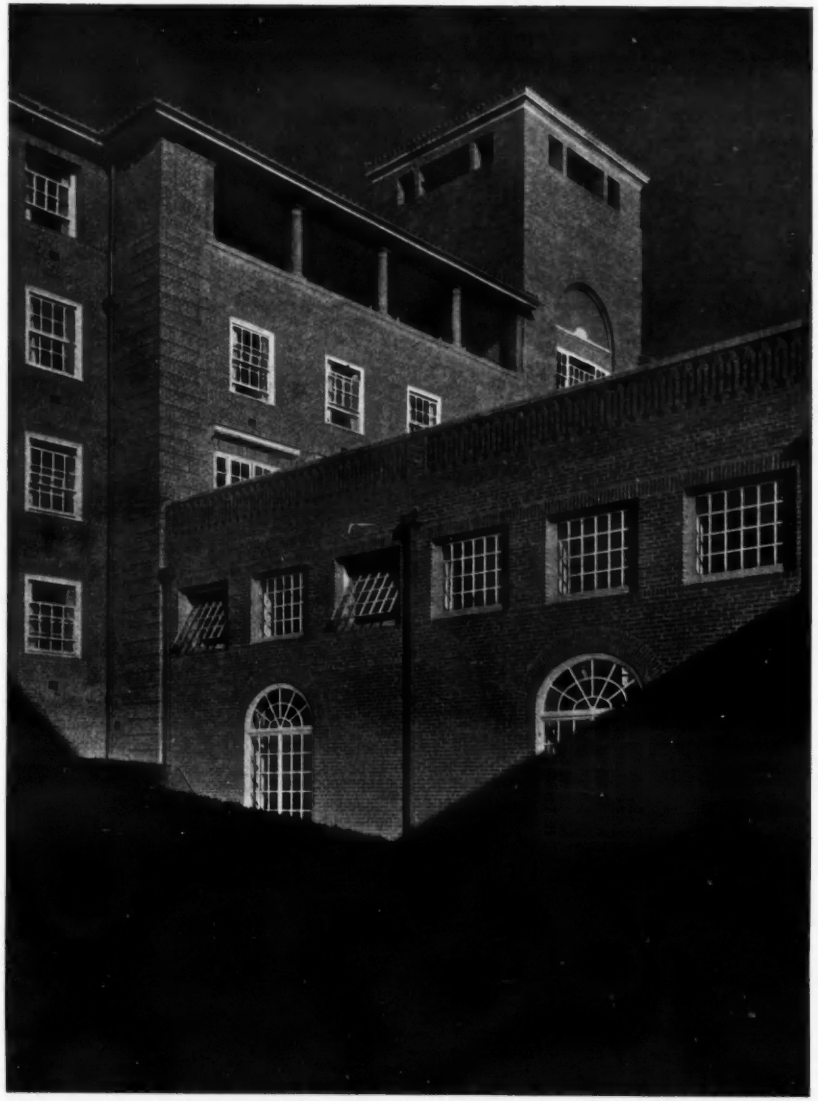


WHITELANDS Women's Training College for Teachers originally occupied a row of Tudor buildings in the King's Road, Chelsea, next door to the Duke of York's School, the headquarters of the Territorial Army Association, and formerly the home of the Duke of York's Boys, who were removed some few years ago to Dover.

The buildings occupied by the college in Chelsea eventually became inadequate for modern educational needs, and a site of twelve acres was secured at West Hill, East Putney, near Wimbledon Common, for the new college buildings and chapel. Sir Giles Gilbert Scott, R.A., was appointed architect, and the new college, which contains a study-bedroom for each student, common rooms and lecture rooms, a library, a gymnasium, and adequate accommodation for art, handwork and science, was completed this year. Playing-fields are provided within the college grounds.

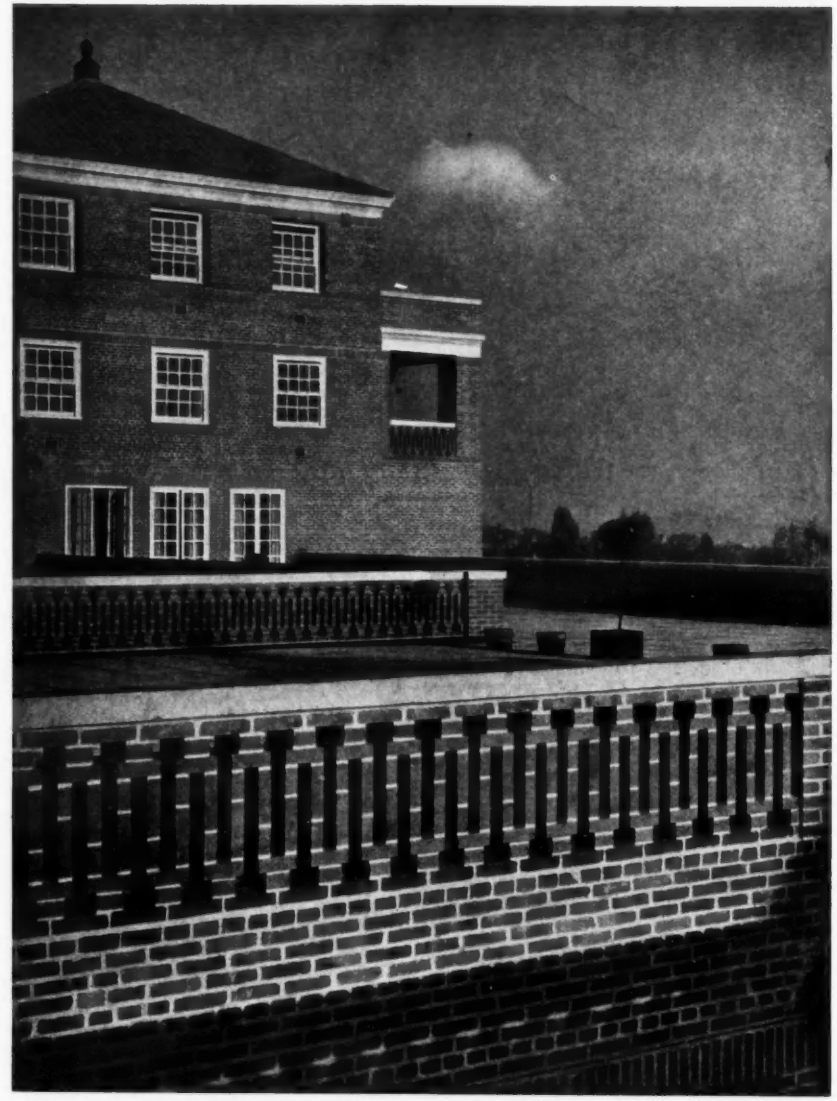


This ground-floor plan of the main building should be studied in conjunction with the lower ground-floor plan reproduced on the next page. The college has been designed to admit as much sunlight and to provide as large an area of roof garden as possible.



A photograph of the garden front, which faces south-south-east; and the architect's drawing of the lower ground-floor plan. The classrooms are all on the lower ground floor on the garden front and are lighted by large arched openings, fitted with French windows of interesting design (see frontispiece). The tower on the right contains an isolation block and an infirmary below, with a loggia. The central tower which crowns the main staircase contains water tanks. The elevations are built throughout in purple-brown bricks with white pointing and dressings of stone, the roofs being covered with red Italian tiles.

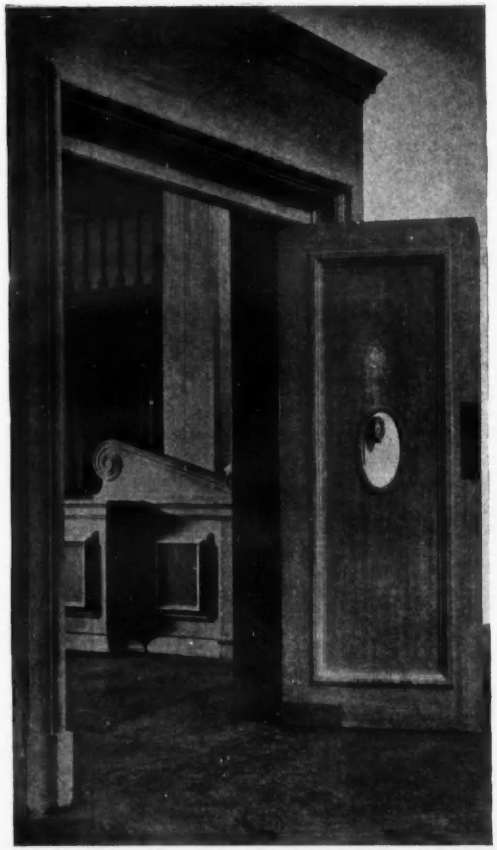
Whitelands College, Putney, S.W. [*By Sir Giles Gilbert Scott.*



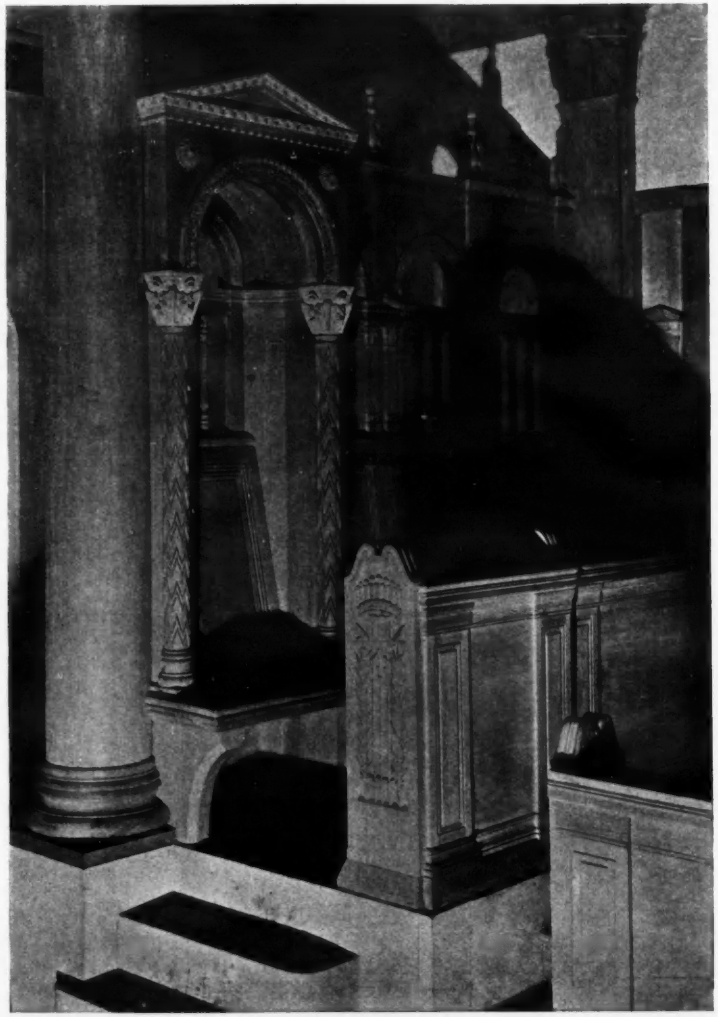
Whitelands College, Putney, S.W.] [*By Sir Giles Gilbert Scott.*

The architect's working drawings of the half elevation of south-west tower on the garden front, section through some of the balconies, and part section through classroom showing part of the side elevation of the south-west tower.

A photograph taken from one of the internal courts, showing the assembly hall, with a pierced brick parapet wall, and the central tower beyond.



A view from one of the courts looking across the roof garden, which is paved with artificial stone with wide raked-out joints. In the distance is the infirmary wing.



WHITELANDS COLLEGE

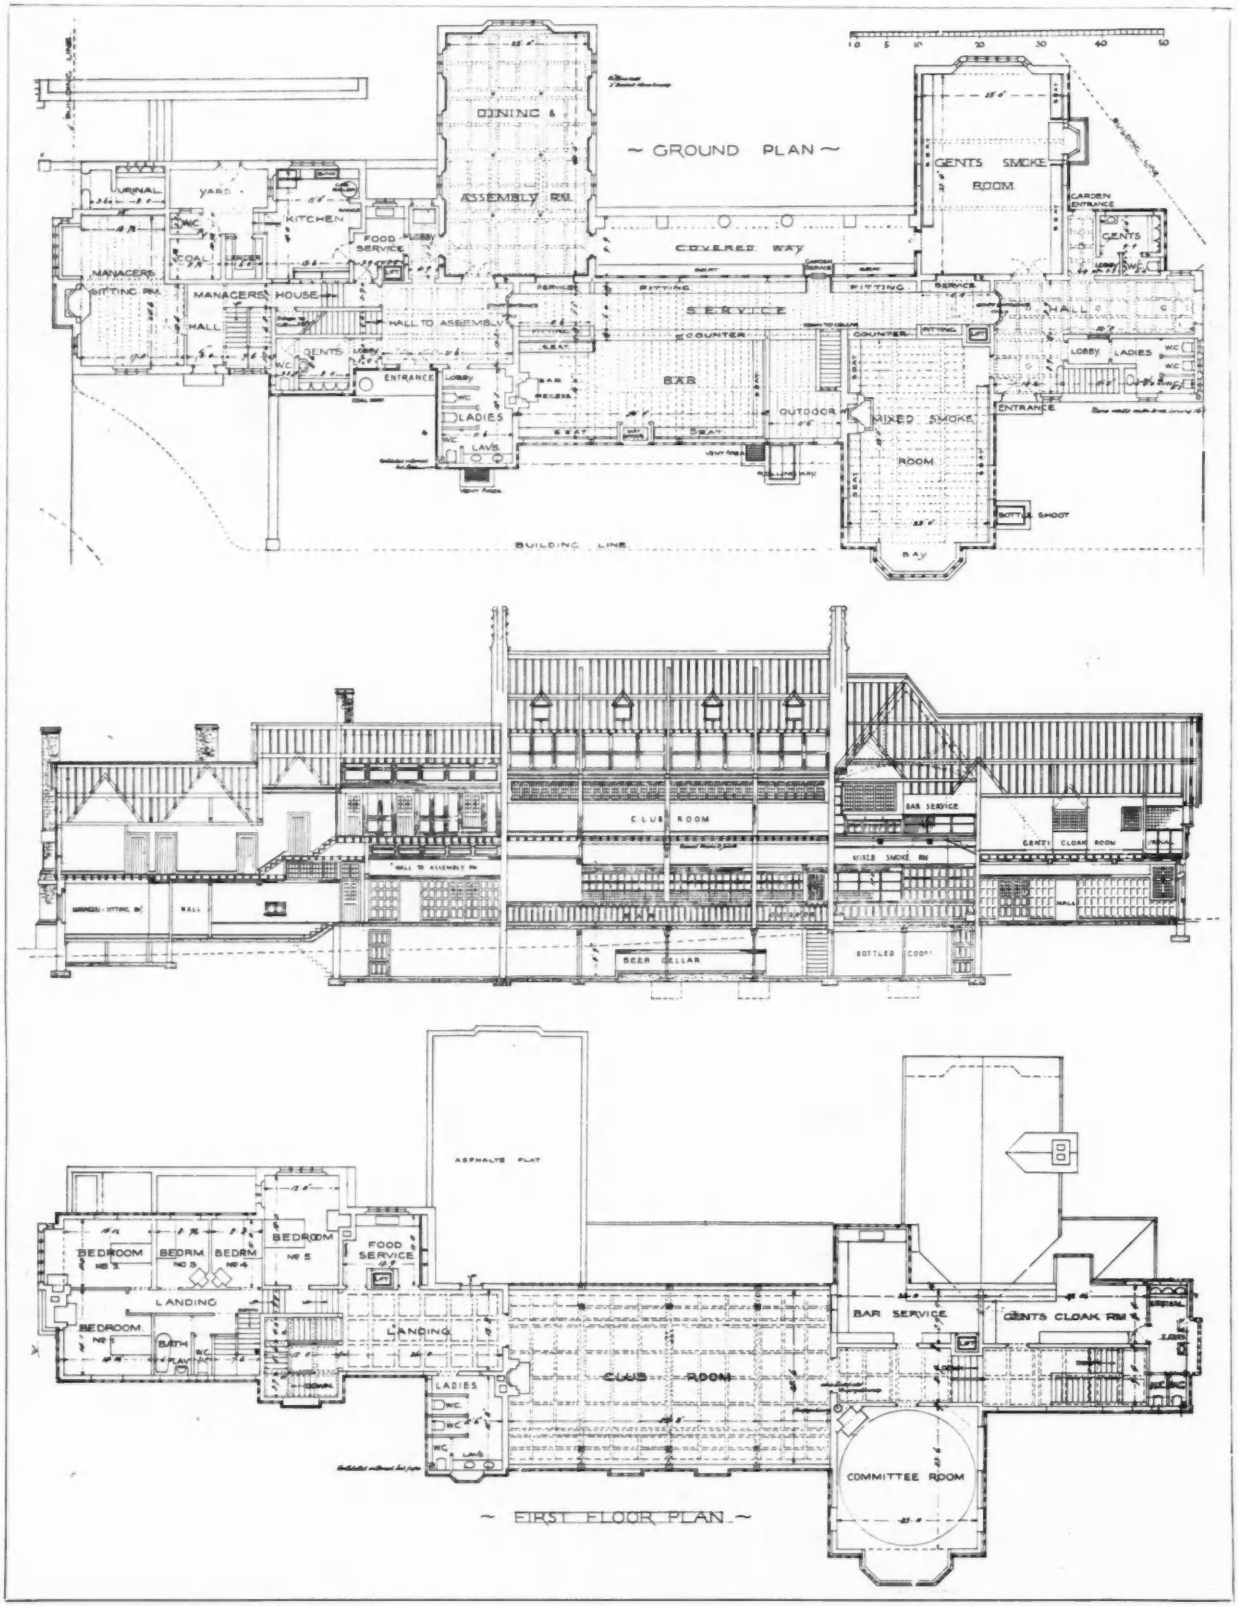
Designed by SIR GILES GILBERT SCOTT



Looking from main corridor to stage in assembly hall.

Part of the screen in the chapel showing the principal's and staff's seats under the gallery at the end.

A fitted bookcase in the main common room.

Black Horse Hotel, Northfield, Birmingham.] [*By Bateman, Hale and Goldsbrough.*

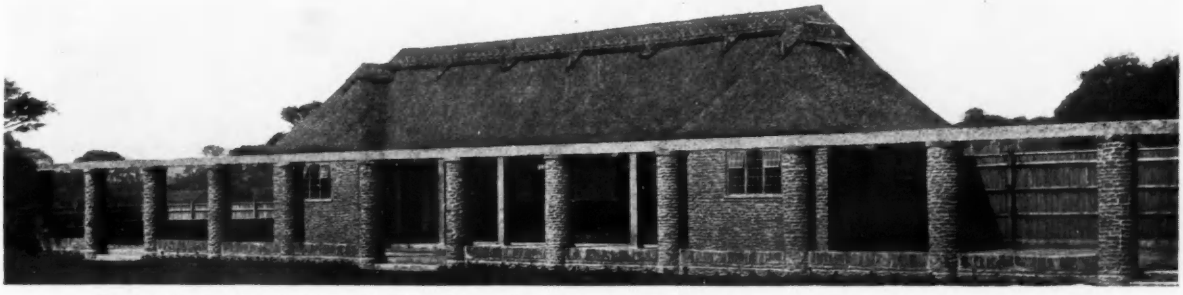
The architects' drawings of ground floor ; longitudinal section ; and first floor. The length of the building runs approximately east and west, and faces to the main road (bottom of plan) in a southerly direction ; on the other side is the garden. The extent and variety of the accommodation are clearly shown, but attention may perhaps be drawn to the compact manager's house at the westerly end.

A general view, from the main road, showing the bar entrance, in the centre, and indicating the wide draw-up for vehicles.

THE BLACK HORSE, NORTHFIELD

DESIGNED BY BATEMAN, HALE AND GOLDSBROUGH

THE reconstructed Black Horse, Northfield, near Birmingham, is an example of the improved type of public-house now being provided in the Birmingham district in compliance with the policy of the City Licensing Authority. The intention is to encourage the erection of places of refreshment that shall be well and easily supervised by the manager, his staff and the police, that shall be convenient and pleasing inside and outside, and that shall offer such added attractions as a garden, bowling green and shelters, etc., for the summer months, together with an adequate draw-up space for motor cars in front.



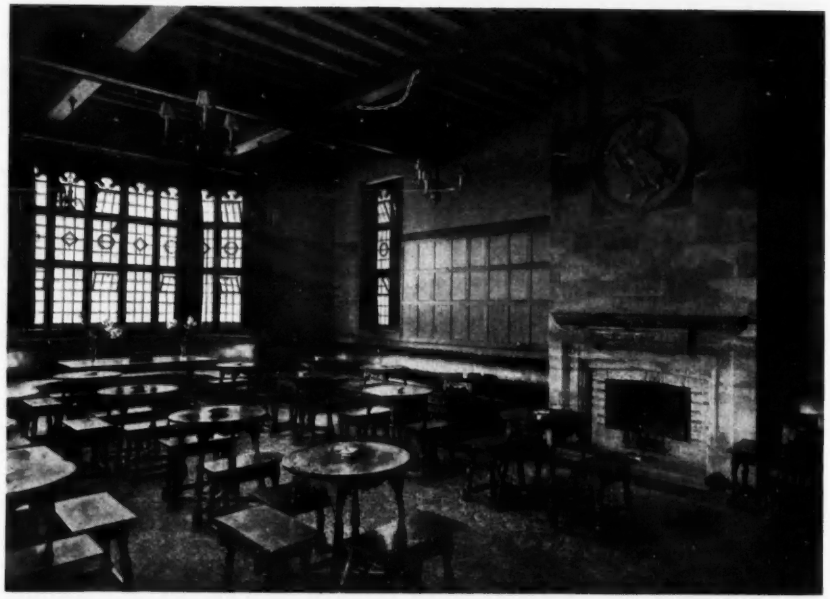
The accommodation provided includes a bar, an out-door department, gentlemen's and ladies' smoke-rooms and an assembly room, all served and supervised by the bar staff; a hall for dinners, luncheons, concerts and dances, with cloak-rooms and service rooms and lifts, *en suite*; and a committee room, for bowling club and other societies' meetings.

Part of the garden court, of which a more comprehensive view appears on the next page.

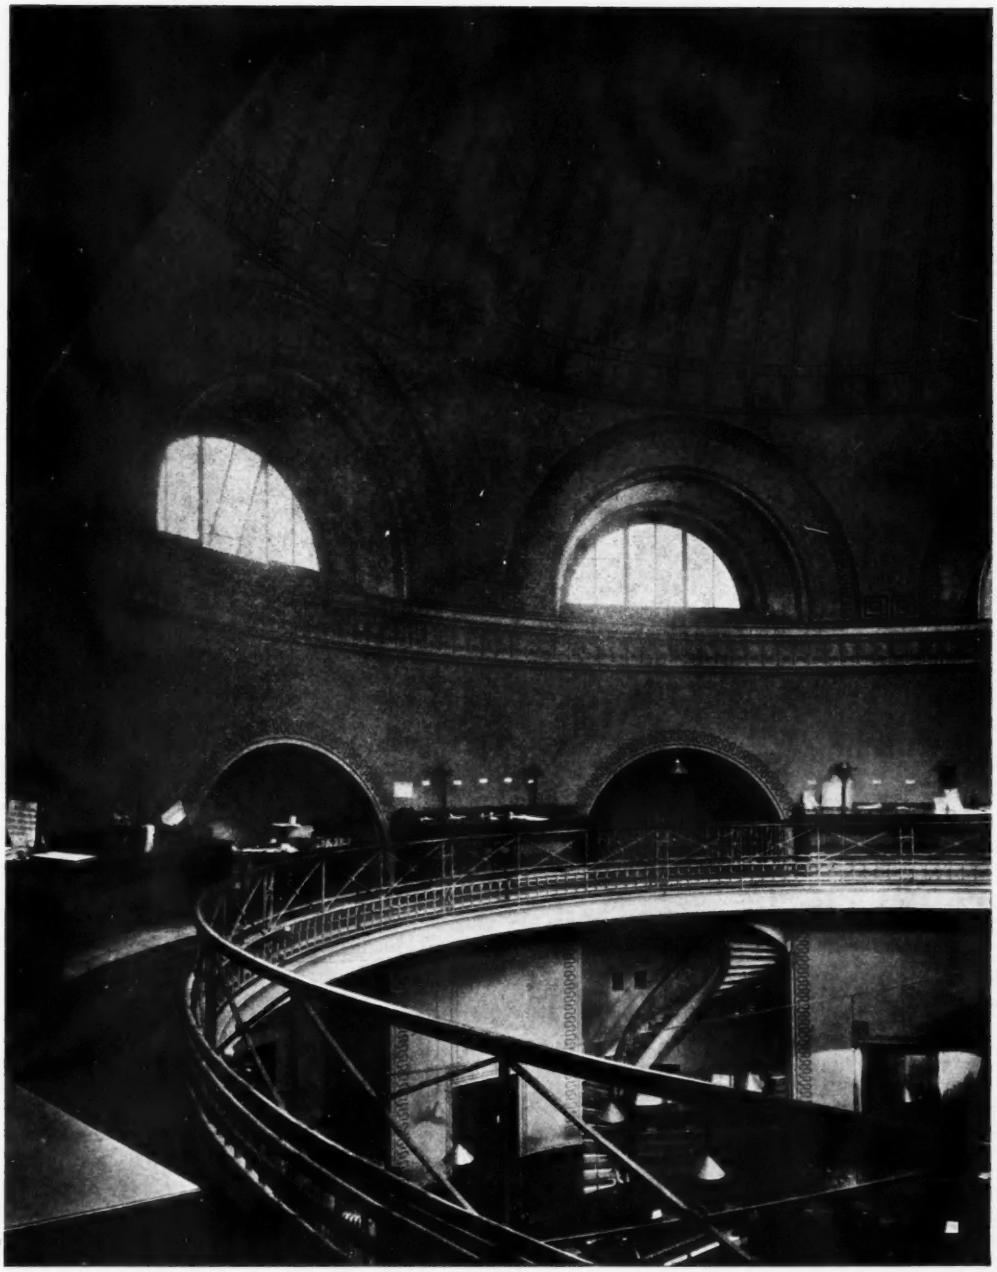
The cellars have received special attention in order to ensure as far as possible an equable temperature in winter and summer, together with easy ingress and egress of the goods; sanitary accommodation and ventilation have also been carefully considered.

Included in the plans, at the western end, but virtually self-contained, is a spacious and convenient manager's house.

The garden pavilion is thatched, and has, running before it, a pillared screen similar to that of the garden court.



The garden front, showing the screen of brick pillars and the central garden court; this is overlooked by the high windows of the club room.



The east end. The line of the oad pavement is indicated on the left, and serves to show the wide pull-in space. On the right is the garden entrance.

Black Horse Hotel, Northfield, Birmingham.]
The bar, which occupies the centre of the building, facing the main road; the screen of the entrance doorway is seen on the left.

LETTERS FROM READERS

Housing: the Counter Revolution

SIR,—Your leader writer, in a letter under the above heading in your issue for December 17, says we are out for the negation of the principal virtues of careful planning in order that private individuals should make money out of the business. The only two departures from the principles of the present subsidy which we recommend are that density should be increased to twenty to the acre and that blocks of eight houses should be permitted. Both of these your leader writer admits are worthy of examination, but he talks of the "negation of the principles." It would appear that the unforgivable sin is that private enterprise wants to carry on business for profit.

NORMAN MCKELLEN
(SECRETARY, NATIONAL FEDERATION OF HOUSE BUILDERS)

Architects' Registration Bill

SIR,—It may be remarkable, but it is nevertheless a fact, that very few architects have anything but the haziest notion as to the provisions of the Registration Bill. Thus, in at least one recent meeting of architects in the provinces, reckless statements having reference to the Bill were made by the speakers, who can produce no foundation for them. Either these statements were made in ignorance, or for the purpose of intimidating the "unattached."

It is true that the Bill has received a second reading and has been remitted to a Standing Committee—but the Bill is not yet law and may never become law in its present form. It should be borne in mind that the Bill as drafted is a permissive and not a compulsory measure; that is to say, assuming the Bill were passed in its present form, an architect need not go on to the register. He can still practice as an architect and call himself "architect." In fact, the Bill will not prevent the quack from calling himself an architect; he can practise as an architect, undercut the fees of the genuine architect, advertise and tout for work, and generally eschew rules of professional conduct without let or hindrance. Pains and penalties are reserved for "registered" persons, who will pay for the "privilege" of being registered.

In the opinion of my Council it is the title "architect" that should be safeguarded, and a Bill that does not provide for such protection is useless to the architectural profession and the public served by that profession.

Architects are being asked to write to Members of Parliament inviting the latter to support the Bill; may I suggest that architects first make themselves acquainted with the provisions of the Bill and then insist that the title "architect" be reserved for those who are qualified to use it?

G. B. J. ATHOE
(Secretary, Incorporated Association of Architects and Surveyors)

An Architect's Claim for Fees

SIR,—I have read with interest the "Law Report" in the December 17 issue of the JOURNAL on the case of *Adamson* v. *Purkis*.

There are two lessons which the case seems to teach. One is the great benefit of the proposed revision by the R.I.B.A. of the clause providing for payment for unexecuted work. Where the payment on this point has hitherto been definitely laid down, an architect has been in the difficult situation of being bound by his "trades union" rate to charge a certain fee for his work, although he may have thought that he was entitled to more, or even though he considered his labours merited less. I think the new *quantum meruit* basis will be a great blessing.

In the present instance, it looks to me as if the suggested R.I.B.A. amendment came to the notice of the architect between the time when he made his original claim and the date when he agreed to the final settlement.

The other lesson which one might learn is the old story of the importance of architects obtaining, at as early a stage as possible of their connection with a building scheme, a clear understanding with regard to the amount of their fees, and by whom they shall be paid.

G. VAL MYER

Professional Dignity and Advertising

SIR,—Astragal's remarks on this subject in the JOURNAL for December 17 prompts me to send you a copy of a circular letter issued, and also advertised in the local press by the Winchester Town Planning Architectural Sub-Committee.

The fact that practising members of the profession serve on this Committee is having the obvious effect on those who do not enjoy this privilege even if they wished to.

T. F. Y.

WINCHESTER AND DISTRICT TOWN PLANNING SCHEME
CONTROL OF ELEVATIONS TO PROPOSED NEW BUILDINGS

DEAR SIR(S),—I am instructed to bring to your notice the existence of an Architectural Sub-Committee in connection with the preparation of the above scheme.

This Sub-Committee is formed of representatives of the Rural Districts, the Chamber of Commerce, the Hants and Isle of Wight Architectural Association, the Hampshire Field Club and the Town Planning Advisory Committee.

Monthly meetings are held, at which all plans of the works within the area of the scheme are examined as to architectural treatment and general appearance. If it is considered necessary, suggestions are made to the owners of buildings that certain amendments should be made for the improvements of the elevations.

Experience so far shows that these amendments are usually the omission of meaningless features, and generally the simplification of design.

The Sub-Committee wish to work in cordial co-operation with builders and owners, and ask your support in endeavouring to improve and maintain the standard of design of new buildings to be erected. The Sub-Committee are willing to give expert advice on any plans submitted for examination.

The particular object of this letter is to invite you to submit plans for any new work you may have in mind to this Sub-Committee whilst the plans are in the pencil stage. Thus any suggestions made, which you are prepared to accept, may be incorporated in the drawing quite simply, and the finished drawing would then be ready for depositing with the Local Authority concerned. Approval by the Sub-Committee as to elevations does not in any way affect the compliance with the by-laws in the usual way. This suggestion is made with a view to saving time and expense in preparing the drawings.

Yours faithfully,
(Signed) J. S. FURLEY, CHAIRMAN,
THE WINCHESTER TOWN PLANNING
ARCHITECTURAL SUB-COMMITTEE.

Expiration of Lease

SIR,—There are many cases where one meets such people as the rebellious lessee and they require careful handling. The usual method is to pay instead of doing the work, leaving it to the new tenant to have it done as he wishes. I think if put to the test that any Court would hold that black paint would not be acceptable, although I have seen it used by a designer for the setting off of certain colours on the walls.

H. J. LEANING

COMPETITION RESULT

The awards in the competition for the development of a site fronting St. John's Lane, Queen Square and Rose Street, Liverpool, for the General Building Syndicate, Ltd., has been adjudicated by the assessors, Messrs. Duncan A. Campbell, F.R.I.B.A., and William E. Mounsey, F.C.A., as follows:

First Prize (£250), W. Pritchard, A.R.I.B.A., of West Derby, Liverpool.

Second Prize (£100), David McChleary, of Clydebank.

Third Prize (£50), L. H. Bucknell, F.R.I.B.A., of London.

The assessors, in their report, state: "In our opinion, having regard to the value of the site, none of the above schemes nor any of the other schemes submitted would be a financial success."

The designs, with the names of the authors attached, will be exhibited, together with the assessors' award, between the hours of 11 a.m. and 4 p.m. from December 31 to January 3, 1931, at No. 20 St. John's Lane, Liverpool.

FLATS SCALED TO INCOMES

Sweden's Contribution to the Housing Problem—ii

SITE-PLANNING FOR FLATS

THE popularization of the motor car since the war has completely altered the science of town planning as it was previously understood. The requirements which emerge from a study of the traffic conditions in a modern city may be described under the three following headings :

1 : Increasing differentiation between through and local traffic and between vehicular and pedestrian traffic, with a consequent separation of housing areas from through traffic routes.

2 : Open building development instead of the old type of enclosed building, and the abolition of dark and uneconomical corner sites in building.

3 : Siting and arrangement of building development with a view to uniform daylight illumination of all dwellings, but more particularly of those on the lower floors.

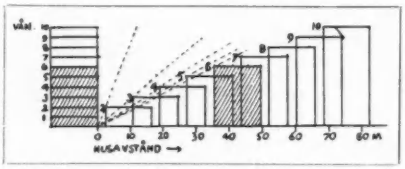

Figure two. Diagram to show variations in the heights and distances apart of houses on land, for blocks of a width of 45 feet.

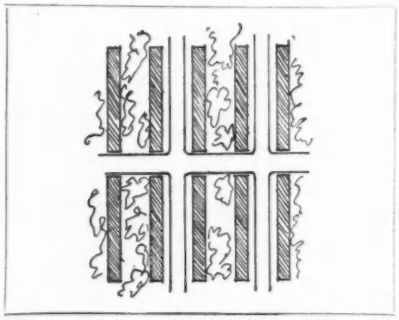

Figure three. A planning scheme for building on the "lamella" method.

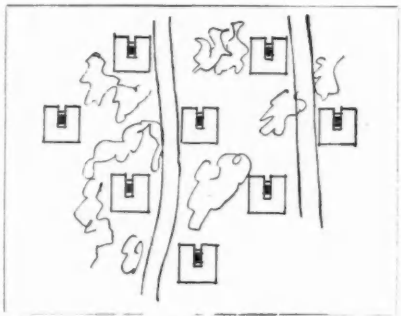

Figure four. A planning scheme for building on the "point" method.

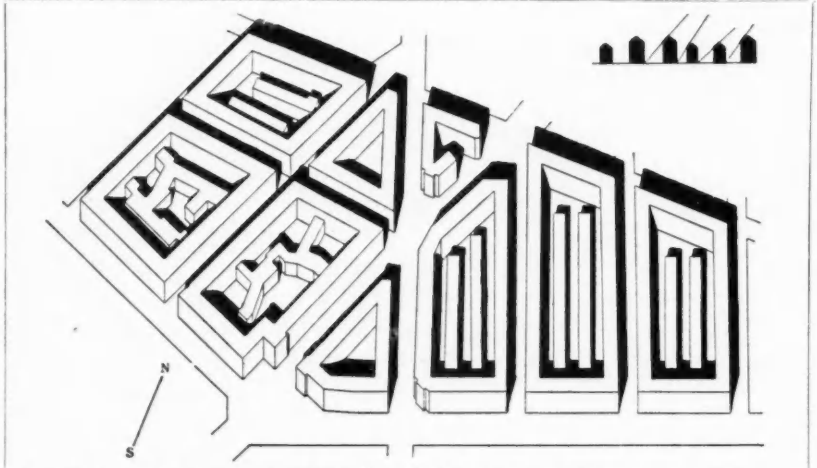

Figure five. Isometric sketch of part of the Vasastaden estate, illustrated in figure one, to show the layout of the existing buildings.

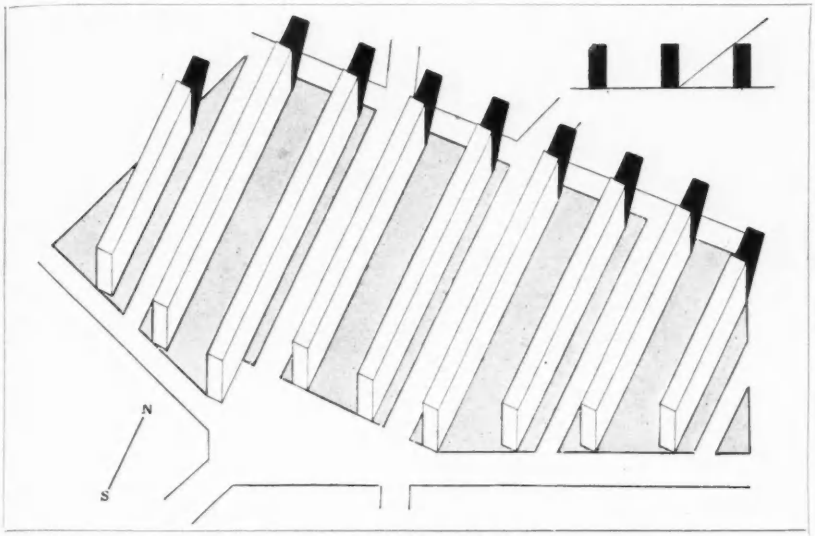
A great deal of research along these lines has been undertaken in various countries, especially in Germany. On the whole, it would appear that the most efficient type of development plan is that shown in figure three, in which the buildings take the form of long strips parallel to each other. A spotted development like that shown in figure four may also yield good results on broken-up sites. The first of these two, however, is receiving by far the greater attention in Sweden at present.

The greater part of the task involved in laying out a site on the parallel strip scheme lies in the dimensioning of the solids and voids, a purely mathematical problem in which the main factors are those of sunlight on the one hand and the cost of land on the other. The German architect, Hoenig, has introduced a system of measurement founded on what he calls the exploitation figure of the site. The meaning of this word may be explained by means of an example.

Let us take the proportion between the height of the buildings and the distance between them. If we assume the accommodation to remain constant, then this proportion will diminish as the height of the building increases and as, consequently, the number of rows of buildings on the site becomes less. In other words, the total accommodation of the site remains the same if we increase the height of the buildings and so get a greater proportion of open space between them. It is important



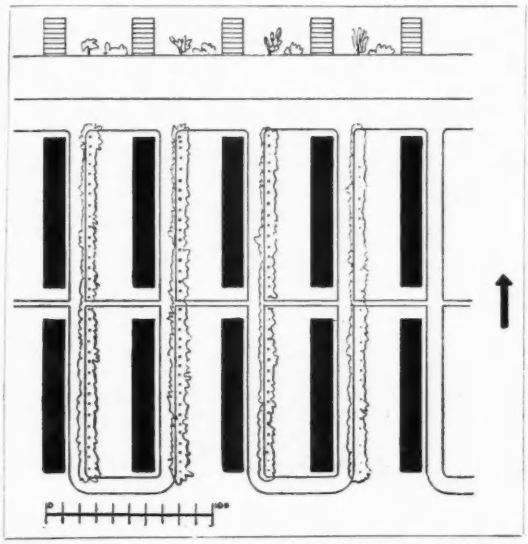


Figure six. Isometric sketch of the same area, as shown in figure five, to illustrate development on the "lamella" open system, affording the same accommodation.

Type No. 2 (see table on page 984). Site plan, to show disposition and orientation of the flat buildings.

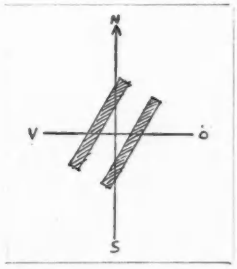

Figure seven. Scheme for the orientation of a town plan for permanent dwellings.

parts of Stockholm, the advantages of the new scheme compared with the existing development are nevertheless conspicuous.

The depth of buildings is a question which cannot be disassociated from that of aspect. It has been laid down that the ideal type of flat is that which stretches right across a building and has windows on two opposite fronts. The building depth of 49–52 ft. now common in Stockholm does not allow of any but the largest types of flats being planned in this way. The question of cost makes it impossible for the smaller types to reach across the whole depth of the building: unfortunately, a large proportion of these flats will always remain of the one-sided type. For this reason the strips of building should run from north to south, so that equal amounts of sunlight may be obtained on each side. With a through type of flat a greater latitude of planning is allowable. Figure seven shows the angle most favourable for a building containing flats of this type.

Type No. 2. Plan of a single flat (Gunner Sundbärg, architect): (1) Living-room; (2) bedroom; (3) bathroom; (4) kitchen.

to notice in this connection that in the United States the density figure has not remained constant, but has been allowed to rise proportionately with the height of buildings, thus reducing instead of increasing the amount of open space.

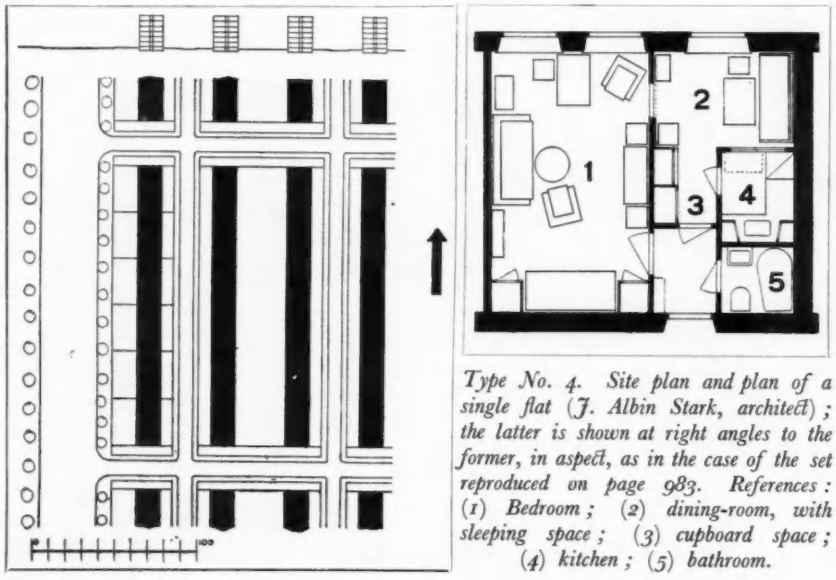
The first figure, figure two, and the bird's-eye views five and six, have been prepared by the exhibition authorities to illustrate the principle on which their blocks of flats have been laid out. Figure six, a site in one of the Stockholm suburbs now awaiting construction, is shown covered with twelve-story blocks of flats providing the same accommodation as the crowded existing buildings shown in figure five. Though this area will in future remain, as it is now, one of the most densely populated

Type No. 2. The living-room (1), looking towards the balcony. The farthest window lights the sleeping apartment

TABLE B (FLATS).

Type No.	No. of persons (children under 13 reckoned as ½).	Total household income.	Rent.
		£	£
1	1	*circa* 165	34–38
2	1–2	165–220	38–47
3	1–2	198–275	49–60
4	2–2½	165–220	41–49
5	2–3	192–330	55–66
6	2–3	248–385	66–77
7	2–3	220–303	60–71
8	2–3	330–495	82–93
9	3–4	275–385	66–71
10	3–4	385–660	93–110
11	4–4½	248–385	60–71
12	4–5	385–660	88–104
13	6	440–826	110–132
14	2½–3½ (including servants)	440–826	110–132
15	5–6 (including servants)	605–826	132–154

Table to show typical flats, with accommodation and costs (reprinted from last issue).



Type No. 4. The L-shaped combined dining-room and sleeping compartment (2 on plan below), seen from the cupboard end. The sleeping couch is behind the dining table.

Experiments carried out in Germany have shown that, though the hours of sunlight are longer on one side than the other, buildings so placed receive an equal amount of solar heat on both fronts.

ESTIMATES AND COSTS

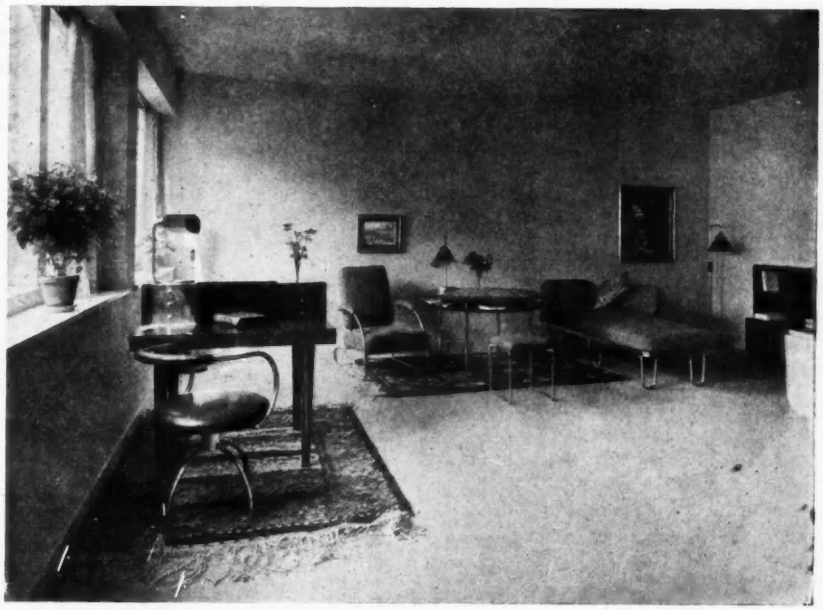
The cost of all the dwellings was worked out by the committee of architects assisted by a well-known Stockholm firm. The cost of plumbing, electrical wiring, etc., was calculated on an actual six-story block of flats recently erected in Stockholm. For purposes of costing, all kitchens and bathrooms were reckoned to be similarly equipped, and any individual arrangements suggested by competing architects were left out of account. The kitchens were furnished with a marble-topped shelf and gas-cooker, but refrigerators, very common in Sweden, were not included. Bathrooms were taken to contain a tiled floor and dado, and to have walls finished with oil paint. For all rooms, including the kitchen, a hard wood-block flooring was allowed and the walls were taken as uniformly papered, with the exception of the kitchen and bathroom, which were painted. The calculated rental value of individual houses was worked out on a minimum basis of 8½ and a maximum of 10 per cent. of the total cost of construction—limits arrived at after elaborate actuarial and other calculations.

Type No. 4. Site plan and plan of a single flat (J. Albin Stark, architect); the latter is shown at right angles to the former, in aspect, as in the case of the set reproduced on page 983. References: (1) Bedroom; (2) dining-room, with sleeping space; (3) cupboard space; (4) kitchen; (5) bathroom.

An examination of the building costs of various types shows unmistakably that the higher blocks of flats cost, in proportion, less to build than the lower, type 5; the lowest, a four-story block of flats, providing the least advantageous of all. The comparison between types 3 and 4 will show how equipment and fitments will affect the cost. In the first of these an area of 400 sq. ft. is planned for one person only. In the second, an area of 387 sq. ft. is provided for a family of two to three. In type 3 there are no built-in cupboards, wardrobes, or furniture of any sort except in the kitchen. In type 4 wardrobes, a china cupboard and a linen cupboard are all built in. (Type 3 is a seven-story block, comprising 6 flats on each floor, with two staircases and two lifts; while type 4 is a six-story block of flats comprising eight flats on each floor, two staircases and one lift.) An interesting fact is that type 3 works out 22 per cent. cheaper per sq. ft. of floor area than type 4.

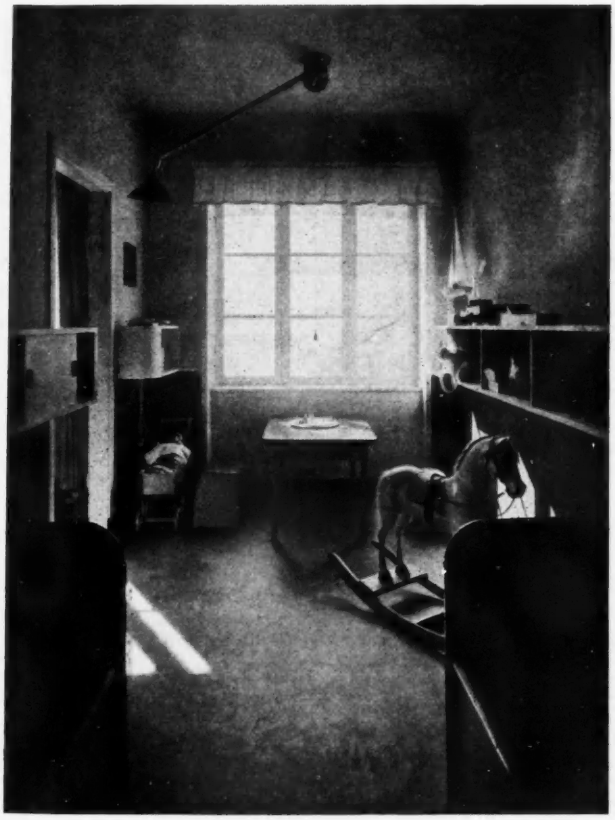
The two types 11 and 12, in which the principal living-room has a height 50 per cent. greater than the statutory minimum, bedrooms and lesser rooms being inserted on two levels, prove these to be no more costly than the ordinary type of flat and in every way practicable.

The following calculations of the cost of installing an electrical passenger lift have been put at the disposal of the exhibition authorities by the Academy of Engineering of Stockholm. For a block of flats containing



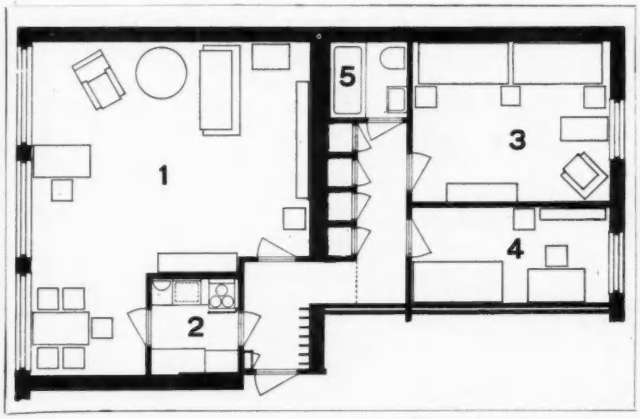
six to eight floors, the cost of putting in an automatic electrical lift to carry three passengers is £413 to £446. The extra building costs incurred in the way of engine-room, etc., amount to a further £220. The actual expenses may be calculated as follows :

	£
Power, lubrication, and other running costs	22
Repairs and depreciation at the rate of 12 per cent. on the cost of the lift	49
Depreciation at the rate of 7 per cent. on the structural accessories	17
Total annual expenditure ..	£88

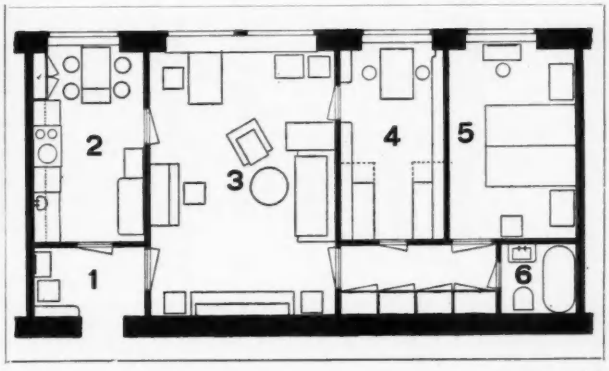


In the calculations for a building of fifteen stories and a lift to carry six to seven passengers, the total capital outlay is fixed at £1,211 and the annual expenditure at £446.

If we compare the building costs of individual houses with those of flats, we find the average cost of all the types of the latter, including types 11 and 12, is 21s., while the total cost of various types of individual houses, with the exception of type 1, is found to be 18s. 8d.

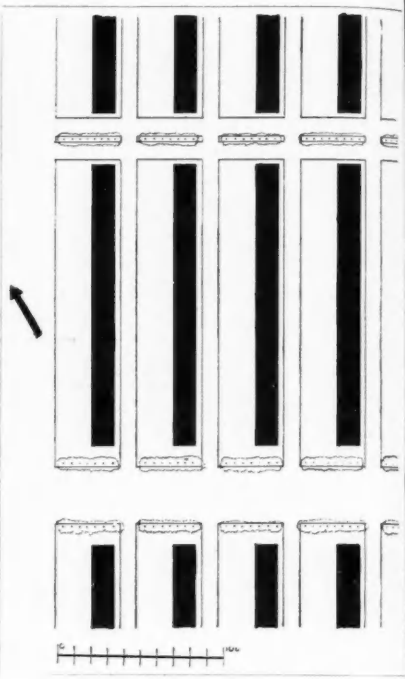


In working out the building cost of the individual dwelling-houses, it is estimated that they are all built of a timber carcase, with external rough cast for the house types 2 and 8, and internal plastering for type 8 only. For the other types, outside weather-boarding and an internal finishing of building boards have been assumed.

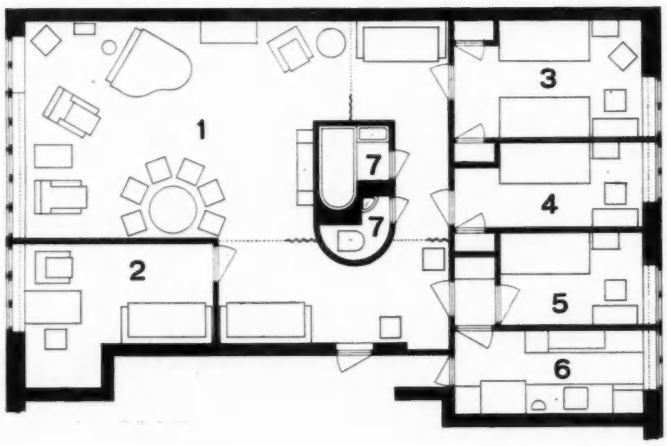


Type No. 10. The sitting-room, with dining space (1), of the flat of which a plan is illustrated below.

Type No. 8. The nursery (4) of the flat (Gustaf Clason, architect), of which the plan is illustrated adjoining. Other accommodation includes (1) Hall ; (2) kitchen, with dining space ; (3) sitting-room ; (5) bedroom for two persons ; (6) bathroom.



Type No. 10. Plan of the flat (Paul Hedqvist, architect). References : (1) Living-room, with space for dining table ; (2) kitchen ; (3) bedroom for two persons ; (4) bedroom for one person ; (5) bathroom.



Type No. 14. The sitting-room (1) is a spacious apartment, some 25 feet long, with plenty of space for a grand piano.

FUNCTIONALISM

At a recent meeting of the Birmingham Architectural Association, Mr. R. A. Duncan, A.R.I.B.A., lectured on "The Theories of the Functionalists."

The lecturer dealt briefly with the remarkable fluctuations of fashion in the architecture of the nineteenth century. The phenomena of the rapidly-succeeding phases of this period, he explained, indicated unstable conditions. Art and artists were not to be blamed, for art was purely an expression—an effect, not a cause. Each doctrine that had been propounded had been hailed as the very truth, and each had failed to remain established for long. Until our civilization defined more clearly its objectives and beliefs, we should continue to see violent changes in the arts. It was therefore unlikely that this new movement would prove more stable in its forms than those that had preceded it.

Type No. 14. Site plan and plan of a single flat (Sigurd Lewerentz, architect). References: (1) Sitting-room; (2) writing room; (3) bedroom, two persons; (4) bedroom, one person; (5) servant's room; (6) kitchen; (7) bath and toilet room.

Apart, however, from the more extravagant claims made, something had been achieved in that its exponents had tried to relate their work to the true character of our age, with its machines, mechanized processes and artificial materials. The new generation, born with a machine in their hand, undoubtedly would show a greater appreciation and understanding of this functional architecture than was possible to most of us, who were romanticists for ever looking backward.

Type No. 14. The writing room (2) is L-shaped, and occupies one corner of the flat.

LAW REPORTS

ASSESSMENT OF FLATS—COURT OF APPEAL'S JUDGMENT

Towle v. *Improved Industrial Dwellings Co., Ltd. The Company* v. *Towle. Johnstone* v. *Consolidated London Properties, Ltd. Court of Appeal. Before the Master of the Rolls, and Lords Justices Slesser and Romer*

THE Court delivered its reserved judgment in these appeals, which decided important points in regard to assessment of blocks of flats in London.

In the first appeals, that of Towle, Inspector of Taxes, against the company, and the cross-appeal, the matter referred to a block of artisans' dwellings around Morrison Buildings South, Commercial Road, Whitechapel. The contention on behalf of the Crown was that the unit of assessment was each group of flats, notwithstanding that they were within the area of the Valuation (Metropolis) Act, 1869, and that the amount of the assessment was the amount of assessment of each group of flats.

The company contended that each of the flats was in fact and in law a separate house for all the purposes of the Income Tax Acts, and was to be assessed and charged separately.

Mr. Justice Rowlatt, who heard the case in the first instance, decided that the contention of the Crown was right and allowed the appeal.

It was from this decision that the cross-appeals came before the Court. The previous hearings have been reported in THE ARCHITECTS' JOURNAL.

Mr. Latter, K.C., and Mr. L. Tooth appeared for the company in the appeal and cross-appeals, and the Solicitor-General, Sir Stafford Cripps, K.C., and Mr. R. Hills, for the Crown.

The Master of the Rolls, in giving judgment, referred to the decision in the reported case of the Attorney-General against Mutual Tontine Westminster Chambers Association, heard in 1875, and said the question raised was whether the owners of a building let out in separate tenements to several occupiers were assessable to inhabited house duty, or whether the respective tenants of different tenements must be assessed as occupiers of distinct properties. It was held that the association must be assessed and treated as occupiers of the several blocks, which comprised in the whole one dwelling-house. It was also held that as section 45 of the Valuation Act, 1869, made the valuation list in force under that Act conclusive for the tax levied for inhabited house duty, the right way to value such a block was by aggregating the value of the several tenements appearing in the valuation list, although, owing to some suites being unlet, the list did not represent the annual value to the association. That decision was affirmed in the Court of Appeal, and if the matter rested there the Court would seem bound to hold that the assessments were rightly made.

It seemed, as said by counsel for the Crown, that the effect of the Valuation Act, 1869, was to lift out of the valuation list the values contained in it, and to place them in the assessment to be made for income tax under Schedule A; and did that despite the obvious criticism that such a transfer prevented full rebate being granted for voids and in respect of repairs.

But it was necessary to turn to Rule 8 (c) of No. VII. of Schedule A of the Income Tax Act, 1918. The words were that the assessment should be made on the landlord in respect of:

> (c) Any house or building let in different apartments or tenements and occupied by two or more persons severally. Any such house or building shall be assessed and charged as one entire house or tenement.

The short point therefore in the case was whether that rule was one which related to the ascertainment of the value of the lands or tenements. Rightly or wrongly, the Court had to decide the true interpretation of complex provisions in several Acts, which were made to interact on each other. The judgment of Mr. Justice Rowlatt on the first point must be affirmed.

On the second point raised—namely, what constituted the house: whether each separate tenement, whether each group of tenements to which there was a common entrance from the street, or whether the larger building of which those groups formed part, he agreed with the judgment of Mr. Justice Rowlatt. It was a question of fact rather than of law, and one on which the Court was justified in accepting the findings of the Commissioners. The appeal failed on both points, and would be dismissed with costs.

Lords Justices Romer and Slesser concurred.

In Johnstone's case, the company appealed from a decision of Mr. Justice Rowlatt, in favour of the Crown, who heard appeals by the company from a decision of the Income Tax Commissioners in regard to eight of their flats at Linden Gardens, Notting Hill Gate. The flats were self-contained, let to separate tenants, and each had a separate front door to a common staircase, with one entrance from the street.

The Commissioners were of opinion that the income tax assessments should follow the assessments as fixed under the Valuation (Metropolis) Act, 1869, and that the appropriate deductions for repairs should be allowed in the case of each flat. They reduced the assessments on that footing.

Mr. Justice Rowlatt, who heard the case, reversed the decision of the Commissioners, holding that to make an assessment by adding together the gross valuations under the Valuation (Metropolis) Act, 1869, accorded with section 45 of that Act, which provided that the assessment value was to be the gross value stated in the valuation list and Rule 8 of No. VII. of Schedule A, which provided that any house or building let in different apartments or tenements and occupied by two or more persons severally should be assessed and charged as one entire house or tenement. Further, there was no title to the reduction claimed by the company as the amount of the assessment was less than the rent by a sum greater than the authorized.

The Court now held that the appeal from that judgment failed and dismissed it with costs.

The Master of the Rolls said it was unnecessary to give a judgment in this appeal, as the judgment in the former case covered the questions raised.

BUILDING ESTATE AT STAINES

Collinson and Stephenson v. *R. E. Bennett, & Co., Ltd. Chancery Division. Before Mr. Justice Maugham*

Questions arising out of the sale of land for development as a building estate at Staines were raised in the action by Messrs. Collinson and Stephenson against Messrs. R. E. Bennett & Co., Ltd., for specific performance of an agreement to purchase the freehold property known as The Manor House, Staines, for £2,500. Defendants alleged misrepresentation on the part of plaintiffs, and asked by counter-claim for a rescission of the contract.

The onus being on the defendants to substantiate their counter-claim, Mr. Swords, their counsel, stated that in the particulars the property was represented as being "fully ripe for development, and from every point of view formed an exceptional building estate." The property, however, was found to be useless as a building estate, because the Staines Urban District Council declined to approve any plans for its development unless a road 40 ft. wide was constructed across Shortwood Common, to give access from the public highway to the estate. There were nearly insuperable difficulties in the way of this being carried out.

Evidence was called to show that such a road could only be constructed by the passing of an Act of Parliament,

and that the Council would not pass any building scheme unless the road was constructed.

Mr. T. H. Smith, of Messrs. Brewer, Smith and Brewer, architects and surveyors, who prepared a scheme for the development of the estate on defendants' instructions, said he never contemplated any difficulty in regard to obtaining access to the estate, till told by the steward to the Manor of Staines that it was virtually impossible to get a road across the common except by Act of Parliament.

In reply to the counter-claim, evidence was called to show that the estate was one that could properly be developed as a building estate, and that the description was correct.

His lordship held that the contract was obtained by an innocent misrepresentation, by which the defendants were induced to buy the property for a building estate on the statement that it was ripe for development, whereas the agents of the plaintiffs must have known that there were tremendous difficulties in the way. He made an order for rescission of the contract, the return of the deposit, and ordered the plaintiffs to pay the costs of the action and counter-claim.

QUESTIONS THAT ARISE

Discoloured Wall Paper

R. writes: "*May I have your expert's opinion on the following three points? 1: What are the spots on the enclosed sample of wallpaper? 2: What caused them? 3: The remedy to be applied? The paper has been taken from the outside wall of a bedroom, which has three outer walls and one inside wall. The room is seldom heated. The paper was hung about May, 1929, after loose lime plaster had been removed and the repairs effected in thistle plaster (in patches only). The room then showed damp on one wall, caused by defective gutters. The walls are known to be of very poor masonry, with large holes in which there is no mortar. All three sides of outside walls were lime dashed.*

"*After papering, the weather was good for about two or three months and the walls were dry. Before the weather broke, one outer wall was rendered three coats in cement mortar and the work apparently well done. It was noted that the paper-hanger applied an excess of paste. He also applied petrifying liquid to the walls before papering. The soil of the country is impervious, giving rise to a close atmosphere on some days, and causing condensation on mirrors.*

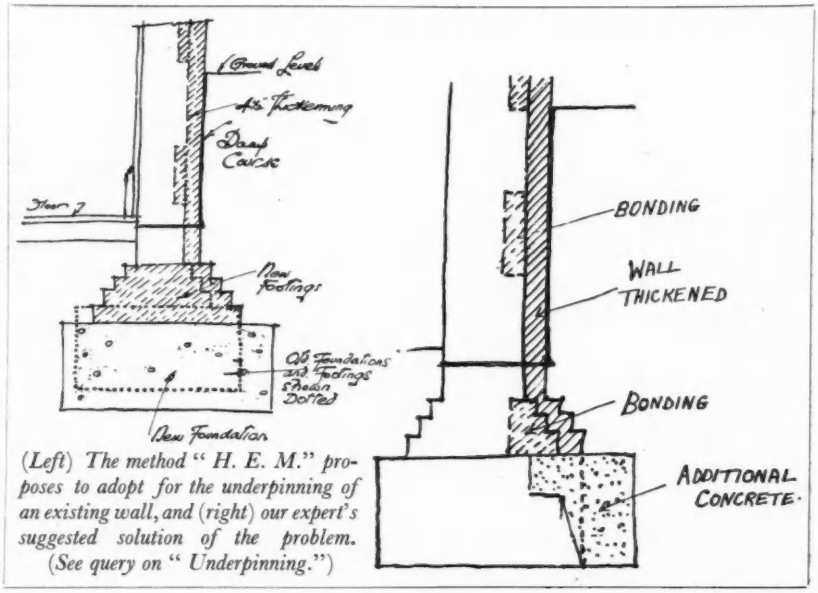
"*All outside walls show these black spots, and the cemented portion (which was the one originally noted as damp) is no better than the remainder. It is known the gutters (one half-round iron supported on iron straps and free from the wall) still overflow. One outer wall is a gable end, and there is no gutter. There is also no leakage from the roof. The inside wall is free from these spots. Before papering, the old paper was removed from the walls, and the walls washed; but carbolic was not used in the washing. The thistle plaster portions do not appear to be any different from the rest. The conclusions come to are that the spots are not caused by the excess of paste, the petrifying liquid or condensation, or any combination of them. If the spots be of the nature of a fungus or growth it is believed the excess of paste with damp may assist the growth. Formalin was not used in the paste.*"

From a superficial examination of the sample submitted, there can be little doubt that the discoloration is due to a growth of fungoid type. The spores of moulds and organisms of this kind are widely distributed, and, given a suitable habitat, their propagation is rapid when conditions are favourable for their growth. Damp provides the essential condition, and from your correspondent's description of the state of the walls we should assume that this is the cause of the discoloration.

In a case of this sort it is desirable to correct the fundamental cause of the trouble and to prevent the further penetration of moisture from the exterior. The defective paper should be removed and burnt, and the wall should be given a thorough wash with a fungicidal agent such as phenol. It would perhaps be an advantage if the walls could be left unpapered until such time as they had an opportunity to dry out. We have not conducted experiments here, but should consider that it might be practicable to incorporate a small quantity of phenol in the paste when the room is re-papered. This should inhibit future growths of organisms of this kind, at any rate for a considerable period. P. W. BANISTER
(FOR DIRECTOR OF BUILDING RESEARCH)

Underpinning

H. E. M. writes: "*The accompanying sketch illustrates the method I propose to adopt for the base of an existing wall which is to be thickened by 4½ ins. to a height of two stories. I do not intend cutting away too much of the brickwork to the base, for this would disturb the finishing to the existing lower floor rooms. Is it absolutely necessary to build new footings and foundation to conform with the spread and depth required for a 1 ft. 6 in. wall, or could I satisfactorily widen the present foundation? The earth is of compact, loamy sand.*"

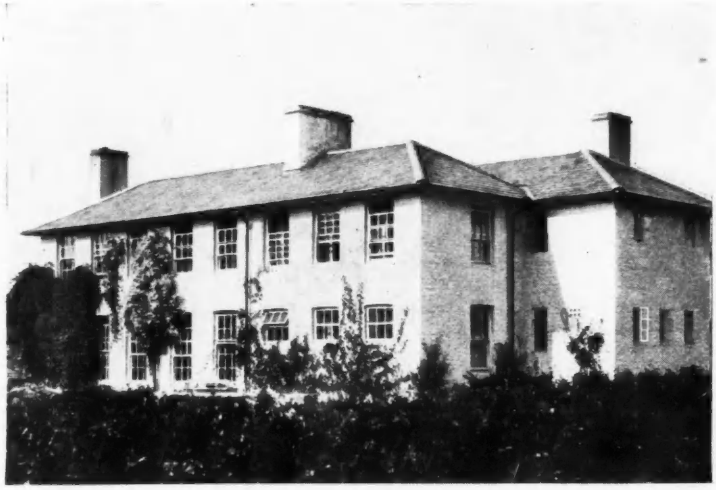


Unless the wall is properly underpinned it will be useless to try and lay a new concrete foundation in the manner suggested.

In order to cut away the existing concrete foundation and lay new concrete, it will be necessary to shore up and remove in short lengths the brick walling for at least 4 ft. above the concrete foundation, in order to give room for laying the new bed of concrete.

This will, of course, mean that the internal finishings to the lower rooms will be disturbed.

I do not think it necessary, as the earth is good, to underpin, and I suggest the work be carried out as shown on my accompanying sketch. I had work of a similar nature executed in this manner on a soil of Thames ballast.



The existing concrete foundation is simply roughly cut back to a splay to form a key for the additional concrete, and the new work bonded to the old by diagonal block bonding. A. J. T.

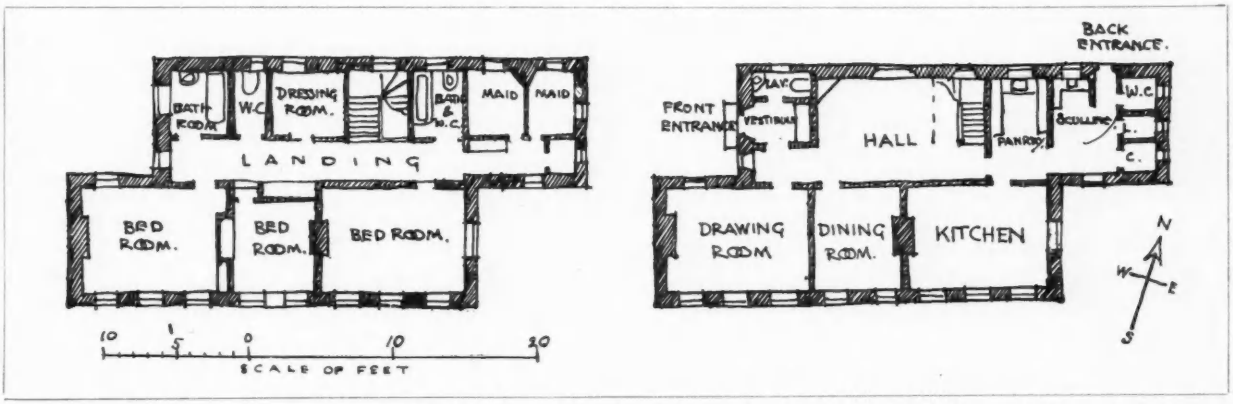
(Left) The method "H. E. M." proposes to adopt for the underpinning of an existing wall, and (right) our expert's suggested solution of the problem. (See query on "Underpinning.")

A RUBBLE-BUILT COUNTRY HOUSE

DESIGNED BY POWYS AND MACGREGOR

A general view of the south or garden elevation. In reality, this is treated as the main front of the house, the north side, facing the road, being mainly devoted to hall and service quarters; the front door is placed at the north-west corner.

QUARRY HOUSE, The Avenue, Sherborne, Dorset, was built for a client who had been brought up in country vicarages built in the first thirty years of the last century, and therefore had an affection for that type of house. Hence its general characteristics of appearance and accommodation.



The walls are constructed of Stalbridge (Dorset) fossil-rubble stone, without quoins or dressings. So well did the masons employed understand this manner of walling, the architects have stated, that they know of no example, old or new, which surpasses these walls for strength and good building: "the texture is like the texture of a XIII-century rubble-built church tower."

The roof, which is covered with Norwegian slates, has been designed so as to be easily accessible for inspection. It has comparatively deep eaves, the top of the wall being covered with a 9-in. bed of concrete which projects beneath to form the eaves soffit. The windows to the main rooms are of the sliding sash type, divided into small panes; metal casements are fitted to the service quarters.

A near view of the front door and entrance porch, which comes in an angle of the north side and west end. The deep eaves have a 9-inch bed of concrete as soffit. The roof is covered with slates.

In laying out the plan the amenities of the site were taken into consideration. The undulating garden falls fairly sharply from the south front, on which side there are also a few trees. Accordingly, this was made the principal elevation, and a stone-flagged terrace was formed, with a retaining wall and steps leading down to give access to a sloping lawn. The result is that the three main rooms on the ground floor, and the bedrooms above, enjoy the benefit of a charming outlook.

The architects' drawings of the ground and first floors reveal planning that, though apparently simple, is the result of careful forethought. It will be noticed that the servants' quarters are concentrated and isolated on both floors.

THE SKETCH CLUB

NINETEENTH SESSION

ALL the sketchers whose work is here reproduced have previously contributed exhibits to the Sketch Club—with one exception. This is Professor S. D. Adshead, two of whose pen-and-ink illustrations for his lecture on Essex, summarized in last week's issue, were reproduced therewith; here are two more in the same medium, and also another couple, in coloured crayon.

By R. A. F. Riding (Pencil).

LITERATURE

THE OLD BANK OF ENGLAND

THE ground-floor plan of the Bank of England discloses a tightly-welded mass of different-sized compartments betraying uncertain affinity with the lines of the encircling walls, but no clarity of expression. It might be, indeed, a slice of the crowded Roman forum for all a first glance would tell one; and like Rome it is the result of a slow accretion by more than one mind's working, of a complex organism serving many purposes under the all-embracing title of the Bank of England.

The history of the Bank is prosaic enough. It started from an idea, and by well-consolidated stages grew; and it might never have been a history to interest us had not the major task of giving form and character to the buildings, as we have known them up to this present, fallen to the lot of an architect whose original mind and strong personality place him in a niche apart from the genealogy of English architecture.

Of the earliest work of Samson, the first architect to the Bank, there are little more than records, but Sir Robert Taylor, had he left behind him nothing more than the Court Room suite, would be remembered as a designer fit to rank with the best minds of his time.

As it was, most of his work was found by Soane to be in a dangerous condition, and was demolished and rebuilt under his remarkable system of "fireproof" construction, and in a style the product of an unusual admixture of constructive ingenuity with nearly febrile imagination.

It should be remembered, when one is trying to get at the inside of Soane's work, that his great halls and the Rotunda in which seem to me to lie the innermost spirit of his design, were works of *construction* only comparable today to the work of some few architects who have made it their concern to understand their materials and use them to their best economy. Soane never underestimated. He worked out all his own bills, and had a knowledge of prices, materials and labour superior to that of any other architect of his day. That knowledge made it possible for him to rebuild Taylor's halls with four stone piers instead of sixteen columns, and to infuse his memory of the vast vaults of the Roman baths with a feeling of shell-like lightness unknown to Rome. Thus his sensibility brought grandeur again to life without a resuscitation of dead form—with what effort of brain and spirit one can but dimly guess at, not being Soane.

It is recorded of him that he made twenty alternatives for every one design finished; that he was uncertain and unsettled in every step he took. One can see this, especially outside the great halls.

It is the defect of a too sensitive imagination—unlike his cheerful contemporary Nash.

And what a wealth of imagination is gathered together in this generous collection of clear photographs and finely-lined drawings! This book is fit to stand with Professor Richardson's great work, as a more than adequate testimony to English monumental architecture.

BERKSHIRE REGIONAL PLANNING SURVEY

THIS Survey has been prepared under the auspices of a committee composed of five representatives of the County Council and one from each of the town-planning authorities within the county. The technical sub-committee included all the surveyors to the authorities interested; by this means the fullest knowledge of the character of the area was made available and proposals could be studied in the light of local information. While the report is largely devoted to the recording of existing conditions as suggested by the title, it also contains a general outline of probable future developments, and of the steps necessary to provide for these.

Berkshire may be divided into two main areas, connected by a narrow neck near Reading. The smaller area to the east is largely suburban in character, while the larger one to the west is mainly agricultural and pastoral country. This latter can conveniently be divided into four parallel strips running east and west, namely, the Thames Valley, the Vale of the White Horse, the Berkshire Downs, and the Kennet Valley. With the exception of extensive pastoral areas on the Downs, these districts are mainly agricultural, but there is also some forest land. It is suggested that industries might

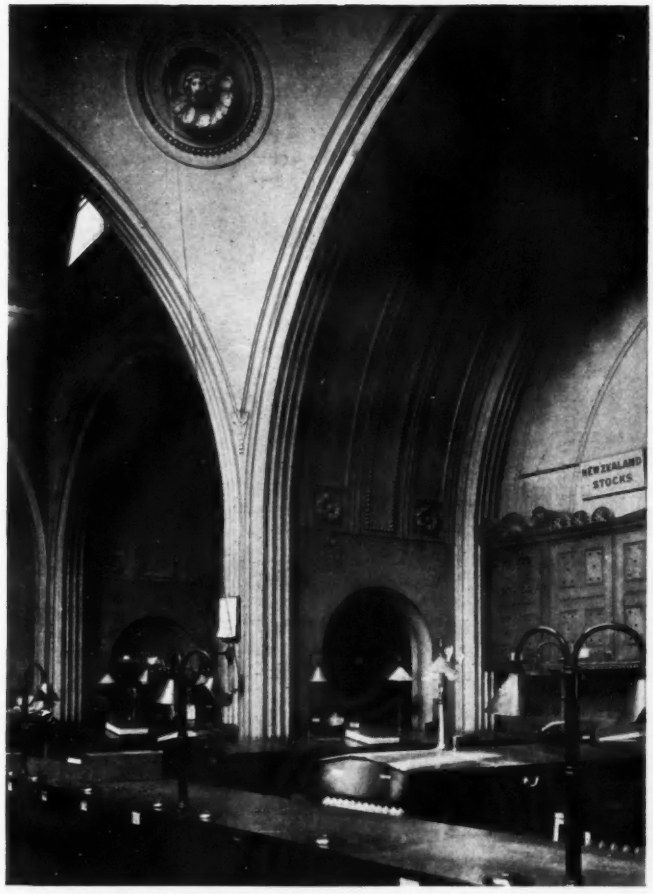
[*From* The Old Bank of England. *By H. Rooksby Steele and F. R. Yerbury*]



appropriately locate themselves around Wantage and Newbury, but in general no very drastic changes are anticipated.

An important consideration in a district possessing such interesting natural features as western Berkshire is the preservation of these from injurious developments; the report recommends as essential the reservation of the river banks and the escarpments of the Downs. The uplands are generally described as of "national importance," while specially selected areas are included in one or other of these categories. Features of archæological interest are also scheduled and the necessary steps for their preservation recommended.

Modern developments such as roads, aerodromes, and other public services receive careful consideration, and the report deserves especial commendation for the well-selected illustrations and the very clear and explicit series of maps. H. V. LANCHESTER

The Berkshire Regional Planning Survey. By W. R. Davidge. Reading: Bradley and Son.

SOCIETIES AND INSTITUTIONS

R.I.B.A. COUNCIL MEETING

FOLLOWING are some notes from the minutes of a recent meeting of the R.I.B.A. Council:

Librarian and Editor: Mr. E. J. Carter, B.A.(CANTAB.), A.R.I.B.A., was unanimously appointed Librarian and Editor in succession to Mr. Rudolf Dircks on the latter's retirement.

The Honorary Associateship: It was unanimously agreed to nominate Mr. Rudolf Dircks and Sir Leslie Scott, K.C., for election as Hon. Associates.

Housing Work Panels: A scheme for the establishment of Housing Work Panels was approved and referred to the Allied Societies for their comments. It was agreed to ask Mr. R. T. Longden, F.R.I.B.A., the author of the scheme, to start the Panel in North Staffordshire with the least possible delay.

Revision of the R.I.B.A. Scale of Professional Charges: The comments and criticisms received from members upon the draft revised Scale of Charges were submitted to the Special Committee on the Scale of Charges for consideration and report.

R.I.B.A. Prizes for Secondary Schools: On the recommendation of the Board of Architectural Education, it was decided to increase the value of the R.I.B.A. Prizes for Secondary Schools from £5 to £10 10s.

The Court of Governors of University College, Hull: Mr. F. J. Horth, F.R.I.B.A., was reappointed to represent the R.I.B.A. on the Court of Governors of University College, Hull.

The International Congress of Architects, Budapest: A cordial message of thanks was sent for the hospitality offered by the Hungarians to the British members of the Congress.

The Registration Committee: Lt.-Col. P. A. Hopkins was appointed a member of the Registration Committee in the place of the late Mr. W. Gillbee Scott.

The Town Planning and Housing Committee: Mr. Arthur Crow was reappointed a member of the Town Planning and Housing Committee.

Membership: Election, November 3, 1930.—Applications for membership were approved as follows: As Hon. Fellows, two applications; as Hon. Associates, two applications; as Hon. Corresponding Member, one application; as Fellows, forty-five applications; as Associates, 102 applications; as Licentiates, sixty-five applications. *Reinstatement.*—The following ex-members were reinstated: As Licentiates: Messrs. Peter Frederick Binnie, Arthur Albert Messer, Eric Alexander Sutherland.

Applications for Election as Licentiates under Section III (f) of the Supplemental Charter of 1925: Two applications were approved.

Resignations: The following resignations were accepted with regret: Messrs. Percy Frank Hockings, A.R.I.B.A., John Halstead Waterworth, L.R.I.B.A.

AUSTRALIAN ARCHITECTS' GREETINGS

The President of the R.I.B.A. has received the following cablegram from the President of the Royal Australian Institute of Architects:

FIRST ANNUAL MEETING OF ROYAL AUSTRALIAN INSTITUTE OF ARCHITECTS AT MELBOURNE SENDS GREETINGS TO MOTHER INSTITUTE OF EMPIRE.

Blackett President

WELSH SCHOOL OF ARCHITECTURE

At a meeting of the Welsh School of Architecture held at the Cardiff Technical College, Principal Charles Coles, B.SC. (LOND.), presiding, a presentation was made to Mr. R. H. Winder, M.A., A.R.I.B.A., on the occasion of his leaving the Welsh School of Architecture to take up a position as Head of the School of Building in the Technical College at Leeds.

Mr. H. J. Hughes spoke on behalf of the students; Mr. Lewis John, M.A., B.ARCH., A.R.I.B.A., on behalf of the staff; while Mr. H. Norman Edwards (Chairman of the Central Branch of the South Wales Institute of Architects),

and Mr. C. F. Jones, A.R.I.B.A., spoke on behalf of the architects of the district. The presentation was made by Mr. W. S. Purchon, M.A., A.R.I.B.A.

All the speakers emphasized the importance of the work which had been done by Mr. Winder during the past ten years in helping to raise the school from very small beginnings to an Institution with the fullest recognition of the R.I.B.A., and one which had already produced a Rome scholar.

In responding, Mr. Winder thanked the other members of the staff for the support which they had given him, and expressed the hope that the Welsh School of Architecture would continue to develop.

FRENCH MEDIÆVAL ARCHITECTURE

Sir Banister Fletcher, P.R.I.B.A., lecturing at the Central School of Arts and Crafts, London, dealt with French mediæval fortified towns, castles, country houses, hotels-de-ville, palaces and hospitals, which, he said, involved the study of a different aspect of social and political life to that called forth by the cathedrals and churches. He pointed out that mediæval architecture was not confined to ecclesiastical buildings only, but was invariably employed in the many secular buildings which were constructed.

R.I.B.A. STATUTORY EXAMINATION

The R.I.B.A. Statutory Examination for the office of district surveyor under the London Building Acts, and the examination for the office of building surveyor under local authorities, will be held at the R.I.B.A., London, on May 6, 7, 8 and 9, 1931.

The closing date for receiving applications for admission to the examinations, accompanied by the fee of £3 3s., is April 15.

Full particulars of the examinations and application forms are obtainable from the Secretary, R.I.B.A., 9 Conduit Street, W.1.

SCOTLAND'S SURVEYORS' ANNUAL DINNER

Sir John Gilmour, BT., was the principal guest at the annual dinner of the Faculty of Surveyors of Scotland, held at Glasgow. Mr. J. Parnie Dansken, president of the Faculty, presided.

Sir John, who proposed the toast of "The Faculty of Surveyors of Scotland," pointed out that in the Royal Charter of the Faculty, which was granted in 1913, there was recorded its past history and its high hopes for the future. The hallmark of the Faculty had been the integrity and honour of the profession, and that in public life counted for a great deal.

Mr. Dansken, responding, said it was a matter of pride to the Faculty that Scotland was the first country in the world to inaugurate a mode of measurement of its own. At the present moment these modes of measurement were being revised, and he sincerely hoped that the result would tend towards simplification. He was glad to think that the profession of quantity surveying, or measuring, was every day becoming more widely known, and he was pleased to say that the Corporation of Glasgow and its Education Committee fully recognized the Faculty of Surveyors of Scotland, and entrusted them with many of their large building contracts.

Other speakers were: Professor J. Graham Kerr, and Messrs. John Jubb, David Allan Hay, and Robert Robertson.

THE FULHAM POWER STATION

The London Society has issued the following statement regarding the proposed extension of the electricity power station at Fulham :—

"We wish most strongly to support the opposition to the establishment of one of these great stations at Fulham which is being offered on behalf of the L.C.C., the Council of the City of Westminster, and the Metropolitan Borough Councils of Chelsea and Kensington, and for the following reasons: We view with concern the proposal to increase the capacity of the existing electricity power station in Townmead Road, Fulham, so as nearly to equal the consumption of coal in the proposed new master station at Battersea, and we entirely agree with the contention put forward by the L.C.C. that if the full programme is carried out the resulting concentration of stations consuming raw coal will constitute a serious menace to the health of the inhabitants not merely of the surrounding neighbourhood but of the whole of the Metropolis, as well as to vegetation and to buildings both of stone and of brick, the main cause of trouble being the sulphur that will still be present in the products of combustion even after they have been submitted to the most efficient processes of purification. In support of this belief it has been established that serious damage to crops within an area of about a mile was caused by the modern power station at Barton, near Manchester, consuming some 500 tons of coal per day, which is only about one-quarter of the amount contemplated both at Battersea and Fulham. With regard to health, we have before us a report of the Public Health Department of the City of Glasgow, in which it is stated that, during a coal stoppage that lasted three months, deaths from diseases of the breathing organs dropped by 420 when compared with the same period of the previous year. While it is admitted that too much stress should not be laid on a single case, the figures are none the less interesting and significant.

"The principal aim of the signatories of this petition is to try and look at the situation from the point of view of London as a whole, and it appears to them that it is a wasteful policy to restore the stonework of buildings such as the Houses of Parliament and Henry VII.'s Chapel and to install non-smoke-producing apparatus in houses and offices, and at the very same time to encourage in the midst of the built-up area of London a concentration of huge coal-consuming power plants—plants, it must be remembered, that are intended to consume raw coal in unprecedented quantities.

"With regard to the elimination of sulphur, we suggest that before it is possible to decide on the success or otherwise of any measures that may be taken to effect this, a decision should be come to as to the amount of sulphur in the products of combustion that might really be considered harmless when discharged into the atmosphere. Even with an elimination of 90 per cent., some two tons a day would be available to be deposited on the surrounding neighbourhoods in damp and foggy weather.

"We anticipate that in the future definite areas in London will be set aside for development for industrial purposes, and that within certain limits no new coal-consuming plants of any description will be permitted, old ones being required to be converted within an agreed number of years.

"We therefore urge that the present proposal should be abandoned and that these great coal-consuming stations, supplemented by efficient purification plant to eliminate as much of the sulphur and grit as possible, should be banished to sparsely populated districts."

The undersigned societies and individuals wish to be associated with the London Society in the foregoing statement :—

R.I.B.A.; Dean and Chapter of Westminster; National Smoke Abatement Society; Incorporated Association of Architects and Surveyors; Chelsea Society; Curator of the Chelsea Physic Garden; Chelsea Chamber of Commerce; Commissioners of the Royal Hospital, Chelsea; Chelsea Arts Club; Metropolitan Public Gardens Association; Chelsea Gardens Guild; Barnes and Mortlake Amenities Committee; Lord Dawson of Penn; New Health Society; Sunlight League; President, Town Planning Institute; Royal Society of British Sculptors; Secretary of the Garden Cities and Town Planning Association; Trustees of the National Gallery; Society for the Protection of Ancient Buildings.

The January issue of THE ARCHITECTURAL REVIEW *will be a special number devoted exclusively to the City of New Delhi, India, planned and designed by Sir Edwin Lutyens, R.A., and Sir Herbert Baker, A.R.A., F.R.I.B.A. This issue will be published at the usual price of 2s. 6d.*

ANNOUNCEMENTS

Mr. Basil Oliver has removed to 6 Unwin Mansions, Queen's Club Gardens, W.14. Telephone: Fulham 2422.

Mr. Arthur Stratton, F.S.A., F.R.I.B.A., for some years Reader in Architecture at University College, London, has recently resigned his university and college appointments. Although he has retired to Pulborough, Sussex, where he will carry on his architectural practice and devote himself to literary work, he will be in London from time to time at his old address, 88 Gower Street, W.C.1.

In view of the important requirements of the new regulations governing the issue of driving licences and the physical fitness of applicants, the Automobile Association Legal Department will furnish a copy of the regulations, free of charge, to any motorist upon request. Applications should be made to the Automobile Association, Fanum House, New Coventry Street, London, W.1.

THURSDAY, FEBRUARY 5
WEST YORKSHIRE SOCIETY OF ARCHITECTS. Biennial Dinner. (Particulars will be announced later.)
INSTITUTION OF STRUCTURAL ENGINEERS. South Wales and Monmouthshire Branch. At the Institute of Engineers, Park Place, Cardiff. "Thames House." By R. Travers Morgan, A.M.INST.C.E.

TUESDAY, FEBRUARY 10
INSTITUTION OF HEATING AND VENTILATING ENGINEERS. Manchester and District Branch. At the Milton Hall, Deansgate, Manchester. "Panel Heating." By C. M. Oates. **7 p.m.**

COMPETITIONS OPEN

January 7.—The Incorporated Association of Architects and Surveyors invites competitive designs for a Model Petrol Filling and Service Depot. Assessors: Alfred Stephens Cross, M.A. (CANTAB.), V-P., I.A.A.S.: Edward H. Fryer, and Walter Groves. Prizes: 50 guineas, 20 guineas and 10 guineas. Smaller awards may also be made on the advice of the assessors. Full particulars, etc., are obtainable from the Secretary, the Incorporated Association of Architects and Surveyors, 1 Wilbraham Place, London, S.W.1. Latest date for submission of designs: January 7, 1931.

January 10.—The Bermondsey B.C. recently invited competitive designs for a proposed new medical clinic in Tower Bridge Road, S.E. Premiums: £250, £150 and £50. Designs should be submitted to E. Goff Clark, Town Clerk, Town Hall, Spa Road, Bermondsey, by January 10, 1931.

January 15.—The Committee of the Foundation Hospital and the Rectorate of the Royal Yugoslavian University of Zagreb invites competitive designs for the general rebuilding plans of the Foundation and Clinic Hospital of Zagreb. Prizes: 1st, 20,000 Swiss francs; 2nd, 15,000 Swiss francs; 3rd, 10,000 Swiss francs. 15,000 Swiss francs have been set aside for any further work which may be required. Latest date for submission of designs: January 15, 1931.

January 31.—The Coventry Corporation invites architects to submit competitive designs for a new Hospital for Infectious Diseases. Architects competing must be established in private practice. Assessor: E. Stanley Hall, M.A., F.R.I.B.A. Premiums, £300, £200 and £100. Particulars may be obtained from Frederick Smith, Town Clerk, Council House, Coventry, until January 31. Deposit £1 1s. Latest date for submission of designs: April 30, 1931.

February 1.—The Norwich Corporation invites architects practising in the County of Norfolk to submit competitive designs for a proposed new fire station to be erected on a site in Bethel Street, Norwich. Conditions of the competition are obtainable from Noel B. Rudd, Town Clerk, Guildhall, Norwich. Deposit, £1 1s. Latest date for submission of designs: February 1, 1931.

February 12.—Messrs. Venesta, Ltd., invite practising architects and designers to submit preliminary designs for a stand at the Building Trades Exhibition at Manchester. Assessors: Messrs. Christian Barman, H. de C. Hastings, W. L. Wood, Henry Rutherford, and Professor A. E. Richardson. Premiums: 1st, £100, and £10 each to the four competitors placed next in order. Full particulars may be obtained from the Editor of THE ARCHITECTS' JOURNAL, 9 Queen Anne's Gate, S.W.1, or direct from Venesta, Ltd., Vintry House, Queen Street Place, London, E.C.4. Latest date for submission of designs: February 12, 1931.

April 1.—An international competition, for the development of the uses of aluminium and its alloys, open to inventors of any nationality, is to be held annually by the International Aluminium Bureau. The competition will be divided into two sections. The prizes to be awarded are 25,000 French francs for the entries under Sections A (methods of working or using the metal) and B (manufacture of articles therefrom) respectively, and 50,000 French francs to the author of a suggestion which has exceptional interest or value under either section. Entries may be submitted between January 1 and April 1, 1931. Full particulars are obtainable from the Bureau International de l'Aluminium, 23 bis, Rue de Balzac, Paris, France.

TRADE NOTES

The Trussed Concrete Steel Co., Ltd., in accordance with long-standing custom, held their annual conference during the second week in December. The weightier matters of the fourth day disposed of, the Truscon Sports Club, which is responsible for the lighter side of the company's activities, held their annual dinner and dance in the evening. On Friday, December 12, the head office principals and the provincial managers were the guests of the directors at a dinner. Here several tributes were paid by the provincial managers and others to the unique and inspiring spirit of co-operation which existed between themselves and the directors, one speaker in particular emphasising his appreciation of the atmosphere of sympathetic understanding of their individual problems and difficulties. It was the general feeling of all the members of the Trussed Concrete Steel Company's executive staff that they were something more than mere ciphers in a highly efficient organization, but were rather a smoothly-working happy team under the captaincy of executives of real foresight and zeal, tempered by a human outlook. In reply, the directors stated that for their part they hoped that this "happy family" atmosphere of enthusiastic efficiency would always be maintained. They were confident that the policy of a definitely helpful and accessible directorate was the finest possible means of ensuring the continued progress of the company. The party rounded off another altogether delightful evening at the Prince Edward Theatre, London.

*

Plaster Locked to Concrete is the title of a new pamphlet issued by Messrs. Macinlop, Ltd., of Manchester, to describe a new mechanical key method which it is claimed gives an added safety factor of twenty to plaster renderings. This key has been marketed under the name of the "Ke-it" unit. It is a double-tapered bevel-edged rubber strip, which, when laid on concrete centering or form-work, results in an undercut void, which forms a hanging medium for the rendering plaster coat. It is claimed to provide a permanent key of great efficiency and to eliminate the risks attaching to shrinkage, as the key remains efficient in spite of shrinking. The value of the unit is said to be especially noticeable when used on ceilings and panels covering embedded heating installations. In this type of work a definitely permanent key which is unaffected by shrinkage is of paramount importance. In buildings containing electrical apparatus, organs and other machinery which sets up vibration, the use of the unit is claimed to give a measure of security to the plaster work which cannot be obtained by any other method. It is also said that the commonly experienced "creeping" which occurs with asphalt on vertical faces in hot weather is very appreciably reduced by the use of the "Ke-it" strip. The most economical method of using the "Ke-it" strip is to place it in the "Ke-it" strip envelope before application. It can then be extracted easily without damage and can be used over and over again without cleaning. It may be used either on horizontal or vertical centering. Used horizontally it is merely laid on the centering, without attachment. For vertical use the loose ends of the paper envelope containing the strip are secured with the aid of tacks driven through a strip of waste cardboard. When required for vertical steel centering, the "Ke-it" strips may be attached with the aid of fine string.

*

Messrs. Redalon, Ltd., announce that approximately 18,000 "Bull Dog" floor clips were used in Cropthorne Court, Maida Vale, W., illustrated in THE ARCHITECTS' JOURNAL for December 17 last. These clips, it is claimed, are a most efficient and economical method of obtaining strong, silent floors, and at the same time reduce the dead load by 18 lb. per square foot of floor area.

*

The Mersey Docks and Harbour Board have accepted the tender of Messrs. Dorman, Long & Co., Ltd., of Middlesbrough and London, for the supply and erection of three rolling bascule bridges at Liverpool, the inclusive price being £96,969. Two of the bridges will carry railway and road accommodation and have openings of 70 ft. 3 ins., and the third will have road accommodation only and an opening of 51 ft. Work on these bridges will start immediately. The stipulated contract time for completion is nine months.

THE BUILDINGS ILLUSTRATED

Following is a list of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Whitelands College, Putney, S.W. (pages 968, 971–975). General contractors, John Garlick (1910), Ltd. Sub-contractors: J. L. Green and Vardy, Ltd., special joinery, furniture, library panelling and carving, carved stalls in chapel; Ragusa Asphalte Paving Co., Ltd., asphalt; Trussed Concrete Steel Co., Ltd., reinforced concrete engineers; Ames and Finnis, bricks and roof tiles; Portland Stone Co., stone; Moreland, Hayne & Co., Ltd., structural steel; Acme Flooring and Paving Co. (1904), Ltd., woodblock flooring; G. N. Haden and Sons, Ltd., central heating, boilers, electric wiring, electric light fixtures, bells, telephones; Davis Gas Stove Co., Ltd., gas fixtures; Jas. Reekie and Sons, plumbing; Leeds Fireclay Co., Ltd., sanitary fittings; Nicholls and Clarke, Ltd., door furniture; Xelite Plaster Co., Ltd., plaster; Yetton Safe Co., Ltd., metal work; J. Whitehead and Son, Ltd., marble; Bennet Furnishing Co., Ltd., furniture and school fittings ; Associated Purchasers, Ltd., furniture ; John Garlick (1910), Ltd., and S. Elliott and Sons, Ltd., joinery and church fittings ; Watts & Co., Ltd., church fittings ; Jas. Gibbons, Ltd., cloakroom fittings ; Express Lift Co., Ltd., lifts.

The Black Horse, Northfield, near Birmingham (pages 976–978). General contractors, J. and A. Brazier, Ltd., who were also responsible for the plumbing. Sub-contractors : J. F. Booth and Son, stonework; King's Heath Guild, carvings and modelled plaster; Freemans and C. A. Fellowes, stone slate roofing; W. and H. Pearson, plaster; Stratford - on - Avon Guild, ornamental heads; Doulton & Co., Ltd., sanitary fittings; Maw & Co., Ltd., tile paving; Gaskell and Chambers, bar fittings; Horrell and Bowman, ironmongery; Haywards, Ltd., pavement lights; Waygood-Otis, Ltd., electric lifts; Midland Heating and Ventilating Co., heating and ventilating; Thomas Glover, electrical work; Ingram and Kemp, electrical fittings; J. R. Pearson, Ltd., swing sign; Arthur Brett and Sons, furniture; B. P. Venn, carpets; Middleton and Wallis, garden furniture; Bakers, garden contractors; Harvey and Ashby, leaded lights and glass; Kean and Scott, curtains; C. Creedon and Sons, gas; Marley Bros., iron gates; Lightfoot Refrigerator Co., refrigerator; Chas. Wade & Co., steelwork.

NEW INVENTIONS

[The following particulars of new inventions are specially compiled for THE ARCHITECTS' JOURNAL, by permission of the Controller of H.M. Stationery Office. All inquiries concerning inventions, patents and specifications should be addressed to the Editor, 9 Queen Anne's Gate, Westminster, S.W.1. For copies of the full specifications here enumerated readers should apply to the Patent Office, 25 Southampton Buildings, W.C.2. The price is 1s. each.]

THE WEEK'S BUILDING NEWS

LONDON AND DISTRICTS

Mr. Thomas Scott, architect, is preparing plans for the new secondary boys' school at Gunnersbury Lane, BRENTWOOD.

The CROYDON Corporation Housing Committee has submitted the following statement and recommends that the proposals should be submitted to the Ministry of Health as a preliminary scheme for houses to be completed during five years commencing January 1, 1931 : Mitcham Road estate, 320; Waddon estate extension, 500; Downsview Road estate, forty-two; Ham Farm estate, seventy-eight; Old Town (housing improvement area), 120; Old Town (streets improvement area), 170; sundry improvements, say, 100—total, 1,330. It is recommended further that the Minister be informed that the Council is considering the acquisition of more land for schemes under the 1924 Act, and will submit a further scheme next June.

A scheme for the transfer of the Imperial War Museum from SOUTH KENSINGTON to the site of the Old Bethlem Hospital, LAMBETH, has been accepted by the L.C.C. on the recommendation of the Parks Committee. Plans for the conversion of part of the existing buildings at Lambeth have been formulated by the Office of Works.

SOUTHERN COUNTIES

The BOURNEMOUTH Corporation is investigating the possibilities of erecting houses by direct labour.

Plans passed by the CANTERBURY T.C. : Pair of houses, Stodmarsh Road, for Messrs. Gammon & Co.; store, Sturry Road, for Messrs. Anglo-American Oil Co.; house, Old Dover Road, for Miss N. Fowler; alterations to Oporto Tavern, St. Peter's Street; alteration to premises at corner of Mercery Lane and The Parade, for Boots, Ltd.; alterations, 10 and 10a Burgate Street, for the Dean and Chapter; and a bungalow, St. Martin's Avenue, for Mr. W. S. Cozens.

The DORKING U.D.C. has approved plans submitted by the Workmen's Housing Association, Ltd., for the erection of 102 houses at the Meadowbank estate. The Ministry of Health is to be asked to sanction the scheme.

Subject to the approval of the Ministry of Health, the GRAVESEND Town Council, at a recent meeting, decided to purchase land at Denton, to carry out a housing scheme. The land in question is about thirty-one acres, and its price is £8,000. It is situated on the Chalk road, just past Denton Court and "The Nest," and extends back to the marsh.

The KINGSWOOD U.D.C. has decided to defer a definite decision on the proposed purchase of a housing site at Cheltenham Road until their next meeting.

SOUTH-WESTERN COUNTIES

The ST. AUSTELL U.D.C. is recommended by the Housing Committee to submit to the Ministry of Health tenders received for the erection of a further forty-four houses on the Polkyth site.

A housing scheme involving a sum of £500,000, a proposed new hospital at Islay and a road-reconstruction scheme at Campeltown, were matters discussed at a recent meeting of the PLYMOUTH ARGYLE County Council. A committee was appointed to further the proposal for the housing scheme.

The WEYMOUTH R.D.C. propose, if they can obtain the site, to build ten more houses at Upwey.

EASTERN COUNTIES

The SOUTHEND-ON-SEA Town Council has resolved to build a garage for buses at the London Road depot at an estimated cost, including construction of necessary approach road, of £7,400.

MIDLAND COUNTIES

Mr. W. E. Salt, on behalf of a private syndicate, has secured the Birmingham Justices' provisional approval to the erection of a new cinema in Yardley Road, ACOCKS GREEN. This new theatre will have a total seating capacity of 1,458.

The BEDFORD T.C. contemplates the erection of 500 houses during the next five years.

The COVENTRY Education Committee is to erect and furnish a school at Green Lane, at a cost of £45,000.

The HINCKLEY R.D.C. has received the approval of the Ministry of Health for the erection of thirty-two more houses at Earl Shilton.

The NUNEATON Borough Council has approved a programme for the building of 1,215 houses during the next five years.

The STOKE-ON-TRENT Corporation is recommended to borrow £14,159 for the construction of main subways, erection of water tower, etc., in connection with the new hospital scheme, and £33,543 for the erection of hospital pavilion No. 1.

NORTHERN COUNTIES

At a meeting of the City Education Committee of the CARLISLE Council the question of the proposed new Technical and Central Schools was discussed. It was eventually decided to proceed with the work, and to appoint by open competition an architect to carry out the erection of the schools.

Work on the new employment exchange in Prince Albert Street, CREWE, is estimated to cost about £10,000.

The Housing Committee of the DEWSBURY Council has prepared a scheme under the Housing Act (1930) for submission to the Ministry of Health for a five-year programme of slum clearance, and the erection of new houses. The scheme provides for the building during the next five years by the local authority of 600 houses. It is estimated also that during the same period 100 houses will be built by private enterprise. Three hundred and eighty of the houses it is proposed that the Corporation shall erect are to be set aside for the re-housing of tenants displaced as the result of slum clearance.

The LEEDS Entertainments, Ltd., have decided on a big scheme of enlargement and re-organization for the Picture House, Branch Road, Armley. Plans have been prepared by Mr. Walter Bickerton, A.R.I.B.A.

The Unemployed Grants Committee of the SUNDERLAND Corporation has granted a sum of £6,350 towards a new shelter and cloakroom on the Whitburn Road and a cloakroom on the new road near the miniature golf course, which the Corporation propose building.

The STALYBRIDGE Corporation has approved plans of alterations at the Grand Theatre.

Plans passed by the STOCKTON Town Council : Four houses, Osborne Road, for Mr. J. W. Carter; four houses, David Road, for Messrs. R. Blackett & Co.; bungalow, Newlands Avenue, for Mr. A. J. Blackett; alterations, Unicorn Hotel, High Street; four houses, Brisbane Grove, for Mr. G. Fordy; alterations, Old Stockton Arms Hotel, Hartburn; alterations, Spread Eagle Hotel; alterations, Green Bushes Hotel; two houses, Newsham Avenue, for Mr. T. W. Wintersgill.

Messrs. E. W. Chasen Ralph and Son, architects, have been appointed architects for a large elementary school, to accommodate 1,500 scholars, for the SWINTON Education Authority.

An amendment that the THORNABY Town Council's estimate of 306 houses, which are to be erected during the next five years, was insufficient to meet requirements, was passed at a meeting of the Council. The amended number is 320.

The THORNABY Town Council has passed plans for new premises in Mandale Road for the National Provincial Bank, Ltd., and for alterations to the Queen's Cinema, Mandale Road.

A scheme to provide a shelter beneath TYNEMOUTH Plaza, at an estimated cost of £6,710, has been approved by the General Purposes Committee of the Tynemouth Council.

The erection of 850 new houses is recommended as a five-years' programme, under the Housing Act, 1930, by the Housing Committee of TYNEMOUTH Corporation for the re-housing of persons who may be displaced by the carrying out of slum-area clearance schemes.

SCOTLAND

At a joint meeting of the Public Health and Housing Committees of the ABERDEEN Town Council it was decided to recommend to the Town Council a house-building scheme under the Housing (Scotland) Act, 1930, to provide for the construction of 2,400 houses.

Now that the extension of ABERDEEN Fish Market wharf, at Commercial Quay, has been completed, steps are being taken to carry out the widening of the wharf and Fish Market from Market Street to Black's Lane, at a cost of £38,000.

The BATHGATE Town Council has outlined a scheme to erect a swimming pond and baths. The scheme is estimated to cost £12,000.

The DUNDEE Corporation Works Committee has received from the Ministry of Transport the report submitted by Messrs. Mott, Hay and Anderson on the alternative proposals for a high or low level Tay Road bridge. The scheme is estimated to cost £2,100,000.

A survey on EDINBURGH's housing needs was made at a meeting of the Public Health Sub-Committee of Edinburgh Town Council. The sub-committee agreed to recommend that 1,000 houses should be provided during the next three years, and that the schemes be submitted to the Department of Health for their approval. Of these houses, 500 will be allocated for re-housing and 500 as part of slum-clearance schemes.

Plans passed by the EDINBURGH Dean of Guild Court : Twenty-four tenement houses, New Street, Gilmerton; bungalow and garage, Westgarth Avenue, Colinton, for Mr. George Cairns; bungalow, Belmont Avenue, and bungalow, 192 Willowbrae Road, for Mr. James Miller; sub-division of three houses, 234 Newhaven Road, Leith, for Mr. George Dickson; shop and house, Biggar Road, Fairmilehead, for Mrs. Jessie Williamson.

The FORT WILLIAM T.C. has under consideration the proposed purchase of sites for further houses.

The PERTH C.C. has approved a scheme for the new county buildings estimated to cost £32,300.

IRELAND

Plans passed by the DUBLIN Corporation : Additions, Sacred Heart Home, Drumcondra; reconstruction and new garages, Hollybrook Park, for Mr. L. Maguire; two cottages, O'Briens Place, for Mr. J. McCourt; houses, Pimlico, for Messrs. O'Connor and Treacy.

Messrs. Dorman, Long & Co., Ltd., of Middlesbrough and London, have been awarded the contract for the building of the new Carlisle Bridge at LONDONDERRY, Ireland. This contract, the successful tender for which amounted to £255,000, is for a steel bridge consisting of five spans of 130 ft. each and seventeen approach spans, making a total length of 1,260 ft. overall. Work will start immediately and it is estimated that the bridge will be completed in 2½ years. Approximately 6,000 tons of steel will be used, all of which will be of British manufacture throughout, being smelted in the Middlesbrough works of Dorman, Long & Co., Ltd. Work will thus be provided for North Country steel workers and also for about five hundred men on the actual site throughout the period of the contract. The engineers for the new bridge are Messrs. Mott, Hay and Anderson.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers; the rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given. The rates for every trade in any given area will be sent on request.

PRICES CURRENT

The wages are the Union rates current in London at the time of publication. The prices are for good quality material, and are intended to cover delivery at works, wharf, station, or yard, as customary, but will vary according to quality and quantity. The measured prices are based upon the foregoing, and include usual builders' profits. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry.

EXCAVATOR AND CONCRETOR

EXCAVATOR, 1s. 3½d. *per hour;* LABOURER, 1s. 3½d. *per hour ;* NAVVY, 1s. 3½d. *per hour ;* TIMBERMAN, 1s. 5d. *per hour ;* SCAFFOLDER, 1s. 4½d. *per hour ;* WATCHMAN, 7s. 6d. *per shift.*

	£	s.	d.
Broken brick or stone, 2 in., per yd.		11	6
Thames ballast, per yd.		10	0
